Pre-historic remains. From the numerous sepulchral mounds, monumental ruins, and other remains thickly strewn over Chontales and all the western provinces, as well as from the direct statements of the early Spanish writers, it appears that most of Nicaragua was densely peopled at the time of the conquest. In many districts colossal monolithic statues of men and gods, crumbling temples, cairns, and tombs of all sizes are met in every direction, and in some places the inhabitants still supply themselves with pottery from the vast quantities of fictile vessels preserved below the surface, or piled up

[3] The exports in 1880 amounted to £411,500, the imports to £295,000. For the same year the revenue was £487,000, the expenditure rather more; the public debt was £700,000.

in heaps like that of Monte Testaccio near Rome. One explorer speaks of "mountains of earthenware," and another tells us that "around Libertad the tombs are in thousands, offering every possible variety of form, size, and thickness." Monuments of this sort have been found ranging from 20 to over 170 feet in length and 120 in breadth, built of huge stones piled up 5 feet in thickness, which must have been brought from great distances. Managua appears to have had a population of 40,000; mention is made of other cities four miles in extent; and when Gil Gonzalez penetrated into the country in 1522 he found in one district a cluster of six considerable towns all less than two leagues apart. But "a few years of Spanish rule sufficed to turn whole tracts of flourishing country into uninhabited wilds" (H. H. Bancroft), and, after making every allowance for the defective character of the last census returns, the present population of the whole state cannot be estimated at more than 400,000. A calculation based on the partial census of 1846 gave 300,000, of whom about 100,000 were pure-blood Indians, 150,000 half-castes (Mestizoes, Zambos, &c.), 20,000 Negroes, and 30,000 whites. Throughout the present century the whites appear to have shown a general tendency to diminish, and the indigenous element is by some now estimated at fully one half of the whole population.

Population.

With the exception of some wild tribes in the interior of Mosquitia, nearly all the natives are now in a more or less civilized state, and have generally adopted the Spanish language. At the time of the conquest Herrera tells us that five distinct languages were current in Nicaragua:—the *Caribisi* (Carib) on the east coast, now represented by the Rama, Toaca, Poya, and Waikna (Mosco); the *Chontal* of Chontales, Segovia, and parts of West Honduras and Salvador, now represented by the Woolwa in Chontales and Mosquitia; the *Chorotegan* (Dirian), mainly between Lake Managua and the Pacific and thence north to Honduras, now extinct; the *Orotiñan* between Lake Nicaragua and the Pacific (department of Rivas) and thence south to the Gulf of Nicoya, Costa Rica, also extinct; the *Cholutec* (Niquiran), a pure Aztec dialect spoken in the large islands of Lake Nicaragua, and about Masaya, Granada, and other districts, especially along the north-west side of the lake, where it still survives among a few scattered communities. The presence of Aztec settlements in this region, and at one time even amongst the Chontales of the opposite side of the lake, is abundantly established by this survival, by the archæological remains found in the islands and adjacent mainland, and especially by the Aztec geographical nomenclature widely diffused throughout the whole of West Nicaragua; *e.g.*, Popogatepec = Popocatepetl, the local name of the Masaya volcano; Ometepec or Ometepet = Ometepetl, *i.e.*, "Two Peaks," the largest of the islands in Lake Nicaragua; the ending *galpa*, common in Chontales (Juigalpa, Matagalpa, &c.), which is the Aztec *calpa*, group of houses, town, from *calli*, house. The euphonic changes *c* or *t* for final *tl*, *g* for *c*, &c., occur even in Mexico itself, and are important as showing that the Cholutecs are comparatively recent intruders from the Anahuac plateau, not the original stock of the Aztec nation, as has been suggested by some ethnologists.[1]

Besides the Caribisi, or continental Caribs of Herrera, the Mosquito Coast is occupied by other Carib communities, which are descended from the Caribs removed thither from the island of St Vincent by the English in 1796. To these alone the name of Carib is now applied, although they are not pure-blood Indians, but Zambos, in whom the Negro features greatly predominate. The Woolwas of the interior of Mosquitia and Chontales are divided into a great number of tribes collectively known as Bravos, that is, wild or uncivilized, who live chiefly on hunting and fishing, and are practically independent of the Nicaraguan Government. The term Bravo itself is the exact Spanish equivalent of the Aztec Chontal, Chondal, that is, "barbarian," which at the time of the discovery was applied by the Cholutecs to all the tribes dwelling east of the great lakes and on the Cordillera de los Andes as far north as Honduras and San Salvador. Here they seem to have supplanted a still more ancient race, who had attained a high state of civilization, as attested by the already-mentioned monuments and stone sculptures of Chontales, which are of a different type both from the Aztec and the Maya-Quiché remains of Yucatan and Guatemala.

Administration.

According to the electoral law of 1858 Nicaragua forms a democratic republic modelled on that of the United States, with a legislative assembly of eleven members, a senate of ten, and a president elected for four years and assisted by a cabinet of four ministers. The seat of government, formerly Granada and Leon, has since 1858 been Managua on the south-west side of Lake Managua. Although Roman Catholicism is still recognized as the state religion, the free exercise of all others is guaranteed, together with freedom of the press and of education. Public instruction, which is provided for by one university, three colleges, two hundred schools, and an annual grant of £10,000, is still in a very backward state. The total attendance at the national schools in 1882 was 5000, or less than 8 per cent. of the whole population. The criminal charges in the same year were 1938, or 5 per 1000, showing a slight improvement on previous years. There are no railways, and very few good roads even between the large towns and seaports. But the telegraph system (800 miles) was completed in 1882, and in the same year Nicaragua joined the Universal Postal Union. The telegraph despatches forwarded through twenty-six offices numbered 81,000; letters and packages of all sorts, 1,119,000.[2]

Telegraphs.

History.

First discovered and coasted by Columbus during his fourth and last voyage in 1502, Nicaragua was not regularly explored till 1522, when Gil Gonzalez Davila penetrated from the Gulf of Nicoya to the western provinces and sent his lieutenant Cordova to circumnavigate the great lake. The country takes its name from Nicaragua (also written Micaragua), a powerful Cholutec chief, ruling over most of the land between the lakes and the Pacific, who received Davila in a friendly spirit, and accepted baptism at his hands. Nicaragua's capital seems to have occupied the site of the present town of Rivas over against Ometepec, and soon afterwards the Spaniards overran the country with great rapidity, both from this centre northwards, and southwards from the Honduras coast. The occupation began with sanguinary conflicts between the two contending waves of intrusion, and down to the present day this region has had little respite from external attack and internal convulsions. Granada was founded in 1524 on the isthmus between the two lakes as the capital of a separate government, which, however, was soon attached as a special intendence to the general captaincy of Guatemala, comprising the whole of Central America and the present Mexican state of Chiapas. Hence, during the Spanish tenure, the history of Nicaragua is merged in that of the surrounding region. Of its five earliest rulers "the first had been a murderer, the second a murderer and rebel, the third murdered the second, the fourth was a forger, the fifth a murderer and rebel" (Boyle). Then came the hopeless revolts of the Indians against intolerable oppression, the abortive rebellions of Hernandez de Contreras and John Bermejo (Bermudez) against the mother country (1550), the foundation of Leon, future rival of Granada, in 1610, and its sack by Dampier in 1685, and, lastly, the declaration of independence (1821), not definitively acknowledged by Spain till 1850.

In 1823 Nicaragua joined the Federal Union of the five Central American states, which was finally dissolved in 1833. While it lasted Nicaragua was the scene of continual bloodshed, caused partly by its attempts to secede from the confederacy, partly by its wars with Costa Rica for the possession of the disputed territory of Guanacaste between the great lake and the Gulf of Nicoya, partly also by the bitter rivalries of the cities of Leon and Granada, respective headquarters of the Liberal and Conservative parties. During the brief existence of the Federal Union "no fewer than three hundred and ninety-six persons exercised the supreme power of the republic and the different states" (Dunlop's *Report*). Since then the independent government of Nicaragua has been distinguished almost beyond all other Spanish-American states by an uninterrupted series of military pronunciamientos, popular revolts, partial or general revolutions, by which the land has been wasted, its former industries destroyed, and the whole people reduced to a state of moral debasement scarcely elsewhere paralleled in Christendom. Conspicuous amongst the episodes of this sanguinary drama was the filibustering expedition of General Walker, who was at first invited by the democrats of Leon to assist them against the aristocrats of Granada, and who, after seizing the supreme power in 1856, was expelled by the combined forces of the neighbouring states, and on venturing to return was shot at Truxillo on September 25, 1860. A truce to these internecine troubles has been recently brought about by mutual exhaustion; and, should any of the schemes of interoceanic canalization be carried out, it may be hoped that a national revival will take place under more favourable prospects for the future.

Mosquito reserve.

One source of serious embarrassment has been removed by the settlement of the Mosquito reserve question. This territory, which stretches along the Caribbean coast from the Sisin Creek to the Rama river (from 10° 30′ to 13° N. lat.) and for about 40 miles inland, had enjoyed a semi-independent position under the nominal protection of Great Britain from 1655 to 1850. By the Clayton-Bulwer treaty of 1850, England resigned all claims to the Mosquito Coast, and by the treaty of Managua in 1860 ceded the protectorate absolutely to Nicaragua. The local chief was induced to accept this arrangement on the condition of retaining his administrative functions and receiving a yearly subvention of £1000 from the suzerain state for the ten years ending in 1870. But he died in 1864, and Nicaragua has never recognized his successor. Nevertheless the reserve continues to be ruled by a chief elected by the natives, and assisted by an administrative council, which assembles at Bluefields, capital of the territory.

[1] It should be noted in this connexion that Buschmann has clearly traced a distinct Aztec geographical terminology throughout the whole of Central America from Guatemala to Comayagua in Honduras on the one hand, and on the other through San Salvador and West Nicaragua nearly to the Costa Rica frontier. The Pipil, an Aztec dialect rather more divergent than the Cholutec of Nicaragua, is still current in parts of Guatemala and San Salvador, but no evidence of Aztec settlements has been discovered either in Yucatan or in Costa Rica (*Ueber die Aztekischen Ortsnamen, passim*).

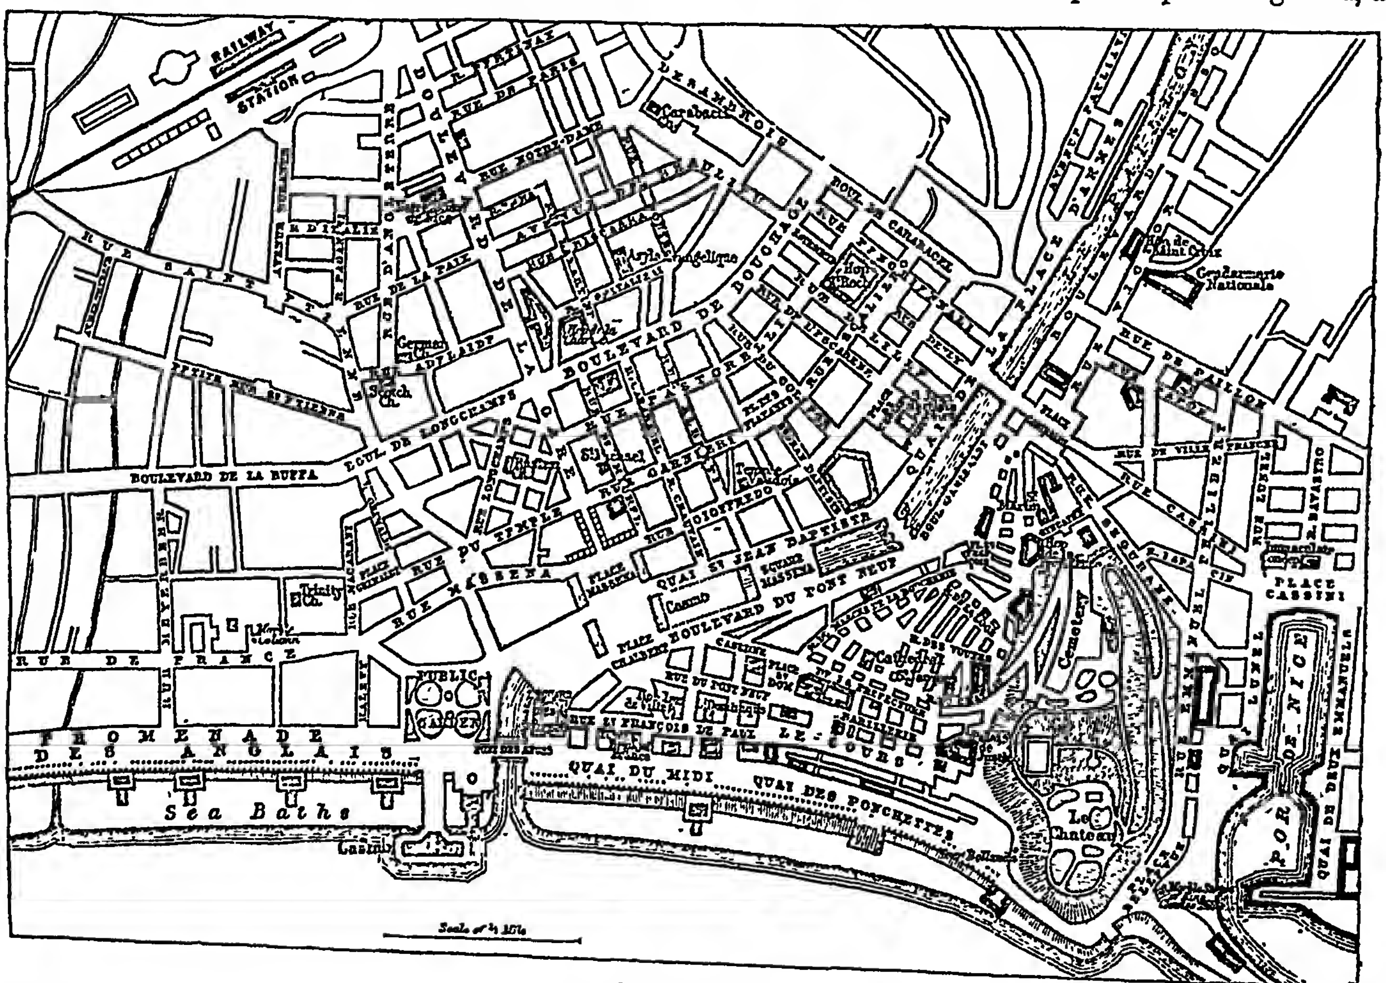
NICASTRO, an episcopal city of Italy in the province of Catanzaro, 16 miles west of Catanzaro and about 6 miles from the Gulf of Sta Eufemia. There are two large suburbs,—Zangaroma, founded by an Albanian settlement in the 15th century, and Bella, dating from 1782,—and the communal population is 14,067 (1881). In the castle of Ferrolito, whose ruins still look down on the city, Frederick II. imprisoned his rebellious son Henry. Nicastro suffered greatly from the earthquake of 1638, which also destroyed the famous Benedictine abbey of Sta Eufemia, about 3 miles to the west.

NICCOLO PISANO. See PISANO.

NICE, a city of France, the chief town of the department of Alpes Maritimes, and previous to 1860 the capital of the countship of Nice (Nizza) in the kingdom of Sardinia, is situated in 43° 42′ N. lat. and 7° 16′ E. long., 739 miles by rail from Paris, and occupies a fine position at the mouth of the Paillon (Paglione), a stream (often dried up in summer) which, after a course of 20 miles, enters the northern end of the Baie des Anges. A steep isolated limestone hill, 315 feet in height, running back for some distance from the shore, forms the historical nucleus of the town. Formerly crowned by a castle, which previous to its destruction by the duke of Berwick in 1706 was one of the strongest fortresses on the coast, it is now laid out as a public pleasure-ground, and



Plan of Nice.

planted with aloe, cactus, agave, and palm. Towards its south-west corner stands a tower (Tour Bellanda or Clérissy) dating, it is believed, from the 5th century. The old town stretches along the western base of the hill; the "town of the 18th century" occupies the ground farther west, which slopes gently towards the Paillon; and away to the north-east and north and west beyond the stream lie the ever-growing quarters of the modern city. To the east of the hill, and thus out of sight of the more fashionable districts, the commercial quarter surrounds the port. The whole frontage of Nice is composed of fine embankments: the Quai des Ponchettes, constructed in 1770 round the base of the castle hill, is continued westward by the Quai du Midi as far as the Pont des Anges, which crosses the mouth of the Paillon; and from the public gardens and the municipal casino on the other side of the stream the Promenade des Anglais, a boulevard 85 feet wide, extends for more than a mile to the mouth of the Magnan, and is likely to be prolonged to the Var. A pier projecting into the sea from the promenade contains a "crystal palace" and a sea-bathing establishment. The course of the Paillon also is embanked on both sides, and at one part the Place Masséna, one of the largest public squares in the city, and the principal resort of foreign visitors, has been laid out across the stream. Besides a Roman Catholic cathedral—Ste Réparate, dating from

1650—Nice possesses a Russian church, two synagogues, and several Protestant chapels. Architecturally the most remarkable church is Notre Dame, a modern Gothic building with two towers 213 feet high, erected by the town in 1835 to commemorate its preservation from cholera. The secular buildings include the town-house, the prefecture, the theatres, the hospitals, the lycée (founded by the Jesuits in the 17th century), the natural history museum, the library (especially rich in theology), and, at some distance from the town, the astronomical and meteorological observatory on Mount Gros. The industrial establishments comprise perfume factories, distilleries, oil-works, furniture and wood work factories, confectionery works, soap-works, tanneries, and a national tobacco factory employing several hundred persons. Besides the vine, the trees principally cultivated in the neighbourhood are the olive, the orange, the mulberry, and the carob; and the staple exports are oil, agricultural produce, fruits, and flowers. The harbour, which as yet only covers 10 acres, is being enlarged. In 1881 the population of the city was 54,953, and of the commune 66,279,—an increase respectively of about 9000 and 13,900 since 1872. During winter there is a large proportion of strangers from all parts of the world.

Protected towards the north by hills which rise stage behind stage to the main ridge of the Alps, Nice is celebrated for the mildness of its climate. The mean temperature is 60° Fahr., that of winter being 49°, of spring 56°, of summer 72°, and of autumn 63°. For a few nights in winter the mercury sinks below freezing point, but snow is practically unknown, falling, on an average, only half a day in the year. The highest reading of the thermometer is rarely above 90°. There are sixty-seven days with rain in the course of the year; but it usually falls in heavy showers which soon leave the sky clear again, though the whole annual amount exceeds 32 inches. Fine days and rainy days are almost equally distributed throughout the different seasons. The winds are very variable, sometimes changing several times a day. Apart from the ordinary land and sea breezes, the most frequent is the east wind, which is especially formidable during autumn. The south-west wind is moist and warm; the north-east, which is happily rare, brings storms of hail and even snow in winter. The mistral (from the north-west) and the tramontane (from the north) are generally stopped by the mountains; but when they do reach the city they raise intolerable dust-storms. For two thousand years the climate of Nice has been considered favourable in chest complaints. Those who are requiring rest, and those suffering from gout, asthma, catarrhs, rachitic affections, scrofula, stone, also experience benefit; but the reverse is the case when heart disease, nervous disorders, or ophthalmia are concerned. Autumn is the best season; in spring the sudden changes of temperature demand great care. Means of passing the time pleasantly are fairly abundant. The city is at its liveliest during the carnival festivities, in which, as at Rome, battles are waged with sweetmeats and flowers.

Nice (*Nicæa*) was founded about two thousand years ago by the Phocæans of Marseilles, and received its name in honour of a victory (*νίκη*) over the neighbouring Ligurians. It soon became one of the busiest trading stations on the Ligurian coast; but as a city it had an important rival in the town of Cemenclium, which continued to exist till the time of the Lombard invasions, and has left its ruins at Cimiez (Italian, Cemella), 2½ miles to the north. In the 7th century Nice joined the Genoese league formed by the towns of Liguria. In 731 it repulsed the Saracens; but in 859 and 880 they pillaged and burned it, and for the most of the 10th century remained masters of the surrounding country. During the Middle Ages Nice had its share in the wars and disasters of Italy. As an ally of Pisa it was the enemy of Genoa, and both the king of France and the emperor of Germany endeavoured to subjugate it; but in spite of all it maintained its municipal liberties. In the course of the 13th and 14th centuries it fell more than once into the hands of the counts of Provence; and at length in 1388 it placed itself under the protection of the counts of Savoy. The maritime strength of Nice now rapidly increased till it was able to cope with the Barbary pirates; the fortifications were largely extended and the roads to the city improved. During the struggle between Francis I. and Charles V. great damage was caused by the passage of the armies invading Provence; pestilence and famine raged in the city for several years. It was in Nice that the two monarchs in 1538 concluded, through the mediation of Paul III., a truce of ten years; and a marble cross set up to commemorate the arrival of the pope still gives its name, Croix de Marbre, to part of the town. In 1543 Nice was attacked by the united forces of Francis I. and Barbarossa; and, though the inhabitants, with admirable courage, repulsed the assault which succeeded the terrible bombardment, they were ultimately compelled to surrender, and Barbarossa was allowed to pillage the city and to carry off 2500 captives. Pestilence appeared again in 1550 and 1580. In 1600 Nice was taken by the duke of Guise. By opening the ports of the countship to all nations, and proclaiming full freedom of trade, Charles Emmanuel in 1626 gave a great stimulus to the commerce of the city, whose noble families took part in its mercantile enterprises. Captured by Catinat in 1691, Nice was restored to Savoy in 1696; but it was again besieged by the French in 1705, and in the following year its citadel and ramparts were demolished. The treaty of Utrecht in 1713 once more gave the city back to Savoy; and in the peaceful years which followed the "new town" was built. From 1744 till the peace of Aix-la-Chapelle (1748) the French and Spaniards were again in possession. In 1775 the king of Sardinia destroyed all that remained of the ancient liberties of the commune. Conquered in 1792 by the armies of the French Republic, the countship of Nice continued to be part of France till 1814; but after that date it reverted to Sardinia. By a treaty concluded in 1860 between the Sardinian king and Napoleon III. it was again transferred to France, and the cession was ratified by nearly 26,000 electors out of a total of 30,700 Nice is the seat of a bishopric, at present dependent on the archbishopric of Aix, and the headquarters of a military division forming part of the corps d'armée of Marseilles. Masséna and Garibaldi were natives of the city.

See Roubaudi, *Nice et ses environs*, Turin, 1843; Tisserand, *Hist. de la cité de Nice*, Nice, 1862; Lacoste, *Nice pittoresque et pratique*, Nice, 1876.

NICEPHORUS I., emperor of Constantinople from 802 to 811, born at Seleucia in Pisidia, is alleged on very doubtful authority to have been a descendant of Jaballah, who had been monarch of the small Arabian kingdom of Ghassân in the time of Heraclius, and for a time had professed the Mohammedan religion. In the reign of Irene he rose to the office of logothetes, or lord high treasurer, and in 802 he was joined by her favourite eunuchs in a plot by which she was dethroned and exiled, while he himself assumed the crown (October 31). Soon after his accession, Bardanes, one of his ablest generals, rose in revolt against him and received much powerful support, including that of Leo the Armenian and Michael the Amorian (names which reappear in history), but the skilful diplomacy of Nicephorus soon brought the rebel to the position of a suppliant, willing to accept the seclusion of a monastery. The conspiracy headed by the patrician Arsaber in 808 had a similar issue. In 803 Nicephorus had entered into a treaty with Charlemagne by which the limits of the two empires were amicably fixed,—Venice, Istria, the maritime parts of Dalmatia, and South Italy being assigned to the East, while Rome, Ravenna, and the Pentapolis were recognized as belonging to the West; this treaty was renewed in 810. Shortly after the retirement of Bardanes, who had been appointed to march against the Saracens, Nicephorus in person took the field against Haroun al-Rashid, but sustained a great defeat at Crasus in Phrygia; and subsequent inroads of his conqueror compelled him to sue for peace, which was granted only on condition of an annual tribute of 30,000 pieces of gold, besides three additional pieces (perhaps, as Finlay suggests, medallions of superior size) for himself, and three for his son Stauracius. By the death of Haroun in 809 Nicephorus was left free to turn his attention to the Bulgarians, whose warlike king, Crumn, had begun to harass the empire in the north; but six days after it had crossed the frontier the powerful Byzantine army was

attacked in force by night, and Nicephorus, along with six patricians, many officers of high military rank, and a large number of rank and file, was put to the sword. Crumn is recorded to have made a drinking cup of the emperor's skull. After a brief reign of two months, Stauracius, who had been proclaimed emperor by the soldiers, was deposed by his brother-in-law, Michael Rhangabe. Nicephorus, who "though a brave soldier was essentially a statesman," gave considerable attention to the finance department of the empire, but did not escape the imputation of avarice and oppression. Ecclesiastically his reign is noted for the comparative success with which he asserted the supremacy of the civil power, and gave effective preponderance to imperial over monkish opinion.

NICEPHORUS II. (Phocas), emperor of Constantinople from 963 to 969, was member of a brave Cappadocian family which had previously furnished more than one distinguished general to the empire. He was born about 912, joined the army at an early age, and under Constantine VII., Porphyrogenitus, attained the high rank of magnus domesticus, or general of the East (954). In the almost continual struggle with the Saracens which this post implied he sustained severe defeat in 956, but retrieved his fame in 958 and again in 959 in Syria; and in July 960 he led the expedition against Crete which compelled Candia to surrender after a siege of ten months, and again brought the whole island under Byzantine rule. The long extinct honours of a triumph were revived to reward him on his return to Constantinople. In 962 he again set out with a large army against Syria; after forcing his way through the narrow passes of Mount Amanus, and compelling the principal cities to open their gates, he was pushing on towards the Euphrates when intelligence reached him in 963 that the emperor Romanus II. had died, leaving the empress Theophano regent for her infant sons. Justly fearing the intrigues of the able minister Joseph Bringas, he returned to Constantinople, after having previously obtained from Theophano and the patriarch Polyeuctes a guarantee for his personal safety; he then, with the help of the patriarch, procured for himself the supreme command of the army during the minority of the princes, and, after gaining over the officers and soldiers to his interest, consented to allow himself to be proclaimed emperor. He was crowned on August 16, and soon afterwards married Theophano, though the union was discountenanced by the patriarch on the alleged ground of a spiritual affinity. In 964 he resumed the war against the Saracens, and, though compelled to raise the siege of Tarsus, was successful in capturing Adana and Mopsuestia; in the following year Tarsus also was forced to surrender to himself, while Cyprus was reconquered for him by the patrician Nicetas. In 966 and 967 the internal affairs of the empire and threatening troubles in Hungary and Bulgaria detained him in Constantinople; but the spring of 968 saw him once more in the field against the caliph, and Laodicea, Hierapolis, Aleppo, Arca, and Emesa were added to his conquests. In the following year Antioch also fell, in the emperor's absence, into the hands of the patricians Burtzes and Peter, but Nicetas was less successful against Sicily. Meanwhile Nicephorus had not made himself so popular on the throne as in the camp. The heavy imposts he found necessary for the support of his expeditions more than counterbalanced, in public estimation, the glory he gained by them. His retrenchment of court largesses and pensions naturally made him many enemies, and he incurred just odium by employing debased coinage to meet the public debts while continuing to exact money of the old standard in payment of the taxes. An accidental tumult in the hippodrome, which had resulted in the loss of many lives, further increased his unpopularity, and, last of all, his fickle wife joined the number of his enemies and began to plot his death. He was assassinated in his sleeping apartment on the night of December 10, 969. At the head of the conspirators was his nephew John Zimisces, who immediately succeeded him.

NICEPHORUS III. (Botaniates), emperor of Constantinople from 1078 to 1081, belonged to a family which claimed descent from the Roman Fabii. He served in the army, and rose to be commander of the forces in Asia. In 1078 he assumed the purple at Nicæa, almost simultaneously with Nicephorus Bryennius (father or uncle of the historian of that name), who had revolted against Michael VII. at Adrianople; the aristocracy and clergy of the capital supported the claims of Botaniates, who was crowned on March 25, 1078. With the able help of Alexius Comnenus, the recalcitrant generals Ursel, Bryennius, and Basilacius were successively driven from the field, but soon afterwards the wakeful jealousy of the emperor was turned upon their conqueror, who was compelled to flee the court. Alexius, however, had hold of the army, and on April 1, 1081, ascended the throne, Nicephorus being forced to abdicate and become a monk of St Basil. He died in obscurity.

NICEPHORUS BRYENNIUS. See BYZANTINE HISTORIANS, vol. iv. p. 613.

NICEPHORUS, surnamed CALLISTI, the last of the Greek ecclesiastical historians, lived at Constantinople, perhaps as a monk in connexion with the church of St Sophia. He was born about the close of the 13th century, and died not later than 1356. His *Historia Ecclesiastica*, in eighteen books, brings the narrative down to the death of Phocas in 610; for the first four centuries the author is largely dependent on his predecessors, Eusebius, Socrates, Sozomen, Theodoret, and Evagrius, his additions showing very little critical faculty; in the later period his labours, based on documents now no longer extant, to which he had free access, though he used them also with small discrimination, are much more valuable. A table of contents of other five books, continuing the history to the death of Leo the Philosopher in 911, also exists, but whether the books were ever actually written is doubtful. A Latin translation of the *Historia* of Nicephorus, by Lange, appeared at Basel in 1553; the Greek text was edited for the first time by Fronton le Duc (2 vols. fol., Paris, 1630).

NICEPHORUS GREGORAS. See BYZANTINE HISTORIANS, vol. iv. p. 613.

NICEPHORUS, one of the Byzantine historians (see vol. iv. p. 614), surnamed PATRIARCHA, was patriarch of Constantinople from 806 to 815. He was born about 758; from his father Theodorus, one of the secretaries of the emperor Constantine Copronymus, who for his zeal as an image-worshipper had been scourged and dismissed into exile, he inherited literary talent as well as strong religious convictions. He was present as secretary to the imperial commissaries at that second council of Nice in 787 which witnessed the triumph of his opinions; but court vicissitudes soon afterwards drove him again into private life. In 806 he was suddenly raised by the emperor Nicephorus I. from the condition of a monk to the patriarchate of Constantinople, and this office he held until 815, when he accepted deposition rather than assent to the iconoclastic edict promulgated by Leo the Armenian in the previous year. He retired to the cloister of St Theodore, which he himself had founded, and died there in 828. Nicephorus is the author of a valuable and well-written compendium (*Breviarium Historicum*) of Byzantine history from 602 to 770, first printed at Paris in 1616, of a much less important *Chronologia compendiaria*, and of one or two controversial writings against iconoclasm.

NICHOLAS, St, of Myra, according to the Roman breviary (December 6) was a native of Patara in Lycia, and was given to his parents in answer to their prayers. From his earliest infancy he signally displayed the piety for which his whole life was remarkable, on Wednesdays and Fridays regularly refusing to receive nourishment from his nurse except once only, and that after sunset. While still a youth he was deprived of his parents, and the wealth that he thus early inherited he forthwith distributed to the poor. To this period belongs what may be called the characteristic deed of his life,—his secret bestowal of dowries upon the three daughters of a citizen fallen into poverty, who, unable to procure fit marriages for them, was minded to give them up to a life of shame. Having given himself wholly to God, Nicholas made a pilgrimage to Palestine, and in his voyaging miraculously stilled a storm by his prayers. On his return to his native province he visited Myra, the capital, where, as it fell out, the bishop had just died, and the chapter had been divinely advised to select as his successor a man named Nicholas who should be the first to enter the church next morning. Nicholas, thus plainly indicated, was duly consecrated, and displayed throughout his whole term of office every episcopal virtue. Under Maximian and Diocletian he was seized for his constancy, removed far from his diocese, and thrown into prison, where he lay until the days of Constantine, when he returned to Myra. He afterwards attended the council of Nice, and died a natural death not long after his return. His remains were subsequently removed to Bari (Barium) in Apulia. So far the authoritative Roman legend, the documentary evidence for which, however, does not take us farther back than to the 9th century at the earliest (Simeon Metaphrastes). Nicholas is not mentioned among the Nicene fathers by any of the church historians of that or the succeeding century, and the earliest extant trace of his existence is in the fact that a church was dedicated to him in Constantinople by Justinian about the year 560. Before the 12th century his name had become very prominent both in the Eastern and in the Western Church, it is difficult to tell precisely why; and to this day he is one of the most popular saints in the orthodox Greek communion. Among the miracles assigned to him is that of restoring to life three youths who had been murdered and salted down by an innkeeper in whose house they had taken lodging; thus Nicholas figures as the patron saint not only of poor maidens and of sailors but also of travellers and merchants. Children, and especially schoolboys, are also regarded as being especially under his guardianship, and in Russia and Greece, as well as throughout the north of Europe, the liberality of Nicholas or Klaus is yearly appealed to by them on the eve of his festival (December 6). His protection is specially invoked against thieves and losses by robbery and violence. It may be well to note that the "Old Nick" belonging to another cycle of legend has no connexion, as has sometimes been supposed, with the subject of the present article, that designation being etymologically connected with such words as Nixie, Nickar, and perhaps even with the river-name Neckar (see Grimm's *Deutsche Mythologie*).

NICHOLAS I., sometimes called The Great, and certainly the most commanding figure in the series of popes between Gregory I. and Gregory VII., succeeded Benedict III. in April 858. According to the annalist "he owed his election less to the choice of the clergy than to the presence and favour of the emperor Louis II. and his nobles,"—who can hardly have foreseen with what ability and persistency the rights of the holy see as supreme arbiter of Christendom were to be asserted even against themselves by the man of their choice. Of the previous history of Nicholas nothing is recorded. His pontificate of nine years and a half was marked by at least three memorable contests which have left their mark in history. The first was that in which he supported the claims of the unjustly degraded patriarch of Constantinople, Ignatius; the history of the conflict cannot be related here, but two of its incidents, the excommunication of Photius, the rival of Ignatius, by the pope in 863, and the counter-deposition of Nicholas by Photius in 867, were steps of serious moment towards the permanent separation between the Eastern and the Western Church. The second great struggle was that with Lothaire, the king of Lorraine (second son of the emperor Lothaire I., and brother of the emperor Louis II.), about the divorce of his wife Theutberga or Thietberga. The king, who desired to marry his mistress Waldrada, had brought a grave charge against the life of his queen before her marriage; with the help of Archbishops Gunther of Cologne and Thietgand of Treves, a confession of guilt had been extorted from Thietberga, and, after the matter had been discussed at more than one synod, that of Aix-la-Chapelle finally authorized Lothaire, on the strength of this confession, to marry again. Nicholas ordered a fresh synod to try the cause over again at Metz in 863; but Lothaire, who was present with his nobles, anew secured a judgment favourable to himself, whereupon the pope not only quashed the whole proceedings, but excommunicated and deposed Gunther and Thietgand, who had been audacious enough to bring to Rome in person the "libellus" of the synod. The archbishops appealed to Louis II., then at Benevento, to obtain the withdrawal of their sentence by force; but, although he actually occupied Rome (864), he was unsuccessful in obtaining any concession, and had to withdraw to Ravenna. Thietberga herself was now induced to write to the pope a letter in which she declared the invalidity of her own marriage, and urged the cause of Lothaire, but Nicholas, not without reason, refused to accept statements which had too plainly been extorted, and wrote urging her to maintain the truth steadfastly, even to the death if need were, "for, since Christ is the truth, whosoever dies for the truth assuredly dies for Christ." The imminent humiliation of Lothaire was prevented only by the death of Nicholas. The third great ecclesiastical cause which marks this pontificate was that in which the indefeasible right of bishops to appeal to Rome against their metropolitans was successfully maintained in the case of Rothad of Soissons, who had been deposed by Hincmar of Rheims. It was in the course of the controversy with the great and powerful Neustrian archbishop that papal recognition was first given (in 865) to the pseudo-Isidorian decretals, which had probably been brought by Rothad to Rome in the preceding year. (For some account of these, see Canon Law, vol. v. p. 17.) At an early period in his reign Nicholas also had occasion to administer discipline to John of Ravenna, who seems to have relied not only on the prestige of his famous see but also on the support of Louis II. After lying under excommunication for some time he made a full submission. Nicholas was the pope to whom Bogoris, the newly converted king of Bulgaria, addressed himself for practical instruction in some of the difficult moral and social problems which naturally arise during a transition from heathenism to Christianity. The letter from the holy see in reply to the hundred and six questions and petitions of the barbarian king is perhaps the most interesting literary relic of Nicholas I. now extant. He died on November 13, 867, and was succeeded by Hadrian II.

NICHOLAS II., a Burgundian, whose Christian name was Gerard, was archbishop of Florence when he was chosen (December 28, 1058) at that place to succeed Stephen IX. in the papal chair. Some time previously the

old Roman feudatory barons had caused to be consecrated, under the name of Benedict X., John, cardinal bishop of Velletri, who, however, was speedily deposed. The election of Nicholas had been brought about by Hildebrand (afterwards Gregory VII.), and his whole pontificate derived its character from that master-spirit. Its first act of historical importance was the framing by the second Lateran council (April 1059) of the decree which vested the election of popes in the cardinal bishops in the first instance, the assent of the cardinal priests and deacons being next required, then that of the laity, and finally that of the emperor. It was at the same council that Berengarius of Tours was temporarily induced to admit the doctrine of the corporeal presence in the sacrament. In the following June Nicholas visited Apulia, accepted the submission of the Normans, and removed the ban of excommunication, investing Richard in the principality of Capua and Robert Guiscard in the dukedom of Apulia, Calabria, and Sicily. He died at Florence in June 1061, and was succeeded by Alexander II.

NICHOLAS III. (Giovanni Gaetano), a member of the noble house of Orsini, succeeded John XXI. as pope on November 25, 1277. Though his election was doubtless largely due to family influence, he was also personally a man of good endowments, and the record of his brief pontificate has more than one touch fitted to recall the grander manner of some of the greatest popes. In 1278 he extorted from the newly-elected and insecurely seated Rudolph of Hapsburg an absolute cession of the Romagna and of the exarchate of Ravenna, and in the same year he deprived Charles of Anjou of his vicariate of Tuscany; in the following year he compelled Charles to renounce his dignity of senator of Rome also, declaring himself perpetual senator, and his nephew Orso his vicar. He was understood to be planning with Rudolph an entirely new distribution of the thrones of the empire, by which the royal dignity was to be conferred on more than one member of the house of Orsini, when a stroke of apoplexy brought his career to a sudden close on August 22, 1280. Towards the beginning of his reign he repaired and strengthened the Lateran palace, and greatly enlarged the Vatican. For his simoniacal nepotism he has been placed by Dante in the third "bolgia" of the eighth circle of hell (*Inf.*, xix. 31 *sq.*). The successor of Nicholas III. was Martin IV.

NICHOLAS IV. (Girolamo de Ascoli), pope from February 22, 1288, to April 4, 1292, was born at Ascoli, of humble parentage. At an early age he entered the Franciscan order, of which he rose to be general in 1274, after the death of Bonaventura. It was in this capacity that in 1278 he condemned Roger Bacon to imprisonment on account of his writings. He subsequently became bishop of Præneste; and he was created cardinal by Nicholas III. Repeated meetings of the conclave upon the death of Honorius IV. resulted, ten months after the vacancy had occurred, in the election of Ascoli, whose first and almost only historical act was to annul the solemn treaty by which Charles the Lame (of Anjou) had obtained from Alphonso III. of Aragon his release from prison,—"the most monstrous exercise of the absolving power which had ever been advanced in the face of Christendom" (Milman). The revival of the old and expiring enthusiasm of the crusading epoch was a cause he had much at heart; and it was partly at least with the object of stirring up the Mongols against the hated Saracens that he gave John of Monte Corvino and other members of his order their missions to China. The fall of Ptolemais, the last remnant of the Christian dominion in Palestine (1291), greatly affected him, and combined with other disappointments to hasten his death. Celestine V. succeeded.

NICHOLAS V. (Tommaso Parentucelli), the pope whose name is most intimately associated with the revival of learning, was the son of a physician, and was born at Sarzana, near Spezzia, in 1389. He received a good education at Bologna, became tutor in the Albizzi and Strozzi families at Florence, and ultimately entered into the service of Albergata, bishop of Bologna. He accompanied his patron on several embassies, and gained so high a reputation for diplomatic ability and for learning that shortly after Albergata's death he himself obtained the see of Bologna, was sent by Eugenius IV. on an embassy into Germany, and in December 1446 was made a cardinal. In less than three months he was pope in succession to Eugenius,—a small majority of the electors, indisposed to the strongest candidate, Cardinal Prospero Colonna, having united upon Parentucelli as a man who had made no enemies. His policy as pope seemed clearly marked out for him. The church was reaching the end of a period of strife and schism. The firmness of Eugenius IV. had at length almost beaten down the emperor, the antipope, and the council of Basel; the wisdom and moderation of Nicholas V. completed the work. Within two years the emperor made peace, the antipope abdicated, and the council dissolved itself. Nicholas hoped for a period of tranquillity, and determined to exhibit the papacy to the world as the protector of art and learning. "To the demand of Germany for reformation," says Mr Creighton, "he answered by offering culture." He aimed especially at making Rome architecturally a worthy capital of the Christian world: he repaired its fortifications, began the rebuilding of its cathedral, enlarged and adorned its thoroughfares, and traced much of the plan of restoration executed by his successors. But his great glory was his active co-operation in the revival of learning. He collected manuscripts from all quarters, caused them to be multiplied by transcription, commissioned the most competent scholars to translate Greek books into Latin, and gathered around him the most distinguished humanists of his day, Poggio Bracciolini, Valla, Filelfo. Under him the papacy regained much of its former lustre, and till late in his reign his administration was disturbed by no unfortunate events. In January 1453 the conspiracy of Stefano Porcaro was detected on the eve of breaking out. The pope and cardinals were to have been seized, their effects pillaged, and Rome declared a republic. Nicholas was terrified, and showed himself angry and cruel. On May 29 of the same year Constantinople was taken by the Turks. The fault was not the pope's, who had ineffectually sent his galleys to the rescue; yet he could not but feel that a stain had fallen upon his pontificate. He proclaimed a crusade, but this was an undertaking for which he was constitutionally unfit; he failed to kindle the zeal of others, and many doubted his own. Exhausted by repeated attacks of gout, he died on March 24, 1455. Before his death he summoned the cardinals, and enumerated the good works he had been enabled to perform, "by God's blessing of peace and tranquillity in my days." These last words sufficiently express the general scope of his policy. He was rather a scholar than an ecclesiastic or a statesman, yet enough of both to perform his part on the world's stage with sufficient credit; it is, however, his principal distinction to have been a learned and art-loving pope, and to have formed that alliance between the papacy and intellectual culture which subsisted for the next hundred years. He was succeeded by Calixtus III.

NICHOLAS V. (Pietro di Corvara), antipope in Italy from 1328 to 1330, during the pontificate of John XXII. at Avignon, was a native of the Abruzzi and a member of the Franciscan order. He owed his nomination to the papacy, and his election (May 12, 1328) by popular

acclamation, to the influence of the excommunicated emperor Louis the German, on whose head he placed the crown after his own enthronement. After spending four months in Rome he withdrew along with Louis to Viterbo and thence to Pisa; but, on the revolt of that city from Ghibellinism, he was compelled to throw himself on the mercy of John. Carried to Avignon, on making full confession and abjuration of his heresies and impieties (September 6, 1330), he was kept in honourable imprisonment in the papal palace until his death in 1334.

NICHOLAS I. (1796-1855), czar of Russia, third son of Paul I., was born at Tsarkoe-Selo on the 25th June 1796. His elder brothers were Alexander and Constantine, of whom the former was twenty years his senior. Their father was murdered in 1801, and Alexander then became emperor. The education of Nicholas was conducted under the care of his mother, a pious but narrow-minded woman. He had not, like his eldest brother, whose education was directed by the empress Catherine, the advantage of associating in early life with men of culture and of modern ideas. Nor was he early introduced either to military or to political life. He was brought up in retirement, and even during the invasion of Russia by Napoleon in 1812 he was not permitted to serve in the army. His tastes, however, were all military, and his favourite studies mathematics and fortification. During the campaign of 1814 in France he was allowed to come to the allied headquarters, but not to take part in any engagement. He was present during the occupation of Paris in 1815, and in the following year was sent to travel on the Continent and to visit England, where his striking personal appearance excited the admiration of Sir Walter Scott. He married in 1817 Louise Charlotte, daughter of Frederick William III., king of Prussia, and this union had for half a century an important effect on the history of Prussia and Germany at large. After his marriage he received a military command from his brother, and from this time forward he gave his utmost attention to the mechanical part of military affairs, rejoicing in the occupations of a drill-sergeant, and identifying himself so completely with his soldiers that civil costume became insupportable to him, even when on visits to sovereigns who, like Queen Victoria, would have preferred to see him in less warlike guise. Alexander having no sons, Constantine was heir to the throne. This brutal and ignorant prince had, however, the sense to recognize his own unfitness for the task of governing an empire, and by a secret agreement with the reigning sovereign he renounced his rights in favour of Nicholas. Alexander died on December 1, 1825. Constantine, who was in Poland, showed no inclination to prefer his claims; the edict of the late emperor appointing Nicholas his successor was opened, and the younger brother was called by the highest authorities of Russia to assume the crown. He nevertheless refused, and, as it would seem, in perfect sincerity, until Constantine had formally confirmed his renunciation. The delay led to serious consequences. Conspiracies against the late emperor and in favour of a freer government had been formed in the army and among the nobles; and when the troops at St Petersburg were called upon to take the oath to Nicholas, revolt broke out. The young czar showed great nerve and courage, but the mutiny was not put down without bloodshed, and the impression which it left on his mind never passed away. Despotic by nature, trained in the midst of the monarchical reaction that followed the French wars, and accustomed to hear the earlier liberal tendencies of his brother Alexander spoken of as mere vagaries that had happily been abandoned, Nicholas saw in the outbreak of his soldiers in 1825 a warning never to relax the grasp of authority. The maintenance of despotic power was a duty to which he devoted himself with the deepest religious conviction. At the accession of Nicholas, Russia had been for some years on the brink of war with the Porte. Greece was in insurrection, and Russia had its own specific causes of complaint in consequence of the alleged infraction of the privileges of the Danubian provinces guaranteed by the treaty of Bucharest. It had long been the effort of European diplomatists to dissuade Alexander from interfering on behalf of Greece, and to find a peaceful solution for the difficulties in which Russia was more directly concerned. The Greek cause had, however, at length excited so much sympathy that the British Government took advantage of the accession of Nicholas to send the duke of Wellington to St Petersburg to propose some joint action on behalf of Greece. The attempt succeeded: England and Russia undertook to tender their mediation, requiring the sultan to grant the Greeks a modified independence, and the concert was subsequently joined by France. The result of this combination, and of Ottoman obstinacy, was the destruction of the Turkish fleet at Navarino by the allied squadrons, and the establishment of Greek independence. This, however, did not terminate the contentions between Turkey and Russia. The Porte itself challenged war, and in 1828 hostilities broke out. Nicholas took part in the first and unsuccessful campaign of 1828, but allowed his generals to act by themselves in 1829; and the march of Diebitsch over the Balkans was followed by the peace of Adrianople. A Persian war had already been successfully concluded, and Russia had gained thereby two provinces in the east. The peace of Adrianople gave it only an improved frontier on the eastern shore of the Black Sea. In 1830 the fall of the Bourbons made an end of the friendship which existed between France and Russia, and restored the union between the three despotic courts of St Petersburg, Vienna, and Berlin, which had been framed in 1814 and interrupted by the course of Eastern affairs. Nicholas did not refuse to recognize Louis Philippe, but he would never accord him the usual title of *Mon Frère*, and he lost no opportunity of treating him with contempt. The insurrection of Poland soon followed. Alexander had received the grand-duchy of Warsaw from the congress of Vienna as a separate kingdom, united with Russia only in the person of its ruler; and he had fulfilled his promise of granting it a constitution, and treating it as a distinct nationality. The violation of these rights by the grand-duke Constantine, who was governor of Poland, and the virtual establishment of dictatorial rule, caused the insurrection against Nicholas. The Polish leaders sent their demands to St Petersburg; Nicholas replied that he would only answer them with cannon. The diet now pronounced his dethronement as king of Poland, and the armed struggle began. It was a long and doubtful one, for Poland had a regular army of its own; but the victory was at length won by Nicholas, and he showed no mercy to his conquered enemy. Poland was made a Russian province; its liberties were utterly extinguished; its defenders were sent by thousands to Siberia. During the years that followed, the struggle between the sultan and his vassal, Mehemet Ali, pasha of Egypt, brought the Eastern question again to the front of European affairs. The treaty of Unkiar-Skelessi seemed for a moment to have placed Turkey in absolute dependence upon the czar, who guaranteed it his protection against all internal and external enemies; but France and England now made their influence felt, and the ultimate settlement was the work of all Europe. Nicholas visited England in 1844, and tried, but unsuccessfully, to frame some plan of joint action with that country in view of the possible collapse of the Ottoman empire. The revolutionary spirit which the czar so passionately abhorred

was now about to convulse Europe again. He watched the events of 1848, and strengthened his army. So long as revolution did not approach his own frontiers he was willing to hold his hand; but when Hungary rose against the Hapsburgs and established its national independence he felt that Poland would soon follow its example, and sent his soldiers to crush the Magyar armies which Austria had not been able to subdue. When the victory of despotism was secured, he joined with the Austrian Government in demanding from the Porte the surrender of the Hungarian leaders who had taken refuge in Turkey. But it was not long permitted to him to play the part of international autocrat. His aggressions upon the Ottoman empire, continued up to 1853, brought England and France into the field against him. His armies were defeated at Alma and Inkermann, his fortresses besieged; and in the bitterness of defeat death came upon him, and carried him from a world where, with the deepest conviction that he was doing God service, he had inflicted so much evil on mankind (February 18, 1855). He died as he had lived, a brave man, and his last words were those of simple prayer. Shortly before his death he is said to have laid two injunctions upon his successor,—to liberate the serfs, and never to grant Poland a constitution. (C. A. F.)

NICHOLAS OF BASEL, generally called by his friends the Great Layman or the Great Friend of God, was the founder of a singular widespread association of pious people who, in the age of monastic fraternities, lived in special religious fellowship in a fashion altogether different from the common usage of the time. They did not renounce their property, they took no vows of celibacy or of obedience, but they met together for pious conversation, they corresponded with each other, they had common ideas about conversion, holy living, and Christian faith and duty. They were the Quietists of the 14th century, and called themselves the "Friends of God."

Nicholas was the son of a rich merchant of Basel, and was born in that town about the year 1308. Left his own master at the age of twenty-four, by the death of his parents, and possessed of considerable wealth, he went out into the world to enjoy life and seek adventures. He became engaged, burgher as he was, to a maiden of noble rank. The night before his betrothal, as he was praying, he had a vision which resulted in his breaking off his marriage, leaving home and friends, and devoting himself to an ascetic life. After some years spent in solitude, severe bodily mortifications, and deep soul struggle, Nicholas gained the religious peace he sought, and from this time devoted himself to turning men around him from sin to God. He did not enter any religious order; he remained, what he loved to call himself, a layman; he neither preached nor heard confessions, but by means of a singular gift of personal influence he drew round him disciples from all classes of society. His followers did not form themselves into a sect or into an order. Some of them were priests, monks, and nuns, but some of them lived in the world, were nobles, knights, rich merchants, and their wives. Their religious opinions were what are commonly called mystical; and indeed all the more notable mystics of the 14th century were under the influence of Nicholas and belonged to the Friends of God. They did not break loose from the outward order of the church; they observed, though with no great scrupulosity, sacraments, fasts, and festivals; but they looked on all such things as unimportant compared with that absolute resignation to the divine will in all things which was their leading principle.

The most striking event in the life of Nicholas is his meeting, in 1346, with Tauler, the Dominican preacher of Strasburg, which had the result of entirely changing the character of Tauler's religious views and of his preaching. In the society of the Friends of God there came to be a small inner circle of thirteen, who attached themselves to Nicholas, lived in community, and were sent by him on long journeys to maintain communication among the brethren in the different countries of Europe. In 1380, two years after the beginning of the "Great Schism," these thirteen friends met together for the last time, coming from Italy, Hungary, and different parts of Germany. The state of the church at the time seemed to fill them with despair. Nicholas had long, by the many secret means he had at his command, exercised a great though invisible influence on church appointments and ecclesiastical affairs, but now he seemed to feel it hopeless to strive any longer against the increasing wickedness of the times, and he broke up the society he had formed, releasing his followers from their obedience, and went with two friends into Austria. Ten years later one Martin of Mainz, a follower of Nicholas, was burnt as a heretic, and in the act of accusation there are allusions to Nicholas which show that he was still living. But, as he must have been then nearly eighty-five years of age, it cannot have been much later, though the actual date is unknown, when, with two companions, he was burnt as a heretic at Vienna, the chief crime of which he was accused being that "he audaciously affirmed that he was in Christ and Christ in him."

Our information about Nicholas comes to us chiefly through Rulmann Merswin, a banker of Strasburg, who with his wife belonged to the Friends of God. Merswin collected many letters and documents relating to the society, and bequeathed them to a convent of the Knights of St John which he founded in Strasburg. They lay hid for centuries, while the memory of Nicholas perished; even his name was forgotten, and mediæval students were aware only of a mysterious presence who was sometimes referred to as "the Great Friend of God." At last Professor C. Schmidt discovered the documents in the library of the university, and was able to identify Nicholas with Tauler's mysterious visitor and with the Great Layman.

See Carl Schmidt, *Nicolaus von Basel, Leben und Wirken*, Vienna, 1866; *Die Gottesfreunde im vierzehnten Jahrhundert*, Jena, 1854; and Miss Winkworth, *History and Life of Johann Tauler*, London, 1857.

NICHOLS, JOHN (1745–1826), a printer, ranks among the most industrious and voluminous of English antiquaries and collectors. He was editor of the *Gentleman's Magazine* for nearly half a century, from 1778 till his death, and, partly in his magazine and partly in his numerous volumes of *Anecdotes* and *Illustrations*, made invaluable contributions to the personal history of English men of letters in the 18th century. The project of compiling these volumes grew gradually out of his business as a printer. Born in London in 1745, he had been the apprentice and successor of Bowyer, a learned and accomplished printer, a graduate of Cambridge, who had printed for many distinguished men; and on the death of this revered master, in 1778, he issued a brief memoir. This he afterwards expanded into biographical and literary anecdotes of Mr Bowyer and his friends; and, materials accumulating upon him, he expanded his design into a sort of anecdotical literary history of the century, many important letters being placed at his disposal. Large as this work is, it formed but a small part of the indefatigable collector's activity, of which a full account is given in a memoir by Chalmers accompanying the extension of the *Illustrations* by Mr J. B. Nichols. One of his favourite works was an antiquarian history of the town and county of Leicester; and another, on which he himself set great value, a collection of documents illustrating the manners and expenses of ancient times in England. He produced six volumes concerning the progresses, processions, and festivities of Elizabeth and James. In the days of his apprenticeship he wrote and published two volumes of poetry, but had the good sense to throw his genial energies afterwards into other channels. Vol. xcvi. of the *Gentleman's Magazine*

contains a portrait of him at the age of eighty and several well-earned tributes to the worth of his busy and fruitful life. He died November 26, 1826.

NICHOLSON, WILLIAM (1753–1815), a writer on natural philosophy, was born in London in 1753, and after leaving school made two voyages as midshipman in the East India service. He subsequently entered an attorney's office, but, having become acquainted, in 1775, with Wedgwood, he resided for some years at Amsterdam as agent for the sale of pottery. On his return to England he was induced by Holcroft to devote himself to the composition of light literature for periodicals, assisting that writer also with some of his plays and novels. Such work was little in accordance, however, with his scientific tastes, and he employed himself on the preparation of *An Introduction to Natural Philosophy*, which was published in 1781, and was at once successful. A translation of Voltaire's *Elements of the Newtonian Philosophy* soon followed, and he now entirely devoted himself to scientific pursuits and philosophical journalism. In 1784 he was appointed secretary to the general chamber of manufacturers of Great Britain, and he was also connected with the society for the encouragement of naval architecture, established in 1791. Besides his literary labours, he bestowed much attention upon the construction of various machines for comb-cutting, file-making, cylinder printing, &c.; he also invented an aerometer. In 1800 he commenced in London a course of public lectures on natural philosophy and chemistry, and about this period he made the discovery of the decomposition of water by the agency of galvanism, which was said to be the foundation of Sir Humphrey Davy's discoveries in the decomposition of the alkalins. In 1797 the *Journal of Natural Philosophy, Chemistry, and the Arts*, generally known as *Nicholson's Journal*, the earliest work of the kind in Great Britain, was begun; it was carried on till 1814. During the later years of his life Nicholson's attention was chiefly directed to engineering works at Portsmouth, at Gosport, and in Southwark; these with his other employments placed him in an affluent position, which, however, from domestic and other causes, he was unable to maintain. He died in poverty in 1815.

A memoir was written by his son long after his death, but it never was published. Besides considerable contributions to the *Philosophical Transactions*, Nicholson wrote translations of Fourcroy's *Chemistry* (1787) and Chaptal's *Chemistry* (1788), *First Principles of Chemistry* (1788), and a *Chemical Dictionary*; he also edited the *British Encyclopædia, or Dictionary of Arts and Sciences*, 6 vols. 8vo, London, 1809.

NICHOLSON, WILLIAM (1784–1844), portrait-painter, was born at Newcastle-on-Tyne in 1784. Having settled in Edinburgh, he became, along with Thomas Hamilton the architect, one of the founders and most vigorous promoters of the Scottish Academy, of which in 1826 he was appointed the first secretary, a position which he held for about seven years. He is known by his life-sized portraits in oils, and still more favourably by his very delicate and faithful likenesses in water-colours. In 1818 he published a series of etchings entitled Portraits of Distinguished Living Characters of Scotland. They are executed in an effective and painter-like fashion, mainly from the artist's own water-colours, and include portraits of Sir Walter Scott, Lord Jeffrey, Robert Burns, and Professor Wilson. Nicholson died at Edinburgh on August 16, 1844.

NICIAS was the leader of the aristocratic party at Athens and one of the foremost figures in Athenian history during the Peloponnesian War. Although he opposed the democratic tendencies which gave the tone to Attic politics at this time, his high character for piety and honesty, combined with his wealth and influence, gained the confidence of the people, and raised him to the highest offices in their gift. His abilities were not equal to the duties he was called on to perform, and in the severe trial of the Sicilian expedition his conduct showed such timidity in critical situations, such wavering in the general plans of warfare, such obstinacy in details where piety or superstition were concerned, that the disastrous end of the siege of Syracuse must be mainly laid to his charge. It is unnecessary here to write his life, a task which would be almost equivalent to writing the history of Athens for a number of years. See GREECE, vol. xi. p. 102.

NICKEL, a chemical term, designating a metallic element which was discovered by Cronsted in 1751. In 1754 he succeeded in isolating it (in an impure state), and found it to be a "halbmetall" (semi-metal). Afterwards finding it to be present largely in "kupfer-nickel,"[1] he borrowed from that mineral the name for his new element.

Nickel (Ni) is one of the less abundant of elements. It is contained in the sun's atmosphere and in all meteoric iron. Of nickel minerals the following are of metallurgic importance:—nickel-blende, NS; arsenical nickel glance, $Ni(As.S)_2$; niccolo-cobaltic pyrites, $(Ni, Co, Fe)_3S_4$; garnierite, $5(Ni, Mg)O.4SiO_2 + \frac{3}{2}H_2O$. Almost invariably part of the nickel is replaced by cobalt, and not unfrequently part of the arsenic by antimony, or occasionally bismuth. Nickel ores are in general complex mixtures of one or more of these minerals, with sometimes very large proportions of copper, iron, and other foreign metallic ores and gangue. The metallurgy of nickel accordingly is a complex subject which cannot be fully treated here.

As an example of a sulphureous ore may be quoted that niccolo-cupreous pyrites which is being worked at Dillenburg in Nassau. The process employed is closely analogous to the old process of copper-smelting as explained in METALLURGY (vol. xvi. p. 61). The fully refined mat ("Concentrations-Stein") consists of 35 per cent. of nickel, 43 of copper, 2 of iron, and 20 of sulphur. The article METALLURGY (*ut sup.*), under arsenides, describes a process which, when applied to arseniferous cobalt and nickel ores, yields the cobalt as smalt, the nickel as part of a "speis" (an alloy of arsenides). The same process serves occasionally for (so to say) collecting small proportions of nickel diffused throughout oxidized ores, the arsenic requisite being introduced in the form of native arsenide of iron.

If an arseniferous ore contains copper, the process sometimes is modified by addition of iron pyrites or some other sulphureous material, and so conducted that, in addition to a nickelous speis, a cupreous mat is produced. The speis and mat do not mix, but form separate layers, the mat, as the lighter of the two, going to the top.

All sulphureous, arsenical, or poor oxidized nickel ores are being wrought by methods analogous to the above, in so far at least as they all aim, in the first instance, at the production of a speis or mat from which the metal has to be extracted by subsequent operations. Direct methods are being used only in conjunction with one kind of ore, namely, that rich oxidized nickel ore which was discovered in New Caledonia about 1875, and has since been imported into Europe in large and yearly increasing quantities. It occurs in veins within serpentine, and consists of garnierite mixed with more or less of oxide of iron, chrome-iron ore, and a little black oxide of cobalt. It is valuable chiefly through its absolute freedom from arsenic and sulphides. Most of the ore goes to France, where it is worked chiefly by two firms. Christofle at St Denis treats the ore with hydrochloric acid, and from the solution recovers the metal by methods analogous to those customarily employed in connexion with speis and mats. Garnier, at the Septêmes Works near Marseilles, makes straight for the metal. The powdered ore, after mechanical purification (by such methods as are explained in METALLURGY, vol. xvi. p. 59), is mixed with charcoal and fluor-spar (or other flux) and worked into a paste with coal-tar, which is then shaped into bricks or walnut-sized stones. The ore thus prepared is then manipulated pretty much in the same way as an iron ore is for the production of pig-iron. The furnaces used are about 13 feet high, and worked with cold wind. Garnier in this manner produces three kinds of metal:—(1) an almost pure carbide of nickel, which needs only be decarbonized to be converted into pure metal; (2) an alloy of the carbides of nickel and iron; and (3), from mixtures of nickel and iron ore, a nickeliferous pig-iron which,

[1] Said to be originally a term of contempt—"goblin copper," meaning a tricky ore, which promises copper but does not yield it.

when refined and puddled, yields a very superior kind of wrought iron, harder and less liable to oxidation than the ordinary metal.

Extraction of Metal from Mats and Speises.—The first step as a rule is a roasting process, which, in the case of a speis, yields an arseniferous mixture of oxides; a mat, in general, passes into a mixture of oxide, sulphate, and unchanged sulphide. Either roasted material is easily disintegrated by being treated with aqueous muriatic or sulphuric acid, with formation of a solution of nickel-salt, contaminated, in general, with arsenic, antimony, bismuth, copper, iron, cobalt, and zinc, which must be removed by suitable analytical methods. But, as we have no space to consider this problem in its general form, we will assume antimony, bismuth, and zinc to be absent. If, in this case, the iron predominates sufficiently over the arsenic, these two can both be removed at one stroke by evaporating the solution to dryness and calcining the residue at the lowest sufficient temperature; the iron-salt only is reduced to an insoluble basic salt (of Fe_2O_3), which includes all the arsenic, so that by redissolving in water and passing the liquor through a filter press we obtain a solution which, by theory, is free of iron and arsenic. Practically, however, a trace of iron remains, and must be removed by precipitation with carbonate of lime in the cold and filtration. A repetition of the same process at about 60° C. eliminates the copper, so that only the cobalt is left, which, however, is no impurity metallurgically, and consequently may be suffered to remain, but, if present in sufficient quantity, must be recovered for its own sake. This is effected by addition of bleaching powder and gentle heating. If care be taken to let a little of the cobalt escape, the rest goes down as black peroxide, Co_2O_3, sufficiently pure for its ordinary applications. From the filtered nickel solution the metal is precipitated, by addition of milk-of-lime, as a green hydrated oxide, which is collected and washed in a filter press. The precipitate, being inconveniently gelatinous and bulky, is next rendered compact by a gentle calcination, and, if it is, as usual, contaminated with sulphate of lime, is freed from this impurity by judicious washing with highly dilute muriatic acid or otherwise. The purified oxide then, either by mere pressure or with the help of starch or other plastifying material, is shaped into little cubes of about one centimetre's side, embedded in charcoal dust within graphite or fire-clay crucibles and heated in a fire. A dull red heat suffices for the mere reduction of the oxide to metal; but a strong red heat is applied in order to cause the nickel cubes to sinter together and become fast and compact. No degree of red heat will fuse them unless they are contaminated with copper. There is no need to explain how, with cupriferous leys, the process has to be modified to lead ultimately to a fused regulus of copper-nickel available for the preparation of german silver. From a copper-free liquor, provided only it contains its iron all as ferric salt, a pure nickel precipitate can be obtained at once by addition of oxalic acid. The (green) oxalate of nickel precipitate need only be washed, dried, and ignited to be converted into a pure (but partially oxidized) metal. This process has actually been applied, at least experimentally, in the working of the New Caledonian ore, with this modification, however, that the oxalic acid was recovered by boiling the oxalate of nickel with carbonate of potash, and precipitating the acid by milk-of-lime from the alkaline solution.

Ordinary cube-nickel contains from 94 to 99 per cent. of real nickel. The purest commercial metal is that extracted from the New Caledonian ore; it often contains only a fraction of a per cent. of impurities. The present writer has no information regarding the mechanical characters of such highly-refined New Caledonian metal. The best commercial cube-nickel (although it may contain less than 1 per cent. of impurities) is always utterly devoid of plasticity; it breaks under the hammer, although the pure metal, as was shown as early as 1804 by Richter, and confirmed by Deville in 1856, is highly ductile and tenacious. To obtain the pure metal, the best laboratory method is to prepare pure oxalate and heat it intensely in a close crucible made of quicklime, when it is obtained as an almost silver-white regulus, which has all the ductility and malleability of the best wrought iron combined with one and a half times the breaking strain and greater hardness. It is attracted by the magnet. Its specific gravity is 8·279 for ingot, and 8·666 (Richter) for the forged metal. It can be welded at a red heat like wrought iron, which it exceeds in relative infusibility. It does not tarnish even on long exposure to the air. Sulphuretted hydrogen does not blacken it. Liquid water, even in the presence of air, has no action upon it. Aqueous non-oxidizing acids act upon it as they do on iron, but more slowly. Nitric acid and aqua regia dissolve it as nitrate $Ni(NO_3)_2$ and chloride $NiCl_2$ respectively. When heated strongly in air it is gradually oxidized; it decomposes steam, slowly, at a red heat. In brief, it unites in itself all the virtues of iron with some of the characteristics of the noble metals, and yet its application in the mechanical arts was never thought of until Fleitmann in 1879 made a most remarkable observation. Finding that even the purest nickel which he could produce on a manufacturing scale was brittle, he attributed this defect not to the traces of metallic impurities still present in it but to occluded carbonic oxide, and tried to remove this by addition of magnesium to the molten metal. He succeeded beyond expectation: one-eighth of a per cent. of magnesium added to the metal (in an atmosphere of carbonic acid) before pouring imparted to it all the plasticity of the pure metal.[1] Fleitmann also found that the thus purified nickel could be permanently welded on wrought iron, and that a combination plate thus produced could be rolled out into the thinnest sheet without breach of continuity. Since that time his firm (Fleitmann & Witte of Iserlohn) have made a business of the manufacture of cooking utensils and other useful articles out of such nickel-plated iron. Physiological experiments on a dog, instituted at the instance of the firm, showed that the metal is innocuous. Cobalt, as Fleitmann found, behaves in every respect like nickel, and even exceeds it in whiteness and brilliancy.[2] The writer has for more than a year been in the habit of using a nickel basin (supplied by Messrs Johnson & Matthey of London) for operations with caustic-alkali lye, and finds it to work admirably—better, in fact, than a silver one.

Nickel Electroplating.—This art, invented by Böttcher about 1848, has developed into an important industry, especially in the United States. The best kind of solution to use is one of the double sulphate of nickel and ammonia, which should be saturated at 25° and used in conjunction with a plate of nickel as positive electrode.

Alloys.—Nickel alloys were used practically long before Cronsted's discovery of the metal. GERMAN SILVER (*q.v.*), long known to the Chinese as "Pack Tong," *i.e.*, "white copper," consists of nickel, copper, and zinc united in varying proportions,—3 of copper, 1 of zinc, and 1 of nickel is said to give the most silver-like alloy. An alloy of "german" with real silver has lately been introduced as "tiers-argent"; it consists of silver 27·6, copper 59·0, zinc 9·6, nickel 3·4 per cent. In the United States, in Belgium, and in Germany, an alloy of 1 of nickel with 3 of copper serves for the making of minor coins. All these alloys are non-magnetic.

Salts.—For nickel salts see CHEMISTRY and chemical handbooks.

Analysis.—Nickel-salts, as a rule, and their solutions more generally, exhibit a green colour. Sulphuretted hydrogen does not precipitate the metal from solutions containing free mineral acid. Sulphide of ammonium, from neutral or alkaline solutions, precipitates a black sulphide which, like sulphide of cobalt, when once produced is almost insoluble in dilute cold hydrochloric acid, and has the specific property of being very appreciably soluble in a mixture of yellow (*i.e.*, ordinary) sulphide of ammonium and free ammonia, forming a dark coffee-brown solution. Unlike iron-salts, nickel-salts are not oxidized into sesquioxide (analogous to Fe_2O_3) salts by nitric acid or chlorine. Carbonate of baryta, which readily precipitates oxide of iron (Fe_2O_3) and alumina, does not precipitate nickel from its solutions in the cold. By means of these reactions nickel is easily distinguished and separated from all other metals except cobalt. To test a nickel solution for cobalt, add excess of nitrite of potassium and acidify with acetic acid. Cobalt, if present, comes down gradually as "Fischer's salt," a double nitrite of Co_2O_3 and K_2O.

The atomic weight of nickel, according to the latest determinations, is identical with that of cobalt:—$Ni (= Co) = 58{\cdot}6$, O being 16.

Karmarsch and Heeren's *Technisches Wörterbuch* gives a very full account of the metallurgy of nickel, quite up to date (1883). (W. D.)

---

[1] It is perhaps well to repeat a warning given by Fleitmann, that the introduction of the magnesium, if not very cautiously done in the absence of air, leads to violent explosions.

[2] It is only fair to state that as early as the Universal Exhibition of Vienna in 1873 the American Wharton exhibited vessels of pure forged nickel, prepared from the spongy metal by strong compression under a steam hammer at a red heat.

NICOBARS, a cluster of eight large and twelve small islands in the Bay of Bengal, lying to the south of the Andamans, between 6° 40′ and 9° 20′ N. lat. and between 93° and 94° E. long., with a population in 1881, exclusive of aborigines, of 308. The largest island, the Great Nicobar, is about 30 miles in length and from 12 to 15 in breadth. Many of the islands are hilly, with peaks of considerable height; others are flat and covered with forests of cocoa-nut trees. All are well wooded. Tropical fruits grow in abundance, and yams of fine quality and size. The Nicobar swallow is the builder of the edible bird's nest, which, together with trepang (bêche-de-mer), cocoa-nuts, tortoiseshell, and ambergris, forms the whole export of the islands. Agriculture is quite unknown. Trade is carried on by barter with the crews of English, native, and Malay vessels. The inhabitants, a race of savages with Malay-like features, had an evil reputation for piracy, and murder of the crews of vessels visiting the island or shipwrecked upon them. An inquiry by the Government of India into a case of this sort in 1869 led to the annexation of the whole archipelago, the administration being placed under the superintendent of the Andaman Islands.

NICOL, William, the inventor of the invaluable polarizing prism (Light, vol. xiv. p. 612), was born about 1768, and died at Edinburgh in September 1851. Nothing is known of his early history, beyond the fact that, after amassing a small competence as an itinerant popular lecturer on various parts of natural philosophy, he settled in Edinburgh to live a very retired life in the society of his apparatus alone. Besides the invention of his prism (of which we are told that he himself did not understand the mode of action), he devoted himself chiefly to the examination of fluid-filled cavities in crystals, and of the microscopic structure of various kinds of fossil wood. In the preparation of the sections of wood he introduced improvements of the utmost value. Before his time only the roughest slices were employed. His skill as a working lapidary was very great; and he executed a number of lenses of garnet and other precious stones, which he preferred to the achromatic microscopes of the time. The majority of the few, though important, papers which he published are to be found in the old and new *Edinburgh Philosophical Journal*.

NICOLAI, Christoph Friedrich (1733–1811), a German author and bookseller, was born on the 18th of March 1733, at Berlin, where his father was a bookseller. He was educated at a real-school in Berlin, and in 1749 went to Frankfort-on-the-Oder to learn his father's business. In 1752 he returned to Berlin, and soon began to take part in current literary controversy. At that time the leaders of critical opinion in Germany were Gottsched and Bodmer. In 1755 Nicolai issued a book, *Briefe über den jetzigen Zustand der schönen Wissenschaften*, in which he tried to show that each of these writers was in his own way narrow and intolerant. This work secured for the author the friendship of Lessing, whose power as a critic was then beginning to be recognized. In 1757 Nicolai devoted himself exclusively to literature; but next year, after the death of his brother, who had continued the elder Nicolai's business, he found it necessary to resume the life of a bookseller. He did not, however, abandon his literary labours. In association with his friend Moses Mendelssohn he had established, in 1757, the periodical called *Bibliothek der schönen Wissenschaften*, and this he conducted until 1760. From 1761 to 1766 he contributed to the *Briefe, die neueste Literatur betreffend*; but it was Lessing's work that made this series famous. For many years (from 1765 to 1791) Nicolai edited the *Allgemeine deutsche Bibliothek*, a periodical which served as the organ of the so-called popular philosophers, who warred against authority in religion and against what they conceived to be extravagance in literature. The new movement of ideas represented by Herder, Goethe, Schiller, Kant, and Fichte he was incapable of understanding, and he made himself ridiculous by foolish misrepresentation of their aims. Of Nicolai's independent writings, perhaps the only one of permanent value is his *Anekdoten von Friedrich II.* His romances are forgotten, although *Leben und Meinungen des Herrn Magisters Sebaldus Nothanker* had a certain reputation in its day. His *Beschreibung einer Reise durch Deutschland und die Schweiz* was attacked by many writers, and it proved that in middle life he had become in a new way not less bigoted than the authors whose bigotry he had spent much of his time in exposing. Nicolai died on the 8th of January 1811. He wrote an *Autobiography*, which was published in 1806. See *Nicolai's Leben und literarischer Nachlass*, by Göckingk (1820).

NICOLAIEFF. See Nikolaieff.

NICOLAS, Sir Nicholas Harris (1799–1848), English antiquary, was born 10th March 1799, the fourth son of John Harris Nicolas of East Looe in Cornwall, whose Breton ancestors had settled there on the revocation of the edict of Nantes. He entered the navy in 1808, and was promoted lieutenant in 1815. At the close of the war he retired from the service and began to study for the bar. He was called at the Inner Temple in 1825, but his business as a barrister was chiefly confined to the claims of peerage before the House of Lords, his special genealogical knowledge rendering his assistance in such cases invaluable. On genealogical questions and those connected with the descent of ancient families his researches have thrown much important light. Of works on these subjects he published a considerable number, the most useful being *Notitia Historica* (1824; expanded in 1835 for "Lardner's Cabinet Cyclopædia" into *Chronology of History*), *Synopsis of the Peerage of England* (2 vols., 1825), and *Testamenta Vetusta* (2 vols., 1826). Nicholas wrote a number of valuable biographical notices for Pickering's Aldine edition of the poets, among others those of Chaucer, Surrey, Wyatt, Collins, Cowper, Thomson, Burns, and Kirke White. His "Lives of Isaak Walton and Charles Cotton," prefixed to Pickering's edition of the *Complete Angler*, are also the fruit of independent and original research. The service of Nicolas in the royal navy seems to have left an impress on his mind which his antiquarian studies tended rather to deepen than obliterate; and it is where his passion for antiquarian research was exercised in illustrating the historic glories of England and the heroic deeds of famous individuals that he found the most congenial scope for his powers. His *magnum opus* is his *History of the Orders of Knighthood of the British Empire* (4 vols., 1841–42). For his previous researches into the history of the orders he was, in 1831, made a knight of the Hanoverian Guelphic order and in 1832 chancellor of the Ionian order of St Michael and St George, and in 1840 he was advanced to the grade of the Grand Cross. In his later years Nicolas was occupied chiefly with works connected with the naval achievements of England. He published *Dispatches and Letters of Admiral Lord Viscount Nelson* (7 vols., 1844–46); and he was engaged until a few days before his death in editing the papers of Sir Hudson Lowe. He died at Cape Curé, near Boulogne, August 3, 1848.

Sir Harris Nicolas left an unfinished *History of the British Navy*, in 2 vols. He became a member of the council of the Society of Antiquaries in 1826, but on account of a controversy with the other members in regard to the management of its affairs he withdrew in 1828. Besides exposing in various pamphlets what he regarded as serious defects in its management, he made frequent reference to them in the *Retrospective Review*, of which he was joint-editor. He also instituted an inquiry into the proceedings of the Record Commission, the publications of which he regarded as not commensurate in value with the money expended on them. But, although, owing

to the warmth of his feelings and his keen interest in his subject, Nicolas was apt to involve himself in keen controversy, he never cherished personal animosity, and his motives were otherwise above suspicion. A complete list of the writings of Nicolas will be found in the *Gentleman's Magazine* for October 1848.

NICOLE, Pierre (1625–1695), one of the most distinguished of the Port-Royalists, a scholar of great excellence, and, according to Bayle (who had no particular reason for praising him), "one of the best writers in Europe," was born at Chartres in 1625. Like his friend Pascal he was a precocious boy, though his precocity showed itself in classics and in miscellaneous reading, not in mathematics, and it was when he was transferred from his native town to Paris to finish his education that the rising school of Port Royal fixed its attention upon him. At an early age he was made a master in the Port Royal school, where his special department was classical instruction, though he is said to have taken no small part in the famous *Art de Penser* or Port Royal logic. He shared in the history of the school, and with the exception of Arnauld and Pascal may be said to have been its most accomplished member. Not a little of the materials of the *Provinciales* is said to be due to him, and at the completion of Pascal's great work he translated it into Latin. One of the most virtuous men in France, he was a favourite of the notorious duchess of Longueville for politico-theological reasons, and he was the immediate master of Racine. This latter circumstance brought about an incident thoroughly discreditable to the dramatist. Nicole was the author of certain *Lettres sur les Visionnaires* or *à un Visionnaire*, as they are most frequently cited. The actual title of the collected work is *Les Imaginaires et les Visionnaires* (1667). In these he had attacked Desmarets de Saint Sorlin, and with the excessive puritanism which characterized his sect had reflected on fiction and the drama generally. Racine, without a shadow of personal provocation, replied in two letters of great asperity, of which the first was actually published, and the second only delayed (it was published after its author's death) owing to the judicious counsel of Boileau. But Nicole made no reply, and indeed public opinion condemned Racine without hesitation. Nicole, who, owing to the theological disputes in which he was concerned, had never fully taken orders, and who had been compelled at one time to leave France, devoted himself in his later years chiefly to moral philosophy. The first volume of his *Essais de Morale* appeared in 1671, and the rest of his life was chiefly occupied on this book, though he wrote many others. He was warmly admired by many of the best judges among his contemporaries, Madame de Sévigné deserving especial mention, and numerous selections of his ethical works have appeared in recent times. Modern opinion hardly recognizes in Nicole the right to hold the place close to Pascal which his own time accorded to him. His style is clear, simple, and correct, but a little flat and monotonous; his thought sensible, just, and charitable, but somewhat destitute of depth, subtlety, and originality. He was certainly one of the best men of his time, but as certainly not one of the greatest; and his reputation was due first to his scholarship, secondly to his moderation. He died of apoplexy, November 16, 1695, and had latterly somewhat separated himself from the Jansenists. Numerous stories are told of his personal timidity and unreadiness in oral argument. It does not appear that his works (by far the most important of which is the already-mentioned *Essais de Morale*, Paris, 1671, *sq.*) were ever collected.

NICOMEDES I., son of Zipœtes, succeeded his father as king of Bithynia in 278 B.C. He enlarged and consolidated the kingdom, which had been founded by his father in 288, and founded the great city of Nicomedia as the capital. He was for some time engaged in war with Antiochus of Syria, and invited the Gauls under Leonnorius and Lutarius to cross into Asia Minor and help him against his foreign and domestic enemies. His reign seems to have been long, prosperous, and uneventful; the year of his death is unknown.

NICOMEDES II., fourth in descent from the preceding, was son of Prusias II. He was so popular with the people that his father became jealous and sent him to Rome. Here he was so much favoured by the senate that Prusias sent an ambassador, Menas, to Rome, giving him secret orders to assassinate Nicomedes. Menas revealed the plot, and persuaded the prince to rebel against his father. Supported by Attalus II., king of Pergamum, he was completely successful, and ordered his father to be slain before the altar of Zeus in Nicomedia. Nicomedes reigned from 149 to 91 B.C., and during his long reign adhered steadily to the Roman alliance. He made himself for a time master of Paphlagonia, and married Laodice, widow of Ariarathes VI., in order to have a claim on her deceased husband's kingdom of Cappadocia.

NICOMEDES III., son and successor of the preceding. His brother Socrates contested the kingdom with him, relying on the alliance of the great Mithradates. Nicomedes was established on the throne by Roman help in 90 B.C., but expelled by Mithradates in 88, after a great defeat in Paphlagonia. In 84 he was restored by the Romans. In 81 Julius Cæsar, sent to him by his commander, became so intimate with him as to give rise to great calumnies at home. He died in 74 B.C., and beqeathed his kingdom to the Romans.

NICOMEDIA, a town at the head of the Sinus Astacenus, which opens on the Propontis, was built in 264 B.C. by Nicomedes I., king of Bithynia, and has ever since been one of the chief towns in this part of Asia Minor. It still retains the ancient name under the form Ismid, and it is the terminus of a short railway. Its situation made it a convenient centre of government. It was the metropolis of Bithynia under the Roman empire (see Nicæa); Diocletian made it the capital of the East, and fixed his court there. It retained its importance even after Constantinople was founded, for the roads from all parts of Asia Minor to the capital converge at Nicomedia.

NICOPOLI. See Nikopoli.

NICOPOLIS, or Actia Nicopolis, an ancient city of Epirus, founded 31 B.C. by Octavian in memory of his victory over Antony and Cleopatra at Actium. The colony, composed of settlers from a great many of the towns of the neighbouring countries (Ambracia, Anactorium, Calydon, Argos Amphilochicum, Leucas, &c.), proved highly successful, and the city was considered the capital of southern Epirus and Acarnania, and obtained the right of sending five representatives to the Amphictyonic council. On the spot where Octavian's own tent had been pitched he erected a sanctuary to Neptune adorned with the beaks of the captured galleys; and in further celebration of his victory he instituted the so-called Actian games in honour of Apollo Actius. The city was restored by the emperor Julian, and again after the Gothic invasion by Justinian; but in the course of the Middle Ages it was supplanted by the town of Prevesa. The ruins of Nicopolis, now known as Paleoprevesa (Old Prevesa), lie about 3 miles north of that city, on a small bay of the Gulf of Arta (Sinus Ambracius) at the narrowest part of the isthmus of the peninsula which separates the gulf from the Ionian Sea. Besides the acropolis, the most conspicuous objects are two theatres (the larger with twenty-seven rows of seats) and an aqueduct which brought water to the town from a distance of 27 miles. See Wolfe in *Jour. Roy. Geog. Soc.*, 1833; Leake, *Northern Greece*; Bursian, *Geog. von Griechenland.*

Nicopolis was also the name of (1) a city in Cappadocia in the valley of the Lycus, founded by Pompey on the spot where he defeated Mithradates; (2) a city in Egypt, founded by Octavian 24 B.C. to commemorate his final victory over Antony; and (3) a city in Thrace at the junction of the Iatrus with the Danube, founded by Trajan in memory of his victory over the Dacians (Nikup).

NICOSIA is the name in common use, though originally a mere corruption of the Greek name Leikosia, for the capital of Cyprus. It is situated in the midst of the great plain of the Mesaria, which traverses the island from sea to sea, and is nearly equidistant from the Gulf of Morphu at one end and that of Famagosta at the other. Though the name of Leikosia (Λευκωσία) is undoubtedly Greek, it is not found in the ancient geography of the island; and, though the discovery of some ancient tombs in the immediate neighbourhood prove that the site was inhabited in very early times, no mention is found of it before the reign of Constantine, by whom it was fortified with a circuit of walls, which continued to exist down to the time of the Venetians. It became the capital of the island under the kings of the Lusignan dynasty, who were the rulers of Cyprus from 1192 to 1489,—an advantage which it probably owed to its inland, and somewhat central, situation, though in other respects its position affords few advantages. It stands in a barren and treeless plain, on the banks of the river Pedias, which is, however, a mere shingly bed during the greater part of the year, and the town is dependent for its supply of water upon an aqueduct by which it is conveyed from the neighbouring hills. Like many other Oriental towns, Nicosia has rather an imposing effect from a distance, in consequence especially of its lofty walls, built by the Venetians to replace the previously existing circuit, which remain unbroken to the present day. Above these towers the beautiful Gothic cathedral, now converted into a mosque. But the interior of the city is a mere labyrinth of narrow streets, and presents an aspect of great decay. The population, which was previously estimated at 16,000, was found by an actual census, taken in 1879, to amount to only 11,197 souls, of whom 5628 were Mohammedans and 5251 Greeks. Since the occupation of Cyprus by the English, some improvements have been introduced at Nicosia, which still continues to be the capital of the island, and the residence of the British commissioner, as well as of the Greek archbishop. A new carriage road has also been constructed from thence to Larnaca, which is becoming a place of considerable trade. But the natural disadvantages of its situation will probably prevent Nicosia from ever rising again to an important town. At the present day it is worthless as a fortress, on account of its being completely commanded from the neighbouring heights.

NICOSIA, a city of Italy in the province of Catania in Sicily, about 50 miles west of Catania, near the rise of the Seminato. It is a picturesque mediæval-looking place, with a cathedral in the Norman style, a communal library, mineral wells, and a trade in grain, wine, and oil. The population of the commune was 14,731 in 1861 and 15,460 in 1881; that of the town was 14,508 in 1871.

Nicosia probably represents the ancient Herbita, which gallantly maintained its independence against Dionysius of Syracuse. Destroyed by the Saracens, the city was restored by the Normans, and the Lombard colony introduced by Roger is said to have left its trace in the popular speech. The bishopric dates from 1816.

NICOTINE. See TOBACCO.

NIEBUHR, BARTHOLD GEORG (1776–1831), the historian of ancient Rome, was the son of Karsten Niebuhr, noticed below, and was born at Copenhagen on August 27, 1776. His family was of Hanoverian extraction. In his infancy his father removed to Meldorf in South Ditmarsh, where he had received a Government appointment, and devoted his leisure to the instruction of his son. From the earliest age young Niebuhr manifested extraordinary precocity, and especial interest in history and politics. From 1794 to 1796, being already a finished classical scholar and acquainted with several modern languages, he studied at the university of Kiel, applying himself to mathematics, logic, philosophy, and other studies previously neglected. He there formed the most important friendship of his life, that with Madame Hensler, the widowed daughter-in-law of one of the professors, and a woman of unusual strength of character, six years older than himself. He also made the acquaintance of her sister, Amelie Behrens, whom he subsequently married. After quitting the university he became private secretary to Count Schimmelmann, Danish minister of finance, but finding that the post did not allow him sufficient leisure for study, he quitted it for an appointment at the royal library. He shortly afterwards travelled in Great Britain, and spent a year at Edinburgh studying agriculture and physical science. His observations on England and Scotland, conveyed in letters to his betrothed, are exceedingly interesting; but he failed to obtain that confidence in the capacity of an educated community for self-government which residence in a free country might have been expected to bestow, and which would have saved him much sorrow, and most of his errors in practical politics. He says, nevertheless, "my early residence in England gave me one important key to Roman history. It is necessary to know civil life by personal observation in order to understand such states as those of antiquity. I never could have understood a number of things in the history of Rome without having observed England." He also acquired in Scotland a feeling for nature, in which he had previously been remarkably deficient. In 1799 he returned to Denmark, where he was soon appointed assessor in the East India department of the Board of Trade, and secretary for the affairs of the Danish consulates in Barbary. In 1800 he married and settled at Copenhagen. In 1804 he became chief director of the National Bank, but in September 1806, after negotiations which had extended over more than a year, quitted this for a similar appointment in Prussia. The step was a false one as concerned his personal interests, and not highly creditable to his patriotism as a Danish subject; but it is not to be regretted, since, without the release from public life which it ultimately occasioned, we should not have possessed his *Roman History*.

He arrived in Prussia on the eve of the catastrophe of Jena, and shared to the full all the disasters and miseries which overwhelmed the monarchy. He accompanied the fugitive Government to Königsberg, where he rendered considerable service in the commissariat, and was afterwards still more useful as commissioner of the national debt, and by his opposition to ill-considered schemes of taxation. He was also for a short time Prussian minister in Holland, where he endeavoured without success to contract a loan. The extreme sensitiveness of his temperament, however, disqualified him for politics; he proved impracticable in his relations with Hardenberg and other ministers, and in 1810 retired for a time from public life, accepting the more congenial appointment of royal historiographer and professor at the university of Berlin. He commenced his lectures with a course on the history of Rome. The enthusiastic reception these experienced filled him with delight. He recognized that he had found his vocation, and henceforth regarded the history of Rome from the earliest age to Augustus as the task of his life. The first two volumes, based upon his lectures, were published in 1812, but attracted little attention at the time owing to the absorbing interest of political events. In 1813 Niebuhr's own attention was diverted from history by

the uprising of the German people against Napoleon; he entered the landwehr, and ineffectually sought admission into the regular army. He edited for a short time a patriotic journal, *The Prussian Correspondent*, joined the headquarters of the allied sovereigns, and witnessed the battle of Bautzen, and was subsequently employed in some minor negotiations. In 1815 he lost his father, whose life he subsequently wrote; and in July his beloved wife, whose health had long been declining, expired, enjoining him to finish his *History*. He next accepted the post of ambassador at Rome, which he probably thought would assist his historical labours, and departed to assume that office in July 1816. On his way he discovered in the cathedral library of Verona the long-lost *Institutes* of Gaius, afterwards edited by Savigny, to whom he communicated the discovery under the impression that he had found a portion of Ulpian. Before his departure for Rome he had married his wife's niece, an amiable young person, but inferior intellectually to his first wife, and almost equally delicate in constitution. Although devoted to him, she could in no way replace her predecessor. Nor was he happy in other respects. He disliked the Italians, and found himself unable to proceed as he wished with his *History*. These causes, acting upon a naturally querulous and despondent temper, produced a general dissatisfaction and discouragement which coloured all his views of human affairs, and deprived the world of the benefit that it might have received from the observations of one endowed with such profound insight and such noble sympathies. While his distrust made him ungenerous to those who were contending for a better order of things, his appreciation of the lessons of history withheld him equally from siding with the reactionary party. His position in his latter years was hence one of great isolation, not uncheered, however, by the sympathy of friends and disciples such as Savigny and Bunsen. During his residence in Rome he discovered and published fragments of Cicero and Livy, aided Cardinal Mai in his edition of Cicero *De Republica*, and shared in framing the plan of Bunsen and Platner's great work on the topography of ancient Rome, to which he contributed several chapters. He also, on a journey home from Italy, deciphered in a palimpsest at St Gall the fragments of Flavius Merobaudes, a Roman poet of the 5th century. In 1823 he resigned the embassy and established himself at Bonn, where the remainder of his life was spent, with the exception of some visits to Berlin as councillor of state. He here rewrote and republished (1827–28) the first two volumes of his *History*, and composed a third volume, bringing the narrative down to the end of the First Punic War, which he did not himself entirely complete, but which, with the help of a fragment written in 1811, was edited after his death by Professor Classen. He also assisted in Bekker's edition of the Byzantine historians, and delivered courses of lectures on ancient history, ethnography, and geography, and on the French Revolution, which were published from notes after his death. In February 1830 his house was burned down, but the greater part of his books and manuscripts were saved. The revolution of July in the same year was a terrible blow to him, and filled him with the most dismal anticipations of the future of Europe. He died on January 2, 1831, from a chill taken in coming home from a news-room where he had been eagerly studying the trial of the ministers of Charles X. His wife survived him only nine days. He left several children by her; his first marriage had been childless.

Niebuhr's great work counts among epoch-making histories both as marking an era in the study of its special subject, and for its momentous influence on the general conception of history. "The main results," says Dr Schmitz, "arrived at by the inquiries of Niebuhr, such as his views of the ancient population of Rome, the origin of the plebs, the relation between the patricians and plebeians, the real nature of the ager publicus, and many other points of interest, have been acknowledged by all his successors." Other alleged discoveries, such as the construction of early Roman history out of still earlier ballads, have not been equally fortunate; but if every positive conclusion of Niebuhr's had been refuted, his claim to be considered the first who dealt with the ancient history of Rome in a scientific spirit would remain unimpaired, and the new principles introduced by him into historical research would lose nothing of their importance. He suggested, though he did not elaborate, the theory of the myth, so potent an instrument for good and ill in modern historical criticism. He brought in inference to supply the place of discredited tradition, and showed the possibility of writing history in the absence of original records. By his theory of the disputes between the patricians and plebeians arising from original differences of race he drew attention to the immense importance of ethnological distinctions, and contributed to the revival of these divergences as factors in modern history. More than all, perhaps, since his conception of ancient Roman story made laws and manners of more account than shadowy lawgivers, he undesignedly influenced history by popularizing that conception of it which lays stress on institutions, tendencies, and social traits to the neglect of individuals. History, so treated, always inclines to degenerate into mere disquisition: and if Niebuhr were weighed in the scales of Livy it might be questioned whether he could even claim to rank among historians. That his rank should be so high is a proof of the extension which the definition of history has received in our day. An historian should before all things tell a story. Niebuhr is often engaged in proving that there is no story to tell. The peculiar character of his work is incidentally expressed by himself. "That," he says, "which would be harmonious in a national and poetical historian would be out of tune in a work written more than eighteen hundred years later by a foreigner and a critic. His task is to restore the ancient tradition." He is not, that is to say, an historian but an historical critic. It would therefore be unjust to try him by the standard of great artists in history like Gibbon, eminent in narrative, in character-painting, in historical grouping and light and shade. His intense admiration for Livy proves how greatly he himself valued such accomplishments, but he makes no attempt to emulate them. Such an endeavour could have had no place in the treatment of early Roman history according to the principle he had prescribed for himself; and it is perhaps fortunate for his fame that the pen dropped from his hand as he was slowly emerging from the regions of historic twilight into a clear day where the actions of statesmen and generals are no longer a matter of uncertainty, and only require to be interpreted by their motives. There are indeed in the latter pages of his history evidences of deep human sympathy, and a capacity for viewing men and things in the concrete, as, for instance, in his treatment of Pyrrhus; but this tendency is continually checked and controlled by his propensity to analytical criticism. Had his work been carried down, as he designed, to the period of Augustus, he would have given a masterly study of such episodes as the legislation of the Gracchi, he would have thrown the clearest light on the constitutional questions between Cæsar and his adversaries, he would now and then have illuminated the character of a great man by a flash of inspiration; but as a whole his history would have lacked life, colour, and movement. It must be added that, if his style is not precisely inelegant, even the refined literary skill of his English translators has failed to render it attractive. Whence, then, is this history not merely valuable, but delightful? The answer must be from its freshness, its elation of real or supposed discovery, the impression it conveys of actual contact with a great body of new and unsuspected truth. We seem to be at once learning and unlearning; we see many new things, and old things as we never saw them before. It is an intellectual emancipation, momentous for the world and the individual, even if particular conclusions should prove to be hasty, and particular details inaccurate. In this sense Niebuhr was justified in his proud assumption that "the discovery of no ancient historian would have taught the world so much as my work." His further prediction "that all that may hereafter come to light from ancient and uncorrupted sources will only tend to confirm or develop the principles I have advanced" has not received equal confirmation. The theory on which he laid so much stress of the derivation of ancient Roman history from popular ballads has been refuted by Sir George Lewis, and now finds little acceptance. The general scepticism as to the credibility of ancient history implied in his method went too far, and has been succeeded by a legitimate reaction fortified by such practical arguments as the recent archæological discoveries at Ilion and Mycenæ, and more lately at Samos, in the deserts of Moab, and even on the confines of Ethiopia. Writing, it is evident, was more ancient and more practised; oral tradition was more disciplined (as might have been inferred from a memorable passage in Plato's *Timæus*); there was more even of a judicial and critical spirit in antiquity than was surmised by Niebuhr. The testimony of Xanthus to the Lydian origin of

the Etruscans, so summarily set aside by him, would now be considered strong *prima facie* evidence. Yet, after every deduction, Dr Leonhard Schmitz, prefacing the English translation of the *Roman History* by Mommsen which has for readers of general cultivation superseded Niebuhr, is able to say of the latter, "The main pillars of his grand structure are still unshaken." The endowments which enabled him to achieve so much in the absence of so many of the historian's most essential gifts may be characterized as learning, memory, sagacity, imagination. His erudition is marvellous for a man so much engaged in public affairs, and the perfect ease with which it is wielded is even more rare and admirable. This facility was greatly assisted by the prodigious memory which remembered things not only in themselves but in their relations to other things, and hence would often quite unexpectedly bring one circumstance to bear upon the interpretation of another. Niebuhr's sagacity is considerably overestimated when it is spoken of as "divination"; this dangerous term, however, may be serviceable in expressing his faculty for remote inference, and for detecting how much may be implied in a statement, an allusion, or an omission previously disregarded. It must be confessed that this faculty was sometimes perverted by a tendency to paradox, particularly observable in some of his minor speculations, such as his disquisitions on the dates of Quintus Curtius and Petronius. Imagination, nevertheless, was Niebuhr's most signal endowment,—not the historical imagination that reanimates actors departed from the world's theatre, but the critical imagination that makes past social conditions living and real. In the pourtrayal of men Niebuhr's touch is uncertain, but his treatment of institutions is an actual contact. Everything becomes alive to him, and to the reader's elation at finding himself thus apparently introduced to realities where he had looked only for abstractions must be ascribed much of the overwhelming influence and success of a work so deficient in the ordinary attractions of history.

Niebuhr's other works are interesting, but would not of themselves have made a great reputation. The notes of his Bonn lectures on ancient history and geography disappointed expectation, but expectation had been pitched unreasonably high. They were not finished compositions, and could not be more than useful and suggestive commonplace books. A detailed examination of their *obiter dicta* by the light of recent discovery and more exact research would be highly interesting. His lectures on the French Revolution, delivered in 1825, though well worth hearing, were not worth publishing, especially as the editor cannot vouch for their verbal or even their substantial fidelity. The *Kleine Schriften* include many valuable essays. His letters form one of the most interesting collections of correspondence extant, alike for the multiplicity of important subjects treated in them, and their revelation of the writer in all his strength and weakness. The luminous profundity of his remarks is frequently startling. Like Coleridge he seems to have an intuitive faculty for descending below the apparent surface of things, while he is no more successful than Coleridge in applying this gift to the appreciation of the practical problems of his own age. There is hardly another book from which it would be possible to select more entirely perverse and erroneous views respecting human society in general, and more admirable observations on individual men and things. A selection of remarks and aphorisms, both from his correspondence and his historical writings, would be a compilation of great value.

Niebuhr's personal character was in most respects exceedingly attractive. His heart was kind and his affections were strong; he was magnanimous and disinterested, simple and honest. He had a kindling sympathy with everything lofty and generous, and framed his own conduct upon the highest principles. His chief defect was an over-sensitiveness leading to peevish and unreasonable behaviour in his private and official relations, to hasty and unbalanced judgments of persons and things that had given him annoyance, and to a despondency and discouragement which have frustrated the great good he might have effected as a critic of public affairs from the point of view of a lofty morality. His imagination sometimes usurps the functions of his judgment, and his sagacity is traversed by a vein of paradox. In this, as in many other features of his intellectual character, he strikingly resembles Bentley, but his moral constitution is totally dissimilar.

The principal authority for Niebuhr's life is the *Lebensnachrichten*, prepared by Madame Hensler in 1838, and consisting mainly of correspondence linked by a brief biographical narrative. In the English translation by Miss Winkworth (1852) a great part of the correspondence is omitted, but the narrative is rendered more full, especially as concerns Niebuhr's participation in public affairs. It also contains interesting communications from Bunsen and Professor Loebell, and select translations from the *Kleine Schriften*. The reminiscences of Francis Lieber (London, 1835) convey a pleasing view of Niebuhr's character, and preserve passages of his conversation when ambassador at Rome. The first edition of his *Roman History* was translated into English by F. A. Walter (1827), but was immediately superseded by the translation of the second edition by Julius Hare and Connop Thirlwall, completed by Dr William Smith and Dr Leonhard Schmitz (last edition, London, 1847–51). The *History* has been discussed and criticized in a great number of publications, the most important of which, perhaps, is Sir George Cornwall Lewis's *Essay on the Credibility of the Early Roman History*. The *Lectures on Ancient History* have been translated by Dr Schmitz (London, 1852–53). (R. G.)

NIEBUHR, KARSTEN (1733–1815), Eastern traveller, was born at Lüdingworth, Lauenburg, on the southern border of Holstein, March 17, 1733, the son of a small farmer. He had little elementary education, and for several years of his youth had to do the work of a peasant. His bent was towards mathematics, and he managed to obtain some lessons in surveying. It was while he was working at this subject that one of his teachers, in 1760, proposed to him to join the expedition which was being sent out by Frederick V. of Denmark for the scientific exploration of Egypt, Arabia, and Syria. To qualify himself for the work of surveyor and geographer, he studied hard at mathematics for a year and a half before the expedition set out, and also managed to acquire some knowledge of Arabic. The expedition sailed in January 1761, and, landing at Alexandria, ascended the Nile and devoted some time to an examination of the pyramids and of the hieroglyphic writings of Egypt. Proceeding to Suez, Niebuhr made a visit to Mount Sinai, and in October 1762 the expedition sailed from Suez to Jiddah, journeying thence overland to Mocha. Here in May 1763 the philologist of the expedition, Van Haven, died, and was followed shortly after by the naturalist Forskål. San'a, the capital of Yemen, was visited, but the remaining members of the expedition suffered so much from the climate or from the mode of life that they returned to Mocha. Niebuhr seems to have saved his own life and restored his health by adopting the native habits as to dress and food. From Mocha the ship was taken to Bombay, the artist of the expedition dying on the passage, and the surgeon soon after landing. Niebuhr was now left alone, the only surviving member of the expedition. He stayed fourteen months at Bombay, and then returned home by Muscat, Bushire, Shiraz, and Persepolis, visited the ruins of Babylon, and thence went to Baghdad, Mosul, and Aleppo. After a visit to Cyprus he made a tour through Palestine, crossing Mount Taurus to Brussa, reaching Constantinople in February 1767, and Copenhagen in the following November. On his return Niebuhr at once set himself to the task of preparing the records of the expedition. His first volume, *Beschreibung von Arabien*, was published at Copenhagen in 1772, the Danish Government defraying the expenses of the abundant illustrations. This was followed in 1774–78 by other two volumes, *Reisebeschreibung von Arabien und anderen umliegenden Ländern*. The fourth volume was not published till long after his death, in 1837, under the editorship of Niebuhr's daughter. He also undertook the task of bringing out the work of his friend Forskål, the naturalist of the expedition, under the titles of *Descriptiones Animalium*, *Flora Ægyptiaco-Arabica*, and *Icones Rerum Naturalium* (Copenhagen, 1775–76). To a German periodical, the *Deutsches Museum*, Niebuhr contributed papers on the interior of Africa, the political and military condition of the Turkish empire, and other subjects. He married in 1773, and for some years held a post in the Danish military service which enabled him to reside at Copenhagen. In 1778, however, he accepted a position in the civil service of Holstein, and went to reside at Meldorf, where he died, April 26, 1815.

Niebuhr was in no sense a genius nor even a man of many accomplishments, but he was one of the best scientific travellers that ever lived. He was well equipped for the particular service which he had to perform in connexion with the Eastern expedition; above all, he was an accurate and careful observer, had the instincts of the scholar, was animated by a high moral purpose, and was rigorously conscientious and anxiously truthful in recording the results of his observation. His works have long been classical, and even now must be consulted by any one who desires to have the most trustworthy accounts, not only of the geography, but of the people, the antiquities, and the archæology of much of the district of Arabia which he traversed. His narratives are simple

and he himself is kept almost entirely in the background. He was a genuine peasant in many respects to the end of his life, having many of the peasant's virtues as well as failings.

French and Dutch translations of his narratives were published during his lifetime, and a condensed English translation, by Robert Heron, of the first three volumes in Edinburgh, 1792. His distinguished son Barthold published a short *Life* at Kiel in 1817; an English version was issued in 1836 in the *Lives of Eminent Men*, published by the Society for the Diffusion of Useful Knowledge.

NIELLO (Italian form of Latin *nigellum*, diminutive of *niger*, "black"; late Greek, *μελανόν*), a method of producing delicate and minute decoration on a polished metal surface by incised lines filled in with a black metallic amalgam. In some cases it is very difficult to distinguish niello from black enamel; but the black substance differs from true enamel in being metallic, not vitreous. Our knowledge of the process and materials employed in niello-work is derived mainly from four writers,—Eraclius the Roman (a writer probably of the 11th century), Theophilus the monk, who wrote in the 12th or 13th century,[1] and, in the 16th century, Ben. Cellini[2] and Giorgio Vasari.[3] These, with the exception of Eraclius, whose account is slightly different, agree closely in their description of the process. The design was cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold or even bronze. An alloy was formed of two parts silver, one-third copper, and one-sixth lead; to this mixture, while fluid in the crucible, powdered sulphur in excess was added; and the brittle amalgam, when cold, was finely pounded, and sealed up in large quills for future use. A solution of borax to act as a flux was brushed over the metal plate and thoroughly worked into its incised lines. The powdered amalgam was then shaken out of the quills on to the plate, so as to completely cover all the engraved pattern. The plate was now carefully heated over a charcoal fire, fresh amalgam being added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid, so as to fill all the lines, the plate was allowed to cool, and the whole surface was scraped, so as to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all the nielloed plate was very highly polished, till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silver work, on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello, and became a distinct black line, ornament of the most minute and refined description could easily be produced.

The earliest specimens of niello now existing belong to the Roman period. Two fine examples are in the British Museum. One is a bronze statuette of a Roman general, nearly 2 feet high, found at Barking Hall in Suffolk. The dress and armour have patterns partly inlaid in silver and partly in niello. The dark tint of the bronze rather prevents the niello from showing out distinctly. This statuette is apparently a work of the 1st century.[4] The other example is not earlier than the 4th century. It is a silver casket or lady's toilet box, in which were found an ampulla and other small objects, enriched with niello-work.[5]

From Roman times till the end of the 16th century the art of working in niello seems to have been constantly practised in some part at least of Europe, while in Russia and India it has survived down to the present day. From the 6th to the 12th century an enormous number of most massive and splendid works in the precious metals were produced at Byzantium or under Byzantine influence, many of which were largely decorated with niello; the silver dome of the baldacchino over the high altar of S. Sophia was probably one of the most important of these. Niello is frequently mentioned in the inventories of the treasures belonging to the great basilicas of Rome and Byzantium. The Pala d'Oro at S. Mark's, Venice, 10th century (see METAL-WORK), owes much of its refined beauty to niello patterns in the borders. This art was also practised by Bernward, artist-bishop of Hildesheim (*ob.* 1023); a fine silver paten, decorated with figures in niello, attributed to his hand, still exists among the many rich treasures in the church of Hanover Palace. Other nielli, probably the work of the same bishop, are preserved in the cathedral of Hildesheim. In France too, judging both from existing specimens of ecclesiastical plate and many records preserved in church inventories, this mode of decoration must have been frequently applied all through the Middle Ages: especially fine examples once existed at Notre Dame, Paris, and at Cluny, where the columns of the sanctuary were covered with plates of silver in the 11th century, each plate being richly ornamented with designs in niello. Among the early Teutonic and Celtic races, especially from the 8th to the 11th centuries, both in Britain and other countries, niello was frequently used to decorate the very beautiful personal ornaments of which so many specimens enrich the museums of Europe. The British Museum possesses a fine fibula of silver decorated with a simple pattern in niello and thin plates of repoussé gold. This, though very similar in design to many fibulæ from Scandinavia and Britain, was found in a tomb at Kertch (Panticapæum).[6] Several interesting gold rings of Saxon workmanship have been found at different times, on which the owner's name and ornamental patterns are formed in gold with a background of niello. One with the name of Ethelwulf, king of Wessex (836–838), is now in the British Museum (see figure). Another in the South Kensington Museum has the name of Alhstan, who was bishop of Sherborne from 823 to 867. The metal-workers of Ireland, whose skill was quite unrivalled, practised largely the art of niello from the 10th to the 12th century, and possibly even earlier. Fine croziers, shrines, fibulæ, and other objects of Irish workmanship, most skilfully enriched with elaborate niello-work, exist in considerable numbers. From the 13th to the 16th century but little niello-work appears to have been produced in England. Two specimens have been found, one at Matlask, Norfolk, and the other at Devizes, which from the character of the design appear to be English. They are both of gold, and seem to be the covering plates of small pendent reliquaries, about an inch long, dating about the end of the 15th century. One has a crucifix between St John the Baptist and a bishop; the other, that found at Devizes, has the two latter figures, but no crucifix.[7] It is, however, in Italy that the art of niello-work was brought to greatest perfection. During the whole mediæval period it was much used to decorate church plate, silver altar-frontals, and the like. The magnificent frontals of Pistoia cathedral and the Florence baptistery are notable instances of this.[8] During the 15th century, especially at Florence, the art of niello-work was practised by almost all the great artist-

Gold and Niello Ring.

goldsmiths of that period. Apart from the beauty of the works they produced, this art had a special importance and interest from its having led the way to the invention of printing from engravings on metal plates. For the description of how this happened see ENGRAVING, vol. viii. p. 439. Vasari's account of this invention, given in his lives of Pollajuolo and Maso Finiguerra (*Vite dei Pittori e Scultori*), is very interesting, but he is probably wrong in asserting that Maso was the first worker in niello who took proofs or impressions of his plates. The most important work of this sort by Maso Finiguerra, described at length by Vasari, still exists in the Opera del Duomo at Florence. It is a pax with a very rich and delicate niello picture of the coronation of the virgin; the composition is very full, and the work almost microscopic in minuteness; it was made in 1452. Impressions from it are preserved in the British Museum, the Louvre, and other collections. Among the many great Italian artists who were also niellists occur the names of Brunelleschi, Ant. Pollajuolo, Baccio Baldini, Francia, Pellegrino da Cesena, Cellini, Caradosso, and Foppa. Some fine specimens signed by Francia are preserved in the Bargello at Florence. The British Museum, the Louvre, the Berlin Museum, and the royal gallery of Vienna are especially rich both in nielli and in sulphur and paper impressions. The British Museum also possesses the finest existing example of 15th-century German niello. It is a silver beaker, covered with graceful scroll-work, forming medallions, in which are figures of cupids employed in various occupations;[1] it is a very remarkable piece of silver-work, both for design and beauty of execution. The art of niello-work is still practised with considerable skill both in Russia and in various parts of India. The "bidri work," so called from Bedar in Hyderabad, is a variety of niello, in which the pattern shows as silver on a niello ground. The modern revival of the art in Paris has been hitherto very unsuccessful.

Literature.—The Archæological Journal (vol. xix. p. 323) has an excellent monograph on the subject, see also vol. xii. p. 79 and vol. iv. p. 247; *Archæologia*, vol. xxxi. p. 404; Merrifield, *Ancient Practice of Painting*, vol. i., 1849 (gives MSS. of Eraclius and other early writers); Catalogue of Museum of Royal Irish Academy; *Les Nielles à la Cath. d'Aix-la-Chapelle*, Paris, 1859; Alvin, *Nielles de la Bibliothèque roy. de Belgique*, 1857; Duchesne, *Nielles des Orfèvres Florentins*, 1826; Passavant, *Le Peintre-graveur*, 1860-64; Ottley, *History of Engraving* (1816) and *Collection of Fac-similes of Prints* (1826); Cicognara, *Storia della Scultura* (iii. p. 168, Prato, 1823) and *Storia della Calcografia*, (Prato, 1831); Lanzi, *Storia Pittorica*, ep. i. sec. iii., 1809; Baldinucci, *Professori del Disegno* (1681–1728) and *L'Arte di Intagliare in Rame* (1686); Zani, *Origine dell' Incisione in Rame*, 1802; Labarte, *Arts of the Middle Ages*, 1855; Texier, *Dictionnaire de l'Orfèvrerie*, p. 1822, Paris, 1857; Bartsch, *Le Peintre-graveur*, vol. xiii. pp. 1–35; Rumohr, *Untersuchung der Grunde für die Annahme*, &c., Leipsic, 1841; and Lessing, *Collectaneen zur Litteratur* (vol. xii. art. "Niellum"). (J. H. M.)

NIEMCEWICZ, JULIAN URSIN (1757–1841), was born in 1757 in Lithuania. In the earlier part of his life he acted as adjutant to Kosciusko, was taken prisoner with him at the fatal battle of Maciejowice (1794), and shared his captivity at St Petersburg. On his release he travelled for some time in America, where he married. He died as an emigrant at Paris in 1841.

Niemcewicz tried many styles of composition. He wrote comedies (one of which, *The Return of the Deputy*, enjoyed a great reputation), tragedies, and a novel, *John of Tenczyn*, in the style of Scott, which gives a vigorous picture of old Polish days. He was also the author of a *History of the Reign of Sigismund III.* Perhaps, however, he is now best remembered by his *Historical Songs*, a series of lyrical compositions in which the chief heroes of Polish history are introduced. The poet dwells with delight upon the golden age of Sigismund I., and the reigns of Stephen Bathori and Sobieski. With the last of these, as with the fall of Polish grandeur, the collection closes, one piece only being added by way of supplement, entitled "The Funeral of Prince Joseph Poniatowski," the marshal of Napoleon, drowned in the Elster in 1813 after the battle of Leipsic. Niemcewicz also translated a great deal from the English, among other poems Pope's *Rape of the Lock* and Gray's *Elegy*. His reputation has somewhat waned since his death. He has been eclipsed in modern times by the genius of Mickiewicz, to say nothing of Slowacki and Krasinski, all poets of much greater calibre. Perhaps some of the enthusiasm which his writings once kindled may have been due to his being a patriot and a man of action during the death-struggles of his unfortunate country.

NIEPCE, JOSEPH NICÉPHORE (1765–1833), one of the inventors of photography, was born at Châlon-sur-Saône on March 7, 1765. His father, a "conseiller du roi," was in good circumstances, and young Niepce, who was of a meditative and poetical temperament, showed no eagerness to choose a profession. In 1792, however, he entered the army as a sub-lieutenant, and in the following year he saw active service in Italy. Ill-health and failing eyesight compelled him to resign his commission before he had risen above the rank of lieutenant; but in 1795 he was nominated "administrateur" of the district of Nice, and he held the post until 1801. Returning in that year to his birthplace, he gave himself along with his brother to mechanical and chemical researches; and in 1811 he directed his attention to the rising art of lithography. In 1813 the idea of obtaining sun pictures first suggested itself to him in this connexion; the history of the subsequent development of the conception will be found under DAGUERRE (vol. vi. p. 761) and PHOTOGRAPHY. Niepce died at Gras, his property near Châlon, on July 3, 1833. A nephew, Claude Félix Abel Niepce de Saint-Victor (1805–1870), served with destinction in the army, and also made important contributions towards the advancement of the art of photography (actinescence); he published *Recherches photographiques* (Paris, 1855) and *Traité pratique de gravure héliographique* (Paris, 1866).

NIÈVRE, a central department of France, formed out of the old province of Nivernais with a small portion of the Orléanais, lies between 46° 40′ and 47° 35′ N. lat. and between 2° 50′ and 4° 12′ E. long., and is bounded N.W. by Loiret, N. by Yonne, N.E. by Côte d'Or, E. and S.E. by Saône-et-Loire, S.W. and W. by Allier, and W. by Cher. It belongs partly to the basin of the Loire, partly to that of the Seine. Towards the west its limits are marked by the Allier-Loire valley,—the Loire striking across the south-west corner of the department by Decize and Nevers and then continuing the line of its great affluent the Allier northwards by Fourchambault, La Charité, Pouilly, and Cosne. Secondary feeders of the Loire are the Nièvre, which gives its name to the department, and the Aron, whose valley is traversed by the Nivernais Canal. The largest Seine tributary in Nièvre is the Yonne, which rises in the south-east, passes by Clamecy, and carries along with it the northern part of the Nivernais Canal. The Cure, the principal affluent of the Yonne (with which, however, it does not unite till after it has left the department), is the outlet of a lake, Lac des Settons, which serves as a reservoir for the practical regulation of the river. The watershed between the two river systems runs, like the general slope of the department, from south-east to north-west,—the highest summits belonging to the Morvan, an uplift of granite, porphyry, and gneiss, which extends into Saône-et-Loire, Côte d'Or, and Yonne. Here stands

[1] It is well illustrated in Shaw's *Dresses and Decorations of the Middle Ages*, vol. ii., 1858.

Mount Préneley (2790 feet), the highest point in Nièvre; and 7 or 8 miles north-north-west, at an altitude of nearly 2000 feet. is Château-Chinon, the highest town in the department. The lowest level in the department is 443 feet, at the exit of the Loire. Nièvre is divided by the line of the canal into two distinct geological districts: to the east the old crystalline rocks of the Morvan, to the west the Jurassic limestones. Both are partly covered by extensive stretches of woodland. Morvan ("Black Forest") is one of the most picturesque portions of France; and the western district, known as the "Bon Pays," is one of its finest pastoral areas, terminating towards the Loire in hills generally clad with vines. Owing to its greater elevation and the retention of the rain-water on its hard surface in the shape of ponds and streams, Morvan shows a mean temperature 6° Fahr. lower than that of the western district, which, in the valley of the Loire, is almost identical with that of Paris (52° Fahr.). At Nevers the annual rainfall amounts to only 18 inches; but in Morvan it is about three times as great.

The area of the department is 2631 square miles, one-half being arable land, a third woods, and a tenth pasture, while 42 square miles are occupied by vines. The live stock numbers 20,000 horses (mainly of Morvan breed, small but hardy and strong), 500 mules, 7000 asses, 146,100 cattle (generally of Nivernais-Charolais breeds), 210,000 sheep, 70,000 swine, 5700 goats; and there are 18,600 bee-hives. In 1880 the department produced 2,984,000 bushels of wheat, and about the same quantity of oats; barley, 1,122,000 bushels; rye, 521,000; buckwheat, 211,000; potatoes, 4,620,000; besides beetroot (86,108 tons), pulse, maize, hemp, colza, fruits. The vintage of 1881 yielded 5,304,816 gallons of wine,—the best being the white wines of Pouilly, a locality which besides sends a great quantity of its grapes to Paris for table use. The Nièvre forests, consisting of oak, beech, hornbeam, and elm, supply about three-fifths of the firewood required for the Parisian market. The coal-field of Decize, with its seven seams making a total thickness of 40 feet, yielded 200,000 tons in 1882. Fine building stone, a little white marble, sandstone, millstones, granite, and kaolinic sands are all worked in the department. The best-known mineral springs are those of Pougues and St Honoré,—the former chalybeate and the latter sulphurous, as at Eaux Bonnes in the Pyrenees. Of the iron-works for which Nièvre is famous, the most important are those of FOURCHAMBAULT (*q.v.*), employing more than 2000 workmen, and manufacturing into bridges, building frames, rails, wheels, &c., the product of 40,000 tons of ore. At Imphy the staple is rails and Bessemer steel. The Government works of La Chaussade at Guérigny employ 1300 workmen, and make armour-plates and the materials required in iron shipbuilding; wood charcoal is used, which explains the selection for this industry of a department so well supplied with timber. There are besides in the department minor foundries and forges, manufactories of agricultural implements and hardware, potteries, tile-works, chemical works, paper-mills, and wool-mills, as well as numerous tanneries, breweries, and oil works (colza, poppy, and hemp). In the Morvan district a large part of the population is engaged in the timber industry; the logs carried down by the streams to Clamecy are then collected into rafts or put into boats. Besides firewood and charcoal Nièvre exports cattle; but it has to import cereals. A great deal of the traffic is by water: the canal along the left bank of the Loire runs through the department for 38 miles, and the Nivernais Canal (from Decize to Clamecy and so to the Yonne) for 47 miles. The total length of the railways is 145 miles. The population of the department was 347,576 in 1881. Nièvre is divided into 4 arrondissements, 25 cantons, 313 communes. It forms the diocese of Nevers, and part of the districts dependent on the corps d'armée and the court of appeal of Bourges. The chief towns of the arrondissements are Nevers, Château Chinon (2613 inhabitants), Clamecy (5536), and Cosne (7401). Other places of note are La Charité (4826), with an old church of the order of Cluny; Decize (4927), with an old church and interesting ruins; and St Pierre le Moutier (3080), having an old Cluniac monastery.

NIEZHIN, NIEJIN, or NYEZHIN, a district town of Russia, situated in the government of Tchernigoff, 50 miles south-east of that town, on the railway between Kursk and Kieff. The old town is built on the left bank of the (canalized) river Oster, and its suburbs, Novoye Myesto and Magherki, on the right. It has an old cathedral, two Greek churches, one Catholic church, a synagogue, and two monasteries. The high school (lyceum of Bezborodko) formerly had 200 students, but now only from 30 to 40, since its transformation into a philological institute. The 23,000 inhabitants are mostly Little Russians and Jews (about 3000); there are also some 400 Greeks, descendants of those who immigrated in the 17th century, at the invitation of Bogdan Khmelnitski, and have since then constituted a privileged trading corporation. About 7000 of the population of Niezhin are engaged in agriculture, in market gardening, and especially in the cultivation and preparation of tobacco. Cast-iron wares and agricultural implements are manufactured, but not extensively; candle-making and tanning are also carried on. In the district there are several distilleries, producing about 160,000 gallons of wine-spirit. The commerce of Niezhin, which formerly was very prosperous, has fallen off since the opening of the Black Sea ports. Its merchants, however, especially the Greeks, still carry on an active trade in tobacco, which is exported from Niezhin to the amount of nearly 200,000 cwts., in all kinds of manufactured wares, in cattle, in wine-spirit, and also in preserved fruits and vegetables, which are a kind of specialty with the citizens.

The date of the foundation of Niezhin is unknown, but Unyezh, which is supposed to have been its former name, is mentioned as early as 1147. At that time it belonged to the principality of Tchernigoff; afterwards it fell under the rule of Poland. It was ceded to Russia about 1500, but became again a Polish possession after the treaty of Deulin. In 1649, after the revolt of Little Russia and its liberation from the Polish rule, Niezhin was the chief town of one of the most important Cossack regiments. It was annexed to Russia in 1664. In the 18th century it was a flourishing commercial city, owing to its situation on the highways from Kieff to Moscow and from Tchernigoff to Poltava, and to the Greek merchants who kept up commercial relations with Turkey, Italy, and Austria.

NIGER, one of the most famous of African rivers, has its headwaters on the north side of the mountains (known as Kong Mountains and by various other local names) which run parallel with the coast of Upper Guinea and Sierra Leone at a distance of about 200 miles, flows north-eastward as far as 17° 30′ N. lat. and the meridian of Greenwich, and then turning south-eastward reaches the Gulf of Guinea after a total course of about 2600 miles. The main stream bears in different districts a great variety of names—Joliba (Dholiba or Dialiba), Kworra (Quorra), Mayo, Kaki 'n ruwa, &c.; and the same is true of the great eastern confluent the Benue, Shary or Tchadda.[1] (For other synonyms see Baikie, *Narr. of an Expl. Voyage*, p. 426.) It will be convenient to retain the established European name for the whole river system, and to call the main stream the Kworra and the confluent the Benue.

Of the many headwaters which go to form the upper Kworra, the Tamincono, Falico, and Tembi are the most important; and, as the largest of these, the Tembi, rises in the Loma Mountains in 8° 36′ N. lat. and 10° 33′ W. long., this may be considered the true position of the long-sought source of the Niger. The Falico rises in 8° 45′ N. lat. and 10° 25′ W. long.; the Tamincono, of much less significance, about 60 miles farther north. A narrow watershed separates these headstreams from the head-streams of the Rokelle, which flows west through Sierra Leone. At Farannah (now destroyed), in 10° N. lat., the river is about 100 yards wide, and taking its Mandingo name of Joliba (or Great River) bends eastwards. From the source of the Tembi to Kuruassa, where Caillié crossed in June 1825, and found it 9 feet deep, the course of the river (nearly 300 miles) has not been followed by any European; but the general character of the next 60 or 70 miles, down to Bora, is known because Caillié's route skirted the eastern bank. Below that point there is another unexplored stretch. At Bammako, after the junction of the Milo, the Bafing or Bafi (Black River), the Fan-

[1] These last two names really belong to another river which discharges into Lake Chad, Tchad, or Tsad.

dube, &c., the depth is 6 feet, with a breadth of 1300 feet. About 7 or 8 miles farther down the Sotuba rocks mark the end of what may be regarded as the upper Kworra. Even in this section the stream is probably navigable in small boats all the way from the union of the headstreams to Sotuba. From Bammako begins a more rapid deflexion towards the east, and it is not till the Mahel Balevel, a very important tributary, joins in that a more directly northward direction is resumed. For several hundred miles below this confluence the Kworra shows a great tendency to split into different channels, often enclosing extensive tracts of country in their meshes, and turning whole provinces into a perfect labyrinth of creeks, backwaters, and lagoons. Kabara, the port of Timbuktu, is situated on one of the secondary branches; but the main channel, at no great distance, is about a mile across. At times the river rises so that boats can approach the walls of the city proper; and in 1640 an exceptional inundation turned the central and lowest quarter into a lake. The swamps and side-creeks continue to the east of Timbuktu, and, though at Bamba (130 miles) the river is shut in by steep banks and narrows to 600 or 700 yards, it again spreads out for some distance farther down. At Tahont 'n eggish (Entrance Rock), however, a great change is observed, the banks beginning to be rocky and the channel definite; and at Tosaye the width is reduced to not more than 150 yards, and the depth is enormously increased. At Burrum the valley again widens out to about 3 miles, and tracts of level ground, swamps, or sandy downs skirt the river on both sides. A ledge of rocks runs right across the stream at Tazori; about 1500 yards below a passage is forced between two masses 30 or 40 feet high; and at Tiborawen there is a very labyrinth of rapids and divided creeks. In the neighbourhood of Birni the hills close in so as to form a kind of defile, but at Say the Kworra is again a noble stream about 700 yards in breadth, with rocky banks 20 to 30 feet high on the one side and a comparatively flat country on the other. Between Say (Barth's southmost point) and Gompa (Flegel's northmost) the distance of 60 or 70 miles is practically unknown, and forms the only complete break in the delineation of the river from Bammako. At Gompa lies the mouth of the Gubbi 'n Gundi, a left hand tributary which brings down the waters of the Mayo (Mao) Kebbi or river of Sokoto, the Mayo Ranco, the Gubbi 'n Rimi, and other streams from the north-east and south. Between Yauri (100 miles farther down) and Bussa or Bussan (60 miles) the Kworra is often interrupted by rocks and islands, and below Bussa, where Park lost his life, these obstructions increase so that a distance of 10 or 12 miles cannot be passed by canoes, at least in November. The islands are occupied by considerable villages. Just where the direction of the course turns eastward, a curious rock, Mount Ketsa (Kesa or Kisey of Lander), rises in mid channel to a height of 300 feet. At Rabba (130 miles below Bussa) the width of the stream is about 2 miles, and opposite the town lies the low and populous island of Zagozhi. About 60 miles farther down is the mouth of the left hand tributary the Kadina, which passes near the important town of Bida (Crowther, 1857).

In 7° 50′ N. lat. and 6° 45′ E. long., the Kworra is joined by the Benue or Binue ("Mother of Waters" in the Batta tongue). This magnificent confluent rises in Adamaua a little to the north of Ngaundere (Ngamdere of the Houssas), about 7° 10′ N. lat. and 13° 20′ E. long., at a height of between 3000 and 5000 feet above the sea, and in the early part of its course it is separated by a narrow waterparting from the headstreams of the Logone or Serbewel, which probably flows eastward to Lake Chad. For the first 100 miles of its course it remains a rocky mountain stream, but after the junction (at about 800 feet above the sea) of the Mayo Kebbi (itself probably navigable to Dawa in the Tuburi country, and there possibly forming a bifurcation between the basins of the Niger and Lake Tchad) it takes a western direction and becomes navigable for boats drawing 4 feet of water. For some 40 miles below Ribago (Rebom)—the farthest point reached by exploration upward—the Benue has an average width of 180 to 200 yards, and flows with a strong steady current, although a broad strip of country on each side is swampy or submerged. Below the junction of the Faro the width increases to 1000 or 1500 yards, and, though it narrows at the somewhat dangerous rapids of Rumde Gilla to 150 or 180, it soon expands again. It flows onwards with comparatively unobstructed current through a beautiful country, its valley marked out for the most part by ranges of hills, and its banks diversified with forests, villages, and cultivated tracts. (See Crowther in *Proc. Roy. Geog. Soc.*, 1877; Hutchinson, *Ibid.*, 1880; Flegel in *Petermann's Mitth.*, 1880.)

At their confluence the Kworra is about ¾ mile broad and the Benue rather more than a mile. The united stream is like a lake about 2 miles in width, dotted with islands and sandbanks; and the peninsula at the junction is low, swampy, and intersected by numerous channels. From this point the course of the Niger is well known. As far south as Iddah or Idah, a town on the east bank, it rushes through a deep valley cut between the hills, the sandstone cliffs at some places rising 150 feet high. Between Iddah and Onitsha (destroyed by British gunboats in 1879), 80 miles, the banks are lower and the country flatter, and to the south of Onitsha the whole land is laid under water during the annual floods. From this point, consequently, may be said to begin the great delta of the Niger, which, extending along the coast for about 120 miles, and 140 or 150 miles inland, forms one of the most remarkable of all the swampy regions of Africa. The river soon breaks up into an intricate network of channels, dividing and subdividing, and intercrossing not only with each other but with the branches of other streams that drain the neighbouring coast, so that it is practically impossible to say where the Niger delta ends and another river system begins. Westwards the anastomosis probably extends to the lagoons at Lagos, and eastwards to the Old Calabar or Cross River. Hitherto the channel almost regularly followed is the Rio Nun, a direct continuation of the line of the undivided river. From the sea the only indication of a river mouth is a break in the dark green mangroves which here universally fringe the coast. The crossing of the bar requires considerable care, and at ebb tide the outward current runs 5½ knots per hour. For the first 20 miles (or as far as Sunday Island, the limit of the sea tide in the dry season), dense lines of mangroves 40, 50, or 60 feet in height shut in the channel, so that nothing is visible save a narrow strip of sky overhead; then palm and other trees begin to appear, and the widening river has regular banks; and before long little villages and plantations of plantains and sugar-cane show that even in this region of miasma and mud human beings find means to exist.

As the Kworra and the Benue have quite different gathering grounds they are not in flood at the same time. The upper Kworra rises in June as the result of the tropical rains, and decreases in December, its breadth at Turella expanding from between 2000 and 2500 feet to not less than 1½ miles. The middle Kworra, however, reaches its maximum near Timbuktu only in January; in February and March it sinks slowly above the narrows of Tinsherifen (Tosaye), and more rapidly below them, the level being kept up by supplies from backwaters and lakes; and by April there is a decrease of about 5 feet. In August the channel near Timbuktu is again navigable owing to rain in the Wangara highlands. The Benue reaches its greatest height in August or September, begins to fall

in October, falls rapidly in November, and slowly in the next three months, and reaches its lowest in March and April, when it is fordable in many places, has no perceptible flow, and at the confluence begins to be covered with the water-weed *Pistia Stratiotes*. The flood rises with great rapidity, and reaches 50, 60, or even 75 feet above the low-water mark. The two confluents being so unlike, the united Niger differs from each under the influence of the other. Here the river is at its lowest in April and May; in June it is subject to great fluctuations; about the middle of August it usually begins to rise; and its maximum is reached in September. In October it sinks, often rapidly. A slight rise in January, known as the *yangbe*, is occasioned by water from the Kworra. Between high and low water-mark the difference is as much as 35 feet.

As a highway of commerce the Niger has been little used, trading steamers having mainly confined their operations to the river below the confluence. But since 1857 the area of supply has been considerably extended, the quantity of goods (chiefly oil and shea butter) collected has greatly increased, and steamers five or six times the size of the vessels formerly used have been introduced. The delta region has become more populous, and trading posts more frequent. The Church Missionary Society, which, except the British Government, has done more than any other agency for opening up the lower Niger, has stations at four places on the coast, at Osamare (120 miles inland), Onitsha (20 miles farther), Lokoja (90 miles), Kipo Hill, Egan (90 miles), Shonga (94 miles farther, and only 12 or 15 short of Rabba). Lokoja is near the site of the experimental farm maintained by the Government for some years from 1841.

Pliny mentions a river Nigris of the same nature with the Nile separating Africa and Ethiopia, and forming the boundary of Gætulia; and it is not improbable that this is, in fact, the same with the modern Niger. In Ptolemy, too, appears along with Gir a certain Nigir (Νίγειρ) as one of the largest rivers of the interior; but so vague is his description that, while D'Anville and Leake strongly maintain that this, also, is the Niger, Walckenaer and Vivien St Martin insist on the negative view, and Mr Bunbury is almost inclined to follow them. When the Arabian geographers became acquainted with the river near Timbuktu they called it the Nile of the Negroes, and down to the present century European authorities (such as Jackson in his *Empire of Morocco*, 1800) fought zealously for the identity of this Nile with the river of Egypt.

The following dates show the progressive exploration of the river. 1788. Formation of the African Association in England. 1795. Mungo Park (African Association) saw the Niger near Sego "glittering in the morning sun as broad as the Thames at Westminster, and flowing slowly to the eastward." In this first expedition he went down the river as far as Sella and up as far as Bammako; in his second he sailed down to Bussa, where he was drowned. Park adopted the opinion that the Niger and the Congo were one. Major Peddie's expedition to the Niger, and Tuckey's expedition to the Congo, threw no light on the relation of the rivers. 1802. Reichard, a German, suggested that the Rio Formoso was the mouth of the Niger. 1822. Laing learned that the sources of the Niger lay not far from Sulima. 1826. Caillié sailed down the river from Jenne to the port of Timbuktu. Clapperton and Richard Lander visited Bussa. 1830. Richard and John Lander passed down from Yauri to the mouth of the Rio Nun, thus settling the doubt as to the outlet of the river. 1832. Macgregor Laird established the African Steamship Company, and Richard Lander and Oldfield (as members of its first expedition) ascended the Niger to Rabba and the Benue (or, as it was then called, the Shary or Tchadda) as far as Dagbo (80 miles). 1840. Consul Beecroft ascended beyond Rabba in the "Ethiope." 1841. An expedition, consisting of three steamers of the royal navy, under Captain (afterwards Admiral) H. D. Trotter, went up to Egga (Egam), but was forced to return owing to sickness and mortality. 1851. Barth crossed the Benue at the junction of the Faro, and conjectured it to be the upper part of the Tchadda. 1854. Barth sailed down from Saraiyamo to Kabara (port of Timbuktu), and then skirted the left bank to Bornu and the right thence to Say. The "Pleiad" expedition (Baikie, Crowther, D. J. May) advanced up the Benue 400 miles to Dulti or Jin. 1857–59. Expedition (Baikie, Glover, &c.) up to Bussa; steamer "Dayspring" wrecked on a rock above Rabba. Mission stations founded at Onitsha, Gbebe, and Rabba. 1864. Crowther made bishop of the Niger. 1877. Rev. Henry Johnson journeyed up the river to Bida. 1879. "Henry Venu," steamer (Ashkroft, Kirk, Flegel), passed up the Benue to Gurua (145 miles beyond Jin), and her boats 8 miles farther to Rebom or Ribago. Zweifel and Moustier, sent out by M. Verminck, a Marseilles merchant, discovered the sources of the Falico, &c. 1880–81. Flegel went up from Rabba to Gompa.

Besides the reports of expeditions published by Laird and Oldfield, Allen, Baikie, Crowther, &c., see Barth's *Travels*, vols. iv. and v., and his paper in *Z. für allg. Erdkunde*, Berlin, 1863; Cole, *Life on the Niger*; Crowther, *The Gospel on the Niger*; *The Church Missionary Intelligencer*; *Mittheilungen der Afrikan. Ges. in Deutschland*, 1882 and 1883; and Hutchinson's paper in *Jour. of Soc. of Arts*, 1880.

(H. A. W.)

NIGER, C. PESCENNIUS, governor of Syria under the emperor Commodus, and one of the rivals of Septimius Severus for the succession after the murder of Pertinax, belonged to an Aquinum family of equestrian rank, and owed his promotion to the Syrian command not only to the interest of Narcissus, the favourite of Commodus, but also to his known merits as a soldier. He was saluted emperor by the troops at Antioch as soon as the death of Pertinax became known, in the spring of 193 A.D., but he unaccountably delayed marching on Rome until he learned that Severus had assumed the offensive. He now strongly garrisoned Byzantium as well as the principal towns of Asia Minor, but after his legate Æmilianus had been defeated and slain near Cyzicus he himself was driven from Nicæa and decisively routed, with great slaughter, in the neighbourhood of the Cilician Gates. Having failed in an effort to escape towards the Euphrates, he was brought back and put to death in 194.

NIGHTINGALE (Anglo-Saxon, *Nihtegale*, literally "singer of the night"), the bird justly celebrated beyond all others by European writers for the admirable vocal powers which, during some weeks after its return from its winter-quarters in the south, it exercises at all hours of the day and night. The song itself is indescribable, though several attempts, from the time of Aristophanes to the present, have been made to express in syllables the sound of its many notes; and its effects on those that hear it depend so much on their personal disposition as to be as varied as are its tones. To some they suggest melancholy; and many poets have descanted on the bird (which they nearly always make of the feminine gender) leaning its breast against a thorn and pouring forth its melody in anguish. It is accordingly to be observed that the cock alone sings, and that there is no reason to suppose that the cause and intent of his song, unsurpassed though it be, differ in any respect from those of other birds' songs (see BIRDS, vol. iii. p. 770). Sadness, therefore, is certainly the last impelling sentiment that can be properly assigned in this case. In great contrast to the Nightingale's pre-eminent voice is the inconspicuous coloration of its plumage, which is alike in both sexes, and is of a reddish-brown above and dull greyish-white beneath, the breast being rather darker, and the rufous tail shewing the only bright tint. The range of this bird in Europe has already been so fully described (BIRDS, vol. iii. p. 756, 757) as to render a further account of it needless. The Nightingale reaches its English home about the middle of April,[1] the males (as is usual among migratory birds) arriving some days before the females; and, often stopping on their way, letting their song be heard in places they do not habitually frequent, pass to their proper breeding-quarters. At this time they run very great danger from birdcatchers, for their capture is effected with facility, and it is painful to add that of those then caught nine-tenths are said to die within a month. Fortunately for the species, it receives great protection from the practice of game-preserving, which guards from intrusion so many of the localities it affects, and there is probably no country in which the Nightingale breeds more abundantly and in greater security than in England. On the cocks being joined by their partners, the work for which the long and hazardous journey of both has been undertaken is speedily begun, and before long the nest is completed. This is of a rather uncommon kind, being placed on or near the ground, the outworks

[1] Poets and novelists are apt to command at will the song of this bird, irrespective of season. If the appearance of truth is to be regarded, it is dangerous to introduce a Nightingale as singing in England before the 15th of April or after the 15th of June. The "Early Nightingale" of newspaper paragraphs is generally a Song-Thrush.

consisting chiefly of a great number of dead leaves ingeniously applied together so that the plane of each is mostly vertical. In the midst of the mass is wrought a deep cup-like hollow, neatly lined with fibrous roots, but the whole is so loosely constructed, and depends for lateral support so much on the stems of the plants, among which it is generally built, that a very slight touch disturbs its beautiful arrangement. Herein from four to six eggs of a deep olive colour are duly laid, and the young hatched. If the latter be taken when nearly fit to fly from the nest, they can with proper care be reared by hand, and this is the only justifiable mode of proceeding for those who wish to keep this fine songster in confinement, as, if the birds survive their first moult, they may live for some years in a cage, and the cocks will in due time exercise their full vocal powers. The nestling plumage of the Nightingale differs much from that of the adult, the feathers above being tipped with a buff spot, just as in the young of the Redbreast, Hedge-Sparrow, and Redstart, thereby shewing the natural affinity of all these forms. Towards the end of summer the Nightingale disappears, and but little has been observed of it in its winter-retreats, which are presumably in the interior of Africa. One of the few records of it at that season proves that it visits the Gold Coast (*Ibis*, 1872, p. 291).

The Nightingale is the *Motacilla luscinia* in part of Linnæus, and the *Daulias luscinia* of some modern ornithologists. In the east of Europe a second species occurs which was not discriminated by Linnæus, though long known to German bird-fanciers as the *Sprosser*. This, the *Sylvia philomela* or *Daulias philomela* of many scientific writers, is a somewhat larger bird, which fact, and the presence of some faint spots on its breast, have caused it to receive the English name of Thrush-Nightingale. Its westward range appears to be limited to the valley of the Rhine, and the statement that it has occurred in England is erroneous. Its song is louder than that of the true Nightingale, but not so sweet in tone or so varied in note. The name Nightingale has been vaguely applied to several other birds. The so-called "Virginian Nightingale" is a species of GROSBEAK (vol. xi. p. 205), and the REDWING (*q.v.*), strangely enough, has been often spoken of as the "Swedish Nightingale."

The Nightingale holds a place in classical mythology. Procne and Philomela were the daughters of Pandion, king of Attica, who in return for warlike aid rendered him by Tereus, king of Daulis in Thrace, gave him the first-named in marriage. Tereus, however, being enamoured of her sister, feigned that his wife was dead, and induced Philomela to take her place. On her discovering the truth, he cut out her tongue to hinder her from revealing his deceit; but she depicted her sad story on a robe which she sent to Procne; and the two sisters then contrived a horrible revenge for the infidelity of Tereus, by killing and serving to him at table his son Itys. Thereupon the gods interposed, changing Tereus into a Hoopoe, Procne into a Swallow, and Philomela into a Nightingale, while Itys was restored to life as a Pheasant, and Pandion (who had died of grief at his daughters' dishonour) as a bird-of-prey (see OSPREY). The fable has several variants. Ovid's version may be seen in the 6th Book of his *Metamorphoses* (lines 412-676). (A. N.)

NIGHTSHADE, a general term for the genus of plants known to botanists as *Solanum*. The species to which the name of Nightshade is commonly given in England is the *Solanum Dulcamara*, L., which is also called the Bittersweet or Woody Nightshade. It is a common plant in damp hedgebanks and thickets, scrambling over underwood and hedges. It has slender slightly woody stems, with alternate lanceolate leaves more or less cordate and auriculate at the base. The flowers are arranged in drooping cymes, and resemble those of the potato in shape, although much smaller. The corolla is rotate, of a lilac-blue colour with a green spot at the base of each segment, and is furnished with yellow sessile anthers united at their margins so as to form a cone in the centre of the corolla. The flowers are succeeded by ovate scarlet berries, which in large doses appear to be poisonous or, to say the least, dangerous to children, cases of poisoning by them having occurred. The plant derives its names of bittersweet and *Dulcamara* from the fact that its taste is at first pleasantly sweet and then bitter. The young stems collected in autumn have been used in medicine as an alterative in rheumatism and certain skin diseases, but are little used at the present time except by homœopaths, by whom *Dulcamara* is given as an anticatarrhal remedy in all symptoms produced by cold arising from exposure to damp. It owes its medicinal activity to a bitter principle yielding by decomposition sugar and the alkaloid "solania," $C_{43}H_{69}NO_{16}$. This principle has been found in small quantity in the leaves, stalks, and berries. *Dulcamara* also contains another glucoside "dulcamarin," $C_{22}H_{34}O_{10}$, which when boiled with dilute acid splits up into sugar and "dulcamaretin," $C_{16}H_{26}O_6$. Solania appears to exert a depressant action on the vagus nerve and an excitant action on the medulla oblongata. The term Deadly Nightshade is often erroneously applied to this plant, and the popular usage has even been confirmed by so eminent a botanist as Bentham (*Handbook of the British Flora*, p. 384, 1858). It is generally accepted, however, that the deadly nightshade is *Atropa Belladonna*, L. (see vol. iii. p. 543).

Solanum Dulcamara is subject to the same parasitic fungus (*Peronospora infestans*) as the potato, and may serve as a medium for communicating the spores to the potato if not removed from the hedges of the fields where potatoes are grown.

The Garden Nightshade, *Solanum nigrum*, L., differs from *S. Dulcamara* in having white flowers in small umbels and globose black berries. It is a common weed in gardens and waste places, growing about 12 or 18 inches high, and has ovate, entire or sinuate-dentate leaves. Two varieties of the plant, one with red and the other with yellow berries, are sometimes met with, but are comparatively rare. The berries have been known to produce poisonous effects when eaten by children, and owe their properties to the presence of solania. They are, however, said to be eaten without inconvenience in British Kaffraria, and in Réunion and Mauritius the leaves are eaten like spinach; their innocuousness in these cases may, however, be due to the poisonous principle being removed or decomposed by the process of cooking.

The name of nightshade is applied to plants of different genera in other countries. American Nightshade is a species of *Phytolacca*; the Three-leaved Nightshade is a *Trillium*; the Malabar Nightshade is a *Basella*; the Bastard Nightshade is a *Rivina*; and the Enchanter's Nightshade is *Circæa lutetiana*. The last-named is not known to possess any poisonous property, and the name seems to have been given to it in the first place in mistake for a species of *Mandragora* (see MANDRAKE).

NIGRITIA. See SOUDAN.

NIIGATA, a city of Japan, with a population of about 34,000, the chief town of the province of Echigo, and one of the ports open to foreign trade since 1869, lies in 37° 57′ N. lat. and 139° E. long., on the west coast of the island of Nippon, on a narrow strip of sandy ground between the left bank of the Shinano and the sea, which though quite at hand is shut out from view by a low range of sandhills. It occupies an area of rather more than one square mile, and consists of five long parallel streets intersected by cross-streets, which in most cases have canals running down the middle and communicating with the river, so that the internal traffic of the city is mainly carried on by water. The houses are usually built with gables to the street, and roofs and verandas project so as to keep the windows and footpaths from

being blocked up by the heavy winter snows. In August 1880 nearly half of the town was destroyed by fire; but in the following year most of the public buildings were restored. The college, founded in 1870, was handed over to the authorities in 1878 (with an English department, an engineering school, a geological museum, and various laboratories); and the large hospital was rebuilt on a more spacious scale and in European style in 1878. There are large public gardens in the city; many of the canals are bordered with trees; and an air of tidiness and comfort prevails throughout the un-Europeanized quarters. Niigata has a greater junk traffic than any other town on the west coast of Japan, but it has been found quite unsuited in its present state for foreign commerce. The mouth of the river is obstructed by a bar with only 12 feet of water at high tide, and in autumn and winter the squalls are so violent that only very powerful steamers can safely anchor in the bay. Ebisuminato, on the island of Sado, has been opened as a supplementary harbour of refuge but not as a trading port. The shore of the Shinano has already been improved up to the town; and when the Government has constructed the new harbour and breakwater planned in 1880 Niigata will doubtless become a very flourishing commercial centre, as it is the natural outlet of a large and populous province, producing rice, tea, coal, petroleum, copper, silver, and gold. Almost all the foreign trade of the place has passed into the hands of the Japanese since the Mitsubishi Company began to call at the port. In 1879 thirty-six of their vessels entered, with a total burden of 29,361 tons. In 1878 there were only twenty foreigners in the city, and these mostly in Government employment or agents of mission societies. The Edinburgh Medical Mission has maintained a valuable hospital and dispensary since 1875. During winter Niigata suffers from a terribly severe climate, and the people go "about in wadded clothes with only their eyes exposed."

See Bird, *Unbeaten Tracks in Japan*, for many picturesque details.

NIJAR, a town of Spain, in the province of Almeria, 14 miles to the east-north-east of that town, occupies an exposed site on the southern slope of the Sierra Alhamilla. It has dye-works, and manufactures woollen stuffs and pottery; trade is carried on in the products of these industries, as well as in corn, cattle, barilla, and fine potter's clay procured in the neighbourhood. The population of the ayuntamiento in 1877 was 13,661.

NIJNE-TAGHILSK, currently known as TAGHIL, a town and iron-work of Russia, situated in the government of Perm and district of Verkhoturie, 100 miles to the south-east of the district town. It occupies an advantageous position in a longitudinal valley on the eastern slope of the Ural Mountains, within a few miles of the place where the Taghil, cutting through the eastern wall of the valley, escapes to the lowlands to join the Tura, a tributary of the Tobol. The southern part of this valley is occupied by the upper Taghil, and its continuation towards the north by the upper Tura, from which it is separated by a low watershed; it is dotted with numerous iron-works, and is now connected by railway (the first in Siberia) with Perm and Ekaterinburg (88 miles distant). The town was founded in 1725 by the well-known Russian miner Demidoff, and is still the property of his family. The river, which above the iron-work expands into a small lake, supplies the iron-work with motive power, driving no less than twenty-seven water-wheels, while there are several steam-engines. Nijne-Taghilsk is a central foundry for a number of iron-mines and eleven other works scattered in the valley of the Taghil and its tributary, the Salda, the aggregate production of which in 1879 amounted to 749,000 cwts. of cast iron and 280,000 cwts. of wrought iron (547,500 cwts. of iron and iron-ware, worth 6,000,000 roubles, in 1881). About 360 ℔ of gold, 2500 ℔ of platinum, and 11,600 cwts. of copper are also annually mined at Nijne-Taghilsk. The town has several educational institutions both primary and secondary, the latter including a technical school and a school for girls. It has a very animated appearance during its weekly fairs, and, being the chief corn-market for the supply of nearly all the iron-works of the district of Verkhoturie, carries on a brisk corn trade, which the railway has further developed. The inhabitants also make wooden boxes and trays which are sent to the fairs of Irbit and Nijni-Novgorod. The population, including that of the Vyiski iron-work, situated close at hand, exceeds 30,000, all Great-Russians, and chiefly Nonconformists.

NIJNE-TCHIRSKAYA, a Cossack village, or stanitsa, of Russia, chief town of the Second Don district of the Don Cossack government, is situated on the right bank of the Don, at its junction with the Tchir, 25 miles below the Kalatch station of the Volga and Don Railway, and is the chief point for corn and linseed from the basin of the middle Don. Its 14,000 inhabitants (with the 11,000 of Verkne-Tchirskaya, 2 miles distant) are mostly engaged in agriculture and cattle-raising, favoured by the extensive landholdings (about 700,000 acres) belonging to the Cossacks of both stanitsas. The hills above the village are covered for several miles with rich gardens and vineyards. Besides the trade in grain and linseed, a considerable business is done in cattle, wool, and salt. Manufactures, as among the Don Cossacks generally, are very limited, being confined to tanning, brick-making, and candle-making. The place is in regular steamboat communication with Novotcherkassk and Taganrog.

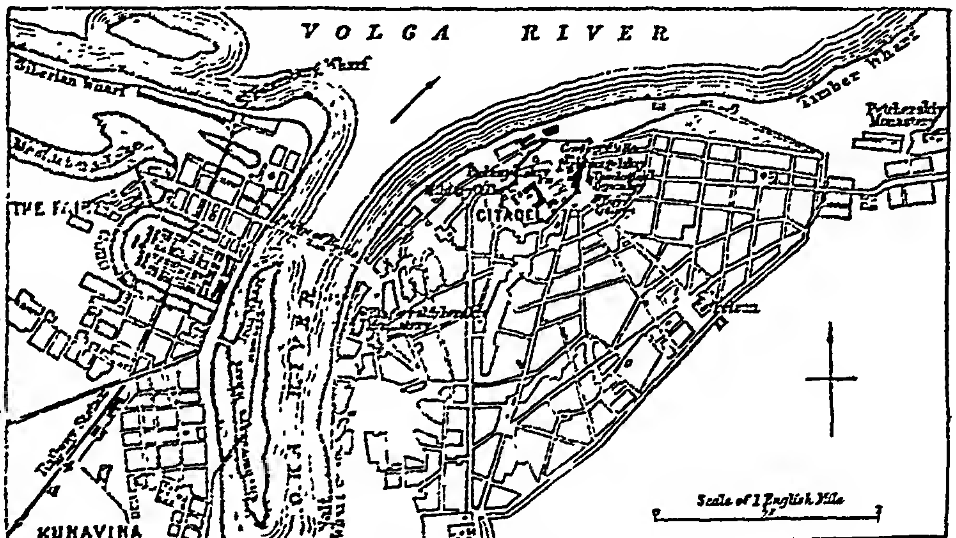
NIJNI-LOMOFF, a district town of Russia, in the government of Penza, 69 miles west-north-west from the capital of the government, on the Lomoff; the railway from Penza to Tula passes within 17 miles. It was founded as a south-eastern frontier fort in 1636, in a country of moderate fertility, and has but slowly developed. It has now 19,000 inhabitants, who support themselves chiefly by agriculture and gardening. The merchants carry on trade in grain, wine-spirit, hempseed oil, leather, woollen goods, and a variety of wooden wares (cars, sledges, wheels, and so on), largely manufactured in the southern and wooded part of the district. The yearly fair is of some importance as regards corn and cattle. The town and the district have also a few distilleries, manufactures of woollen cloth and potash, oil-works, and potteries.

NIJNI-NOVGOROD, or NIJNIY-NOVGOROD, a government of Central Russia, bounded by Vladimir on the W., by Yaroslaff and Vyatka on the N. and N.E., by Kazan and Simbirsk on the E., and by Penza and Tamboff on the S., with an area of 19,800 square miles, two-thirds being on the right and the rest on the left bank of the Volga. The smaller portion, with the exception of the better-drained lands close to the river, is a low flat marshy district, covered with thick forests and sandy hills, and is but thinly peopled. The space between the Oka and Volga is also flat and covered with forests, but offers somewhat greater advantages to the settler. The best part of the government is that to the east of the Oka; it is hilly, traversed by deep ravines, and better drained, and has patches of fertile black earth in the south. Geologically, Nijni-Novgorod belongs chiefly to the Permian system; the Carboniferous appears only in the lowest formations, and the Permian limestones are covered with a stratum 450 feet in thickness, of variegated marls, formerly considered as Permian, but now supposed to be Triassic. It is watered by the Volga with its tributaries, the Kerjenetz and Vetluga on the left, and the Sura (with the Piana)

and Oka on the right. These and their numerous tributaries offer great facilities both for navigation and for the transit of timber. Very numerous lakes dot the government, especially in the north; and one-third of its entire surface is still covered with forests, which occupy nearly the whole of the Zavoljie (to the north of the Volga), and extend without a break for 50 and 80 miles to the west and south-west. The climate is severe, especially in the Zavoljie, where the average yearly temperature is 5°·6 Fahr. lower than at Nijni. The population in 1880 reached 1,376,000; they are mostly Great-Russians, Mordvinians (50,600), and Tartars (42,650); the Tcheremisses numbered 5630, and the Jews about 1500. Of the total, 1,266,550 belong to the Greek Church, 63,850 (probably much understated) are registered as Old Believers and Raskolniks, 42,650 are Mohammedans, 750 Protestants, and 740 Catholics. The urban population is only 101,000. The yearly increase of the population is estimated at 0·43 per cent., and the mortality at 47 per 1000.

The chief occupation of the inhabitants is agriculture, but only 35 per cent. of the area is under crops. Cattle breeding is falling off rapidly, and in 1880 there were only 229,000 horses (as against 326,000 in 1848 and 261,000 in 1865), 232,000 horned cattle, 444,000 sheep (585,000 in 1865), and 74,000 pigs. Kitchen-gardens are a source of income in several districts. Agriculture, on the whole, has to contend with great difficulties on account of the climate, the soil, and the small allotments of land. A variety of petty trades carried on by the peasantry have accordingly developed in the villages; of these cutlery is the chief, no less than 6000 families being engaged in that industry at Pavlovo and Vorsma. In other parts of the government the peasants make felt and woollen wares, leather wares and harness, iron-wire and sieves, &c.; each village has its own specialty, being renowned for its felt shoes, or for its gloves, its fine scales, and so on. The chief occupation, however, is the manufacture of wooden wares,—sledges, wheels, dishes and spoons, window frames, boxes, &c.,—which are exported in large quantities to the governments of the lower Volga, and even to Bokhara and Persia. The manufactures are rapidly developing. In 1880 there were 465 factories (principally machine-works, steam flour-mills, iron and steel works, naphtha distilleries, cutlery and copper works, tanneries, and rope-works), employing about 20,000 work-people, and producing goods to the value of more than 15,000,000 roubles (8,840,000 in 1876); the production of the distilleries amounted to 4,540,000. The building of boats and steamers is also a considerable source of income. A very large proportion of the population fails to find the means of self-support within the province, and every year no fewer than 100,000 to 117,000 persons leave their villages and go in search of labour as far as St Petersburg and Astrakhan. Trade in corn, salt, timber, leather, iron, and all kinds of manufactured ware is well developed in all towns of the government, and there are important fairs at several places. The educational institutions are few, and, on the whole, except among the Raskolniks, education stands at a very low level. The government is divided into eleven districts, having as their chief towns Nijni-Novgorod (50,000 inhabitants), Ardatoff (3500), Arzamas (10,500), Balakhna (4000), Gorbatoff (3000), Knyaghinin (2500), Lukoyanoff (10,000), Makarieff (2000), Semenoff (3000), Sergach (4000), and Vasilsursk (3000). The other towns are Perevoz (1000) and Pochinki (7500); the two villages Pavlovo (about 10,000) and Vorsma (4000) are important manufacturing centres.

NIJNI-NOVGOROD, or simply NIJNI or NIJNIY, capital of the above government, is situated at the confluence of the Oka and Volga, 276 miles by rail to the east of Moscow. It occupies a most advantageous position on the great artery of Russian trade, at a place where the manufactured and agricultural products of the basin of the Oka meet with the metal wares from that of the Kama, the corn and salt brought from the south-eastern provinces, the produce of the Caspian fisheries, and the various wares imported from Siberia, Central Asia, Caucasus, and Persia. It has thus become the seat of the great Makarievskaya fair, and one of the chief commercial centres of Russia. Its importance has still further increased during the last twenty years in consequence of the growth of manufactures in the Oka basin, the rapid development of steamboat traffic on the Volga and its tributaries, the extension of the Russian railway system, and the opening of Central Asia for trade. Nijni-Novgorod consists of three parts:—the upper city, including the Kremlin; the lower town, or Nijni Bazaar; and "the Fair," with the suburb Kunavina. The upper city covers three hills, which rise as steep crags to a height of 400 feet (490 feet above sea-level) on the right banks of both the Oka and the Volga. The Kremlin, or old fort, occupies one of these hills facing the Volga. It was erected in the beginning of the 16th century, on the site of the old palisaded fort, and has a wall 2300 yards long, with eleven towers; it contains the law-courts, the governor's residence, the arsenal, barracks, the military gymnasium of Count Arakchéeff, transferred from Novgorod, and two cathedrals, Preobrajenski and Arkhangelski. These were erected in 1225 and 1222 respectively, and have been rebuilt more than once; the present structures, in somewhat poor taste, date from



Plan of Nijni-Novgorod.

1834 and 1732. The Preobrajenski cathedral, however, retains several relics of the past, such as a holy picture of 1380, and a Bible of 1404; Minin, the hero of Nijni, lies buried there. The Kremlin is adorned with a square, containing a monument to Minin and Pojarsky erected in 1826, and pretty boulevards have been laid out along its lower wall. The view from the Kremlin of the broad Volga, with its low-lying and far-spreading left bank, is very charming. The Pechorsky monastery, close by, is archæologically interesting; it was built in the first half of the 16th century,—instead of the old monastery founded in 1330 and destroyed by a land-slip,—and has several antiquities and a library with very valuable MSS. Another monastery, contemporary with the foundation of Nijni, that of Blagovyeschensk, is situated on the right bank of the Oka. Its old churches have been destroyed by fire, but it has a very ancient holy picture—probably the oldest in Russia—dating from 933, which attracts many pilgrims. Besides the Kremlin, the upper town contains the best streets and public buildings. Five descents lead from it to the lower town, which covers the alluvial terrace, 30 to 35 feet in height, on the banks of the Oka and Volga, and is the centre of a very lively

traffic. Its embankments are covered with storehouses, and during the fair great quantities of merchandise are unloaded there: hills of salt surround the salt-harbour on the Oka; farther down are seen the extensive storehouses and heaps of grain of the corn-harbour; then comes the steamboat quay on the Volga, opposite the Kremlin, and still farther to the east the timber-harbour. The fair is held on the flat sandy tongue of land between the Oka and the Volga, connected with the town only by a bridge of boats, 1500 yards long, which is dismounted in winter. The shops of the fair, more than 3000 in number, built of stone in regular rows, are surrounded by a canal, and cover half a square mile. A complete town has sprung up around them, whilst the sandy banks are occupied by storehouses. The Siberian harbour during the fair has a special interest on account of its accumulations of tea boxes and temporary shelters where the different kinds of tea are tried and valued by tasters. The point of the peninsula is occupied by the storehouses of the steamboat companies, while metal wares and corn are discharged on a long island of the Oka, at the iron-harbour and Grebnovskaya harbour. An island in the Volga is the place where various kinds of rough wares are landed. An immense cathedral has been recently erected to the north of the fair, on a site which is often flooded. The railway from Moscow has its terminus close to the fair buildings, to the south of which is the suburb Kunavina, widely known throughout the East as a place for amusements of the lowest kind during the fair.

Nijni-Novgorod is well supplied with drinking-water by springs which flow from beneath the Triassic marls of which its hills are constituted. The water is collected in a basin on the banks of the Volga and pumped to the upper town (114,000 gallons per day). The climate of Nijni is harsh and continental, the yearly average temperature being 39° Fahr. (10°·6 in January and 64° in July), and the extreme thermometric readings − 40° and 104° Fahr.

The town has a settled population of 50,000 inhabitants, rising to 250,000 or perhaps to 300,000 during the fair. The inhabitants are nearly all Great-Russians, and many of them are Nonconformists. The mortality exceeds the birth-rate. The educational institutions, which are few, include, besides the military school, one college (gymnasium) for boys and one for girls, a technical school, a theological seminary, two schools for sons and daughters of the clergy, and a dozen primary schools. The aggregate number of scholars being 3000, nearly 6000 children receive no public instruction. There is a small public library, and a single periodical—*The Exchange News*; the five printing offices are employed almost exclusively by the public institutions. Of late the statistical committee has issued a most valuable publication, the *Nijegorodskiy Sbornik*, containing all kinds of statistical, ethnographical, and archæological information about the government.

The manufactures are unimportant, but on the increase. The steam flour-mills, iron and machine works, manufactories of ropes and candles, distilleries, and potteries have an aggregate production of nearly £250,000 per year. Shipbuilding, especially for the transport of naphtha on the Caspian Sea, and also steamboat building, have recently advanced considerably. Nijni is the chief station of the Volga steamboat traffic. The first steamer on the Volga made its appearance in 1821, but it was not till 1845 that steam navigation began to assume large proportions. In 1846 the whole traffic, carried on by nearly 1000 boats and 200 larger boats moved by horse-power, did not exceed 1,000,000 tons; it is now estimated at 2,500,000 tons, worth £3,000,000, and the number of steamers on the Volga alone is about 500. The head offices of the chief companies are at Nijni. The merchants also carry on a brisk trade, valued (apart from that of the fair) at more than £2,000,000 (20,000,000 roubles) of purchases and £1,500,000 of sales; the chief items are corn (from £200,000 to £250,000), salt, iron, tea, fish, groceries, and manufactured goods. The annual budget of Nijni is under £20,000.

The chief importance of Nijni is due to its fair, which is held from August 8th to September 15th. From remote antiquity Russian merchants were wont to meet in summer with those from the East at different places on the Volga, between the mouths of the Oka and Kama,—the fair changing its site with the increasing or decreasing power of the nationalities which struggled for the possession of the middle Volga. Bulgary, or Bakhtimovo, Nijni-Novgorod, Kazan, and Vasilsursk have successively been its seat since the 10th century. From 1624 its seat was long at the Jeltovodski monastery, 55 miles below Nijni, close to Makarieff, whence its present name. The situation, however, being in many ways inconvenient, and a conflagration having destroyed the shops at Makarieff, the fair was transferred in 1817 to its present seat at Nijni. The first fair held here showed a large increase of arrivals, which reached the value of 27,000,000 roubles, and this figure has steadily increased, reaching an average of 168,628,600 roubles in 1871–75, and 200,446,000 roubles in 1880. The value of the merchandise unsold usually varies from 15 to 25 millions (31 millions in 1880). The goods chiefly dealt in are cotton, woollen, linen, and silk stuffs (35 to 38 per cent. of the whole), iron and iron wares, furs and skins, pottery, salt, corn, fish, wine, and all kinds of manufactured goods. The Russian goods constitute four-fifths of the whole trade; those brought from Asia—tea (imported *via* Kiachta, Canton, and Suez), raw cotton and silk, leather wares, madder, and various manufactured wares—do not exceed 10 or 11 per cent. Manufactured wares, groceries, and wines are the goods principally imported from western Europe.

The above figures, however, convey but a very imperfect idea of the total business transacted at the fair, which has been estimated at 371,013,911 roubles in 1880 (320,532,700 in 1876), and in reality stands at a much higher figure. Twenty-five years ago, the Russian manufacturers depending chiefly on the barter-trade in tea at Kiachta, their production was regulated principally by the prices of tea established at the fair; but now cotton takes the lead, and the extension to be given each year to the mills of central Russia is determined at the fair by the price of raw cotton imported from Asia, by that of madder, and by the results of the year's crop which become known during the fair. The same holds good with regard to all other stuffs, the prices of wool (provisionally established at the earlier fairs of south-western Russia) being ultimately settled at Nijni, as well as those of raw silk. The whole of the iron production of the Ural depends also on the same fair. The "caravans" of boats laden with iron-ware, starting from the Ural works in the spring, reach Nijni in August, after a stay at the fair of Laisheff, which supplies the lower Volga; and the purchases of iron made at Nijni for Asia and middle Russia determine the amount of credit that will be granted for the next year's business to the owners of the iron-works, on which credit most of them entirely depend. The fair thus influences directly all the leading branches of Russian manufacture. It exercises a yet greater influence on the corn and salt trades throughout Russia, and still more on the whole of the trade in Siberia and Turkestan, both depending entirely on the conditions of credit that the Siberian and Turkestan merchants obtain at the fair.

The Makarievskaya fair attracts therefore no fewer than 200,000 people from all parts of Russia, and partly from Asia. The 3000 shops of the Gostinoy Dvor being insufficient for all the merchandise, other 3000 shops are erected on a field close by, whilst the quays are covered for 10 miles with heaps of ware and temporary shelters. The Oka and Volga are literally covered with thousands of boats of all descriptions; thousands of bargemen swarm in the dirtiest holes, spreading epidemics; whilst the lowest amusements are carried on in the houses of Kunavina. The fair is under the control of a special committee, who raise more than 400,000 roubles for shop rents.

Two other fairs of some importance are held at Nijni,—one for the trade in wooden wares is held on the ice of the Oka, and another, in June, for the trade in horses.

History.—The confluence of the Oka and the Volga, inhabited in the 10th century by numerous Mordvinian tribes, began to be coveted by the Russians as soon as they had occupied the upper Volga, and as early as the 11th century they had established a fort, Gorodetz, 20 miles above the mouth of the Oka. In 1221 the people of Suzdal, under Yuri Vsevolodovich, erected a fort on the hill now occupied by the Kremlin of Nijni, and gave it the name of *Novgrad Nizovskiya Zemli* (new town of the lowland). Until the beginning of the 14th century Nijni-Novgorod, which grew rapidly as the Russians colonized the banks of the Oka, remained a sub-town of Suzdal; it enjoyed, however, almost complete independence, being ruled by its popular assembly. In the 14th century, until 1390, it elected its own princes. Ill protected by its palisaded walls, it was plundered in 1377 and 1378 by the Tartars, supported by the Mordvinians. In 1390 Prince Vasili of Moscow, in alliance with the khan Toktamish, took Nijni and established his own governors there; in 1412 it was definitely annexed to Moscow, becoming a stronghold for the further advance of that principality towards the east. It was fortified in 1508–11, and was able to repel the Tartars in 1513, 1520, and 1536. The second half of the 16th century was for Nijni a period of peaceful and rapid development. It became a depôt for all merchandise brought from the south-east, and even English merchants established warehouses there. With the fall of Kazan, and the opening of the free navigation on the Volga, it became also the starting place for the "caravan" of boats yearly

sent to the lower Volga under the protection of a military force; whilst the thick forests of the neighbourhood favoured the development of shipbuilding. In 1606–11 the trading classes of Nijni took an active part in the expeditions against the revolted serfs, and it was a Nijni dealer in cattle, Kozma Minin Sukhoruki, who took the initiative in sending an army for the delivery of Moscow from the Poles. During the 17th century the country around Nijni became the seat of a vigorous religious agitation, and in its forests the Raskolniks spread hundreds of their monasteries and communities, those of the Kerjenets playing an important part in the history of Russian Nonconformity even to our own day.

Nijni-Novgorod had at one time two academies, Greek and Slavonic, and took some part in the literary movement of the end of the last century; its theatre also had some importance in the history of the Russian stage. It is the birthplace of Kulibin and Dobroluboff. (P. A. K.)

NIKKO, one of the chief religious centres of Japan, is beautifully situated on the Nikko Zan (Mountains of the Sun's Brightness) in Tochigi *ken* (province of Shimotsuke), about 92 miles north-north-west of Tokio (Yedo) by the ordinary route *via* Utsunomiya. The town is properly called Hachi-ishi, but this name is very little used in comparison with that of the shrines. A Shintô temple seems to have existed at Nikko from time immemorial, and in 767 its first Buddhist temple was founded by Shô-dô Shô-nin (the subject of many strange legendary adventures); but the main celebrity of the place is due to the sepulchres and sanctuaries of Iyeyasu and Iyemitsu, the first and third shôguns of the Tokugawa dynasty. Iyeyasu was buried with amazing pomp in 1617, and Iyemitsu, his grandson, was slain in 1650 while visiting his tomb. From 1644 to 1868 the "abbots" of Nikko were always princes of the imperial blood; thirteen of them are buried within the sacred grounds. Though the magnificent abbots' residence was destroyed by fire in 1871, and the temples have lost most of their ritual and much of their material splendour, enough remains to astonish by excellence and bewilder by variety of decorative detail. Of the numerous structures which cluster round the shrine of Iyeyasu, it is sufficient to mention the cylindrical copper column, 42 feet high, adorned at the top with a series of six lotus flowers, from the petals of which hang small bells; a five-storied pagoda, 104 feet high, with the animals of the duodenary cycle running round the base; the gate of the Two Kings, with its figures of unicorns, tapirs, elephants, and tree-pæonies; the vermilion-coloured timber enclosure to which this gate gives entrance, with three great storehouses, a sumptuous stable for the sacred horses, and a finely fashioned granite cistern for holy water; and the Yo-mei gate, which with the contiguous cloister is covered with the most elaborate carving, and gives access to the court in the midst of which stands the last and most sacred enclosure. This, known as the *Tamagaki*, is a quadrangle of gilt trellis-work 50 yards square; within it stands the "chapel" or oratory (or rather a series of chapels, though the inmost is kept closed), in the decoration of which gilding and black lacquer have been lavishly employed. The tomb of Iyeyasu lies apart from all this magnificence two hundred and forty steps higher up the hills, in the shadow of tall cryptomerias—a single light-coloured bronze urn or casket standing on a circular base of three steps with a stone table in front on which rest a censer, a lotus-cluster, and a stork with a candlestick in its mouth,—the whole enclosed by a high stone wall. Somewhat similar are the tomb of Iyemitsu and its surroundings; and though the art displayed is of an inferior character, the profusion of buildings and embellishments is even more perplexing. Hotoké Iwa, the hill on which the tomb stands, is completely covered to the summit with trees of various tints.

See Satow and Hawes, *Guide-book to Japan*, 1881; Bird, *Unbeaten Tracks in Japan*, 1880.

NIKOLAIEFF, the chief naval station of Russia on the Black Sea, is situated in the government of Kherson, 41 miles north-west of the government capital. It stands most advantageously a little above the junction of the Ingul with the Bug, at the head of the *liman*, or estuary, of the Bug, and is the natural outlet for the basin of that river. The estuary, which is 23 miles long, enters that of the Dnieper; and Nikolaieff, 42 miles distant from the Black Sea, thus combines the advantages of a good seaport with those of an inland town. The entrance to the double estuary of the Bug and Dnieper is protected by the fortress of Otchakoff and by the fort of Kinburn, erected on a narrow headland opposite, while several forts surround Nikolaieff on both sides of the Bug and protect it from an attack by land. The town, which occupies two flat peninsulas between the Bug and the Ingul, extends up the banks of the latter, while its suburbs spread still farther into the steppe, the whole covering an area of 6 square miles. Immense unoccupied spaces separate the houses, which are mostly one-storied, and border on spacious streets. The bank of the Ingul is taken up with shipbuilding yards, docks, slips, and various workshops of the admiralty for the construction of armour-plates, guns, boilers, &c. On the river there is a floating dock for armoured ships, but Nikolaieff has this drawback that fully armoured ships are unable to pass the bar, which is only 18 to 21 feet deep. Before the Crimean War the activity of the dockyards was very great, ships of 130 guns being built in them; the suburbs—which belong to the admiralty—were bound to supply the necessary hands to the number of 3000 every day, and all the inhabitants had to perform compulsory service. Special bodies of militarily organized workmen were trained in shipbuilding, and thus Nikolaieff became a great school for all branches of navigation and naval architecture. The population, numbering 35,000, was mainly dependent on these sources; but when the activity of the admiralty was brought to a stop for fourteen years by the treaty of Paris the inhabitants had to seek other means of support. By a branch of the Balta-Krementchug Railway, starting from Znamenka (147 miles), Nikolaieff has been brought into connexion with the Russian railway system, and its grain exports now equal those of Riga, while it is the chief market for a region comprising the governments of Kherson, Poltava, Kharkoff, Ekaterinoslaff, and parts of Kieff and Podolia. In 1878 it reached the maximum of 2,665,000 quarters (9,660,000 cwts. in 1881). Large storehouses, capable of holding 2,000,000 quarters, stand close to the commercial port, two miles distant from the town, at Popova Balka on the Bug. The export of timber, skins, tallow, and cattle is steadily increasing. The population, which is growing rapidly, now amounts, including the suburbs, to upwards of 70,000 (45 per cent. of them military, and 7000 Jews). The sanitary conditions are bad, and the mortality reaches 40 per thousand. The educational institutions of Nikolaieff are more numerous and better than in many capitals of Russian governments. They include a gymnasium, an artillery school, and a dozen schools for boys and girls, an astronomical and meteorological observatory (46° 58′ N. lat. and 31° 38′ E. long.), four museums and libraries, and a hydrographical institute. Among the public buildings, the cathedral, which contains some good Italian pictures, the theatre, the admiralty and several other state buildings are worthy of mention. The manufactures in the hands of private individuals include a shipbuilding yard and several tallow-melting houses and tobacco works. Since 1870 the Nikolaieff admiralty has resumed activity, especially in the construction of armoured ships and torpedo boats, though not to such an extent as before the Crimean War. Though a district town of the government of Kherson, Nikolaieff is under an independent military governor.

The remains of the well-known Greek colony Olbia have been discovered close to the confluence of the Ingul with the Bug at the Sto-Moghily (Hundred Graves). In mediæval times the country was under the Lithuanians, and subsequently under the Zaporogian Cossacks. Russian colonists settled in the locality about the end of the last century, and after the fall of Otchakoff Prince Potemkin established a wharf on the Ingul which received the name of Nikolaieff. The further development of the town is due almost entirely to the efforts of the Russian Government to make it an important naval station.

NIKOLAIEVSK, a district town of Russia, in the government of Samara, on the right bank of the Irghiz, lies 48 miles from the Volga and 109 miles to the south-west of Samara. Its 10,000 inhabitants are mostly Raskolniks, or of the "United Church," and about 2000 Tartars occupy a separate part of the town. The chief occupation of the Russian and Tartar inhabitants is agriculture and cattle-breeding, in the products of which the merchants carry on a lively trade. The industries (tallow-melting and tanning) are unimportant. The fertility of the soil in the district favours commerce, as well as the development of large villages, many of which—Poganovka (6000 inhabitants), Ekaterinstadt (5000), Porubejka (5000), and several others—are more important and wealthier than many district towns of Russia. The famous Irghiz monasteries of the Raskolniks occur along the Irghiz in the same district, whilst the left bank of the Volga is studded with rich German colonies.

Under the name of Metchetnoye, Nikolaievsk was founded in 1762, by Raskolniks who had fled to Poland and returned when Catherine II. undertook to grant them religious freedom. The monasteries which were founded at the same time became the refuge of numerous runaway serfs, and so the focus of the disturbances which broke out in 1773. In 1828 serious prosecutions began, with the result that the monasteries were closed with the exception of three, which were handed over in 1829 and 1836 to the United Church by order of Government. In 1835 the name of Metchetnoye was changed to Nikolaievsk.

For Nikolaievsk-on-the-Amur, a town of Eastern Siberia, on the left bank of the estuary of the Amur, 23 miles from the Gulf of Amur, see MARITIME PROVINCE, vol. xv. p. 548.

NIKOLAIEVSKAYA SLOBODA, a village of Russia, in the government of Astrakhan and district of Tsareff, 3 miles from the Volga, on its left bank, opposite Kamuishin. It dates from about the end of the last century, when a number of Little-Russians settled here for the transport of salt from Lake Elton. Although still but a village, it has about 30,000 inhabitants, and is one of the chief centres on the lower Volga for the trade in corn and salt.

NIKOPOL, a town of Russia, in the government and district of Ekaterinoslaff, on the right bank of the Dnieper, 76 miles to the south-south-west of Ekaterinoslaff. The town, formerly called Nikitin Rog, occupies an elongated peninsula between two branches of the Dnieper, at a point where its banks are covered on both sides and to a considerable distance with marshes, and has been for many centuries one of the places where the middle Dnieper could most conveniently be crossed. The old "setcha," or fortified camp, of the Zaporogian Cossacks had its seat a little above. Numbers of graves around it recall the battles which were fought for the possession of this important strategic point. One of them, close to the town, "the Great Grave" (*Tolstaya Moghila*), contained, along with other Scythian antiquities, the well-known precious vase representing the capture of wild horses. Even now Nikopol, which is situated on the highway from Ekaterinoslaff to Kherson, is also the point where the "salt-highway" of the Chumaks (Little-Russian carriers of salt) to the Crimea crosses the Dnieper. A wharf for the building of trading ships navigating the estuary of the Dnieper has been established at Nikopol, and it is still one of the chief places on the lower Dnieper for the export of corn, linseed, tallow, and wool. Its 10,000 inhabitants are Little Russians, Jews, and Mennonites, who prosecute agriculture extensively. The trade in wheat, hemp, tallow, and wool is important in connexion with the export trade of Nikolaieff and Odessa.

NIKOPOLI, or NICOPOLI (Turkish, *Nighebolu* or *Nebul*), a city of Bulgaria, the chief town of a circle in the district of Plevna (Plyeven), is picturesquely situated on the south bank of the Danube, at the confluence of the Osma. According to the census of 1881 it had only 4652 inhabitants, but previous to its destruction by the Russians in 1877 they numbered about 10,000, and as a military post the town has for centuries been of considerable importance. A ruined castle still dominates the place, and fortifications stretch down to the river.

Nikopoli occupies the site of the ancient Asamus, but by some mediæval confusion bears the name of Nicopolis ad Istrum, which was founded by Trajan several miles down the river, at the inflow of the Iatrus or Yantra, at the spot still called Nikup. The following are the chief points in the modern history of the place:—capture of the fortress by Sigismund of Hungary in 1392 and 1395; defeat of Sigismund and his hosts in 1396 by Bajazet; siege of the town by Uladislaus of Hungary in 1444; defeat of the Turks by Bathori in 1595 and by Michael of Wallachia in 1598; occupation of the fortress by the Russians in 1810; destruction of the Turkish flotilla and storming of the Turkish camp by Govaroff in 1829; and the capture and burning of the town by the Russians under Krüdener on 15th June 1877.

NILE. This mighty river, which after a course of 3370 miles pours into the Mediterranean a low-water current of 61,500 cubic feet per second, has its cradle in the Victoria Nyanza, an enormous lake in Central Africa where the line of the equator is crossed by 32°, 33°, and 34° of E. long., somewhere about 4000 feet above the sea. The Victoria Nyanza[2] measures 230 miles from north to south and 220 from east to west. Its coast-line, which is very irregular, cannot be less than 2000 miles; its water area is estimated at 27,000 miles, and its very islands have an aggregate area of 1400 square miles. The physical features of the shores vary greatly from district to district.[3] At the south-east corner is Speke Gulf, about 60 miles long, formed partly by a deep indentation of the mainland and partly by the peninsular island of Ukerewe, which is separated from the mainland by Rugisi or Rugeshi Strait, a narrow and shallow channel about ¾ mile long, overgrown with rushes, papyrus, and a fine network of grass which undulates beneath the foot. Bukindo is the chief village on the island, which forms the territory of a separate ruler. Its inhabitants murdered Lieutenant G. Shergold Smith, R.N., and Mr O'Neill, members of the 1876-77 expedition of the Church Missionary Society. To the north of Ukerewe lies Ukara, for the most part barren, and with two rugged hills rising 200 or 300 feet. The natives average less than 5 feet in height (Wilson and Felkin, i. pp. 99-101). Along the south and south-west coasts is a whole series of islands—notably Komeh, Mysomeh, Bumbireh, and Bukerebe or Alice Island; but of much more importance is the great Sesse Archipelago off the coasts of western Uganda. At first entered on our maps as a single great island, it has turned out to be (according to King Mtesa's possibly somewhat exaggerated statement) a cluster of four hundred mostly inhabited islands, some of the largest being 10 to 15 miles in length and 3 to 4 miles in breadth. Clothed as they generally are with forest, and fringed along the shore with papyrus or low jungle, they often present scenes of the richest tropical luxuriance. Along the east half of the northern coast are a number of

Plate XV.[1]

Victoria Nyanza.

[1] Plate XV. shows the river system south of the Tropic of Cancer. For the Egyptian portion see Plate VI., vol. vii.

[2] Nyanza means water or lake. Other names are—Nyanza Kerewe (Linant), Neraa Bali (Baker), Luero lo Luta Nzige, *i.e.*, "white with dead locusts" (Speke), Bahari ya Pila or "Second Lake" and Bahari ya Ukara (of the Sawahili), and Sea of Ukerewe (of the Arabs).

[3] A description will be found in Wilson and Felkin, *Uganda and the Egyptian Soudan*, vol. i. p. 250-54.

considerable islands such as Usuguru, and, at the head of Napoleon Channel, Uvuma, famous for the canoe contest waged between its inhabitants and King Mtesa of Uganda, of which Mr Stanley was spectator. Ugingo, on the east coast, is a large island separated like Ukerewe by a narrow channel from the mainland. Though when its extent is taken into account Victoria Nyanza may be described as shallow in contrast to such basins as those of Tanganyika, the depth, especially on the eastern side, appears to be very considerable, Stanley giving 275 and even 580 feet not far from the shore. Of the affluents of the lake a few only require to be mentioned. The Shimiyu, which falls into the south side of Speke Gulf, was described by Stanley (March 1875) as a magnificent flood a mile wide receiving the waters of the Monangah, the Luwamberri, and the Duma, and having a course of 300 miles. If this were the case it would take the southmost point of the Nile system as far at least as between 4° and 5° S. lat. But when Lieutenant Shergold Smith saw the Shimiyu in 1876 he found it a comparatively insignificant stream, and if the altitudes observed by Smith and Pearson be correct it cannot be the recipient of the Luwamberri and the Monangah. Instead of the Shimiyu, either the Wami (or Kiye) or the Mninguira (Isanga or Isanda), both of which flow into Jordans Creek,[1] may be the southmost feeder of the Nile. Of much more importance as a tributary than any of these is the Kagera (of the Waganda), otherwise known as the Kitangule, Kitangure (Burton), Tengure (Grant), or Alexandra Nile (Stanley), a river 450 feet wide and 85 feet deep at its mouth, with a strong current, apparently pouring into the lake more water than is carried off by the Nile. It may be navigated for about 50 miles, and is believed to have its sources between 200 and 300 miles to the south-west. There are several lakes along its course—Lake Windermere, Lake Thema, and the larger Lake Alexandra not yet reached by Europeans.

The leading fact in regard to the position of Victoria Nyanza in the general hydrography of Central Africa is that by none of its affluents is it connected with any of the other great "equatorial" lakes. Tanganyika[2] lies in a trough about 1400 feet lower. Between the Victoria and Lake Nyassa (Zambesi system) there is a stretch of 500 miles; and, though a large lake, part of which Stanley saw in 1876, and named Gulf Beatrice, lies to the west, it forms in all probability a distinct basin.

Ripon Falls

In 1875 Stanley proved that the only outflow from Victoria Nyanza was by the Ripon Falls on the north side of the lake. These falls (named after Earl de Grey and Ripon, president of the Royal Geographical Society in 1859) were discovered July 28, 1862, by Captain Speke, but from native accounts he was led to believe that other streams (such as the Luajerri) issued from the lake. The Nile, as it drops about 12 feet over the rocks, has a breadth of 400 to 500 feet, divided into several sections by a number of wooded isles. For the next 300 miles the Victoria Nile or Somerset River, as this section is called, has all the character of a mountain stream racing swiftly along a rocky channel often walled in by cliffs (at times 180 feet high) and broken by picturesque islands and countless rapids. At first for 117 miles its course is north-north-west, but reaching the Khór Kafu (on which Mruli stands), about 1° 38′ N. lat. and 32° 20′ E. long., it takes the north-east direction of this channel, and it is not till 2° N. lat. that it again turns north-west towards the Albert Nyanza. About 52 miles below the Ripon Falls, Long, who in 1874 boated from Urondogani to Foweira, describes himself as having passed through a lake 20 to 25 miles broad; but this expanse, which appears in text-books and maps (sometimes as two lakes, Kaja and Ibrahim Lakes), may have been the result of a mere temporary overflow. At Karuma, below Foweira, the river falls over a wall-like ledge of rock 5 feet high which extends right across its bed. But the great feature of the Victoria Nile is the Murchison Fall, about 2° 18′ N. lat. and 31° 50′ E. long., where the river rages furiously through a rock-bound pass, and plunges at one leap of about 120 feet into a gloomy abyss. Below this point, continuing between steep forest-covered hills, it gradually calms down into a stream so slow and steady that at certain seasons it is only from the scarcely perceptible drifting of the little green water-plants, called *Pistia Stratiotes*,[3] that the flow can be observed. About 20 or 25 miles below the fall it enters the north end of the Albert Nyanza.

Murchison Fall

Albert Nyanza

This lake[4] was first reached by Baker on March 14, 1864, near Vacovia on the east coast, a small village of fishermen and salt-makers. From a granitic cliff 1500 feet above the water he looked out over a boundless horizon on the south and south-west, and towards the west descried at a distance of 50 or 60 miles, blue mountains about 7000 feet high.[5] The Albert Nyanza was consequently entered on his map as a vast lake extending from 2° S. lat. to 2° 30′ N. lat., or a distance of about 380 miles. But the circumnavigation of the lake by Gessi Pasha (1876), Mason Bey, and Dr Emin Bey leaves no doubt that its real dimensions are—length 97 miles, average breadth 22 miles, and area about 2000 square miles. The western shore is in its northern half overhung by lofty and precipitous mountains, but farther south is formed by a wide forest-clad plain. At the south end the water is very shallow and encumbered by a vast stretch of ambatch forest. Instead of the lake being, as Baker contended, one of the great sources of the Nile, its functions are those of a large backwater. Of course a considerable amount of drainage must reach it from the surrounding high grounds, though the lakeward slopes are not very extensive; but none of its tributaries appear to be of much importance as feeders of the main stream. Along the western shore the depth is from 15 to 20 feet.

Bahr al-Jebel

Escaping by an island-studded channel from the north-west corner of the Albert Nyanza, the Nile, which now takes the name of Bahr al-Jebel, or River of the Mountains, continues to flow in a general northward direction. From Magungo to Dufile (Dufli), 128 miles, its course is wonderfully smooth, and forms a series of lake-like reaches. Below Dufile the high lands close in upon the river, which, from a width of a mile at Dufile, narrows to 400 or 500 yards, and rushes through a gorge. Near Mugi (50 miles below Dufile) are the formidable Yarborah rapids. From Kiri (Kerrie)—an Egyptian fort on an eminence 1500 feet high on the left bank—the river is again navigable, but flows with so strong a current that Mr Felkin's boat took only three and a half hours to reach Bedden, a distance of some 30 miles. At Bedden a line of hills runs right athwart the channel, which is divided by an island of great beauty. An iron rope ferry was established by Gordon at this point, and without it the river could not be crossed. Between Bedden and Rejaf (12 miles) the hills give place to park-like plains dotted with large trees. About 15 miles below Rejaf, Gondokoro is passed on the right hand, and there the traveller may still see the ruins of the old mission church, the earthworks of Baker's camp,

[1] Named not after the Jordan, but after Speke's country-house, Jordans, in Somersetshire.

[2] Tanganyika level is 2610 feet according to Joseph Thomson.

[3] *Pistia Stratiotes* is characteristic of the Bahr al-Jebel. It is found drifting far down the White Nile, but, according to Steudner, does not occur in the Bahr al-Ghazál.

[4] Otherwise known as the Mwutan Nzige (Locust Lake) and the Luta Nzige (Dead Locust).

[5] The descriptive phrase "blue mountains" has since been converted into a geographical name, "Blue Mountains."

and the lemon grove from which the fruit has been distributed throughout the equatorial provinces. At this point the river, about 656 feet wide, is divided by a large island. Eight miles farther down lies Lado (often spelled Lardo) on the left bank, a well-built Egyptian town with houses of burnt brick and a considerable area of cultivated land watered by shadúfs. With the hill to the west of Lado, variously called Nyerkani and Luyola, the mountainous region ends, and the river enters on a vast plain. The affluents which it has hitherto received are for the most part short and individually insignificant *khórs* (temporary streams), but two at least deserve a few words of description. The Unyama, joining the river opposite J. Kuku or Neri, 10 miles below Dufile, is a perennial stream rising in the prairies between Fatiko and Unyoro, and winding through a lovely country for about 80 miles. The Asua (Atza of the Madi), whose mouth is 20 miles farther down on the same side, is about 120 paces broad, and flows through a rocky bed 15 feet deep. As it receives nearly the whole drainage of the Madi and Shua countries and various districts farther east, it becomes in the rainy season a deep and furious torrent. The Atabbi or Atappi (the main drain of the western face of the Shuli mountains) reaches the Asua a short distance above the mouth.

The great plain which the Nile enters below Lado, about 5° N. lat., slopes so gradually towards the north that the river falls only 300 feet in a stretch of more than 650 miles between Gondokoro and Khartoum. As the river has gradually raised the level of both bed and banks, an overflow takes place, and lagoons or side channels (*mayás*) are formed wherever the bank breaks down; and as these, from their position, naturally act as settling-ponds they get rapidly silted up.

Up to about 7° 25′ N. lat., in spite of this condition of things, the Nile maintains a fairly definite course, with a considerable depth of water in its main current, but at this point it splits up into two branches as if to form a delta. The left branch, which retains the name Bahr al-Jebel, but which may be conveniently distinguished by the Denka name of Kir, continues in the line of the river, and the right branch, or Bahr al-Zeráf (Giraffe River), tends rather more towards the east. After flowing respectively about 160 and 140 miles, they reach the Bahr al-Ghazál, slowly gliding east with a slight deflexion to the south. The whole region is a vast expanse of low swampy lands crossed by secondary channels, and flooded for many miles in the rainy season. At the junction of the Bahr al-Ghazál and the Kir the permanently submerged area is usually named Lake No on our maps, but the Arabs simply call it the confluence—Mokren al-Bohúr. The scenes presented by this portion of the Nile are of the most peculiar description. The dark and ill-smelling water shows no sign of motion. On all sides stretch monotonous reaches of omm súf (*i.e.*, woolly) grass (*Vossia procera*) and papyrus, rising 20 or 30 feet above the water so as often to close the view like a stone wall; the level of the plain is broken only at intervals by little mounds of earth, tenanted for the most part by white ants, and covered with a clump of brushwood or trees;[1] the moisture in the air is so excessive that gunpowder left in the guns overnight is reduced to a paste; mosquitoes and other swamp flies swarm in myriads. And yet touches of beauty are not wanting. Water-lilies (*Nymphæa stellata* and *Nymphæa Lotus*)—white, blue, and crimson—often adorn the surface of the stream; multitudes of water-fowl, from the familiar Egyptian duck and the pelican to the rare and odd-looking *Balæniceps rex* (abú markúb), breed among the reeds, and at night the scene is lit up by a very firmament of fire-flies.

Previous to 1863 both the Kir and the Bahr al-Zeráf had been navigable within the memory of man. But when the Tinné expedition passed down the river in March of that year, the White Nile, the united current of the Bahr al-Jebel and the Bahr al-Ghazál, was found to be blocked by an accumulation of vegetable flotsam, and it cost the crew two days' hard labour to take their vessel through a channel partially cleared by their predecessors. The obstruction rapidly increased, and thirty vessels had to be employed for five weeks to open a permanent passage. In 1865 Baker found a dam about ¾ of a mile wide already overgrown with reeds and grass so as to form a continuation of the surrounding country. Matters went from bad to worse, and the White Nile, the Kir, and the Bahr al-Zeráf were all rendered impassable till, in 1874, Ismael Ayub Pasha cleared the main route by the White Nile and the Kir. But in 1878 again the whole Nile rose to an unusual height (the banks at Lado, 15 to 20 feet above the mean level, were overflowed), and enormous quantities of vegetable debris were carried off by the current. A formation of bars on an unprecedented scale was the result, and communication between the upper and lower Nile was not restored till 1880. White Nile.

If the Kir and the White Nile, with their comparatively strong current, were thus obstructed, it was natural that the more sluggish Bahr al-Ghazál should contain more extensive though less compact accumulations. In 1881 Gessi Pasha spent three and a half months on a part of the voyage usually performed in five hours, and lost half of his men by starvation. Between the mouths of the Kir and Bahr al-'Arab there were twenty distinct dams.[2]

Sir Samuel Baker asserted in 1874 that from the equator to the Mediterranean not a drop of water reached the Nile from the west,—the Bahr al-Ghazál being only a channel of stagnant pools and marshes (*Proc. Roy. Geog. Soc.*, 1873–74, p. 148). But if their total contribution be of little moment in comparison with that of their eastern rivals, the western affluents are exceedingly numerous, and drain a wide extent of country. Their relative importance has been shown by Schweinfurth, Junker, Emin Bey, &c. One or two—the Rodi (Lau) and the Rohl—join the Bahr al-Jebel in its passage through the plain, but by far the greater number converge to the Bahr al-Ghazál. At its lowest state, just before the commencement of the rains, this river had in 1881 a depth varying from 20 to 25 feet, though in many places no perceptible current. It is generally navigable to Meshrat-el-Rek, about 200 or 220 miles above the mouth of the Kir, and in the rainy season even small steamers may ascend its tributary, the Dyur or Jur, as far as Wau. In exceptionally dry seasons the channel at Meshrat-el-Rek is so utterly desiccated that drinking-water can be obtained only by digging. One of the main feeders of the Bahr al-Ghazál is the Bahr al-'Arab, which is formed by the drainage of southern Darfúr, has a breadth—about 10° 20′ N. lat. and 25° 20′ E. long. (before it receives any of its right hand affluents)—of 360 feet and a depth (in December) of 4 feet, and never quite dries up even in the heat of summer (Felkin, *Uganda*, ii. 239). This is the only considerable accession from the north: the rest of the affluents, an almost countless host if all the small headstreams be included, have their rise in the range of mountainous country which stretches, from the Blue Mountains of the Albert Nyanza and their southern continuation, in a general north-east direction as far as 25° or 26° E. long.; and forms the watershed between the Nile basin and those

[1] The ordinary theory is that these mounds are hills constructed by the white ants; but Marno considers them as more probably portions which have resisted the general process of degradation.

[2] See E. Marno, "Die Sumpfregion des äquat. Nilsystems," in *Pet. Mitth.*, 1881, and another paper in 1882.

probably of Lake Chad and the Congo. Flowing in many cases for 400 or 500 miles, these streams in the upper part of their course are of considerable volume and of much importance in the economy of the countries which they traverse.

About 95 miles below the junction of the Kir, and 30 below that of the Bahr al-Zeráf, the White Nile receives its first great affluent from the east. The Sobát, as it is called, has its headwaters (largely unexplored) distributed over a wide area—the southmost rising possibly as far south as 4° N. lat. in the hilly country of Atuka, the eastmost in Kaffa, and the northmost about 9° in the Berta mountains.[1] On one of them there is probably a considerable lake: first inserted as Baro Lake on our maps by Petermann on the report of a slave dealer, it was expunged by Matteucci; but Schuver claims to have seen it from the mountains to the north, and proposes to call it Haarlem Lake. The Sobát proper is navigable from June to November as far as Nasser (180 miles), an Egyptian port established by Gordon in 1874, and even, it is said, for three days farther, though it divides into four branches a short distance above this point. Junker, who visited Nasser[2] in 1876, found the river 15 to 20 feet deep, flowing at the rate of 80 paces per minute between banks high enough to prevent any general inundation. At the mouth of the Sobát there is an Egyptian post of the same name (see *Zeitschr. der Ges. f. Erdk.*, Berlin, 1877).

The northward progress of the White Nile for the next 300 miles is through a great plain stretching from the spurs of the Abyssinian highlands in the east to the hilly districts of Takalla and Kordofan in the west, and consisting almost exclusively of red and other sandstone, often flat as a pavement. Escaping from the swampy region, the river again forms a well-marked channel, with regular and sometimes high banks. Throughout the whole distance indicated a striking confirmation of Baer's law is afforded,—the fairway or deeper side of the stream generally keeping to the eastern shore. About 60 miles below the Sobát mouth lies (on the right bank) Fashoda, an Egyptain town founded in 1867 on the site of Denab, the old "capital" of the Shilluks. In the neighbourhood of Mahadat Abu Zaid (about 13° 5′ N. lat.) begin the Sunt Islands, so called from the Arab name for the *Acacia nilotica*, a tree characteristic of the White Nile.

Blue Nile.

At Khartoum (Khartúm), in 15° 37′ N. lat., the White Nile is joined by its greatest eastern confluent the Blue Nile[3] (Bahr el-Azrak). This river has its head reservoir in Lake Tana (Tsana), which is so situated that the lines of 12° N. lat. and 37° 2′ E. long. cut it into four nearly equal portions.[4] The height of the lake is 5658 feet (Rohlfs). From east to west the breadth is about 40 miles, and the area is estimated at 2980 square miles. Between Dega and Zegi a depth of 236 feet has been found, and between Korata and Zegi 219. The Blue Nile, or Abai as it is called in Abyssinia, rises on the northward slopes of a cluster of mountains (Mount Gesh, &c.) about 11° N. lat., and flowing northwards enters Lake Tana near the southwest corner, to issue again at no great distance. Of the multitudinous ramifications by which the Abai and its tributaries drain a large part of the Abyssinian plateau, a better idea will be obtained from the map than from any description. From east and south and north the mountain streams pour down into the river,—its eastmost tributary probably rising east of Magdala, and its southmost between 8° and 9° N. lat. At Fazokl or Famaka, 11° 17′ N. lat., it begins to escape from the mountains; about 130 miles farther down, after passing Rosaires and Karkoj on the right and Sennaar on the left, it is joined by the Dinder; and 35 miles more bring it to the confluence of the Rahad (Ra'ad) and the town of Abú Haraz. Beyond this point it flows through the most fertile portion of the Egyptian Soudan, the plain on the left hand more especially being a great grain-growing district. The total length of the Abai or Blue Nile may be estimated at 960 miles.

Atb

On the north-west side of the mountains which enclose Lake Tana are some of the headwaters of the Atbara, another important tributary of the Nile; but it does not reach the main stream till about 17° 41′ N. lat., or 200 miles below Khartoum. Its principal branch, the Settit or Takazze, has a course of about 420 miles through the Abyssinian plateau before it joins or (more strictly) is joined by the river which gives its name to the united stream. The Khor-el-Gash, or Mareb, though a considerable river in its upper regions, reaches the Atbara (and thus the Nile, of which it is the northmost affluent) only during a heavy rainy season (see James, *Wild Tribes of the Soudan*, 1883). A large number of these eastern tributaries are mountain torrents, of enormous volume and impetuosity during the rains, and for a short time afterwards, but rapidly dwindling again into mere threads of water or chains of pools, and leaving the rocks and sand of their deep-cut channels as dry and parched as the surrounding desert. No one who has read it will easily forget Sir Samuel Baker's graphic account of the deep pool in the bed of the Atbara into which the fishes, tortoises, crocodiles, and hippopotami from a long reach of the river had gradually been crowded as the water disappeared, and of the sudden release effected by the return of the rainy season.[5] A more recent traveller, Herr Schuver, had a similar experience on the Tumat, the southern tributary of the Blue Nile.[6]

After receiving the Atbara the Nile continues for 650 miles through the Nubian desert, where the volume of the river suffers continual diminution from the extreme dryness of the air, without being recruited by a single drop of water. Between Berber (an important town on the right bank 30 miles below the Atbara) and Wády Halfa (about 600 miles) rapids and cataracts follow at intervals. The highest of these, the fifth cataract of the Nile, is situated about 40 miles below Berber, the fourth, 170 miles farther down, below Shitab, the third, 230 miles farther, at Hannek, and the second just above Wády Halfa. At Assuan (200 miles lower) are the first cataracts. Beyond that point the river flows through the wonderful valley which has already been described in the article EGYPT.

Reduced to its simplest expression, the Nile system may be said to consist of a great steady flowing river fed by the rains of the tropics, controlled by the existence of a vast head reservoir and several areas of repose, and annually flooded by the accession of a great body of water with which its eastern tributaries are flushed. The following details will enable the reader to estimate the hydrographic value of the different portions:[7]—

Victoria Nyanza lies in a zone where rain falls all the year round. At Kagei (south shore) the lake was seen by Mr Wilson in 1877 to be slowly rising in the middle of February, and it had attained its maximum (2 feet) about the middle of May, ten days after the rain had ceased. The total rainfall of this zone is not excessive. Speke's estimate of 49 inches is confirmed by Mr Wilson's much longer experience. In Uganda there are two maximum periods—March to May, and September to November.

The *Assua* is important from 15th April to 15th November.

The *Bahr al-Jebel*, at Gondokoro, begins to rise in April, and

[1] The connexion of the Godjeb or Orno with the Sobát, first suggested by Beke in 1841, and strongly opposed by Von Kloden, is still matter of doubt.

[2] Naser, *locus ubi torrentes fluunt in alveum*

[3] At Khartoum the water of the one river has a milky-limy appearance, that of the other is clear and blue, except when in flood, when it gains a reddish-yellow from its alluvial burden.

[4] Lake Tana has been explored by Bruce, Blanc, De Cosson, Piaggia, Stecker, &c

[5] Baker, *Abyssinian Tributaries of the Nile.*

[6] See *Petermann's Mittheilungen*, 1883; *Erg.-Heft*, No. 72.

[7] *Cf.* Keith Johnston, *Africa*, Appendix.

gradually attains a maximum of $4\frac{1}{2}$ feet, the river being then 6 to 10 feet deep.

On the *Kir* the rainy season lasts from the first week of March to the close of October; but the 100 inches of rainfall goes largely to flood the swamps.

The *Bahr al-Ghazál* is at its lowest in March, and begins to rise soon after.

The *Sobát* is full from June to December.

The *White Nile*, at Khartoum, begins to rise in May, but only gains 2 or 3 feet till July or August. Its maximum (6 feet) is reached in September. Linant Bey estimated its volume at low level as 10,488 cubic feet, and in flood as 213,450.

The *Blue Nile*, at Khartoum, begins to rise in July, and reaches its maximum ($17\frac{1}{2}$ feet) by August 20. Its rise is much more rapid than its decline; it takes eighty days to lose the gain achieved in fifty-one. Linant Bey estimated its volume at low level as 5615 cubic feet, and in flood as 220,620. At Famaka it grows turbid about 20th May.

The *Athara*, for 150 miles above its junction with the Nile, is perfectly dry from March to June.

As a waterway leading into the heart of Africa, the Nile at first sight might appear to be of more importance than it is. Steamers, it is true, as well as sailing craft, can pass up from Egypt as far as Bedden, a distance of 2900 miles; but even at the period of high water (June to August) the ascent of the cataracts between Wády Halfa and Berber is so dangerous for vessels of any size that the river-route is seldom followed throughout. From Wády Halfa the traveller may proceed by camel to El Ordeh (New Dongola), thence take boat to El Dabbeh or to Old Dongola, and again proceed by land either to Berber, Shendy, or Khartoum. Or, instead, he may leave the river at Korosko, and strike through the Nubian desert direct to Berber. From Berber, which is also the terminus of a route often used from Souakim (Suakin) on the Red Sea, steamers ply up the river, but it sometimes takes nineteen days to reach Khartoum. The difficulties of navigating the Kir have already been described. Above Bedden the steamer again finds a free course from Dufile to the neighbourhood of the Murchison Fall; but the route to Victoria Nyanza is again overland from Magungo. It is found more expeditious to come to the equatorial regions from the east coast than up the Nile valley.

For the botanical aspects of the Nile valley the reader is referred to Schweinfurth's papers (*Petermann's Mittheilungen*, 1868); for the general zoology to Heuglin's sketch (*Ibid.*, 1869); and for an account of the fish fauna to Dr Günther's appendix to Mr and Mrs Petherick's *Travels in Central Africa* (1869).

The ancients knew little of the course of the Nile above MEROE (*q.v.*). Juba, in his *Libyca*, quoted by Pliny, makes the Nile rise in western Mauretania, not far from the ocean, in a lake presenting characteristic Nile fauna, then pass underground for several days' journey to a similar lake in Mauretania Cæsariensis, again continue underground for twenty days' journey to the source called Nigris on the borders of Africa and Ethiopia, and thence flow through Ethiopia as the Astapus. This tissue of invention received strange favour in the eyes of many subsequent geographers, and actually left its traces in some of our maps down to a comparatively modern time. Strabo, who ascended the river as far as Syene, states that very early investigators had connected the inundation of the lower Nile with summer rains on the far southern mountains, and that their theory had been confirmed by the observations of travellers under the Ptolemies. Nero despatched two centurions on an expedition for the express purpose of exploring the Nile, and Seneca informs us that they reached a marshy impassable region, which may be easily identified with the country of the White Nile above the mouth of the Sobát. To what they referred when they reported a great mass of water falling from between two rocks is not so readily determined. By the time of Ptolemy information had somewhat accumulated. Two streams, he says, issuing from two lakes[1] (one in 6° and the other in 7° S. lat.), unite in 2° N. lat. to make the Nile which in 12° N. lat. receives the Astapus, a river flowing from Lake Coloe (on the equator). Thus it would appear that he had heard vaguely about the lakes which we know as Victoria Nyanza, Albert Nyanza, and Tana. His two southern lakes, he conceived, were fed by the melting of snows on a range of mountains running east and west for upwards of 500 miles—the Mountains of the Moon, *τὸ τῆς σελήνης ὄρος, Lunæ Montes*. To this opinion he was probably led by hearsay about the snow-clad summits of Kilimanjaro and Kenia. On all the subsequent history of the geography of the Nile Ptolemy's theory had an enormous influence. Mediæval maps and descriptions, both European and Arabian, reproduce the Mountains of the Moon and the equatorial lakes with a variety of probable or impossible modifications. Even Speke congratulated himself on identifying the old Ptolemean range with the high lands to the north of Tanganyika, and connected the name with that of Unyamwezi, the "country of the moon."

[1] The two lakes afterwards received the names Lake of Crocodiles and Lake of Cataracts.

Attacking the lake region from the east coast, the Portuguese explorers gained a good deal of information which found its way into such maps as those of Pigafetta (1580); but it was not till the present century that the geography of those parts was placed on the basis of fully accepted observations. On November 14, 1770, Bruce reached Lake Tana, and considering, as he did, that the Blue Nile was the main branch, very fairly claimed for himself the honour of being the discoverer of the long-sought *caput Nili*.

The following are a few of the chief dates in the progress of knowledge since 1800 in regard to the river system:—

1807. Completion of Jacotin's *Atlas de l'Égypte* (surveys from the Mediterranean to Assuan). 1814. Burckhardt goes up the Nile, partly by land, as far as Shendi, crosses to the Atbara, and skirts the east side to Gos Rajeb. 1819. Cailliaud is the first to visit Meroe. 1820. Steamers first ascend the cataracts to Korosko. 1822. Cailliaud and Letorzec ascend the Blue Nile with Ibrahim Pasha's military expedition as far as Fazokl. 1827. Linant Bey ascends White Nile 132 geographical miles to Al Ais, in 13° 43′ N. lat. Prokesch von Osten surveys the Nile between Assuan and Wády Halfa. 1839. Mehemet Ali sends up White Nile an expedition, usually known as the First Egyptian Expedition, under Selim Bimbashi, which (28th January 1840) reaches an island Badelik, in 6° 30′ N. lat, but adds little information. Thibaut (Ibrahim Effendi) was a member of this expedition. 1840–41. A second Egyptian expedition (D'Arnaud, Sabatier, Werne) reaches island of Janker near Gondokoro, about 4° 42′ N. lat. 1841–42. Third Egyptian expedition (Selim Bimbashi, D'Arnaud, Sabatier, Thibaut). 1845. Brun-Rollet founds trading post not far from subsequent site of Heiligenkreuz. 1846. First steamboat on White Nile. 1849. Baron Von Müller surveys the Nile from Handak to Ambakol in province of Dongola. 1850. Knoblecher (of Austrian mission) reached Logwek. 1855. Rebmann (missionary at Kisulutini, north-west of Mombasa) sends home map showing Lake Ukerewe, extending from 0° 30′ N. lat. to 13° 30′ S. lat. 1858. Speke, twenty marches north of Kazeh, where he had left Burton, reaches shore of Victoria Nyanza. 1859. Miani reaches mouth of Unyama. 1860. Pruyssenaere starts from Khartoum up the White Nile. 1862. Speke reaches Ripon Falls. Steudner passes down the Ra'ad and Blue Nile to Khartoum. The Tinné expedition goes five hours' journey beyond Gondokoro on the White Nile. 1864. Sir Samuel Baker reaches Albert Nyanza. Petherick closes a long series of wanderings in the White Nile and Bahr al-Ghazál districts. 1868–71. Schweinfurth explores the western affluents of White Nile. 1871–73. Baker in the White Nile region. 1874. Watson and Chippendall survey the river from Khartoum to Rejaf, and J. Kemp from Rejaf to Dufile. 1875. Stanley circumnavigates Victoria Nyanza. 1877. First voyage across Victoria Nyanza by Rev. C. T. Wilson and Lieutenant Shergold Smith. 1881–82. Schuver in the source-district of the Tumat. (H. A. W.)

NÍLGIRI, a petty state in Orissa, Bengal, India, bounded on the N. and W. by Morbhanj state and on the S. and E. by Balasor district, with an area 278 square miles, of which only one-third is under cultivation. Valuable quarries of black stone are worked, from which cups, bowls, platters, &c., are made. The population in 1881 was 50,972.

NÍLGIRI HILLS, or NEILGHERRY HILLS, a district and range of mountains in the Madras presidency, India, lying between 11° 12′ and 11° 37′ N. lat. and between 76° 18′ and 77° 5′ E. long., and bounded on the N. by Mysore, E. by Coimbatore, S. by Coimbatore and Malabar, and W. by Malabar. The district until recently consisted exclusively of a mountain plateau lying at an average elevation of 6500 feet, with an area of about 725 square miles. In 1873 this was increased by the addition of the Ochterlony valley in the south-east Wainád, and again, in 1877, by other portions of the Wainád, making a total area of 957 square miles. The administrative headquarters is at Utakamand, which is also the summer capital of the Government of Madras. The summit of the Nílgiri Hills is an undulating plateau, frequently breaking into lofty ridges and steep rocky eminences. The descent to the plains is sudden and abrupt, the average fall from the crest to the general level below being about 6000 feet, save on the north, where the base of the mountains rests upon the elevated land of Wainád and Mysore, standing between 2000 and 3000 feet above sea-level. The Ochterlony valley and Wainád country consist of a series of broken valleys, once forest-clad throughout, but now studded with coffee-gardens.

the highest mountain peaks are—Dodabetta, 8760 feet; Kudiakad, 8502; Bevoibetta, 8488; Makurti, 8402; Dávarsolabetta, 8380; Kúnda, 8353; Kúndamoge, 7816; Utakamand, 7361; Támbrabetta, 7292; Hokabetta, 7267. There are six well-known passes or *gháts* by which the district communicates with the neighbouring provinces, viz., the Kúnúr, Segúr, Gúdalúr, Sispára, Kotágiri, and Sundapatti, the first three of which are practicable to wheeled traffic. The chief rivers are the Moyár, Paikára, and Calicut, none of which are navigable within the district. The only lake of note is an artificial one, Utakamand (7220 feet above sea-level), which is nearly 2 miles long. The forests consist of fine timber trees, such as *sál* (*Shorea robusta*), *kino* (*Pterocarpus Marsupium*), jack (*Artocarpus integrifolia*), blackwood (*Dalbergia latifolia*), and teak. Eucalyptus and Australian wattle have been extensively planted in the higher grounds of the Wainád. The hills were first explored by British officers in 1814, and in 1821 the first English house was built on the plateau.

The population of the district in 1881 was 91,034. The only town with more than 5000 inhabitants is Utakamand, with a population of 12,335. The most interesting of the hill tribes are the Todas, who regard themselves as autochthonous. They are a tall, well-proportioned, and athletic race, but indolent and dirty. Their sole occupation is cattle herding and dairy work. They practise polyandry, a woman marrying all the brothers of a family. In religion they follow a species of Hinduism, and also worship their dairy buffaloes. The race seems to be gradually dying out, and in 1881 only numbered 675. The most numerous as well as the most wealthy and civilized of the hill tribes are the Badagas. They are occupied in agriculture, dress after the fashion of the natives of the plains, and are fond of ornaments. They profess Hinduism, and in 1881 numbered 24,130. The Kotas, another hill tribe (1065 in 1881), follow agriculture and various handicrafts. They perform menial offices for the Todas and Badagas, and, like the latter, pay a gudu to the Todas. They worship "ideal" gods, which are not represented by any image. The Kurumbas, or shepherds (3185 in 1881), are the most uncivilized of the hill tribes, and officiate as priests to the Badagas. Besides cultivating on a small scale, they collect various sorts of jungle produce, which they barter on the plains for grain and cloth. The Irulas (946 in 1881) live on the lowest slopes and forests, extending from the base of the Nílgiris to the plains. They are an idle and dissolute tribe, although in physique adapted to hard manual labour.

The ordinary crops grown on the Nílgiri Hills include wheat, barley, and other cereals, oilseeds, and nearly every variety of English vegetables and fruits. The commercially important products are coffee, tea, and cinchona. Coffee cultivation was introduced about 1844. One of its chief seats is the beautiful Ochterlony valley. The Madras Government commenced the experimental cultivation of cinchona on the Nílgiris in 1860, and in 1882 the receipts therefrom amounted to over £50,000. Several private cinchona gardens have been laid out, owing to the success of the Government experiment. There are 190 miles of road, bridged and available for wheeled traffic. The climate of the Nílgiri Hills is almost unrivalled for equability of temperature. The average is 58° F.

NIMÁR, a district in the Central Provinces, India, lying between 21° 4′ and 22° 26′ N. lat. and between 75° 50′ and 77° 1′ E. long., and bounded on the N. and W. by Dhar and Indore states, S. by Khandesh and West Berar, and E. by Hoshangábád. The area is 3340 square miles, of which only 659 are under cultivation. The population in 1881 was 231,341 (embracing 199,454 Hindus, 24,426 Mohammedans, 5282 aborigines,—the most numerous tribe of these being the Bhils). Khandwa town is the administrative headquarters. The district consists of two portions of the Nerbudda and Tapti valleys, separated by a range of hills, a section of the Sátpurá range, about 15 miles in breadth. On the highest peak, about 850 feet above the plain and 1800 above sea-level, stands the fortress of Asírgarh, commanding a pass which has for centuries been the chief highway between Upper India and the Deccan. The district contains extensive forests, but the only tract reserved by Government is the Punása forest, which extends for about 120 miles along the south bank of the Nerbudda, and contains very fine young teak, besides *sáj* (*Terminalia tomentosa*) and *anjan* (*Hardwickia binata*) of great size. The only towns with a population exceeding 5000, in 1881, were Khandwa, the district capital (15,142), and Burhanpur (30,017). The principal line of road is that from Khandwa to Indore. The Great Indian Peninsular Railway traverses the district.

NIMEGUEN, NIMWEGEN, or NYMEGEN (Dutch, *Nijmegen*), probably the oldest of all the cities of the Netherlands, is situated in the province of Guelderland, on the south bank of the Waal, 80 miles from the sea and 17 miles north-west of Cleves. Built partly on a row of five hills—Hessenberg or Hezelberg, Marienberg, Gruitberg, Klokkenberg, and Hunnenberg or Hoenderberg—so that stairs are necessary to lead to the higher portions, Nimeguen stands out with a boldness quite unusual in a Dutch town. Till past the middle of the present century it was strongly fortified, its old walls, erected in 1447, having been strengthened from time to time with extensive bastions and outworks. The beautiful park—the Valkhof—at the east end of the town is the site of Charlemagne's palace, which was still habitable in 1787, but, being greatly damaged during the French bombardment of 1794, was in 1796 sold for what it would bring. Two portions were fortunately preserved,—the vault of a chapel ("Pagan's Chapel"), with two white marble Corinthian pillars, and an octagonal baptistery ("Roman Chapel"). Near the Valkhof stands a lofty tower, the Belvidere, erected by the duke of Alva. The great church (St Stephen's), which forms one of the most striking features in the general view of the town, was originally built between 1254 and 1273, but in its present condition dates mainly from the 15th and 16th centuries. The immense nave is roofed with circular vaulting and supported by thirty-five slender pillars. In the choir is the monument of Catherine of Bourbon (1469), wife of Adolphus, duke of Guelderland. The town-house, built in 1554, is adorned with medallions representing the kings and emperors who had been benefactors of Nimeguen, and contains the great hall in which the treaty of 1678 was concluded. On the ground-floor is a cumbrous and strong safe in which the town's charters from that of Henry IV. in 1230 were preserved with the most jealous care, the garrison being called out and the gates closed when it was necessary to consult any of them. Other buildings of note are the theatre (1838–39), the old burghers' almshouse, the Protestant hospital (1849), and the Roman Catholic or Canisius hospital (1866). Between 1656 and 1679 Nimeguen was the seat of a university; it has now nothing higher than a gymnasium. Tools, gold and silver work, leather, furniture, tobacco, &c., are the chief products of the local industry; and a good deal of traffic is carried on both by means of the river and (since 1865) the railway. The population of the town in 1876 was 19,196; that of the commune increased from 22,929 (15,984 Roman Catholics, 5806 Dutch Reformed, 408 Jews) in 1875 to 24,984 in 1879.

The name Nimeguen appears for the first time as Noviomagum in the Tabula Peutingeriana, but several antiquaries seek to identify the town with the Oppidum Batavorum of Tacitus. Charlemagne's palace continued to be the temporary residence of kings and emperors for many generations. Prince Henry, son of Conrad II. (1026), and the emperor Henry IV. (1164) were both born within its walls. In 1247–48 William, king of the Romans, pawned the town to Reinald of Guelders, but in 1316 the people refused to remain under his authority. The Burgundians, who entered after a four weeks' siege in 1473, were expelled in 1477. In 1494 the archduke Maximilian was successfully repulsed. The duke of Alva, with ten companies of Spanish soldiers, took possession in 1568; but in 1579 Nimeguen joined the Union. In 1584 the duke of Parma's attempt to recover the town proved a failure; next year, the people having expelled the states garrison, he was successful; and, Martin Schenk having lost his life in a rash *coup de main* in 1589, the Spaniards were left in possession till 1591. Between 1672

and 1674 the town was held by the French; they attacked it again in 1703 without success, got easy possession of it in 1794, and remained till 1814.

NÎMES, or NISMES, a city of France, chief town of the department of Gard, a bishop's see and seat of a court of appeal, lies 450 miles south-south-east of Paris by the Clermont-Ferrand Railway, and 80 miles north-west of Marseilles. The importance of the place is due to its central position between the Rhone, the Cevennes, and the sea, to the richness of the surrounding district, which before the ravages of the *Phylloxera* was clothed with vines, to its commerce and industry, and lastly to its archæological treasures. No town in France can show so many remains of the Roman period. The amphitheatre is still in a good state of preservation. Occupied during the Middle Ages by a special quarter, with even a church of its own, it was cleared in 1809, and since then has been well kept in repair. It is built of large stones without mortar. In form it is elliptical, measuring 437½ by 332½ feet externally; the arena is 327 by 222 feet. The elevation (70 feet in all) consists of a ground story of 60 arches, an upper story of 60 arches, and an attic with consoles pierced with holes for supporting the *velarium* or awning. There

Plan of Nimes.

are four main gates, one at each of the cardinal points; and no fewer than one hundred and twenty-four doorways gave exit from the tiers of the amphitheatre to the inner galleries. Originally designed for gladiatorial shows, or stag or boar hunts, the area has in recent times been sometimes used for bull-fights. The celebrated Maison Carrée, a temple in the style of the Parthenon, but on a smaller scale, 82 feet long by 40 wide, is one of the finest monuments of the Roman period, and probably dates from the time of the Antonines. It contains a collection of antique sculptures and inscriptions. The temple of Diana,—possibly a building connected with the neighbouring baths,—is now overgrown with fig trees and climbing plants, but preserves a few fragments of statues and some rustic columns. The Tour Magne (Turris Magna), situated on the highest point in the city, 375 feet above sea-level, is still 92 feet in height, and was formerly a third higher. Admittedly the oldest monument of Nîmes, it has been variously regarded as an old signal tower, a treasure-house, or the tomb of a Greek family settled in Gaul along with the earliest Phœnician colonists. Attached to the ramparts erected by Augustus, and turned into a fortress in the Middle Ages by the counts of Toulouse, the Tour Magne was restored about 1840. From the top there is a magnificent view extending from Canigou at the east end of the Pyrences to Mont Ventoux, an outpost of the Alps; northward it takes in the vine- and olive-clad Garrigues and the Cevennes, eastward the valley of the Rhone and the Vaucluse and Alpine ranges, and southward the Mediterranean and the Aigues Mortes ramparts. Near the Tour Magne has been discovered the reservoir from which the water conveyed by the Pont du Gard was distributed throughout the city. Two gates, that of Augustus dating from 16 B.C., and the Porte de France, both semicircular arches, are preserved as historical monuments. Many of the finest buildings known to have existed have disappeared. When it still possessed its capitol, the temple of Augustus, the basilica of Plotina erected under Hadrian, the temple of Apollo, the hot baths, the theatre. the circus, constructed in the reign of Nero, the Campus Martius, and the fortifications built by Augustus, Nîmes must have been one of the richest of the Roman cities of Gaul. The cathedral (St Castor), occupying, it is believed, the site of the temple of Augustus, is partly Roman and partly Gothic in style. It contains the tombs of Fléchier and Cardinal de Bernis. The church of St Paul, a modern Romanesque building, is adorned with frescos by Flandrin; St Baudile (modern Gothic) is of note for the two stone spires which adorn its façade; and the court-house has a fine Corinthian colonnade and a pediment. Other buildings and institutions of note are the hospitals, the barracks, the old citadel (dating from 1687, and now used as a central house of detention), the picture gallery in the old lycée, the public library (50,000 volumes), and the museum of natural history.

The esplanade in front of the court-house has in the centre a handsome fountain with five marble statues by Pradier. The Fountain Gardens, in the north-west of the town, owe their peculiar character as well as their name to a spring of water which after heavy rains is copious enough not only to fill the ornamental basins (constructed in the 18th century with balustrades and statues on ancient foundations) but also to form a considerable stream. Neither the spring, however, nor the Vistre into which it discharges, is sufficient for the wants of the city, and water has consequently been brought from the Rhone, a distance of 17 miles. A beautiful avenue, the Cours Neuf, runs south for nearly a mile from the middle walk of the garden.

At the close of the Middle Ages the industries of Nîmes were raised to a state of great prosperity by a colony from Lombardy and Tuscany; and, though the plague, the wars of religion, and the revocation of the edict of Nantes were all sufficiently disastrous in their effects, before the Revolution about half of the whole community, or from 10,000 to 12,000 persons, had come to be engaged in manufactures. Since then, however, the numbers of this class have hardly increased, while the population of the city has been doubled. The silk manufacture (reeling, spinning, weaving) no longer occupies all hands. Upholstery materials (which have almost displaced shawls), carpets, handkerchiefs, tapes, braidings, hosiery, leather, clothes, and boots and shoes are also produced; and, coal being worked in the neighbourhood, a number of foundries have been established. Nîmes is, besides, one of the great southern markets for wine and brandy, silks and cocoons; and there is a good trade in grain, groceries, and colonial wares. The population of the city in 1881 was 61,210; that of the commune was 62,394 in 1871, and 63,552 in 1881.

Nemausus, the ancient Nîmes, derived its name from the sacred wood in which the Volcæ Arecomici (who of their own accord surrendered to the Romans in 121 B.C.) were wont to hold their assemblies. Constituted a colony of veterans by Augustus, and endowed with numerous privileges, it built a temple and struck a medal in honour of its founder. The medal, which afterwards furnished the type for the coat of arms granted to the town by Francis I., bears on one side the heads of Cæsar Augustus and Vipsanius Agrippa (the former crowned with laurel), while on the other there is a crocodile chained to a palm-tree, with the legend COL. NEM. It was Agrippa who built the public baths at Nîmes, the temple of Diana, and the aqueduct of the Pont du Gard. The city-walls, erected by Augustus, were nearly 4 miles in circuit, 30 feet high, and 10 feet broad, flanked by ninety towers, and pierced by ten gates. Hadrian on his way back from Britain erected at Nîmes two memorials of his benefactress Plotina. In the very height of its prosperity the city was ravaged by the Vandals; the Visigoths followed, and turned the amphitheatre into a stronghold, which at a later date was set on fire along with the gates of the city when Charles Martel drove out the Saracens. Nîmes became a republic under the protection of Pippin the Short; and in 1185 it passed to the counts of Toulouse, who restored its prosperity and enclosed it with ramparts whose circuit, less extensive than that of Augustus, may still be traced in the boulevards of the present day. The city took part in the crusade against the Albigenses in 1207. Under Louis VIII. it received a royal garrison into its amphitheatre; under Louis XI. it was captured by the duke of Burgundy, and in 1420 was recovered by the dauphin (Charles VII.). On a visit to Nîmes Francis I. enriched it with a university and a school of arts. By 1558 about three-fourths of the inhabitants had become Protestant, and the city suffered greatly during the religious wars. From the accession of Henry IV. till the revocation of the edict of Nantes (1685) the Protestant community devoted itself to active industry; but after that disastrous event great numbers went into exile or joined the Camisards. Louis XIV. built a fortress (1687) to keep in check the disturbances caused by the rival religious parties. Nîmes passed unhurt through the storms of the Revolution; but in 1815 Trestaillon and his bandit followers pillaged and burned and plundered and massacred the Bonapartists and Protestants. Since then the city has remained divided into two strongly-marked factions—Catholics and Protestants; happily, however, there has been no repetition of such scenes. Domitius Afer (Quintilian's master), Jacques Saurin the Protestant divine, Nicot the introducer of tobacco into France, Séguier the archæologist, Guizot, and Reboul (the Provençal poet whose statue adorns the Promenade de la Fontaine) are among the celebrated natives of Nîmes.

NIMROD (Νεβρώδ, LXX.), apart from the mere mention of his name in Micah v. 5 (A.V., v. 6), occurs only once in Scripture, namely, in Gen. x. 8–12 (1 Chron. i. 10), where, in a Jehovistic portion of the genealogy of the nations there given, we are told that "Cush begat Nimrod, who was the first mighty one in the earth (he was a mighty hunter before Jehovah, wherefore it is said—A mighty hunter before Jehovah even as Nimrod), and the beginning of his kingdom was Babel, and Erech and Accad, and Calneh in the land of Shinar. Out of that land he went forth into Asshur[1] and builded Nineveh," &c. Just as Enos was the first to call upon the name of Jehovah, and Noah the first to plant vines, so is Nimrod the first mighty ruler in the earth, and as such at the same time a mighty hunter before Jehovah, after the manner of the Oriental sovereigns of old. By the Hebrews the Assyrio-Babylonian empire was at all periods regarded as the prototype of the worldly power; and it is of this kingdom that Nimrod here figures as the founder—not in its prehistorical but in its historical form as actually subsisting at the time of the writer. This is apparent, not only from the general character of the genealogical table, but also from the enumeration of the cities in the land of Shinar and Asshur. As founder of the kingdom, Nimrod represents both kingdom and people; the genealogy knows no distinction between the hero and the nation,—the latter is the family of the former. When, therefore, Nimrod is said to be descended from Cush, the mighty nation of Asshur and Babel (which in Gen. x. 22 is regarded as belonging to Shem) is also by the Jehovist assigned to Cush. Shem for him seems to have a very narrow meaning, expressing merely the contrast between the Hebrew lords and their Canaanite subjects; Cush, on the other hand (like Ἰνδοί with the Greeks), is a very comprehensive and vague word, which does not readily admit of clear geographical or ethnological definition, and therefore also cannot be brought into contrast with Shem if Shem be used in its modern application as indicating race. A god spoken of as "Marri with his hounds" was still worshipped in Harran after the introduction of Christianity (Assem., *Bibl. Or.*, i. 327); that this Marri is akin to Nimrod is suggested on the one hand by his hounds and on the other by the etymology of the two names derived from the synonymous roots *mry* and *mrd*. Nimrod looks like a Syriac imperfect of the root *mrd*, in which case it would seem to follow that the legend arose among the Syrians, the next neighbours of the Babylonians and Assyrians, and from them had passed over to the Hebrews. Then, further, Nimrod may be a modification of the name Merodach, the Babylonian chief god, the final syllable *-ach* being dropped.[2] To the later Jews Babylon was the complete embodiment of the enmity of the heathen world against the kingdom of God, and the idea they formed of Nimrod was influenced by this view. The arrogance of his character, which seemed to be implied in his very name, was conceived of as defiance of God, and he became a heaven-storming Titan. As such he built the tower of Babel, and as such was he identified with the giant in bonds in the constellation of Orion. Jewish legend made choice of Abraham to be his antithesis, the representative of God's kingdom over against the heathen autocrat. Nimrod cast the bold confessor of the true God into the fire of the Chaldæans (Ur Kasdim), whence, according to Gen. xv. 7, Isa. xxix. 22, Jehovah delivered him.[3] The Jewish material was afterwards treated by Mohammed and the Arabian theologians, who mixed it up with other elements.

Compare Philo, *De Gigantibus*, sec. 15 (Mang., p. 272); Jos., *Ant.*, i. 4, 2; 6, 2; *Chron. Pasch.*, p. 36 (Cedren., p. 14); Jerome and Jonathan on Gen. xi. 28; Tabari, i. pp. 319-325. (J. WE.)

NINEVEH (Hebrew נִינְוֵה, in classical authors Νῖνος, Ninus; LXX., Νινευή; Jerome, Ninive), the famous capital of the Assyrian empire, called Ninua or Ninâ on the monuments. Though the city appears to have been entirely destroyed in the fall of the empire[4] the name of Nineveh (Syriac, *Nînwê*; Arabic, *Nînawâ*, *Nînawî*) continued, even in the Middle Ages, to be applied to a site opposite Mosul on the east bank of the Tigris, where gigantic *tells* or artificial mounds, and the traces of an ancient city wall, bore evident witness of fallen greatness.[5] The walls enclose an irregular trapezium, stretching in length about 2½ miles along the Tigris, which protected the city on the west.[6] The greatest breadth is over a mile. The most elaborate defences, consisting of outworks and moats that can still be traced, were on the southern half of the east side, for the deep sluggish Khausar, which

[1] Not "out of that land went forth Asshur"; for the "beginning" of his kingdom demands a continuation, and Asshur is called Nimrod's land in Micah v. 5.

[2] Compare the converse Φαλωχ, LXX., in 1 Chron. v. 26 for פל.

[3] Beer, *Leben Abrahams* (1859), p. 1 *sq.* Compare Dan. iii., whence the confusion of Nimrod with Nebuchadnezzar by the Arabs.

[4] It is generally agreed, and the description hardly leaves a doubt, that the ruins of Mespila and Larissa described by Xenophon, *Anab.*, iii. 4, 7 *sq.*, are Kuyunjik and Nimrud respectively. In this case we can be certain that there was no inhabited city on the spot at the time of the march of the Greeks with Cyrus. Comp. Strabo xvi. p. 245.

[5] The references collected by Tuch, *De Nino Urbe*, Leipsic, 1845, are copious, but might easily be added to. Ibn Jubair, p. 237 *sq.*, who as usual is pillaged by Ibn Batuta, ii. 137, gives a good description of the ruins and of the great shrine of Jonah as they were in the 12th century. The name Nînawâ was not appropriated to the ruins, but was applied to the Rustak (fields and hamlets) that stood on the site (Iṣṭakhrî, p. 331; Ibn Haukal, p. 145; Yâkût, ii. 694).

[6] A change in the bed of the stream has left a space between the wall and the present channel of the Tigris.

protects the northern half of this face, then bends round towards the Tigris and flows through the middle of the town, so as to leave the south-east of the city more open to attack than any other part. The principal ruin mounds within the walls are that of Ḳuyúnjiḳ, north of the Khausar, and that of the prophet Jonah (Nebí Yúnus) south of that stream. The latter is the traditional site of Jonah's preaching, and is crowned by an ancient and famous Mohammedan shrine. The systematic exploration of these ruins is mainly due to Layard (1845–46), whose work has been continued by subsequent diggers. These researches leave no doubt as to the correctness of the local tradition. Not only have magnificent remains of Assyrian architecture and sculpture been laid bare, but the accompanying cuneiform inscriptions throw much light on the history of the city and its buildings. The mound of Ḳuyúnjiḳ covers palaces of Sennacherib and Assurbanipal,[1] that of Jonah a second palace of Sennacherib and one of Esarhaddon. Of other remains, the most striking is the gateway near the centre of the north wall, consisting of two halls, 70 feet by 23, the entrance to which towards the town was flanked by colossal man-headed bulls and winged human figures. For the structure and art of the palaces see vol. ii. p. 397 and vol. iii. p. 189.

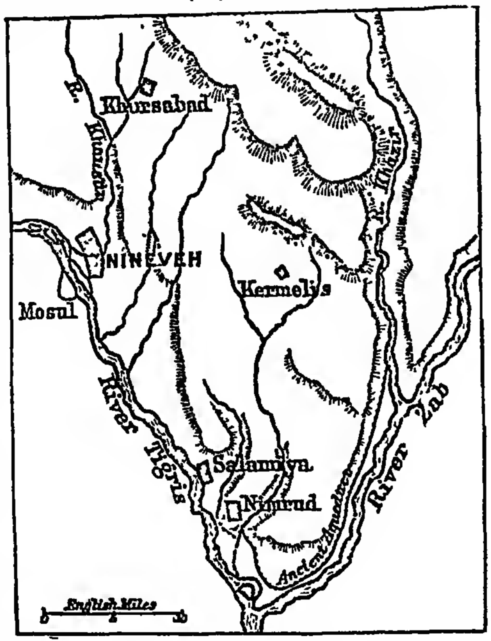

FIG. 1.—Country round Nineveh.

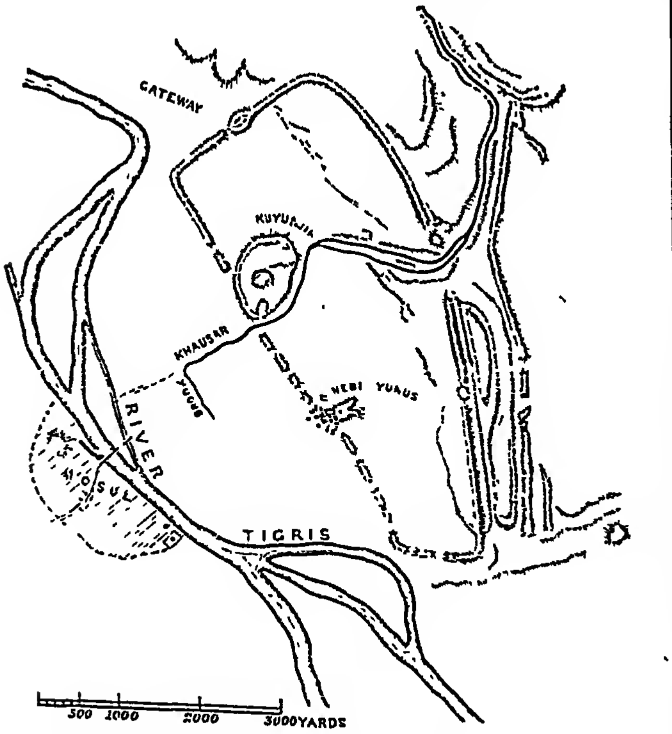

FIG. 2.—Ruins of Nineveh.

[1] In this palace is the famous library chamber from which Layard and George Smith brought the tablets now in the British Museum, containing the account of the deluge.

Nineveh proper was only one of a group of cities and royal residences whose ruins still mark the plain between the Tigris, the Great Záb, and the Kházir. The chief of these are at Khorsábád or Khurustábád, five hours by caravan north-east of Mosul, on a tributary of the Khausar, and at Nimrúd, on the left bank of the Tigris, eight caravan hours (18 miles) south-east from Ḳuyúnjiḳ. The former site was mainly explored by the Frenchmen Botta and Place. The city was almost square, each face of the wall a little more than a mile in length. The vast T-shaped palace of Sargon (722–705 B.C.), whose name the town bore (Dur-Sarrukin), stood near the northern angle. Its main frontage was nearly a quarter of a mile long; it had thirty-one courts and more than two hundred apartments.[2]

The ruins of Nimrúd, identical with the ruin Athúr of Arabic geographers (Yáḳút, *s.vv.* "Athúr," "Salámíya"), and first excavated by Layard, represent the ancient city of Kalḥu, the Biblical Calah. The enclosure, protected on the west by the old bed of the Tigris, is, according to Layard's measurements, a quadrangle of 2331 yards by 2095 at the widest part, and was surrounded by walls with towers and moats. The chief architectural remains belong to a group of palaces and temples which occupied the south-west quarter of the city. The principal palace (north-west palace) was built by Assur-naṣir-pal (885–860 B.C.), and beside it he raised a temple with a great tower (falsely called the tomb of Sardanapalus) built in narrowing stages. The so-called central palace is that of his son Shalmaneser II.; the unfinished south-west palace was the work of Esarhaddon. Of the so-called south-east palace the chief part is really a temple of Nebo; a statue of the god from this temple is in the British Museum.

The main points in the history of these three great cities which are held to be established by monumental evidence are these. The ancient capital of Assyria was Assur (Kal'a Sherḳát) on the Tigris, 50 miles south of Mosul. Assur-naṣir-pal transferred the residence to Calah, a city which he tells us upon an inscription had been originally founded by Shalmaneser I. (*c.* 1300 B.C.), but had subsequently fallen into decay. Calah seems to have been the chief seat of the kings till Sargon the captor of Samaria founded his residence at Khorsábád; the glory of Nineveh proper begins with Sennacherib, but the city existed earlier, for his inscribed bricks represent him only as rebuilder of the walls. It is even averred that kings of the 19th and 15th centuries B.C. built temples at Nineveh, but the remoter dates of Assyrian history must be received with caution.[3] From the time of Sennacherib down to the fall of the capital and empire—an event the date of which is still uncertain, the ancient accounts varying between 626 and 608 B.C.—Nineveh proper, that is, the city on the Tigris and Khausar, appears to have been the chief seat of empire. But when the book of Jonah speaks of Nineveh as a city of three days' journey, or when Ctesias in Diodorus ii 3 describes its circuit as 480 stadia, it is plain that these conceptions imply an extension of the name to the whole group of cities between the Tigris and the Záb. In this connexion the words of Gen. x. 11 *sq.* are remarkable; for, on the most natural view, the clause "this is the great city" applies not to Resen alone but to the four cities of Nineveh, Rehoboth Ir, Calah, and Resen. Rehoboth Ir and Resen are still untraced; the Syriac tradition which connects the latter with Rēsh 'Ainā, that is, with Khorsábád, does not agree with the text, which says expressly that Resen was between Nineveh and Calah, and indeed the verses in Genesis appear to be older than the foundation of the city of Sargon. The description would suit the mound of Salámiya a little above Nimrúd, but in fact the whole district is studded with ruins.

See the works of Layard, Botta and Flandin, V. Place, Oppert (*Expédition en Mesopotamie*), and G. Smith (*Assyrian Discoveries*). For the ruins and their exploration, Tuch's *Commentatio*, above cited, gives all that was known before the explorations. Schrader, *Keilinsch. u. A. T.* gives the bearing of recent discoveries on the Biblical records. See also, in general, the article BABYLONIA, vol. iii. p. 183 *sq.* (W. R. S.)

[2] There is some evidence that Syriac tradition connected these ruins with the name of Sargon; though our authority Yáḳút, in giving the alleged old name of Khurustábád, has corrupted Ṣarghún into Ṣar'ún, by writing ع for غ = ג. Another Syriac tradition connects Khurustábád with Resen, finding the name Resen in the neighbouring Rás al-'Ain (Rēsh 'Ainā). See Hoffmann, *Syrische Acten*, p. 183.

[3] The legend of Ninus and Semiramis in classical authors appears to be of late origin and quite unhistorical. Ninus is merely the eponym hero of Nineveh.

NING-PO, or NING-PO-FOO (*i.e.*, City of the Hospitable Waves), a great city of China, one of the five seaports thrown open to foreign trade in 1842 by the treaty of Nanking, and the principal emporium of the province of Chekeang, stands in a fine plain bounded by mountains towards the west, on the left bank of the Takia or Ning-po river, about 16 miles from its mouth, in 29° 51′ N. lat. and 121° 32′ E. long. It is surrounded by a fine old wall, 25 feet high and 16 feet broad, pierced by six gates and two passages for ships in its circuit of 4 to 5 miles. Just within the walls there is a considerable belt of open ground, and in many places the ramparts are thickly covered with jasmine and honeysuckle. In ascending the river a stranger's eye is first caught by the numerous huge ice-houses with high thatched roofs and by a tall white tower —the Tien-fung-tah or Ning-po pagoda or obelisk—which rises to a height of 160 feet, and has fourteen stories and seven tiers of windows, but has unfortunately been stripped of its galleries and otherwise damaged. Another striking structure in the heart of the city is the Drum Tower, dating from before the 15th century. As is natural in a place long celebrated for its religious and educational pre-eminence, there is no lack of temples, monasteries, and colleges, but few of these are of any architectural significance. Brick is the ordinary building material, and the dwelling-houses are mostly of one story. Silks, cottons, carpets, furniture, white-wood carvings, and straw hats are the chief products of the local industry. Large salt-works are carried on in the vicinity, and thousands of fishermen are engaged, mainly between April and July, in catching the cuttle-fish. In spite of the powerful competition of Shanghai, Ning-po has a valuable foreign trade. It is regularly visited by the vessels of the China Navigation Company and the Chinese Merchants Steam Navigation Company. From 216,191 register tons in 1873 the tonnage of the port had increased to 303,109 in 1880,—British shipping having advanced from 18,592 tons to 86,175, and Chinese shipping from 17,972 to 209,487, though on the other hand the American total had sunk from 170,351 to 2100. The principal import is opium, £982,507 being the average value of the annual quantity between 1876 and 1880. Lead for packing tea was formerly a leading item, but it now enters mainly by other ports. Straw or grass hats, straw mats, samshu (from the Shaou-hing district), Chinese drugs, vegetable tallow, and fish are among the chief exports; in 1877 (the maximum year) the hats numbered 13,724,822, though in 1863 they had only amounted to 40,000, and the mats, mainly despatched to South China, average from 500,000 to 1,000,000. After the storming of Chinhai—the fortified town at the mouth of the river—on October 10, 1841, the British forces quietly took possession of Ning-po on the 12th. In 1864 the Taipings held the town for six months. Missions are maintained in Ning-po by the Romish Church, by the Church Missionary Society (1848), the American Presbyterians, the Reformed Wesleyans, the China Inland Mission (1857), &c. A mission hospital was instituted in 1843. The population of the city and suburbs is estimated at from 400,000 to 500,000.

NINIAN (NINIANUS or NYNIAS), ST, was, according to the earliest account of him we possess,—that of Bede (*H. E.*, iii. 4),—a bishop of the nation of the Britons who had been trained at Rome in the doctrine and discipline of the Western Church, and who built at Leukopibia (a town of Ptolemy's Novantæ, on the west side of Wigtown Bay, the modern Whithorn) a stone church, called Candida Casa, dedicated to St Martin of Tours. He is said to have converted the Picts to the south of the Grampians. An old Irish account mentions that he spent his last years in Ireland, where he founded a church in Leinster called Cluain Conaire; he was afterwards commemorated there under the name of Monenn ("Nenn" being simply "Ninian" with the Irish *mo*, or "my," prefixed). There is some evidence that the founding of Candida Casa took place in the year of the death of Martin of Tours (397). The date of Ninian's own death is unknown; he is commemorated in the Roman martyrology on September 16. See Skene, *Celtic Scotland*, vol. ii. A *Life of St Ninian*, compiled in the 12th century by St Ailred of Rievaux, and edited by the late Bishop Forbes, is given in the fifth volume of *The Historians of Scotland*, Edinburgh, 1874.

NIOBE is a figure who appears in the legends of many parts of Greece, especially Thebes, Argos, and the Hermus valley. Proud of her numerous family, she scoffed at Leto as the mother of only two children. Apollo and Artemis, the children of Leto, slew all her children with their arrows; and Niobe, after vainly trying to defend them, wept over them till she became a rock which still weeps incessantly. It is probable that this tale was in its simplest form a myth of the annual destruction of the bloom of earth by the shafts of the cruel sun-god, and that Niobe was a form of the mother-goddess, the goddess of all earthly life, whose progeny is thus slain every summer. The tragedians read in this tale a moralized myth of the instability of human bliss: Niobe became a representative of human nature, ever liable to become proud in prosperity and to forget the submission and respect due to the gods. In this form the legend has found permanent acceptance in literature and art. The metamorphosis of Niobe was adopted from the local legends of the Smyrna district; here it is probable that Niobe was originally a title of the Meter Sipylene, the deity worshipped all round the sacred mountain of Sipylus. An archaic figure of the goddess, carved in the northern side of the mountain near Magnesia, gave rise to the tales current in this district, that Niobe had thrown herself down from the rock, or that she had been turned into stone. It seems necessary to distinguish from this archaic figure, which is still visible, the "Niobe" described by Pausanias and Quintus Smyrnæus, both natives of the district. This was an appearance assumed by a cliff in Sipylus when seen from a distance and from the proper point of view. In these later writers the genuine old local legend had been replaced by a new form, founded on the myth as developed by the tragedians; the archaic figure carved in the cliff was known by the natives to be an image of the mother-goddess, whom they worshipped there year by year. But, as with every other point in the legend in its most developed form, the natives had a local representative of the Niobe, the weeping rock, which they saw in the heart of Sipylus.

On the myth of Niobe and its artistic representation, especially on the famous group thought to be the work of Praxiteles or Scopas, copies of most of the figures in which are preserved at Florence, see Stark, *Niobe und die Niobiden*. On the "Niobe" in Mount Sipylus, see Hirschfield in Curtius, *Beiträge zur Gesch. v. Topogr. Kleinasiens*; Stark, *Nach dem griechischen Orient*: Ramsay, "Sipylos and Cybele," in *Journal of Hellenic Studies*, 1882.

NIOBIUM, a very rare chemical element which was discovered by H. Rose in 1846 as a component of the columbite of Bodenmais. In it, as also in tantalite, pyrochlore, yttro-tantalite, and a few other rare minerals, it is constantly associated with tantalum, which was discovered by Ekkeberg in 1802. Both metals, with vanadium, form a kind of appendage to the nitrogen group of elements. Like these they are capable of forming acid pentoxides and corresponding chlorides and oxychlorides. The oxychlorides and oxyfluorides, $NbOCl_3$ and $NbOF_3$, were originally thought by Rose to be peculiar (unmixed) chlorides and fluorides of niobium, until Blomstrand ascertained their true nature. The atomic weights of the two elements are $Ta = 182$ and $Nb = 94$.

NIORT, a city of France, chief town of the department of Deux Sèvres, distant 255 miles south-west of Paris by the railway to Poitiers and La Rochelle (here crossed by the line from Angers to Angoulême), is situated at the head of navigation of the Sèvre Niortaise, partly in the valley and partly on the slopes of the enclosing hills. The tower of the church of Notre Dame (16th century) has a spire 246 feet high, with bell-turrets adorned with statues of the evangelists, and at the base a richly-decorated dais in the Renaissance style; and the north doorway shows a balustrade, whose balusters form the inscription, *O Mater Dei, memento mei*. There is a fine window in the apse of St André, and St Hilaire contains some beautiful frescos. Of the old castle, whose site is partly occupied by the prefecture, there still remains the donjon—two large square towers, flanked by several of smaller dimensions. Built, it is said, by Henry II. of England or Richard Cœur de Lion, the south tower contains four vaulted chambers one above the other, and the platform on the top affords a fine view of the public garden (one of the most picturesque in France) and the valley of the Sèvre. The old town-house (now used as "justice de paix") is known as the Aliénor or Éléonore palace, after Éléonore of Guienne; near it is a Renaissance belfry. The convent of the Oratorians is occupied by a public library (30,000 volumes), a picture gallery, and museums of geology and antiquities—the last containing plaster copies of all objects of interest in the ancient monuments of the surrounding country. Niort further possesses extensive barracks, several hospitals, and a lycée named after Fontanes, grandmaster of the imperial university, who was born in the town. The house is still shown in which Madame de Maintenon was born while her father was imprisoned in the donjon. Tanning, currying, shammy-dressing, glove-making, and hair-working are the staple industries of Niort,—gloves alone giving employment to about one thousand workmen, and brush-making, hair-working, and allied industries to nearly as many. A large cotton-mill, oil-works, foundries, distilleries, and a glass-work also exist in the town. Owing to the mildness of its climate, Niort has admirable nurseries, and its market-gardens export onions and artichokes. The population of the city in 1881 was 18,823, and that of the commune 22,254.

Up to the 7th century the Niort plain formed part of the Gulf of Poitou; and the mouth of the Sèvre lay at the foot of the hills now occupied by the town which grew up round the castle erected by Henry Plantagenet in 1155. The place was captured by Louis VIII. in 1224. By the peace of Brétigny it was ceded to the English; but its inhabitants revolted against the Black Prince, and most of them were massacred when his troops recovered the town by assault. In 1369 Duguesclin obtained possession by a stratagem. Protestantism made numerous proselytes at Niort, and Coligni made himself master of the town, which successfully resisted the Catholic forces after the battle of Jarnac, but surrendered without striking a blow after that of Moncontour. Henry IV. rescued it from the League. It suffered severely by the revocation of the edict of Nantes.

NIPPON. See JAPAN, vol. xiii. p. 569.

NISH, NISCH, or NISSA, the ancient Naissus, a city of the Balkan peninsula, which at one time was the capital of Servia, and after being the chief town of a Turkish eyalet in the vilayet of the Danube, and (1877) of the new vilayet of Kossovo, was again in 1878 restored to Servia, where it is now the administrative centre of a circle containing a population of 117,000. The town is a thriving place of 12,800 inhabitants, the see of a Greek bishop, the headquarters of a militia corps, and an important centre in the Servian railway system. It is situated at the east end of a plain, and is traversed by the Nishava, a tributary of the Morava and sub-tributary of the Danube. Fortifications on the heights, buildings well massed together, numerous minarets, and abundant foliage in the suburbs render the outward appearance of the town both pleasant and imposing; but the interior, with its narrow and ill-kept streets, is utterly disappointing. About a quarter of an hour to the north of the citadel is the Voinik (war) hill, where the Turkish army encamped in 1689.

Naissus, best known as the birthplace of Constantine the Great, was destroyed by Attila, but restored by Justinian. The chief facts in the history of the modern town are its capture by the Turks in 1375 and by John Hunyady in 1443; the victory of Louis of Baden over the Turks in 1689; the recovery by the Turks in 1690; the capture by the Austrians and the subsequent surrender by General Dochat in 1737; and finally the siege by the Servians in 1809. On this last occasion Stephen Singelitch blew up his redoubt, to the destruction at once of his Turkish assailants and himself.

NÍSHÁPÚR, or NÉSHÁPÚR (Arabic, *Naisábúr*), the most important city of Khorásán in the Middle Ages, but now much decayed. The second element of the name is that of the traditional founder Shahpuhr or Sapor. Some accounts name the first, others the second Sapor.[1] The older name of the town or district was Abrashahr. The importance of the place under the Sasanians was in part religious; one of the three holiest fire-temples was in its neighbourhood.[2] Níshápúr under the Moslems contained a large Arab element; it became the capital of Khorásán, and greatly increased in prosperity, under the almost independent princes of the house of Ṭáhir (820–873 A.D.). Iṣṭakhrí describes it as a well-fortified town, a league square, with a great export of cotton goods and raw silk. In the decline of the empire the city had much to suffer from the Turkomans, whose raids have in modern times destroyed the prosperity of this whole region. In 1153 it was utterly ruined by the Ghuzz Turkomans, but soon rose again, because, as Yáḳút remarks, its position gave it command of the entire caravan trade with the East. It was again taken and razed to the ground by the Mongols in 1221, but a century later Ibn Baṭúṭa found the city again flourishing, with four colleges, numerous students, and an export of silk-stuffs to India. Níshápúr was famous for its fruits and gardens, which gave it the epithet of "little Damascus."

The surname of Naisábúri connects with the city a number of learned men, including 'OMAR KHAYYAM (*q.v.*), the Ḥáfiẓ Abú 'Alí (*ob.* 960), the Korán commentator Ahmed al-Tha'labí (*ob.* 1035), his disciple Wáhidí, author of the famous *Asbáb nozúl al-Ḳo'rán* (*ob.* 1076), and the disciple of the latter, Maidání, the author of the well-known collection of Arabic proverbs. See further Ḳazwíní, ii. 317 *sq.*

NISIBIS, a once famous city and fortress, situated in 37° N. lat. and 41° 20′ 10″ E. long., in the north of Mesopotamia, near the point where the Jaghjagha leaves the mountains by a narrow defile. The modern Naṣíbín consists of some two hundred wretched huts, mainly inhabited by Jews, who pay tribute to the Shammar Bedouins. The neighbourhood, we are informed by Arab writers, was at one time richly wooded. The locality is at present somewhat marshy and unhealthy. The number of dangerous scorpions is specially noticeable. According to Yáḳút the legend is that Persian scorpions were thrown into the place when it was besieged by Anushirwan. The church of St James, belonging to a small community of Jacobite Christians, and a few pillars and blocks of masonry are the only remains of the former greatness of the town.

The site of Nisibis, on the great military and commercial route between the Tigris and the Mediterranean, and commanding alike the mountain country to the north and the then fertile plain to the south, gave it an importance which began during the Assyrian period and continued under the Seleucidæ (see MESOPOTAMIA, vol. xvi. p. 48). From 149 B.C. to 14 A.D. Nisibis was the residence of the kings of Armenia, and it was there that Tigranes had his treasure-houses. The place afterwards figured frequently as a strong frontier fortress

[1] Spiegel, *Eranische Alterthumskunde*, iii. 254; Nöldeke, *Gesch. der Perser . . . aus Tabari*, p. 59. The first syllable of the name appears to be *Nêv*, "good" (Nöldeke, *l.c.*).

[2] Hoffmann, *Syr. Akten pers. Märtyrer*, p. 290 *sq.*

in the wars of the Romans and the Parthians, its brick walls being unusually thick and its citadel very strong. Ceded to the Parthians by Hadrian, it became a Roman colony (Septimia Colonia Nisibis) under Septimius Severus. It was heroically defended against Sapor II., who unsuccessfully besieged it thrice. In the peace made by Jovian, however, it passed into the hands of the Persians, who established a strong colony there. Nisibis early became the seat of a Jacobite bishop and of a Nestorian metropolitan, and under the Arabs (when it continued to flourish and became the centre of the district of Diyár Rebí'a) the population of the town and neighbourhood was still mostly Christian, and included numerous monasteries. According to Ibn Haukal the taxes and dues derived from the town and district of Nisibin in 358 A.H. (969 A.D.) amounted to five million dirhems and 32,000 dinars. Arab geographers and travellers of the Middle Ages speak in high terms of the gardens of Nisibis, and the magnificent returns obtained by the agriculturist. According to Mukaddasi (*ob.* 1024), acorns, preserved fruits, and manufactured articles such as carriages, inkstands, &c., were exported. A change for the worse soon afterwards set in. The town was so heavily burdened with taxes by the Hamdanid princes living at Mosul that the Arab tribe of the Banu Habíb, although blood relations of the Hamdanids, migrated in a body into Byzantine territory, where they were well received, accepted Christianity, attracted other emigrants from Nisibis, and at last began to avenge themselves by yearly raids upon their old home. Ibn Haukal goes on to say that finally the Hamdanid Násir ad-Daule took possession of the town, confiscated the estates of those who had emigrated, and compelled those who remained to substitute corn for their profitable fruit crops. This made a final end of the prosperity of Nisibis; the surrounding district, no longer protected against the incursions of nomad tribes, ceased to be cultivated and became the wilderness which it continues to be to this day.

NISI PRIUS. For the history and meaning of this term in English law see ASSIZE. As a rule actions only are tried at *nisi prius*, and a judge is said to sit at *nisi prius* when he sits alone, usually in the Queen's Bench Division, for the trial of actions. The trial at *nisi prius* was formerly by jury, unless with consent of the parties, but since the rules of the Supreme Court of 1883 the ordinary trial at *nisi prius* is without a jury in all but some specially excepted cases, chiefly of torts where the damages are unliquidated. Besides actions, indictments or informations may be tried at *nisi prius*, but only before a jury, the change in the law above-mentioned not extending to such cases. The indictment or information is generally removed from the ordinary forum by *certiorari*, and the trial takes place in the Queen's Bench Division or at assizes before a special or a common jury (see JURY). The removal may be at the instance of the crown, the prosecutor, or the accused. Misdemeanours are removed more often than felonies. The most usual grounds of removal are that difficult questions of law are likely to arise, that local prejudice has been excited, or that the case is quasi-civil, as non-repair of a bridge or obstruction of a highway. It is noticeable that criminal cases tried at *nisi prius* take their place in the *nisi prius* list and not with other criminal cases. Where the proceedings are by indictment at assizes, sentence may be passed either at the assizes or in the Queen's Bench Division; where by information, only the latter course is available.

Nisi Prius Record was before the Judicature Acts the name of the formal copy of proceedings showing the history of the case up to the time of trial. After the trial it was endorsed with the *postea*, showing the result of the trial, and delivered by the officer of the court to the successful party, whose possession of the *postea* was his title to judgment. Since the Judicature Acts there is no *nisi prius* record in civil actions, the nearest approach to it being the deposit of copies of the pleadings for the use of the judge, and there is no *postea*, the certificate of the associate or master as to the result of the trial superseding it. In crown practice, the class of practice under which criminal proceedings at *nisi prius* fall, the *nisi prius* record still exists, crown practice being specially excepted from the operation of the Judicature Acts.

NISSA. See NISH.

NITRATES, NITRE, NITRIC ACID. See NITROGEN.

NITROGEN is a chemical element which, on account of its abundance in nature and its relations to life, is of great importance. About three-fourths of the mass of the atmosphere consists of elementary nitrogen; and, as an essential component of all albumenoids, the element pervades the whole of the animal and vegetable kingdom. Nitrogen minerals are scarce (almost the only ones are Chili saltpetre and native nitre), but traces of the two nitrogen compounds, ammonia and nitric acid, are diffused throughout all soils, besides existing in the atmosphere.

Elementary nitrogen exists only in the one form of nitrogen gas ($N_2 = 1$ molecule), which is easily extracted from the atmosphere. Though resembling air in its general properties, it is easily distinguished from it by its not supporting combustion. According to Regnault, its specific gravity is 0·9703 times that of pure, dry air; and one litre, measured at $t°$ C. and P millimetres pressure (strictly speaking the pressure exerted by a column of mercury of 0° C. and the height P, at latitude 45° and sea-level) is W grammes, where

$$W = 0{\cdot}45043 \frac{P}{272{\cdot}6 + t}.$$

For sea-level and lat. 55° 54′ (Edinburgh or Glasgow) the constant is 0·45090; for lat. 51° 32′ (London), 0·45072.

According to Dittmar (*Reports on the Challenger Expedition*) 1000 volumes of pure water, when shaken with excess of gas at $t°$ C. and "one atmosphere's pressure," absorb β volumes of the gas measured at 0° and the same pressure,—β having for the temperatures given the following values:—

$t =$	0°	15°	25°	30°
$\beta =$	24·40	17·65	14·95	13·90

Nitrogen is a permanent gas in this sense that no amount of pressure will liquefy it at any temperature lying above the "critical point" of $-123°{\cdot}8$ C. At or a little below this temperature 42 atmospheres reduce it to a liquid (Sarrau).

Chemically, nitrogen gas is characterized by perfect inertness towards all ordinary reagents under ordinary conditions. But at certain higher temperatures boron, magnesium, vanadium, and titanium combine with it directly into nitrides. Nitrogen is capable even of uniting with ordinary oxygen. A mixture of the two gases, it is true, remains unchanged when exposed *en masse* to any temperature, but when it is subjected to a succession of electric sparks a small proportion of the two gases, no doubt through local dissociation into isolated atoms N and O, does unite into nitric oxide, NO, which then combines with more oxygen into red fumes of peroxide, N_2O_4.

The part which the nitrogen gas in the atmosphere plays in the economy of nature is as yet a mystery. It certainly is not susceptible of being taken up directly by the plants and utilized in their synthesis of nitrogenous compounds. It plays no active part in the processes of combustion and of animal respiration; in either it appears to act only as an inert diluent of the oxygen.

In the case of respiration, however, this particular diluent seems to be essential; no animal could live healthily for any considerable period of time in pure oxygen, and we know of no other diluent which could be substituted for the nitrogen without producing poisonous effects. Besides, there can be no doubt that atmospheric nitrogen, in an indirect way, contributes towards the building up of nitrogenous organic matter. Every process of ordinary combustion probably, and every electric discharge in the atmosphere certainly, induces the formation of some nitric acid, which by combining with the atmospheric ammonia becomes nitrate of ammonia, and from certain experiments of Schönbein's it would appear that nitrogen gas and water are capable of uniting directly into nitrite of ammonia ($N_2 + 2H_2O = NO_2 . NH_4$), which, sup-

posing it to be produced in the atmosphere, would promptly be oxidized into nitrate. The nitrate produced by either process is carried down by the rain and conveyed to the roots of the plants, which assimilate it as part of their nitrogenous organic matter. However small the scale may appear on which these processes of atmospheric nitrification go on when measured by the mass of nitrogen which remains unchanged, as this mass is immense, their absolute effect must be very considerable, and may form an important item in the economy of nature.

The compounds of nitrogen may be arranged under the heads of ammonia, nitrates, nitro-compounds, organic nitrogen compounds, and cyanides. As all the several classes and their most important members are treated of under CHEMISTRY (vol. v. p. 509–514), we confine ourselves here, in the main, to supplementing that article by such details as are of practical or general scientific interest.

Ammonia.

This, the only known compound of hydrogen with nitrogen, is a gas of the molecular formula NH_3. The most convenient process for the preparation of the pure gas is to mix powdered sal-ammoniac with powdered quicklime in a flask and to heat the mixture in a sand-bath. Torrents of ammonia come off, which must be dried by passing it through a closely packed column of solid caustic potash or soda (chloride of calcium absorbs the gas chemically) and collected over mercury, as the gas dissolves most abundantly in water. In addition to what has been said under CHEMISTRY of the properties of ammonia, it may here be mentioned that, though uninflammable in air, it burns brilliantly in oxygen, and that it is liable to the following peculiar kind of oxidation. Pour some strong liquor ammoniæ into a large flask, so as to produce a moist mixture of the gas and of air, and suspend in this atmosphere a recently ignited spiral of thin platinum wire. The wire continues glowing and the flask soon fills with dense white fumes of nitrite and nitrate of ammonia, formed according to equation: $2NH_3 + (4O \text{ or } 3O) = H_2O + NO_3H . NH_3$ or $NO_2H . NH_3$. The platinum suffers no permanent change; its mode of action probably consists in this that it alternately absorbs (*i.e.*, combines with) oxygen and hands it over to the ammonia. In any case the reaction is interesting as throwing some light upon the process of nitrification (*vide infra*).

Aqueous ammonia (liquor ammoniæ), being in constant requisition as a reagent, and also used in medicine and in the arts, is being manufactured industrially. Fresenius recommends the following process. A cast-iron pot, fitted up as a retort, is charged with alternate layers of slaked lime (10 kilos of quicklime plus 4 kilos of water) and a powdered and sifted mixture of 6·5 kilos of chloride and 3·5 kilos of sulphate of ammonium. Eight litres of water are then added and well incorporated with the solids. The retort is now closed, and the outlet-tube joined on to the lower end of an inverted condenser, the upper end of which communicates with a set of Woulfe's bottles charged with water. The ammonia is driven off by judicious application of heat, the inverted condenser serving to make the gas relatively dry before being absorbed. In this operation the tubes conveying the gas to the water must go to the bottom of the bottles, as the solution produced is lighter than pure water; and, of course, the bottles must be kept cool by immersion in a cold water-bath. The strength of aqueous ammonia, for commercial purposes, is readily ascertained by means of an hydrometer ranging from 0·85 to 1·0 specific gravity. The relation between specific gravity S at 14° C. (water of 14° = 1) and percentage of ammonia NH_3 (p), according to experiments by Carius, is as follows:—

p	S	p	S	p	S
36	·8844	25	·9106	10	·9593
35	·8856	20	·9251	9	·9631
34	·8868	15	·9414	8	·9670
33	·8907	14	·9449	7	·9709
32	·8929	13	·9484	6	·9749
31	·8953	12	·9520	5	·9790
30	·8976	11	·9556		

Aqueous ammonia is generally sent out as "liquor fortissimus" of 30 to 35 per cent. For ordinary laboratory purposes it is usually diluted down to 9 to 10 per cent. This explains the discontinuities in the table.

Two natural sources of ammonia are at present in industrial use. (1) The gaseous exhalations of volcanoes always include ammonia, hydrochloric acid, and sulphurous acid, of which the first two are formed no doubt by the action of steam on deposits of nitrides and chlorides in the interior of the earth. This explains the existence in the fumaroles (smoke-holes), and in the clefts of the lava of Vesuvius, Hecla, and other volcanoes, of deposits of (chiefly) sal-ammoniac. This volcanic ammonia salt is highly valued as a material for the preparation of pure liquor ammoniæ; but its supply hardly comes up to the demands of even this small industry. (2) More important are the masses of ammonia formed in the processes of putrefaction which are going on constantly in nature, and of which a mere fraction would satisfy all the demands of industry, if the recovery of such ammonia were not, as a rule, beset with insuperable difficulties. Thus, for instance, all the immense mass of the ammonia of the sewage of our large cities must be allowed to go to waste because we have no economical method for its extraction. Urine, when undiluted, is an easily handled raw material, and in former times actually formed the principal source of ammonia. Human urine contains from 2 to 3 per cent. of urea, or carbamide as it is called in systematic chemistry, because it is the anhydride of carbonate of ammonia. When urine putrefies, this carbamide takes up the elements of water and becomes carbonate of ammonia, $CO . (N_2H_4) + 2H_2O = CO_3(NH_4)_2$. A prompter mode of conversion is to evaporate the urine with a small proportion of vitriol, and heat the residue to near the boiling-point of the acid, when the nitrogen of the urea passes at once into the form of sulphate of ammonia. This latter process would apply also to the urine of horses and cattle, which, instead of urea, contains hippuric acid, a compound which, when taken conjointly with water, contains the elements of ammonia and benzoic and acetic acids. At the present time urine plays hardly any part in the ammonia industry; but it may be mentioned that the produce of the urinals of Glasgow is, or lately was, wrought for carbonate of ammonia.

Preparation of Ammonia from Nitrogenous Organic Matter.—All such matter when subjected to dry distillation gives up part of its nitrogen as ammonia, of which the greater part condenses with the vapour of water produced, and is thus obtained as part of the aqueous portion of the "tar." Large quantities of such tar-water are being produced incidentally in the manufacture of coal-gas, and it is this material which at present forms the principal source for the industrial production of ammonia and ammonia salts.

It may also be mentioned that the tar-water obtained as a bye-product in the distillation of shale for the production of paraffin oil is rich in ammonia, and has long come to be worked up for sulphate like gas-liquors.

Crude tar-water contains about 1 per cent. of ammonia (more or less according to the quality of coal used, and the way it has been manipulated), mostly in the form of carbonate, part as cyanide, sulphocyanate, and sulphide of ammonium; and this ammonia, of course, is associated with traces of hydrocarbons and other organic matter dissolved, or suspended, in the liquor. In some establishments the ammonia is extracted directly in the form of liquor ammoniæ. The liquor is run into a large iron boiler, and after addition of some ferrous and ferric salt (for fixing the sulphur of the

sulphide as FeS, and the cyanogen of the cyanide as prussiate, $(NC)_6Fe.(NH_4)_4$, mixed with slaked lime and distilled. The vapours if condensed as they come off, would yield a very dilute liquor contaminated largely with volatile carbon compounds. To obtain a relatively pure gas, the vapour is subjected to a succession of partial condensations by making it pass through the several compartments of an iron apparatus, similar in its action to the "Coffey's still" which is used for the strengthening and refining of alcoholic liquors (see DISTILLATION, vol. vii. p. 265). The almost pure gas which leaves the last condenser is passed into a mass of water contained in a refrigerated close lead vessel, and thus converted into liquor ammoniæ of the requisite strength. In the majority of large establishments, however, the ammonia is converted into sulphate, for which purpose it need not be so elaborately purified. The ammoniacal vapour obtained from the crude liquor by simple distillation, or by distillation with lime from out of a steam-boiler, is passed into a quantity of chamber-acid contained in a leaden tank, until the acid is almost but not quite neutralized. An excess of alkali would induce the formation of sulphide of iron from the sulphide of ammonium in the vapour and the traces of iron-salt adventitiously present, and lead to a discoloration of the salt. Matters are generally arranged so that the bulk of the sulphate formed crystallizes out, on cooling, in the form of a granular magma, which is allowed to drain and to dry, and either sold as it is, or first purified by recrystallization. The pure salt, $(NH_4)_2SO_4$, forms anhydrous, colourless, transparent crystals, isomorphous with those of the corresponding potash salt, and, like it, belonging to the rhombic system; even when produced on a large scale they are generally of small dimensions; when allowed to grow, they assume forms which strikingly remind one of sugar-candy, although the latter is clino-rhombic. The salt is insoluble in alcohol, like most sulphates,—100 parts of water at 0°, 20°, 100° C. dissolve 71·0, 76·3, 97·5 parts of salt. The solution is neutral to litmus. The salt readily unites with another equivalent of sulphuric acid into crystallizable acid sulphate, $SO_4.(NH_4).H$, soluble in alcohol. The neutral salt melts at 140° C. Above 280° it emits ammonia and leaves acid salt, which latter then breaks up with formation of acid sulphite $SO_3(NH_4)H$, nitrogen, and water. At a red heat it breaks up into sulphur, nitrogen, and water: $(NH_4)_2SO_4 = S + N_2 + 4H_2O$.

Of other ammonia salts only the hydrochloride and the carbonates are industrially important.

The hydrochloride, $HCl.NH_3 = NH_4Cl$, better known as *sal-ammoniac* (see vol. i. p. 741-2), is made sometimes by sublimation of a mixture of the sulphate with common salt, but it is more conveniently produced direct from gas-liquor ammonia by passing it into muriatic acid until the latter is almost neutralized. The liquor, when sufficiently concentrated by evaporation, deposits, on cooling, part of its salt in feathery crystals, which are customarily purified by sublimation. The subliming apparatus consists of two parts, —(1) a hemispherical stoneware basin placed within a close fitting iron one, or an enamelled iron basin, and (2) a hemispherical lead or stoneware lid, or dome, placed on the top of the basin and cemented on to prevent leakage. The dome has a small aperture in the top which remains open to preclude accumulation of pressure. The carefully dried crystallized salt is pressed into the basin, and, after the lid has been fitted on, is exposed to a long-lasting moderate heat. The salt volatilizes (mostly in the form of a mixed vapour of the two components, which reunite on cooling), and condenses in the dome in the form of a characteristically fibrous and tough crust. The salt readily dissolves in water, with considerable absorption of heat; 30 parts of salt with 100 parts of water at 13°·3 give a mixture of the temperature of −5°·1 C. One hundred parts of water at 0°, 10°, 110° dissolve 28·1, 32·8, 77·2 parts of the salt. From its hot saturated solution it crystallizes on cooling in feathery groups of colourless needles. By slow evaporation of the solution it is possible to produce well-developed crystals which belong to the regular system, but look irregular on account of the predominance of the (hemihedric) faces of the trapezohedron.

Of the *carbonates* of ammonia there are a large number, and their chemistry still lacks definiteness. The normal salt $CO_3(NH_4)_2$ is so unstable that it can hardly be said to exist. The acid salt $CO_3(NH_4)H$ is easily produced by passing carbonic acid into a saturated solution of the commercial salt, when it comes down as a crystalline precipitate. The commercial salt (important as a medicinal agent and as a chemical reagent) is obtained by subliming a mixture of sal-ammoniac and chalk from an iron retort provided with a lead dome and receiver. It forms hard fibrous crusts or cakes, smelling strongly of ammonia. The salt has a variable composition. The greater part, as a rule, consists of "sesqui-carbonate," $2(NH_4)_2O.3CO_2 + H_2O = (NH_4)_2CO_3 + 2(NH_4).HCO_3$. But it also contains carbamate of ammonia,

$$CO\begin{cases}NH_2\\O-(NH_4)\end{cases} = CO_2 + 2NH_3,$$

as obtainable by the direct union of carbonic anhydride and ammonia.

Of the several ammonia compounds which we have referred to, the sulphate is by far the most important in an industrial sense. Immense quantities of the crude salt are being used as a manure—the German sugar-beet growers alone consume a considerable fraction of the British produce—while to the technical chemist generally it serves as the most convenient starting-point for the manufacture of ammonia, or of other ammonia salts.[1]

In the mode of distilling coal customarily carried on in gas works, only about one-third of the nitrogen is obtained *as ammonia* in the tar-water, the remaining two-thirds being lost by evaporation into the air, or remaining in the coke in the carbide form. What used to go into the gas is now mostly recovered by efficient scrubbers. But the more efficient condensation of the ammonia actually formed is a matter of chemical engineering which cannot be more than touched on here. According to Bilbey the nitrogen of the coke can be recovered, partly at least, by distilling it at a very high temperature in a current of steam. Bilbey's process, however, has hitherto failed practically to give satisfaction, because the intense heat required means a great expense for fuel, and destroys the retorts at an alarming rate. The analytical chemist has no difficulty in extracting the whole of the nitrogen in a given sample of coal as ammonia by mixing it with soda-lime and heating the mixture in a combustion-tube to redness, and possibly the technical chemist will one day bring this process into a remunerative form. What, however, is meanwhile more easy of attainment is the recovery of the large quantities of ammonia which are being produced in the manufacture of coke and in iron smelting (as far as carried out with coal), and which hitherto have been allowed to go to waste. Quite a number of chemists and engineers have tried their hands at this problem. The apparatus proposed, generally speaking, all come to this, that the coal-smoke produced in the furnace, instead of being allowed to have its own way, is sucked out by exhausters, made to pass through refrigerators to deposit at least part of its tar and ammonia water, and the uncondensed combustible gases are led away to be used as fuel for steam-boilers, or, what in the case of coking is far better, led back to the coke oven and consumed there to increase the temperature, and thus improve the qualities of both coke and tar. The very high temperature of the oven or furnace smoke throws great difficulties in the way of a perfect condensation of the ammonia. These, in a Scottish iron-work, have been turned most ingeniously by mixing the smoke with the sulphureous vapour formed by the roasting of pyritic shale or coal, whereby the ammonia is converted into sulphite and sulphate, which can easily be condensed in even hot water.

Should it not be possible to produce ammonia synthetically from atmospheric nitrogen? This question is still waiting for an industrial solution; scientifically it may be answered in more than one way. Magnesium, boron, and a number of other solid and non-volatile elementary substances, when kept in nitrogen gas at the proper temperature, unite with the nitrogen into solid non-volatile nitrides; and these, when heated in steam, yield ammonia and the corresponding oxide. Thus we have $3Mg + N_2 = N_2Mg_3$ and $N_2Mg_3 + 3H_2O = 2NH_3 + 3MgO$. Unfortunately the reagents are all expensive, and there is no economical method for their regeneration. The following method is not subject to this one objection. A mixture of baryta or carbonate of baryta with charcoal, when heated intensely in nitrogen gas, yields cyanide of barium, $Ba(NC)_2$, and this salt when heated in steam gives off ammonia while carbonate of baryta is left, which latter can be used for starting *de novo*, $BaN_2C_2 + 4H_2O = 2NH_3 + BaCO_3 + CO + H_2$. Where this process fails we are unable to say; what we do know is that nobody has as yet succeeded in working it profitably even as a means for obtaining cyanides, whose value, per unit of nitrogen, is higher than that of ammonia.

Nitrates.

Nitrates (the generic term for nitric acid, HNO_3, and its salts) are produced naturally by the electric discharges in the atmosphere, and in the processes of "nitrification," a fermentative oxidation which always sets in when moist nitrogenous animal or vegetable matter is left to itself in the presence of air and some basic substance (see FERMENTATION, vol. ix. p. 98). This process in former times used to be carried out for the production of saltpetre, but as an industrial operation is now obsolete. The deposits of native nitre in India and elsewhere which nature has produced for us by the same method are, of course, still being utilized as far as they go. But they amount to very little compared with the immense masses of native nitrate of soda which exist in South America, and which, at present, constitute by far the most important raw material for the nitrate industry.

This native *nitrate of soda* forms part of a salty earth known to

[1] For the ammonia process of soda-ash manufacture, which, after having been asleep industrially for some thirty years, was brought into a remunerative form by Solvay and Mond, and is now gradually, but surely, taking the place of the old Leblanc process, see SODIUM.

the natives as *caliche* or *terra salitrosa*, which abounds especially in the district of Atacama and the Peruvian province of Tarapaca. The caliche there lies from ·25 to 1·5 metres deep, and stretches over a distance of forty leagues; it is covered by a layer, from a half to two metres thick, of a hard conglomerate of sand, felspar, phosphates, and other mineral matters, which is designated "costra." In other places the caliche forms part of a sandy deposit which sometimes comes to the surface and never goes down to a depth beyond 2·6 metres. The caliche contains from 48 to 75 per cent. of nitrate of soda and from 20 to 40 per cent. of common salt, which are associated with various minor saline components, including iodate of soda, and more or less of insoluble mineral, and also some organic matter, guano amongst other things, which suggests the idea that the nitrate was formed by the nitrification of this kind of excremental matter. The caliche is worked up *in loco* for crude nitrate of soda; by extracting the salts with hot water, allowing the suspended earth to settle, and then transferring the clarified liquor, first to a cistern where it deposits part of its chloride of sodium at a high temperature, and then to another where, on cooling, it yields a crop of crystals of purified nitrate. The nitre thus refined is imported chiefly from Valparaiso, whence the name of "Chili saltpetre." The mother-liquors used until a few years ago to be thrown away, but are now being utilized for the extraction of their iodine, which, although little in a relative sense, on account of the large masses of raw material wrought, amounts to a good deal absolutely, as is illustrated by the fact that Peruvian iodine has put an end to the kelp industry in Scotland. Chemically pure nitrate of soda can be obtained by repeated recrystallization of Chili saltpetre or by synthesis from pure nitric acid and pure carbonate of soda. It forms colourless transparent rhombohedra, like those of Iceland spar, only the angles are more nearly equal to right angles, so that the crystals look like cubes. Hence the name of cubic saltpetre, which is sometimes given to the salt. One hundred parts of water at 0°, 20°, 50°, 100°, 110° C. dissolve 72·9, 87·5, 112, 180, 200 parts of the salt; at 120°, the boiling-point of the saturated solution, 216 parts. It fuses at 330° C. (Carnelley); at higher temperatures it loses oxygen (more readily than the corresponding potash salt) with formation of nitrite NO_2Na, which, at very high temperatures, is reduced ultimately to a mixture of peroxide, Na_2O_2, and oxide, Na_2O. Industrially the salt is important as being the raw material for the manufacture of nitric acid and of nitrate of potash.

Nitrate of potash (saltpetre), which forms the predominating component of gunpowder, occurs native in India and other parts of the world, and such native nitre has only to be purified by crystallization to become fit for the market. But the bulk of what occurs in commerce is made by double decomposition of Chili saltpetre with (*a*) caustic potash, (*b*) carbonate of potash, or (*c*) chloride of potassium, which processes yield (*a*) caustic soda, (*b*) carbonate of soda, (*c*) common salt as bye-products. The third form (*c*) of the method is most largely wrought, the necessary supplies of cheap chloride of potassium being furnished by the works at the Stassfurt deposits. The two raw materials are analysed, and quantities corresponding to $NaNO_3 = 85$ of nitrate of soda and $KCl = 74·5$ parts of chloride of potassium respectively are dissolved together in an iron basin in the least quantity of hot water. The solution is boiled down to 1·5 specific gravity (hot), when the common salt formed gradually crystallizes out. It is fished out, allowed to drain, and the runnings are returned to the basin. The highly concentrated mother-liquor is allowed to cool with frequent agitation, so that the saltpetre, which crystallizes and assumes the form of a "meal," is more readily freed from mother-liquor, by judicious washing with cold water. The crude saltpetre which is thus obtained is recrystallized until it is almost chemically pure, because an even slightly contaminated salt is unfit for gunpowder making. Nitrate of potash is isomorphous with the soda salt in this sense that it is possible to obtain it in the form of rhombohedra; but these rhombohedra have no great stability, and under ordinary conditions the salt always assumes the form of long six-sided prisms of the right-rhombic system. It is far less soluble in water than nitrate of soda, and, unlike it, is absolutely non-hygroscopic. One hundred parts of water at 0°, 10°, 20°, 50°, 80°, 100° C. dissolve 13·3, 21·1, 31·2, 86, 172, 247 parts of salt. The boiling fully saturated solution is at 114°, and contains 327 parts of salt per 100 of water (Mulder). It fuses at 352° C. (Carnelley) into a colourless liquid, which freezes into a hard compact mass exhibiting a coarse, fibrous fracture if the salt is pure. In an impure salt this structure becomes the less distinct the greater the proportion of impurities; with a saltpetre which contains 3·5 per cent. of common salt, the fibres appear only at the edges of the surface of fracture. This is the basis of a now almost forgotten test for purity, and explains that to the present day the term "refraction" is used to designate the sum total of impurities contained in 100 parts of nitre analysed. When heated sufficiently beyond its fusing point it decomposes similarly to nitrate of soda, only it gives up its oxygen far less readily. A mixture of nitre with charcoal, sulphur, or other combustible matter, when kindled, burns off with explosive violence. Hence its application for the manufacture of gunpowder and in pyrotechnics, and its use in the laboratory as a powerful oxidizing agent in operations of the dry way.

Nitric Acid, HNO_3 (see CHEMISTRY, p. 511 *sq.*), is prepared from nitrate of potash or soda by distillation with sulphuric acid. The scientific chemist prefers the potash salt because it is more easily purified; the manufacturer uses nitrate of soda because it is cheaper and a lower temperature and a less excess of oil of vitriol (over and above $1H_2SO_4$ for $2RNO_3$) suffice for its successful conversion into acid. For manufacturing purposes the distillation is effected from out of horizontal cylindrical or deep hemispherical retorts made of cast iron (a material which is far less attacked by the acids than one might be inclined to think). The retort communicates with a series of Woulfe's bottles made of stoneware, which are sometimes provided with taps for letting off the distillate. The retort, after having been charged and connected with the receivers, is heated over a naked fire until all the acid is driven off, and nothing but a (mere or less acid) sulphate of soda is left. The details of the manufacture vary according to the kind of acid which is intended to be produced. If the manufacture of ordinary aquafortis (of 1·3 to 1·4 specific gravity) is aimed at the receivers are charged with the proper proportion of water, and less than $1H_2SO_4$ may be used for the decomposition of $1NO_3Na$, because the peroxide of nitrogen from the dissociated part of the acid, by the action of the water and the air in the receivers, is to a great extent reconverted into nitric acid. The preparation of acid of highest strength demands the full equivalent of vitriol. But even then the product, apart from the contents of the first few condenser bottles nearest to the retort, is strongly contaminated with dissolved peroxide, which imparts to the acid a deep red colour. This impurity can be brought down to about 2 per cent. by blowing air through the gently heated acid, which carries away the peroxide as a vapour. To utilize the latter, the mixture is made to ascend through a tower filled with coke kept moist by a constant rain of water running downwards against the stream of acid fumes. Water alone would convert two-thirds of the nitrogen into nitric acid, thus:—$3N_2O_4 (+aqua) = 2NO + (2N_2O_5 + aqua)$; but by the cooperation of the oxygen of the air a larger proportion of acid is being regenerated as aquafortis of about 1·3 specific gravity. Two kinds of acid are chiefly being produced, viz., (1) full-strength fuming acid of 1·5 to 1·52 specific gravity at 15° C., which is largely used (in the tar-colour industry for the making of nitro-bodies, and also for the manufacture of gun-cotton and nitroglycerin), and (2) aquafortis of 1·35 to 1·42 specific gravity, for the charging of batteries, and as a reagent generally. Either acid is sold in two qualities,—as colourless acid relatively free of peroxide of nitrogen, and as red acid charged with it, which admixture is not always an impurity in a technical sense, but desired for certain purposes to be present. Most commercial acid is contaminated with chlorine and sulphuric acid, which can both be removed by fractional distillation—most easily from the strongest acid. The chlorine accumulates in the first runnings; the sulphuric acid remains in the retort, if the distillation be stopped in time.

For most purposes the strength of an acid can be determined with sufficient accuracy by means of a hydrometer.

The following table gives the relation between the percentages p of HNO_3 and the specific gravity S according to Kolb:—

p	S at 0° C.	S at 15° C.	p	S at 0° C.	S at 15° C
100	1·559	1·530	30	1·200	1·185
90	1·522	1·495	20	1·132	1·120
80	1·484	1·460	15	1·099	1·089
70	1·444	1·423	10	1·070	1·060
60	1·393	1·374	5	1·031	1·029
50	1·334	1·317	0	1·000	1·000
40	1·267	1·251			

Regarding the reactions of nitric acid with elementary substances and with inorganic compounds generally, see CHEMISTRY (*ut sup.* pp. 511–514). The general effect of the treatment of an organic substance with aquafortis is that the acid is reduced to lower oxides of nitrogen and water, while the organic substance undergoes some kind of oxidation, which sometimes assumes the character of a combustion. With regard to the more immediately formed oxidation products it is difficult to speak in general terms; suffice it to say that, according to Carius, all organic substances when heated with nitric acid in sealed-up tubes to 150° to 300° C. are burned completely into carbonic acid, water, and nitrogen or nitrogen oxides. Any other element that may be present passes into its highest state of oxidation: sulphur, for instance, becomes sulphuric acid; phosphorus, phosphoric, &c. Very remarkable is the action of real nitric acid, when employed in the cold, and under conditions precluding the accumulation of water or lower oxides of nitrogen. The acid then, if it acts at all, unites with the respective substances, with elimination of water and formation from the body B of a product $B + nHNO_3 - nH_2O$ or $B + nNO_2 - nH$. These nitro-bodies, as they are sometimes called, divide themselves into two classes:—(1) *nitric esters*, *i.e.*, real nitrates formed from alcohols, which term

must be understood here to include glycerin, sugar, mannite, cellulose, and many other OH-compounds not usually called alcohols (in these the group $NO_2 . O$ stands where the OH was in the original substance); and (2) *nitro-bodies proper*, in which the NO_2-group has taken the place of an H which was combined directly with carbon. An example is the nitrobenzol, $C_6H_5(NO_2)$, produced from benzol, $C_6H_5 . H$. When such a (true) nitro-body is treated with nascent hydrogen, the NO_2 as a rule goes out and is replaced by an amidogen NH_2; thus $C_6H_5(NO_2)$ becomes $C_6H_5(NH_2)$, amido-benzol or aniline. The nitric esters, in the circumstances, yield up their NO_2 as ammonia.

For other metallic nitrates, see under the respective metals. For *nitric esters*, see METHYL, GUN-COTTON, and NITROGLYCERIN. For *nitric anhydride* (N_2O_5), *peroxide of nitrogen* (N_2O_4), *nitrous acid* (N_2O_3), *nitric oxide* (NO), *nitrous oxide* (N_2O, laughing-gas), also *chloride of nitrosyle* (*aqua regia*), see CHEMISTRY, p. 511 *sq.*

Nitrogenous Carbon Compounds.

Of this very numerous family we can only name a few of the more important groups and explain their genetic relations. Cyanides, compounds of the radical (NC),[1] are important to us here chiefly as a link between the two elements on the one hand and nitrogenous organic bodies proper on the other. Hydrocyanic acid, NCH, can be produced synthetically in a number of ways; we may, for instance, synthesize cyanide of barium, BaN_2C_2, as shown above, and decompose it by sulphuric acid. A more direct method is to first combine carbon with hydrogen into acetylene and then to subject a mixture of this and nitrogen gas to a spark-current, when hydrocyanic acid is produced, thus:—$C_2H_2 + N_2 = 2HNC$.

Alkylamines.—When hydrogen is generated within an acidified solution of hydrocyanic acid by means of zinc, the cyanide, by taking over four atoms of hydrogen, passes into (a salt of) methylamine, $NCH + 4H = NH_2 . CH_3$. It is explained under METHYL how this base may be utilized for the production of methyl-alcohol, and thus, indirectly, of iodide of methyl and of acetonitrile (pseudo-cyanide of methyl, $NC . CH_3$). This shows the possibility of producing from hydrocyanic acid, in the first instance di- and tri-methylamine, and, more indirectly, the whole series of alkylamines (NH_2R, NHR_2, NR_3; where $R = CH_3$, $CH_3 + CH_2 = C_2H_5$, $C_2H_5 + CH_2 = C_3H_7$, &c.). Closely allied to these alkylamines are the diamines, derived from the bromides of the olefines, C_nH_{2n}, as the former are from those, or the iodides, of the alcohol-radicals CH_3, C_2H_5, &c. To ethylamine, for instance, corresponds ethylene-diamine, $C_2H_4(NH_2)_2$.

Acid-amides are bodies related to acids, as alkylamines are to alcohols. Thus, for instance,

$$\underset{\text{Ethylamine.}}{C_2H_5NH_2} \text{ corresponds to } \underset{\text{Acetamide.}}{[CH_3 . CO]NH_2}.$$

Polybasic acids form each a series of amides. Thus succinic acid, $C_2H_4(COOH)_2$, forms two amides, viz.,

$$\underset{\text{Succinamic acid.}}{C_2H_4{<}\begin{smallmatrix}COOH\\ CONH_2\end{smallmatrix}} \text{ and } \underset{\text{Succinamide.}}{C_2H_4{<}\begin{smallmatrix}CONH_2\\ CONH_2\end{smallmatrix}}.$$

All acid-amides are the anhydrides of corresponding ammonia salts, and can be produced from these by actual dehydration; there is no need of explaining by an equation what is so clearly seen in the formulæ. The two succinamides just named, and all analogous "amides," are susceptible of further dehydration: thus

$$\text{succinamic acid, } C_2H_4{<}\begin{smallmatrix}CO[OH]\\ CONH[H]\end{smallmatrix}$$

by losing the bracketed OH and H becomes

$$\text{succinimid, } C_2H_4{<}\begin{smallmatrix}CO\\ CO\end{smallmatrix}{>}(NH);$$

$$\text{and succinamide, } C_2H_4\begin{smallmatrix}C\,\boxed{O}\,N\boxed{H_2}\\ C\,\boxed{O}\,N\boxed{H_2}\end{smallmatrix},$$

similarly becomes

$$\text{succino-nitrile, } C_2H_4{<}\begin{smallmatrix}CN\\ CN\end{smallmatrix}.$$

Acid-amides must not be mixed up with amido-acids.

Amido-acids have their (NH_2) within the specific, not in the generic, radical. Thus, acetic acid, CH_3COOH, by chlorination, becomes chloracetic acid, $CH_2Cl . COOH$, and this chloro-acid again gives up its chlorine to ammonia and to caustic potash, and receives back NH_2 in the one case and OH in the other, becoming

$$\underset{\text{Amido-acetic acid.}}{CH_2(NH_2) . COOH} \text{ and } \underset{\text{Oxy-acetic or glycollic acid}}{CH_2(OH) . COOH}$$

respectively. The latter forms an amide, $CH_2(OH)CO . NH_2$, as acetic acid does, and this amide, as is easily seen, is isomeric with amido-acetic acid, either being oxy-acetic minus OH plus NH_2; but the two differ widely from each other. The amide, when treated with aqueous potash, yields ammonia and glycollate of potash, the amido-acid water and amido-acetate of potash. The substance asparagine, which is contained in so many vegetable juices, and often appears as a decomposition product of albumenoids, is an amide and an amido-acid in one, being amido-succinamic acid.

$$\underset{\text{Succinic acid.}}{C_2H_4\begin{smallmatrix}COOH\\ COOH\end{smallmatrix}} \qquad \underset{\text{Asparagine.}}{C_2H_3(NH_2)\left\{\begin{smallmatrix}CO . NH_2\\ CO . OH\end{smallmatrix}\right.}.$$

With the so-called aromatic bodies a very general method for producing amido-bodies is first to prepare a nitro-body and then reduce it by nascent hydrogen. Thus, for instance, we can convert nitrobenzol, $C_6H_5 . NO_2$, above referred to, into amido-benzol, $C_6H_5 . NH_2$. We shall use this body as an example to explain the general mode of formation of a most interesting group of nitrogenous compounds which at present play a great part in the colour industry.

Diazo-bodies.—All NH_2 compounds, when treated with water and nitrous acid, virtually $NO . OH = \frac{1}{2}(N_2O_3 + H_2O)$, yield the corresponding hydroxyl (OH) compounds, with joint elimination of the nitrogen of substance and reagent as nitrogen gas. Thus we have—

$$\underset{\text{Aniline.}}{C_6H_5NH_2} + OH . NO = \underset{\text{Phenol.}}{C_6H_5 . OH} + H_2O + N_2.$$

This is quite a general reaction; but in the case of aromatic amines the reaction takes a different turn, if, instead of the free amine, we use one of its salts, and, in a relative sense at least, exclude water as a medium. In the case of nitrate of aniline, for instance, the two atoms of oxygen in the nitrous acid combine with all the hydrogen of the generic radicals, while all the rest unites into diazo-benzol:—

$$HNO_3 . C_6H_5 . NH_2 + NO . OH = 2H_2O + \underset{\text{Nitrate of diazo-benzol.}}{C_6H_5—N{=}N—NO_3}$$

And similarly in similar cases. Diazo-benzol has a great tendency to give off the nitrogen gas N_2 which is visible in its formula. We need only treat it with water and it yields what nitrous acid water would have given at once:—

$$C_6H_5—N{=}N—NO_3 + H . OH = HNO_3 + N_2 + C_6H_5 . OH.$$

There is something between the nitrates of amido- and of diazo-benzol, which, it is true, has only a theoretical existence in this case, but can be realized in other analogous cases.

Nitroso-bodies.—Ethylamine, under the action of water and nitrous acid, yields alcohol, $C_2H_5 . OH$, as aniline yields phenol, and other monamines yield their alcohols. With diethylamine this reaction cannot take place; what does take place is that the NO of the nitrous acid expels and takes the place of the one loose H in the amine, and forms nitroso-diethyline:—

$$N . H . (C_2H_5)_2 + NO . OH = H . OH + \underset{\text{Nitroso-diethyline.}}{N . (NO) . (C_2H_5)_2}.$$

Hydrazines.—This nitroso-diethyline is a liquid boiling at 177°, devoid of alkaline properties. When treated with zinc-dust and acetic acid it yields a basic substance diethyl-hydrazine, which contains NH_2 in lieu of the NO of the nitroso-body.

$$\underset{\text{Nitroso-diethyline.}}{N . (NO)(C_2H_5)_2} \qquad \underset{\text{Diethyl-hydrazine.}}{N . (NH_2)(C_2H_5)_2}.$$

This hydrazine is only one of a large genus, representatives of which are also obtainable from diazo-bodies by nascent hydrogen. Example—

$$\underset{\text{Sulphate of diazo-benzol.}}{C_6H_5—N{=}N—(HSO_4)} + 4H = H_2SO_4 + \underset{\text{Phenyl-hydrazine}}{C_6H_5—NH . (NH_2)}$$

Ureids are a class of bodies which are related to urea as amido-bodies are to ammonia. Thus

$$\begin{matrix}NH_3\\ NH_3\end{matrix} \qquad (NH_2)' \qquad (2NH_2)''$$

correspond to

$$\underset{\text{Urea.}}{CO\left\{\begin{smallmatrix}NH_2\\ NH_2\end{smallmatrix}\right.} \qquad CO\left\{\begin{smallmatrix}(NH)'\\ NH_2\end{smallmatrix}\right. \qquad CO{<}\begin{smallmatrix}(NH)'\\ (NH)'\end{smallmatrix}. \quad \text{Urea radicals.}$$

We satisfy ourselves with quoting two ureids derived from oxalic acid, $C_2O_2{<}\begin{smallmatrix}OH\\ OH\end{smallmatrix}$. Just as we have two ammonia derivatives,

$$\underset{\text{Oxamic acid.}}{C_2O_2{<}\begin{smallmatrix}OH\\ NH_2\end{smallmatrix}} \text{ and } \underset{\text{Oxamide.}}{C_2O_2{<}\begin{smallmatrix}NH_2\\ NH_2\end{smallmatrix}},$$

so there exist two urea-derivatives

$$\underset{\text{Oxaluric acid.}}{C_2O_2{<}\begin{smallmatrix}OH\\ [NH . NH_2CO]\end{smallmatrix}} \text{ and } \underset{\text{Parabanic acid.}}{C_2O_2{<}\left[\begin{smallmatrix}NH\\ NH\end{smallmatrix}\right\}CO\right]}.$$

The urea radicals are enclosed in square brackets. These are two examples of a large family of bodies interesting on account of their close relationship to uric acid, a constant component of urine.

Creatine is a crystalline base which was discovered by Liebig

[1] See CHEMISTRY. Some of the more important cyanides will be discussed under PRUSSIC ACID.

in the juice of flesh. Volhard prepared it synthetically by the successive realization of the following two reactions:—

$$\text{(1)}\quad \underset{\text{Chloracetic acid.}}{CH_2Cl.COOH} + \underset{\text{Methylamine.}}{NH_2CH_3} = HCl + \underset{\substack{\text{Methyl-amido-acetic acid.}\\ \text{(sarkosine).}}}{CH_2.NH(CH_3).COOH};$$

$$\text{(2)}\quad \underset{\text{Sarkosine.}}{CH_2.NH(CH_3).COOH} + \underset{\text{Cyanamide.}}{(CN)NH_2} =$$

$$\underset{\text{Creatine.}}{NH{=}C\left\{\begin{array}{l}NH_2\\ N(CH_3).[CH_2.COOH].\end{array}\right.}$$

Betaine and Neurine, two bases derived from trimethylamine, are of great physiological importance. Neurine

$$\begin{array}{c}(CH_3)_3{-}N{-}(OH)\\ \quad\;\; | \\ \quad\;\; CH.CH_2\end{array}$$

was discovered by Liebreich as one of the congeners of a complex substance contained in the brain. By oxidation it is converted into betaine

$$\begin{array}{l}(CH_3)_3{-}N{-\!-\!-\!-}\,\urcorner\\ \qquad\quad\;\, |\qquad\;\; |\\ \qquad\quad CH_2.CO.O\end{array}$$

which Scheibler discovered in the juice of the sugar-beet. Both bases can be produced synthetically,—the betaine by first uniting trimethylamine with chloracetic acid into a chloride, $ClCH_2.COOH + N(CH_3)_3$, and then replacing the Cl by OH by means of oxide of silver and water. The hydroxide

$$N{-}[OH]{<}\left\{\begin{array}{l}(CH_3)_3\\ CH_2.COO[H]\end{array}\right.$$

formed spontaneously loses the bracketed [OH] and [H] as water, and becomes trimethyl-glycocoll, which is betaine.

Native Alkaloids.—These may be divided into (1) bodies consisting of carbon, nitrogen, and hydrogen only, generally volatile liquids (of which nicotine may be quoted as an example); and (2) such as contain oxygen in addition to the three elements named (quinine, morphia, strychnine, &c.). The more important of these bases are noticed in separate articles.

The Albumenoids.—This class comprises those substances known as albumin, fibrin, casein, &c., which, conjointly with carbohydrates and fats respectively may be said to form the basis of vegetable and animal life. They consequently are the most important of all nitrogenous carbon compounds; but unfortunately we know little of their chemical constitution. They are all solids containing 53 to 54·7 per cent. of carbon, 7·1 to 7·2 of hydrogen, 15·6 to 15·8 of nitrogen, and 1·7 to 1·8 of sulphur. Glutin and chondrin (glue) are closely allied to them. See the special articles.

Analysis.

In regard to general methods for the determination (or detection) of the element, see CHEMISTRY, vol. v. p. 546–7. But it may be added that the method there given as that of Dumas, for combustible carbon compounds, can be made to apply to metallic nitrates by simply substituting finely divided metallic copper for the oxide of copper as a burning agent, and that Varrentrapp and Will's method applies, as it stands to metallic nitrides and amides, to metallic cyanides, and to all metal-amines. We confine ourselves here to the more important methods for the detection of certain classes of nitrogen compounds.

1. *Ammonia-salts* and most *acid*-amides and amin-acids, when treated with aqueous potash, give off their nitrogen as ammonia gas, which, if sufficient in quantity, is easily detected by (*a*) its pungent smell, (*b*) its action on turmeric or red-litmus paper, (*c*) its forming dense clouds of sal-ammoniac when brought into contact with a glass rod moistened with muriatic acid. Should the vapours of ammonia be too highly attenuated to be thus identified, condense them in dilute muriatic acid, and to the distillate obtained (after neutralization of the free acid by potash or soda) apply "Nessler's reagent" (a solution of the salt $HgI_2.2KI$ in aqueous caustic potash or soda; see MERCURY, vol. xvi. p. 34). The least trace of ammonia, if present, assumes the form of iodide of mercurammonium, which, if too little to come down as a precipitate, will announce itself by imparting to the liquid an intense brown or yellow colour. One-hundredth of a milligram of ammonia diffused throughout 50 c.c. of liquid (*i.e.*, five million times its weight) can thus be detected with unerring certainty.

2. *Nitrous and Nitric Acid.*—We assume the acids to be given as solutions of their alkaline salts, and may well do so because other metallic salts of either acid can easily be brought into this form by suitable operations. A solution of alkaline nitrite, when mixed with aqueous sulphuric acid, gives off brown fumes (of N_2O_2 and N_2O_4) if it is sufficiently *concentrated*. In more dilute solutions the liberated nitrous acid breaks up into nitric acid and nitric oxide gas, which latter forms brown fumes (of N_2O_4) as soon as it *comes into contact* with the air. In still more dilute solutions the liberated nitrous acid remains undecomposed, but is readily detected by a sufficiency of a strong solution of ferrous sulphate or chloride, which reagents liberate nitric oxide from it and dissolve it with formation of an inky-black solution. This is the most characteristic and a highly delicate test. But in the latter respect it is far surpassed by "*Gries's reagent*,"—a solution of sulphate of meta-diamido-benzol in dilute sulphuric acid. When this solution is added to even the most dilute solution of nitrous acid, a yellow coloration is developed which attains its maximum of intensity after about fifteen minutes standing. This test is fully as delicate as Nessler's for ammonia.

A nitrate solution, when mixed with aqueous sulphuric acid or that acid and ferrous salt, exhibits no visible change. But when the solution is mixed with its own volume of (concentrated) oil of vitriol, so as to not only liberate but also dehydrate the nitric acid, and a strong solution of ferrous sulphate is cautiously poured on the top of the mixture, nitric oxide is eliminated which dissolves in, and strikes an inky-black colour with, the ferrous salt layer. This is *the* test for nitrates.

When a solution containing nitrates or nitrites is distilled with concentrated caustic potash or soda and aluminium foil or zinc-foil and iron filings (or any metal or combination which, with the pure alkali-solution, would give off hydrogen), the nitrogen is gradually eliminated as ammonia, which can be condensed, and, however little it may amount to, detected by Nessler's reagent, as above explained. (W. D.)

NITROGLYCERIN (synonymes *Glonoin, Glonoin Oil, Dynamites, Blasting Gelatin*), $C_3H_5N_3O_9 = C_3H_5(NO_2)_3O_3$, was discovered by Sobrero in 1846, and soon afterwards was more thoroughly investigated by Railton and by De Vrij. It is formed by the action of concentrated nitric acid, in the presence of strong sulphuric acid, upon glycerin at a low temperature, and may be readily prepared upon a small scale by dropping the glycerin into the mixed acids, the mixture being kept artificially cooled, and afterwards poured into a large volume of water. The nitroglycerin then separates as a heavy liquid (sp. gr. 1·6), generally pale yellow, but quite colourless when pure. It is inodorous, and has a sweet pungent aromatic flavour; if it be touched with the tongue or even brought into contact with the skin severe headache ensues, but this effect does not recur after a while with those who habitually handle it, nor is their health premanently injured by working with it. Nitroglycerin is applied medicinally, in very minute doses, in cases of heart disease, but if taken even in small quantities it operates as a violent irritant poison. If a thin layer be spread upon a hard surface and struck sharply with a hammer it explodes violently; under favourable conditions it is more sensitive to explosion by a blow than even mercuric fulminate. It freezes (or crystallizes, in six-sided prisms) at about 40° F., and slowly liquefies again at 50°. When frozen it is less sensitive to explosion; in the United States, where nitroglycerin is extensively used, as such, in mining operations, it is transported in the frozen state for greater safety. Under some circumstances, however, the readiness with which nitroglycerin and its preparations freeze is a source of danger; they have generally to be thawed, by applying heat, before use in cold weather or after they have been frozen for some time, and disastrous explosions have resulted from this being carelessly done. Nitroglycerin is very slightly soluble in water, but is readily taken up by many solvents, especially by methyl-alcohol or wood-spirit. This solution being non-explosive, in the early days of application of nitroglycerin it was transported in that form; but if the spirit became weakened by evaporation, an explosive layer of nitroglycerin containing some spirit would separate, and, in cool weather, nitroglycerin would crystallize out of the solution. The dangers attending the use of nitroglycerin were therefore not much diminished by the use of the solvent.

Unless very carefully freed from acid and from unstable impurities, nitroglycerin will decompose more or less rapidly, especially in warm climates, and the heat developed

by the chemical change may lead to spontaneous explosions. But, when manufactured and purified according to the system originated and developed by Nobel, the liquid is possessed of great stability.

The first attempts to utilize the explosive power of nitroglycerin were made by Nobel in 1863; they were only partially successful until the plan, first applied by General Pictot in 1854, of developing the force of gunpowder in the most rapid manner and to the maximum extent, through the agency of an initiative detonation (see "Detonation," art. EXPLOSIVES, vol. viii.), was applied by Nobel to the explosion of nitroglycerin. Even then, however, the liquid nature of the substance, though advantageous in one or two directions, constituted a serious obstacle to its safe transport and storage and to its efficient employment; it was therefore not until Nobel hit upon the expedient of producing plastic solid preparations by mixing the liquid with solid substances, in a fine state of division, capable of absorbing and retaining considerable quantities of it, that the future of nitroglycerin as one of the most effective and convenient blasting agents was secured. Charcoal was the first absorbent used; eventually the siliceous (infusorial) earth known as "kieselguhr" was selected by Nobel as the best material for producing DYNAMITE (*q.v.*), as it absorbs, after calcination, from three to four times its weight of nitroglycerin, and does not part with it easily when the mixture is submitted to pressure or frequent alterations of temperature. For work requiring the greatest sharpness and violence of action, the so-called No. 1 dynamite, consisting of about 75 parts of nitroglycerin and 25 parts of kieselguhr, is by far the most extensively used; other inert absorbents have been used at times, and numerous other less violent forms of dynamite (*Dynamitis à base action*) are prepared by impregnating mixtures of oxidizable substances and oxidizing agents (*e.g.*, of nitrates and charcoal or carbonaceous bodies) with smaller proportions of nitroglycerin, or by using imperfectly nitrified wood-fibre, or other forms of cellulose, as the absorbent. *Lithofracteur, dualin, glyoxilin, potentite, atlas-dynamite, lignin-dynamite*, are examples. The last-named was employed by the Fenians in the attempted outrages in Glasgow and London in 1883. The only inert absorbent of nitroglycerin which compares in efficiency with kieselguhr is *magnesia alba*, which is extensively used for making dynamite in California. The application of nitroglycerin-preparations to industrial purposes, especially for mining, tunnelling, and blasting work in which great cleaving and shattering effects are desired, has developed very rapidly since 1867. Thus, in that year 11 tons were produced at the various works with which Nobel is associated; in 1870 the yield had increased to 424 tons, in 1877 to 5500 tons, and in 1882 to 9500 tons, while considerable quantities are now manufactured independently of Nobel.

The most recent and most perfect form in which nitroglycerin is now used is called *blasting gelatin*. This material, also invented by Nobel, is composed of the liquid and of a small proportion of so-called nitro-cotton, which consists chiefly of those products of the action of nitric acid on cellulose which are intermediate between collodion-cotton and gun-cotton (trinitro-cellulose, &c.). If the liquid is gently heated together with 5 to 7 per cent. of the finely-divided nitro-cotton, and the mixture kept stirred, the two gelatinize together, producing a translucent, plastic, and tenacious mass, which becomes hard when cooled to the freezing point of nitroglycerin, and may be kept in water for any length of time without an appreciable separation of nitroglycerin. When properly prepared, blasting gelatin is less sensitive to detonation than dynamite; and, while its action as an explosive is somewhat more gradual, it is considerably superior to dynamite in explosive power, and even slightly more powerful than pure nitroglycerin, the reason being that the latter contains somewhat more oxygen than is required for the complete oxidation of the carbon and hydrogen, and that this excess is utilized in supplying the deficiency of oxygen existing in the feebly explosive nitro-cotton. Blasting gelatin is rapidly replacing dynamite in some of its applications, and is already extensively manufactured in different countries. (F. A. A.)

NITZSCH, KARL IMMANUEL (1787–1868), theologian, was born at the small Saxon town of Borna on September 21, 1787. His father, Karl Ludwig Nitzsch, who at that time was pastor and superintendent in Borna, and afterwards became professor at Wittenberg, has also left a name of some distinction in the theological world by a number of writings, among which may be mentioned a work entitled *De discrimine revelationis imperatoriæ et didacticæ prolusiones academicæ* (2 vols., 1830). Karl Immanuel, after receiving his elementary education at home, was sent to Schulpforta in 1803, whence he proceeded to the university of Wittenberg in 1806. In 1809 he graduated, when the subject of his thesis was *De evangeliorum apocryphorum in explicandis canonicis usu et abusu*, and in the following year he "habilitated" with a dissertation *De testamentis patriarcharum, libro veteris testamenti pseudepigrapho*. Having been ordained deacon in 1811, he showed remarkable energy and zeal during the bombardment and siege of the city in 1813; and in 1817 he was appointed one of the preceptors in the preachers' seminary which had been established after the suppression of the university. From 1820 to 1822 he was superintendent in Kemberg, and in the latter year he was appointed professor ordinarius of systematic and practical theology at Bonn. Here he remained until called to succeed Marheineke at Berlin in 1847; subsequently he became university preacher, provost of St Nicolai (in 1855), and member of the supreme council of the church, in which last capacity he was one of the ablest and most active promoters of the Evangelical Union. He died on August 21, 1868.

His principal works are *System der Christlichen Lehre* (1829, 6th ed. 1851), *Praktische Theologie* (1847–60, 2d. ed. 1863–68), *Akademische Vorträge über Christliche Glaubenslehre* (1858), and several series of *Predigten*. His *Protestantische Beantwortung*, a reply to the *Symbolik* of Möhler, which originally appeared in the *Studien u. Kritiken*, may also be mentioned. Nitzsch, whose work in dogmatic theology has been already characterized (see vol. vii. p. 342), still stands out as one of the ablest and most genial and accomplished representatives of the "Vermittelungstheologie" (mediation theology), or what may be called the broad evangelical school of modern Germany.—Gregor Wilhelm Nitzsch (1790–1861), brother of Karl Immanuel, chose philology as his province, and held professorships of ancient literature successively at Kiel (from 1827) and at Leipsic (1852). He published various works, chiefly connected with the elucidation of the Homeric poems.

NIVELLES (Flem., *Nyvel*), a manufacturing town of South Brabant, Belgium, stands on the Thines, a small sub-tributary of the Scheldt, 18 miles by rail to the south of Brussels. The Romanesque church of St Gertrude, dating from the 11th century, is interesting, but the exterior suffered defacement in the 18th century, and the restoration of the tower, which suffered from fire in 1859, has not been successful. The treasury contains some valuable works of art. Nivelles has manufactures of woollen, cotton, linen, and paper, as well as a railway locomotive and carriage work, and does a considerable trade in corn and live stock, especially swine. The town owes its origin to a convent founded in 645 by Ida or Ita, the wife of Pippin of Landen. The population was 9825 in 1876, but is said to have been much larger in the 16th century.

NIZÁMÍ (1141–1203). Shaikh Nizámí or Nizám-uddín Abú Mohammed Ilyás bin Yúsuf, the unrivalled master of the romantic epopee in Persia, who ranks in poetical genius as next to Firdausí, was born 535 A.H. (1141 A.D.). His native place, or at any rate the abode of his father, was in the hills of Kumm, but as he spent almost all his days in Ganjah in Arrán (the present Elisabethpol) he is generally known as Nizámí of Ganjah or Ganjawí. The early death of his parents, which illustrated to him in the most forcible manner the unstableness of all human existence, threw a gloom over his whole life, and fostered in him that earnest piety and fervent love for solitude and meditation which have left numerous traces in his poetical writings, and served him throughout his literary career as a powerful antidote against the enticing favours of princely courts, for which he, unlike most of his contemporaries, never sacrificed a tittle of his self-esteem. The religious atmosphere of Ganjah, besides, was most favourable to such a state of mind; the inhabitants, being zealous Sunnites, allowed nobody to dwell among them who did not come up to their standard of orthodoxy, and it is therefore not surprising to find that Nizámí abandoned himself at an early age to a stern ascetic life, as full of intolerance to others as dry and unprofitable to himself. He was rescued at last from this monkish idleness by his inborn genius,

which, not being able to give free vent to its poetical inspirations under the crushing weight of bigotry, claimed a greater share in the legitimate enjoyments of life and the appreciation of the beauties of nature, as well as a more enlightened faith of tolerance, benevolence, and liberality. The first poetical work in which Nizámí embodied his thoughts on God and man, and all the experiences he had gained, was necessarily of a didactic character, and very appropriately styled *Makhzan-ulasrár*, or "Storehouse of Mysteries," as it bears the unmistakable stamp of Súfic speculations (compare HÁFIZ, vol. xi. p. 368). It shows, moreover, a strong resemblance to Násir Khosrau's ethical poems and Saná'í's *Hadíkat-ulhakíkat*, or "Garden of Truth." The date of composition, which varies in the different copies from 552 to 582 A.H., must be fixed in 574 or 575 (1178–79 A.D.), as the author states himself in the prologue that he was forty years old when he wrote it, and the prince to whom he dedicated it—complying so far with the usual custom of his time—was Fakhr-uddín Bahrámsháh, the ruler of the principality of Arzanján, who died after a very long reign 622 A.H. Although the *Makhzan* is mainly devoted to philosophic meditations, the propensity of Nizámí's genius to purely epic poetry, which was soon to assert itself in a more independent form, makes itself felt even here, all the twenty chapters being interspersed with short tales illustrative of the maxims set forth in each. His claim to the title of the foremost Persian romanticist he fully established only a year or two after the *Makhzan* by the publication of his first epic masterpiece *Khosrau and Shírín*, composed, according to the oldest copies, in 576 A.H. (1180 A.D.). As in all his following epopees the subject was taken from what pious Moslems call the time of "heathendom,"—here, for instance, from the old Sassánian story of Sháh Khosrau Parwíz, his love affairs with the princess Shírín of Armenia, his jealousy against the architect Ferhád, for some time his successful rival, of whom he got rid at last by a very ingenious trick, and his final reconciliation and marriage with Shírín; and it is a noteworthy fact that the once so devout Nizámí never chose a strictly Mohammedan legend for his works of fiction. Nothing could prove better the complete revolution in his views, not only on religion, but also on art. He felt, no doubt, that the object of epic poetry was not to teach moral lessons or doctrines of faith, but to depict the good and bad tendencies of the human mind, the struggles and passions of men; and indeed in the whole range of Persian literature only Firdausí and Fakhr-uddín As'ad Jorjání, the author of the older epopee *Wís and Rámín* (about the middle of the 11th century), can compete with Nizámí in the wonderful delineation of character and the brilliant painting of human affections, especially of the joys and sorrows of a loving and beloved heart.

Khosrau and Shírín was inscribed to the reigning atábeg of Azerbaiján, Abú Ja'far Mohammed Pahlawán, and his brother Kizil Arslán, who, soon after his accession to the throne in 582 A.H., showed his gratitude to the poet by summoning him to his court, loading him with honours, and bestowing upon him the revenue of two villages, Hamd and Niján. Nizámí accepted the royal gift, but his resolve to keep aloof from a servile court-life was not shaken by it, and he forthwith returned to his quiet retreat. Meanwhile his genius had not been dormant, and two years after his reception at court, in 584 A.H. (1188 A.D.), he completed his *Díwán*, or collection of kasídas and ghazals (mostly of an ethical and parenetic character), which are said to have numbered 20,000 distichs, although the few copies which have come to us contain only a very small number of verses. About the same time he commenced, at the desire of the ruler of the neighbouring Shírwán, his second romantic poem, the famous Bedouin love-story of *Laila and Majnún*, which has so many points in common with Ariosto's *Orlando Furioso*, and finished it in the short space of four months. A more heroic subject, and the only one in which he made a certain attempt to rival Firdausí, was selected by our poet for his third epopee, the *Iskandarnáma*, or "Book of Alexander," also called *Sharafnáma* or *Iqbálnáma-i-Iskandarí* ("The Fortunes of Alexander"), which is split into two divisions. The first or semi-historical part shows us Alexander the Great as the conqueror of the world, while the second, of a more ethical tendency, describes him in the character of a prophet and philosopher, and narrates his second tour through the world and his adventures in the west, south, east, and north. There are frequent Súfic allegories, just as in the *Makhzan*; and quite imbued with pantheistic ideas is, for instance, the final episode of the first part, the mysterious expedition of Alexander to the fountain of life in the land of darkness.[1] As for the date of composition, it is evident, from the conflicting statements in the different MSS., that there must have been an earlier and a later recension, the former belonging to 587–589 A.H., and dedicated to the prince of Mosul, 'Izz-uddín Mas'úd, the latter made for the atábeg Nusrat-uddín Abú Bakr of Tabríz after 593 A.H., since we find in it a mention of Nizámí's last romance *Haft Paikar*, or the "Seven Beauties," which comprises seven tales related by the seven favourite wives of the Sassánian king Bahrámgúr. In this poem, which was written 593 A.H., at the request of Núr-uddín Arslán of Mosul, the son and successor of the above-mentioned 'Izz-uddín, Nizámí returned once more from his excursion into the field of heroic deeds to his old favourite domain of romantic fiction, and added a fresh leaf to the laurel crown of immortal fame with which the unanimous consent of Eastern and Western critics has adorned his venerable head. The most interesting of the seven tales is the fourth, the story of the Russian princess, in which we recognize at once the prototype of Gozzi's well-known *Turandot*, which was afterwards adapted by Schiller for the German stage. The five mathnawís, from the *Makhzan* to the *Haft Paikar*, form Nizámí's so-called "Quintuple" (*Khamsah*) or "Five Treasures" (*Panj Ganj*), and have been taken as pattern by all the later epic poets in the Persian, Turkish, Chaghatái, and Hindustání languages. Nizámí died at Ganjah in his sixty-fourth year, 599 A.H. (1203 A.D.).

The fullest account of Nizámí is given in Dr W. Bacher's *Nizâmî's Leben und Werke* (Leipsic, 1871; English translation by S. Robinson, London, 1873, reprinted in the same author's *Persian Poetry for English Readers*, 1883, pp. 103–244). All the errors of detail in Bacher's work have been corrected by Dr Rieu in his *Catalogue of the Persian MSS. in the British Museum*, vol. ii., 1881, p. 563 *sq.*

Principal Editions.—The whole *Khamsah* (lithographed, Bombay, 1834 and 1838; Teheran, 1845); *Makhzan-ulasrár* (edited by N. Bland, London, 1844; lithographed, Cawnpore, 1869; English translation in MS. by Hatton Hindley, in the British Museum Add. 6961); *Khosrau and Shírín* (lithographed, Lahore, 1871; German translation by Hammer in *Shírín, ein persisches romantisches Gedicht*, Leipsic, 1809); *Laila and Majnún* (lithographed, Lucknow, 1879; English translation by J. Atkinson, London, 1836); *Haft Paikar* (lithographed, Bombay, 1849; Lucknow, 1873; the fourth tale in German by F. von Erdmann, *Behramgur und die russische Fürstentochter*, Kasan, 1844); *Iskandarnáma*, first part, with commentary (Calcutta, 1812 and 1825; text alone, Calcutta, 1853; lithographed with marginal notes, Lucknow, 1865; Bombay, 1861 and 1875; English translation by H. Wilberforce Clarke, London, 1881; compare also Erdmann, *De Expeditione Russorum Berdaam versus*, Kasan, 1826, and Charmoy, *Expédition d'Alexandre contre les Russes*, St Petersburg, 1829); *Iskandarnáma-i-Bahrí*, second part, edited by Dr Sprenger (Calcutta, 1852 and 1869). (H. E.)

NIZAM'S DOMINIONS. See HYDERABAD, vol. xii. p. 428.

[1] Compare Dr Ethé's essay, "Alexander's Zug zum Lebensquell," in *Sitzungsber. d. bayerisch. Akad.*, 1871, pp. 343–405.

NOAH (נֹחַ, Νῶε, *Noe*) is, according to the book of Genesis, the son of Lamech, and the second father of mankind after the deluge. His name, which is of obscure origin, is connected in Gen. v. 29 with a play on the word נחם (naḥem), to comfort. The story of the flood, the two elements of which the extant narrative is composed, and the parallel traditions of other nations, particularly of the Babylonians, have been spoken of in the article DELUGE. The earlier narrative does not mention the point at which Noah left the ark, and it is doubtful if Gen. xi. 1 *sq.*, which seems to be a fragment of a still older tradition, and which makes mankind disperse from Babylonia, originally stood in any connexion with the story of Noah and the flood. The later priestly (or, as it used to be called, Elohistic) narrative names the mountains of Ararat, *i.e.*, one of the mountains of the land of Ararat, as the place where the ark rested. The identification of this mountain with the Ararat of modern maps (M. Masis) is tolerably old; Jerome (on Isa. xxxvii. 38) already places the land of Ararat in this quarter; but a more ancient Jewish tradition, which remained alive throughout the Middle Ages, seeks Ararat in the land of Kardu, *i.e.*, the mountains of the Kurds east of the Tigris (comp. ARARAT). From the Bible it is only certain (Isa. xxxvii. 38; Jer. li. 27) that the kingdom of Ararat was a remote northern district. After describing the covenant which God made with Noah on leaving the ark (Gen. ix. 1-17) the priestly narrative has nothing further to tell of the patriarch's life; but an older fragment (Gen. ix. 20-27) makes him plant a vineyard and drink of the wine with consequences which lead him to pronounce a blessing on Shem and Japheth and a curse of slavery on Canaan. The story seems to require, for clearness, the omission of the words "Ham, the father of" in verse 22; and if this be so we find that in one tradition the sons of Noah are Shem, Japheth, and Canaan. So taken, the names of the three sons would represent three elements, not in the population of the world, but in that of Palestine. Shem, in Hebrew, means name, and "sons of name," as opposed to "sons of no name" (Job xxx. 8, A. V., "sons of base men"), would naturally denote the Hebrew pure-blooded aristocracy, in antithesis to the subject aborigines (Canaan). Wellhausen, to whom this ingenious theory is due, would further identify Japheth in this passage with the Philistines; Budde thinks rather of the Phœnicians. That the divisions Shem, Ham, and Japheth had not always one fixed sense is clear from Gen. x., where two distinct schemes of classification have been mixed up with such results as that Sheba and Havilah appear under Ham at ver. 7, and under Shem in ver. 28 *sq.* The one division appears to be mainly geographical, and is preserved complete, vers. 2-7, 20-23, 31; it bears the marks of the priestly narrator, and was not written before the exile. On the other hand, vers. 8-19, 25-30 belong to the older narrative, and are fragments of a classification seemingly more ethnographical in character.

NOAILLES. This great French family took its name from the castle of Noailles, in the territory of Ayen, between Brives and Turenne in the Limousin, and dated its nobility from the 11th century. It did not obtain more than local and provincial fame until the 16th century, when its head, ANTOINE de Noailles (1504-1562), became admiral of France, and was ambassador in England during three important years, 1553-1556, during which he maintained a gallant but unsuccessful rivalry with the Spanish ambassador, Simon Renard. HENRI (1554-1623), son of Antoine, was a commander in the religious wars, and was made comte d'Ayen by Henry IV. in 1593. The grandson of the first count played an important part in the Fronde and the early years of the reign of Louis XIV., became a captain-general of the newly-won province of Roussillon, and in 1663 was made duc d'Ayen, and peer of France. The sons of the first duke raised the family to its greatest fame, and occupied very important positions in the later years of the reign of Louis XIV. The elder son, ANNE JULES (1650-1708), was one of the chief generals of France towards the end of the reign of Louis, and, after raising the regiment of Noailles in 1689, he commanded in chief in Spain during the war of the Spanish succession, and was made marshal of France in 1693. The younger son, LOUIS ANTOINE (1651-1729), took orders, and rose to the most important position of the church in France when he was made archbishop of Paris in 1695. He held this high dignity for more than thirty years, until his death in 1729; he was made a cardinal in 1700. These two distinguished brothers had made their family the most famous in France, with the exception of the Rohans, and the name occurs with almost confusing reiteration throughout the 18th century. ADRIEN MAURICE (1678-1766), the third duke, was also a soldier, and learned war under his father in Spain. He served in all the most important wars of the reign of Louis XV. in Italy and Germany, and became the second maréchal de Noailles in 1734. His last command in the war of the Austrian succession was not a successful one, for he was beaten by the English at the battle of Dettingen in 1743. Two sons of the third duke also attained the rank of marshal of France. The elder, LOUIS (1713-1793), who bore the title of duc d'Ayen till his father's death in 1766, when he became duc de Noailles, served in most of the wars of the 18th century without particular distinction, but was nevertheless made a marshal of France, as the maréchal de Noailles, in 1775. He refused to emigrate during the Revolution, but escaped the fate of most noblemen by dying in August 1793, before the Terror reached its height. On the 4th Thermidor, just before the fall of Robespierre, the aged duchesse de Noailles was executed with her daughter-in-law, the duchesse d'Ayen, and her granddaughter, the vicomtesse de Noailles. JEAN PAUL FRANÇOIS (1739-1824), the fifth duke, was, like his family, in the army, but his heart was bent on scientific pursuits, and for his eminence as a chemist he was elected a member of the Academy of Sciences in 1777. He became duc d'Ayen in 1766 on his grandfather's death, and duc de Noailles on his father's in 1793. Having emigrated in 1792, he lived in Switzerland until the restoration in 1814, when he took his seat as a peer of France. He had no son, but several daughters, one of whom married La Fayette, and another her cousin, the vicomte de Noailles. He was succeeded as duc de Noailles by his grand-nephew, PAUL (b. 1802), who has won some reputation as an author, and who became a member of the French Academy in the place of Chateaubriand in 1849. The grandfather of Paul de Noailles, and brother of the fifth duke, EMMANUEL MARIE LOUIS (1743-1822), marquis de Noailles, was a distinguished diplomatist of the 18th century: he was ambassador at Amsterdam from 1770-1776, at London 1776-1783, and at Vienna 1783-1792; and, like his brother, he survived the Revolution, and lived to see the Restoration.

One other branch of the family deserves notice. PHILIPPE (1715-1794), comte de Noailles, was a younger brother of the fourth duke, and a more distinguished soldier than his brother. He served at Minden and in other campaigns, and was made a marshal on the same day as his brother, under the title of maréchal de Mouchy. He was long in great favour at court, and his wife was first lady of honour to Marie Antoinette, and was nicknamed by her Madame Étiquette. This court favour brought down punishment in the days of the Revolution, and the old marshal and his wife were guillotined on the 27th June 1794. His two sons, the prince de Poix and the vicomte de Noailles, were both members of the Constituent Assembly. The prince de Poix, who was a captain of the body guards, sat on the right of the assembly, and emigrated in 1792, but, surviving the

Revolution, he returned to Paris in 1814, and was made a lieutenant-general. LOUIS MARIE (1756-1804), vicomte de Noailles, was the second son of the maréchal de Mouchy, and the most distinguished of all his family. He served brilliantly under his brother-in-law La Fayette in America, and was the officer who concluded the capitulation of Yorktown. He was elected to the states-general in 1789, and at once showed his enthusiasm for liberty. He began the famous "orgie," as Mirabeau called it, on 4th August, when all privileges were abolished, and with d'Aiguillon proposed the abolition of titles and liveries in June 1790. When the Revolution became more pronounced he emigrated to America, and became a partner in Bingham's bank at Philadelphia. He was very successful, and might have lived happily had he not accepted a command against the English in San Domingo, under Rochambeau. He made a brilliant defence of the mole St Nicholas, and escaped with the garrison to Cuba: but in making for Havana his ship was attacked by an English frigate, and after a long engagement he was severely wounded, and died of his wounds on 9th January 1804. The whole family of Noailles had not a more brilliant representative than the friend of La Fayette, Louis, vicomte de Noailles.

NOÁKHÁLÍ, or NOACOLLY, a district in the lieutenant-governorship of Bengal, India, lying between 22° 22′ and 23° 17′ N. lat. and 90° 43′ and 91° E. long, bounded on the N. by Tipperah, on the E. by Hill Tipperah state and Chittagong, on the S. by the Bay of Bengal, and on the W. by the main stream of the Meghná, with an area of 1641 square miles, consists of an alluvial tract of mainland, together with several islands at the mouth of the Meghná. In general, each homestead is surrounded by a thick grove of betel and cocoa-nut palms, and in the north-western tracts dense forests of betel-nut palms extend for miles. The district is very fertile; and, with the exception of some sandbanks and recent accretions, every part of it is under continuous cultivation. The process of alluvion is gradually but steadily going on, the mainland extending seawards. Wild animals and small game are numerous.

The population of the district was 820,772 in 1881, of whom 608,592 were Mohammedans. The district contains no town exceeding 5000 inhabitants. Sudháram, the civil station, is little more than a large village, with a population (in 1872) of 4752. Rice forms the great staple of cultivation: and rice, betel-nuts, and cocoa-nuts are exported. Noákhálí is peculiarly liable to destructive floods from the sea, generally caused by southerly gales or cyclones occurring at the time when the Meghná is swollen by heavy rains, and at flood-tides,—the tidal bore being sometimes 20 feet high, and moving at the rate of 15 miles an hour. The cyclone and storm-wave of 31st October 1876 was terribly disastrous, sweeping over the whole delta of the Meghná. The loss of human life was estimated at 100,000.

The Mohammedan population of the islands at the mouth of the Meghná practised piracy up to a comparatively recent date, and at the beginning of the 17th century Portuguese pirates, under Sebastian Gonzales, occupied Sandwip. They were ultimately reduced to subjection by Sháistá Khán, the governor of Bengal, about the middle of the century; and their descendants have gradually sunk to the level of the natives surrounding them, whose dress, customs, and language they have, for the most part, adopted. They are Christians, and retain the old Portuguese names. About 1756 the East India Company established factories in Noákhálí and Tipperah, the ruins of some of which still remain.

NOBILI, LEOPOLDO (1784-1834), was in youth an officer of artillery, but afterwards became professor of physics in the archducal museum at Florence, the old habitat of the *Accademia del Cimento*. His most valuable contributions to science consist in the suggestion of the astatic combination of two needles, by which the sensibility of a galvanometer is so greatly increased, and in the invention of the so-called thermo-multiplier or thermo-electric pile. His own experimental work with these instruments was soon eclipsed by the brilliant applications made of them by Melloni and Forbes. He also discovered the exquisitely coloured transparent films of metal deposited by electro-chemical processes, which from their common form are usually known as Nobili's rings. Guebhard has lately improved the process for producing them. Nobili has left a large number of theoretical writings, chiefly on magnetism, light, and electricity, most of which are to be found in the *Bibliothèque Universelle* of Geneva. It is worthy of note that for the measurement of currents he seems to have preferred the use of his "rings" to the use of the galvanometer.

NOBILITY. To form a true understanding of what is strictly implied in the word "nobility" it is needful to distinguish its meaning from that of several words with which it is likely to be confounded. In England nobility is apt to be confounded with the peculiar institution of the British peerage. Yet nobility, in some shape or another, has existed in most places and times of the world's history, while the British peerage is an institution purely local, and one which has actually hindered the existence of a nobility in the sense which the word bears in most other countries. Nor is nobility the same thing as aristocracy. This last is a word which is often greatly abused; but, whenever it is used with any regard to its true meaning, it is a word strictly political, implying a particular form of government. But nobility is not necessarily a political term; the distinction which it implies may be accompanied by political privileges or it may not. Again, it is sometimes thought that both nobility and aristocracy are in some special way connected with kingly government. To not a few it would seem a contradiction to speak of nobility or aristocracy in a republic. Yet, though many republics have eschewed nobility, there is nothing in a republican, or even in a democratic, form of government inconsistent with the existence of nobility; and it is only in a republic that aristocracy, in the strict sense of the word, can exist. Aristocracy implies the existence of nobility; but nobility does not imply aristocracy; it may exist under any form of government. The peerage, as it exists in the three British kingdoms, is something which is altogether peculiar to the three British kingdoms, and which has nothing in the least degree like it elsewhere.

Nobility, then, in the strict sense of the word, is the hereditary handing on from generation to generation of some acknowledged pre-eminence, a pre-eminence founded on hereditary succession, and on nothing else. Such nobility may be immemorial or it may not. There may or there may not be a power vested somewhere of conferring nobility; but it is essential to the true idea of nobility that, when once acquired, it shall go on for ever to all the descendants—or, more commonly, only to all the descendants in the male line—of the person first ennobled or first recorded as noble. The pre-eminence so handed on may be of any kind, from substantial political power to mere social respect and precedence. It does not seem necessary that it should be formally enacted by law if it is universally acknowledged by usage. It may be marked by titles or it may not. It is hardly needful to prove that nobility does not imply wealth, though nobility without wealth runs some risk of being forgotten. This definition seems to take in all the kinds of nobility which have existed in different times and places. They have differed widely in the origin of the noble class and in the amount of privilege implied in membership of it; but they all agree in the transmission of some privilege or other to all the descendants, or to all the male descendants, of the first noble. Definition.

In strictness nobility and gentry are the same thing. This fact is overshadowed in England, partly by the habitual use of the word "gentleman" in various secondary uses, partly by the prevalent confusion between nobility and peerage. But that they are the same is proved by the use of the French word *gentilhomme*, a word which has pretty well passed out of modern use, but which, as long as it remained in use, never lost its true meaning. There were very wide distinctions within the French *noblesse*, but they all formed one privileged class as distinguished Nobility and gentry.

from the *roturier*. Here, then, is a nobility in the strictest sense. If there is no such class in England, it is simply because the class which answers to it has never been able to keep any universally acknowledged privileges. The word "gentleman" has lost its original meaning in a variety of other uses, while the word "nobleman" has come to be confined to members of the peerage and a few of their immediate descendants.

That the English peerage does not answer to the true idea of a nobility will be seen with a very little thought. There is no handing on of privilege or pre-eminence to perpetual generations. The peer holds a great position, endowed with substantial powers and privileges, and those powers and privileges are handed on by hereditary succession. But they are handed on only to one member of the family at a time. The peer's children, in some cases his grandchildren, have titles and precedence, but they have no substantial privileges. His remoter descendants have no advantage of any kind over other people, except their chance of succeeding to the peerage. The remote descendant of a duke, even though he may chance to be heir presumptive to the dukedom, is in no way distinguished from any other gentleman; it is even possible that he may not hold the social rank of gentleman. This is not nobility in the true sense; it is not nobility as nobility was understood either in the French kingdom or in the Venetian commonwealth.

Nobility thus implies the vesting of some hereditary privilege or advantage in certain families, without deciding in what such privilege or advantage consists. Its nature may differ widely according to the causes which have led to the establishment of the distinction between family and family in each particular case. The way in which nobility has arisen in different times and places is very various, and there are several nations whose history will supply us with examples of a nobility of one kind giving way to a nobility of another kind. The history of the Roman commonwealth illustrates this perhaps better than any other. What we may call the nobility of earlier occupation makes way for the nobility of office. Our first glimpses of authentic Roman history set before us two orders in the same state, one of which is distinguished from the other by many exclusive privileges. The privi-

oman *'opulus*, leged order—the *populus*, *patres*, patricians—has all the characteristics which we commonly expect to find in a privileged order. It is a minority, a minority strictly marked out by birth from other members of the commonwealth, a minority which seems further, though this point is less clearly marked, to have had on the whole the advantage in point of wealth. When we are first entitled to speak with any kind of certainty, the non-privileged class possess a certain share in the election of magistrates and the making of laws. But the privileged class alone are eligible to the greatest offices of the state; they have in their hands the exclusive control of the national religion; they have the exclusive enjoyment of the common land of the state,—in Teutonic phrase, the *folkland*. A little research shows that the origin of these privileges was a very simple one. Those who appear in later times as a privileged order among the people had once been the whole people. The patricians, *patres*, housefathers, goodmen—so lowly is the origin of that proud name—were once the whole Roman people, the original inhabitants of the Roman hills. They were the true *populus Romanus*, alongside of whom grew up a secondary Roman people, the *plebs* or commons. As new settlers came, as the people of conquered towns were moved to Rome, as the character of Romans was granted to some allies and forced upon some enemies, this *plebs*, sharing some but not all of the rights of citizens, became a non-privileged order alongside of a privileged order. As the non-privileged order increased in numbers, while the privileged order, as every exclusive hereditary body must do, lessened, the larger body gradually put on the character of the nation at large, while the smaller body put on the character of a nobility. But their position as a nobility or privileged class arose solely because a class with inferior rights to their own grew up around them. They were not a nobility or a privileged class as long as there was no less privileged class to distinguish them from. Their exclusive possession of power made the commonwealth in which they bore rule an aristocracy; but they were a democracy among themselves. We see indeed faint traces of distinction among the patricians themselves, which may lead us to guess that the equality of all patricians may have been won by struggles of unrecorded days, not unlike those which in recorded days brought about the equality of patrician and plebeian. But at this we can only guess. The Roman patricians, the true Roman *populus*, appear at our first sight of them as a body democratic in its own constitution, but standing out as an order marked by very substantial privileges indeed from the other body, the *plebs*, also democratic in its own constitution, but in every point of honour and power the marked inferior of the *populus*.

The old people of Rome thus grew, or rather shrank up, into a nobility by the growth of a new people by their side which they declined to admit to a share in their rights, powers, and possessions. A series of struggles raised this new people, the *plebs*, to a level with the old people, the *populus*. The gradual character of the process is not the least instructive part of it. There are two marked stages in the struggle. In the first the plebeians strive to obtain relief from laws and customs which were actually oppressive to them, while they were profitable to the patricians. When this relief has been gained by a series of enactments, a second struggle follows, in which the plebeians win political equality with the patricians. In this second struggle, too, the ground is won bit by bit. No general law was ever passed to abolish the privileges of the patricians; still less was any law ever passed to abolish the distinction between patrician and plebeian. All that was done was done step by step. First, marriage between the two orders was legalized. Then one law admitted plebeians to one office, another law to another. Admission to military command was won first, then admission to civil jurisdiction; a share in religious functions was won last of all. And some offices, chiefly those religious offices which carried no political power with them, always remained the exclusive property of the patricians, because no special law was ever passed to throw them open to plebeians. In this gradual way every practical advantage on the part of the patricians was taken away. But the result did not lead to the abolition of all distinctions between the orders. Patricians and plebeians went on as orders defined by law, till the distinction died out in the confusion of things under the empire, till at last the word "patrician" took quite a new meaning. The distinction, in truth, went on till the advantage turned to the side of the plebeians. Both consuls might be plebeians, both could not be patricians; a patrician could not wield the great powers vested in the tribunes of the commons. These were greater advantages than the exclusive patrician possession of the offices of *interrex*, *rex sacrorum*, and the higher flamens. And, as the old distinction survived in law and religion after all substantial privileges were abolished, so presently a new distinction arose of which law and religion knew nothing, but which became in practice nearly as marked and quite as important as the older one.

This was the growth of the new nobility of Rome, that body, partly patrician, partly plebeian, to which the name

nobilitas strictly belongs in Roman history. This new nobility gradually became as well marked and as exclusive as the old patriciate. But it differed from the old patriciate in this, that, while the privileges of the old patriciate rested on law, or perhaps rather on immemorial custom, the privileges of the new nobility rested wholly on a sentiment of which men could remember the beginning. Or it would be more accurate to say that the new nobility had really no privileges at all. Its members had no legal advantages over other citizens. They were a social caste, which strove to keep, and which largely succeeded in keeping, all high offices and political power in its own hands. Such privileges, even of an honorary kind, as the nobles did enjoy by law belonged to them, not as nobles, but as senators and senators' sons. Yet practically the new nobility was a privileged class; it felt itself to be so, and it was felt to be so by others. This nobility consisted of all those who, as descendants of curule magistrates, had the *jus imaginum*,—that is, who could point to forefathers ennobled by office. That is to say, it consisted of the remains of the old patriciate, together with those plebeian families any members of which had been chosen to curule offices. These were naturally those families which had been patrician in some other Italian city, but which were plebeian at Rome. Many of them equalled the patricians in wealth and antiquity of descent, and as soon as intermarriage was allowed they became in all things their social equals. The practical result of the Licinian reform was that the great plebeian families became, for all practical purposes, patrician. They separated themselves from the mass of the plebeians to form a single body with the surviving patricians. Just as the old patricians had striven to keep plebeians out of high offices, so now the new nobles, patrician and plebeian alike, strove to keep "new men," men who had not the *jus imaginum*, out of high office. But there was still the difference that in the old state of things the plebeian was shut out by law, while in the new state of things no law shut out the new man. It needed a change in the constitution to give the consulship to Lucius Sextius; it needed only union and energy in the electors to give it to Caius Marius.

The Roman case is often misunderstood, because the later Roman writers did not fully understand the case themselves. Livy could never get rid of the idea that the old struggle between patrician and plebeian was something like the struggle between the nobility and the people at large in the later days of the commonwealth. In a certain sense he knew better; at any rate, he often repeats the words of those who knew better; but the general impression given by his story is that the plebeians were a low mob and their leaders factious and interested ringleaders of a mob. The case is again often misunderstood because the words "patrician" and "plebeian," like so many other technical Roman and Greek words, have come in modern language to be used in a way quite unlike their original sense. The word "plebeian," in its strict sense, is no more contemptuous than the word *commoner* in England. The *plebs*, like the English commons, contained families differing widely in rank and social position. Among them those families which, as soon as an artificial barrier broke down, joined with the patricians to form the new nobility. The whole lesson is lost if the words "patrician" and "plebeian" are used in any but their strict sense. The Catuli and Metelli, among the proudest nobles of Rome, were plebeians, and as such could not have been chosen to the purely patrician office of *interrex*, or *flamen* of Jupiter. Yet even in good writers on Roman history the words "patrician" and "plebeian" are often misapplied by being transferred to the later disputes at Rome, in which they are quite out of place.

Comparison between Roman and Athenian nobilities.

We may now compare the history of nobility at Rome with its history in some other of the most famous city-commonwealths. Thus at Athens its history is in its main outlines very much the same as its history at Rome up to a certain point, while there is nothing at Athens which at all answers to the later course of things at Rome. At Athens, as at Rome, an old patriciate, a nobility of older settlement, a nobility which had once been the whole people, was gradually shorn of all exclusive privilege, and driven to share equal rights with a new people which had grown up around it. The reform of Clisthenes answers in a general way to the reform of Licinius, though the different circumstances of the two cities hinder us from carrying out the parallel into detail. But both at Rome and at Athens we see, at a stage earlier than the final reform, an attempt to set up a standard of wealth, either instead of or alongside of the older standard of birth. This same general idea comes out both in the constitution of Servius and in the constitution of Solon, though the application of the principle is different in the two cases. Servius made voting power depend on income; by Solon the same rule was applied to qualification for office. By this change power is not granted to every citizen, but it is put within the reach of every citizen. No man can change his forefathers, but the poor man may haply become richer. The Athenian εὐπατρίδαι, who were thus gradually brought down from their privileged position, seem to have been quite as proud and exclusive as the Roman patricians; but when they lost their privileges they lost them far more thoroughly, and they did not, as at Rome, practically hand on many of them to a new nobility, of which they formed part, though not the whole. While at Rome the distinction of patrician and plebeian was never wiped out, while it remained to the last a legal distinction even when practical privilege had turned the other way, at Athens, after the democracy had reached its full growth, the distinction seems to have had no legal existence whatever. At Rome down to the last it made a difference whether the candidate for office was patrician or plebeian, though the difference was in later times commonly to the advantage of the plebeian. At Athens, at any rate after Aristides, the eupatrid was neither better nor worse off than another man.

But, what is of far greater importance, there never arose at Athens any body of men which at all answered to the *nobilitas* of Rome. We see at Athens strong signs of social distinctions, even at a late period of the democracy; we see that, though the people might be led by the low-born demagogue—using that word in its strict and not necessarily dishonourable meaning—their votes most commonly fell on men of ancient descent. We see that men of birth and wealth often allowed themselves a strange licence in dealing with their low-born fellow-citizens. But we see no sign of the growth of a body made up of patricians and leading plebeians who contrived to keep office to themselves by a social tradition only less strong than positive law. We have at Athens the exact parallel to the state of things when Appius Claudius shrank from the thought of the consulship of Caius Licinius; we have no exact parallel to the state of things when Quintus Metellus shrank from the thought of the consulship of Caius Marius. The cause of the difference seems to be that, while the origin of the patriciate was exactly the same at Rome and at Athens, the origin of the commons was different. The four Ionic tribes at Athens seem to have answered very closely to the three patrician tribes at Rome; but the Athenian *demos* grew up in a different way from the Roman *plebs*. If we could believe that the Athenian *demos* arose out of the union of the other Attic towns with Athens, this would be an exact analogy to the origin of the Roman *plebs*; the εὐπατρίδαι would be the Athenians and the *demos* the

Atticans (Ἀττικοί). But from such glimpses of early Attic history as we can get the union of the Attic towns would seem to have been completed before the constitutional struggle began. That union would answer rather to the union of the three patrician tribes of Rome. Such hints as we have, while they set before us, just as at Rome, a state of things in which small landed proprietors are burthened with debt, also set before us the Attic *demos* as, largely at least, a body of various origins which had grown up in the city. Clisthenes, for instance, enfranchised many slaves and strangers, a course which certainly formed no part of the platform of Licinius, and which reminds us rather of Cnæus Flavius somewhat later. On the whole it seems most likely that, while the kernel of the Roman *plebs* was rural or belonged to the small towns admitted to the Roman franchise, the Attic *demos*, largely at least, though doubtless not wholly, arose out of the mixed settlers who had come together in the city, answering to the μέτοικοι of later times. If so, there would be no place in Athens for those great plebeian houses, once patrician in some other commonwealth, out of which the later Roman *nobilitas* was so largely formed.

Sparta. Thus the history of nobility at Athens supplies a close analogy to the earlier stages of its history at Rome, but it has nothing answering to its later stages. At Sparta we have a third instance of a people shrinking up into a nobility, but it is a people whose position differs altogether from anything either at Rome or at Athens. Sparta is the best case of a nobility of conquest. This is true, whether we look on the περίοικοι as Achaians or as Dorians, or as belonging some to one race and some to the other. In any case the Spartans form a ruling body, and a body whose privileged position in the land is owing to conquest. The Spartans answer to the patricians, the περίοικοι to the *plebs*; the helots are below the position of *plebs* or *demos*. The only difference is that, probably owing to the fact that the distinction was due to conquest, the local character of the distinction lived on much longer than it did at Rome. We hardly look on the Spartans as a nobility among the other Lacedæmonians; Sparta rather is a ruling city bearing sway over the other Lacedæmonian towns. But this is exactly what the original Roman patricians, the settlers on the three oldest hills, were in the beginning. The so-called cities (πόλεις) of the περίοικοι answered pretty well to the local plebeian tribes; the difference is that the περίοικοι never became a united corporate body like the Roman *plebs*. Sparta to the last remained what Rome was at the beginning, a city with a *populus* (δῆμος) but no *plebs*. And, as at Rome in early times, there were at Sparta distinctions within the *populus*; there were ὅμοιοι and ὑπομείονες, like the *majores* and *minores gentes* at Rome. Only at Rome, where there was a *plebs* to be striven against, these distinctions seem to have had a tendency to die out, while at Sparta they seem to have had a tendency to widen. The Spartan patriciate could afford to disfranchise some of its own members.

The other old Greek cities, as well as those of mediæval Italy and Germany, would supply us with endless examples of the various ways in which privileged orders arose. Venice, a city not exactly belonging to any of these classes, essentially a city of the Eastern empire and not of the Western, gives us an example than which none is more instructive. The renowned patriciate of Venice was as far removed as might be from the character either of a nobility of conquest or of a nobility of older settlement. Nor was it strictly a nobility of office, though it had more in common with that than with either of the other two. As Athens supplies us with a parallel to the older nobility of Rome without any parallel to the later, so Venice supplies us with a parallel to the later nobility of Rome without any parallel to the earlier. Athens has Fabii and Claudii, but no Catuli or Metelli; Venice has Catuli and Metelli, but no Fabii or Claudii.

In one point, however, the Venetian nobility differed from either the older or the newer nobility of Rome, and also from the older nobilities of the mediæval Italian cities. Nowhere else did nobility so distinctly rise out of wealth, and that wealth gained by commerce. In the original island territory of Venice there could be no such thing as landed property. The agricultural plebeian of old Rome and the feudal noble of contemporary Europe were both of them at Venice impossible characters. The Venetian nobility is an example of a nobility which gradually arose out of the mass of the people as certain families step by step drew all political power into their own hands. The *plebs* did not gather round the *patres*, neither were they conquered by the *patres*; the *patres* were developed by natural selection out of the *plebs*, or, more strictly, out of the ancient *populus*. The *commune* of Venice, the ancient style of the commonwealth, changed into the *seigniory* of Venice. Political power was gradually confined to those whose forefathers had held political power. This was what the later nobility of Rome was always striving at, and what they did to a great extent practically establish. But, as the exclusive privileges of the nobility were never recognized by any legal or formal act, men like Caius Marius would ever and anon thrust themselves in. The privileges which the Venetian nobility took to themselves were established by acts which, if not legal, were at least formal. The Roman nobility, resting wholly on sufferance, was overthrown by the ambition of one of its own members. The Venetian nobility, resting also in its beginnings on sufferance, but on sufferance which silently obtained the force of law, lasted as long as Venice remained a separate state. Venice.

The hereditary oligarchy of Venice was established by a series of changes which took place between the years 1297 and 1319. All of them together really go to make up the "Shutting of the Great Council," a name which is formally given to the act of the first of those years. In 1172 the Great Council began as an elective body; it gradually ousted the popular assembly from all practical power. It was, as might be looked for, commonly filled by members of distinguished families, descendants of ancient magistrates, who were already beginning to be looked on as noble. The series of revolutions already spoken of first made descent from former councillors a necessary qualification for election to the council; then election was abolished, and the council consisted of all descendants of its existing members who had reached the age of twenty-five. Thus the *optimates* of Venice did what the *optimates* of Rome strove to do: they established a nobility whose one qualification was descent from those who had held office in past times. This is what the nobility of office, if left unchecked, naturally grows into. But the particular way in which oligarchy was finally established at Venice had some singular results. Some of the great families which were already looked on as noble were not represented in the council at the time of the shutting; of others some branches were represented and others not. These families and branches of families, however noble they might be in descent, were thus shut out from all the political privileges of nobility. When one branch of a family was admitted and one shut out we have an analogy to the patrician and plebeian Claudii, though the distinction had come about in quite another way. And in the Great Council itself we have the lively image of the aristocratic popular assembly of Rome, the assembly of the *populus*, that of the *curiæ*, where every man of patrician birth had his place. The two institutions are the

The Roman *Curiæ* and the Great Council of Venice.

same, only the way in which they came about is exactly opposite. The assembly of *curiæ* at Rome, originally the democratic assembly of the original people, first grew into an aristocratic assembly, and then died out altogether as a new Roman people, with its own assembly, grew up by its side. It was a primitive institution which gradually changed its character by force of circumstances. It died out, supplanted by other and newer powers, when it became altogether unsuited to the times. The Great Council of Venice was anything but a primitive institution; it was the artificial institution of a late age, which grew at the expense of earlier institutions, of the prince on the one side and of the people on the other. But the two different roads led to the same result. The Great Council of Venice, the *curiæ* of Rome, were each of them the assembly of a privileged class, an assembly in which every member of that class had a right to a place, an assembly which might be called popular as far as the privileged class was concerned, though rigidly oligarchic as regarded the excluded classes. But, close as the likeness is, it is merely a superficial likeness, because it is the result of opposite causes working in opposite directions. It is like two men who are both for a moment in the same place, though their faces are turned in opposite ways. If the later *nobilitas* of Rome had established an assembly in which every one who had the *jus imaginum* had a vote and none other, that would have been a real parallel to the shutting of the Venetian Great Council; for it would have come about through the working of causes which are essentially the same.

The Nobility of Venice an Aristocracy.

The nobility which was thus formed at Venice is the very model of a civic nobility, a nobility which is also an aristocracy. In a monarchy, despotic or constitutional, there cannot in strictness be an aristocracy, because the whole political power cannot be vested in the noble class. But in the Venetian commonwealth the nobility was a real aristocracy. All political power was vested in the noble class; the prince sank to a magistrate, keeping only some of the outward forms of sovereignty; the mass of the people were shut out altogether. And, if no government on earth ever fully carried out the literal meaning of aristocracy as the rule of the best, these civic nobilities come nearer to it than any other form of government. They do really seem to engender a kind of hereditary capacity in their members. Less favourable than either monarchy or democracy to the growth of occasional great men, they are more favourable than either to the constant supply of a succession of able men, qualified to carry on the work of government. Their weak point lies in their necessary conservatism; they cannot advance and adapt themselves to changed circumstances, as either monarchy or democracy can. When, therefore, their goodness is gone, their corruption becomes worse than the corruption of either of the other forms of government.

Civic aristocracies.

All this is signally shown in the history both of Venice and of other aristocratic cities. But we are concerned with them now only as instances of one form of nobility. The civic aristocracies did not all arise in the same way. Venice is the best type of one way in which they rose; but it is by no means the only way. In not a few of the Italian cities nobility had an origin and ran a course quite unlike the origin and the course which were its lot at Venice. The nobles of many cities were simply the nobles of the surrounding country changed, sometimes greatly against their will, into citizens. Such a nobility differed far more widely from either the Roman or the Venetian patriciate than they differed from one another. It wanted the element of legality, or at least of formality, which distinguished both these bodies. The privileges of the Roman patriciate, whatever we may call them, were not usurpations; and, if we call the privileges of the Venetian nobility usurpations, they were stealthy and peaceful usurpations, founded on something other than mere violence. But in many Italian cities the position of the nobles, if it did not begin in violence, was maintained by violence, and was often overthrown by violence. They remained, in short, as unruly and isolated within the walls of the cities as they had ever been without. A nobility of this kind often gave way to a democracy which either proved as turbulent as itself, or else grew into an oligarchy ruling under democratic forms. Thus at Florence the old nobles became the opposite to a privileged class. The process which at Rome gradually gave the plebeian a political advantage over the patrician was carried at Florence to a far greater length at a single blow. The whole noble order was disfranchised; to be noble was equivalent to being shut out from public office. But something like a new nobility presently grew up among the commons themselves; there were *popolani grossi* at Florence just as there were noble plebeians at Rome. Only the Roman commons, great and small, never shut out the patricians from office; they were satisfied to share office with them. In short, the shutting out of the old nobility was, if not the formation of a new nobility, at least the formation of a new privileged class. For a certain class of citizens to be condemned, by virtue of their birth, to political disfranchisement is as flatly against every principle of democracy as for a certain class of citizens to enjoy exclusive rights by reason of birth. The Florentine democracy was, in truth, rather to be called an oligarchy, if we accept the best definition of democracy (see Thucydides, vi. 39), namely, that it is the rule of the whole, while oligarchy is the rule of a part only.

It is in these aristocratic cities, of which Venice was the most fully developed model, that we can best see what nobility really is. It is in these only that we can see nobility in its purest form—nobility to which no man can rise and from which no man can come down except by the will of the noble class itself. In a monarchy, where the king can ennoble, this ideal cannot be kept. Nor could it be kept in the later nobility of Rome. The new man had much to strive against, but he could sometimes thrust himself through, and when he did his descendants had their *jus imaginum*. But at Venice neither prince nor people could open the door of the Great Council; only the Great Council itself could do that. That in the better times of the aristocracy nobility was not uncommonly granted to worthy persons, that in its worse times it was more commonly sold to unworthy persons, was the affair of the aristocratic body itself. That body, at all events, could not be degraded save by its own act. But these grants and sales led to distinctions within the ranks of the noble order, like those of which we get faint glimpses among the Roman patricians. The ducal dignity rarely passed out of a circle of specially old and distinguished families. But this has often been the case with the high magistracies of commonwealths whose constitutions were purely democratic.

Rura[l] Nobi[lity]

From this purest type of nobility, as seen in the aristocratic commonwealths, we may pass to nobility as seen in states of greater extent—that is, for the most part in monarchies. There are two marked differences between the two. They are differences which seem to be inherent in the difference between a republic and a monarchy, but which it would be truer to say are inherent in the difference between a body of men packed close together within the walls of a city and a body of men—if we can call them a body—scattered over a wide territory. The member of a civic nobility is more than a member of an order; he is a member of a corporation; he has no powers, he has hardly

any being, apart from the body of which he is a member. He has a vote in making the laws or in choosing those who make them; but when they are made he is, if anything, more strictly bound by them than the citizen of the non-privileged order. To be a fraction of the corporate sovereign, if it had its gains, had also its disadvantages; the Venetian noble was fettered by burthens, restrictions, and suspicions from which the Venetian citizen was free. The noble of the large country, on the other hand, the rural noble, as he commonly will be, is a member of an order, but he is hardly a member of a corporation; he is isolated; he acts apart from the rest of the body and wins powers for himself apart from the rest of the body. He shows a tendency—a tendency whose growth will be more or less checked according to the strength of the central power—to grow into something of a lord or even a prince on his own account, a growth which may advance to the scale of a German elector or stop at that of an English lord of a manor. Now many of these tendencies were carried into those Italian cities where the civic nobility was a half-tamed country nobility: but they have no place in the true civic aristocracies. Let us take one typical example. In many parts of western Europe the right of private war long remained the privilege of every noble, as it had once been the privilege of every freeman. And in some Italian cities, the right, or at least the privilege, of private war was continued within the city walls. But no power of imagination can conceive an acknowledged right of private war in Rome, Venice, or Bern.

The other point of difference is that, whatever we take for the origin and the definition of nobility, in most countries it became something that could be given from outside, without the need of any consent on the part of the noble class itself. In other words, the king or other prince can ennoble. We have seen how much this takes away from the true notion of nobility as understood in the aristocratic commonwealths. The nobility is no longer all-powerful; it may be constrained to admit within its own body members for whose presence it has no wish. Where this power exists the nobility is no longer in any strictness an aristocracy; it may have great privileges, great influence, even great legal powers, but it is not the real ruling body, like the true aristocracy of Venice.

Nobilities in early Western Europe.

In the modern states of western Europe the existing nobility seems to have for the most part had its origin in personal service to the prince. And this nobility by personal service seems commonly to have supplanted an older nobility, the origin of which was, in some cases at least, strictly immemorial. Of this process in England, the substitution of the later nobility of the thegns for the older nobility of the eorls, something has already been said in the article ENGLAND (vol. viii. pp. 274-5). Now the analogy between this change and the change from the Roman patriciate to the later Roman *nobilitas* is obvious. In both cases the older nobility gives way to a newer; and in both cases the newer nobility was a nobility of office. Under a kingly government office bestowed by the sovereign holds the same place which office bestowed by the people holds in a popular government. This new nobility of office supplanted, or perhaps rather absorbed, the older nobility, just as the later *nobilitas* of Rome supplanted or absorbed the old patriciate. In our first glimpse of Teutonic institutions, as given us by Tacitus, this older nobility appears as strictly immemorial (see Waitz, *Deutsche Verfassungsgeschichte*, i. 185 *sq.*), and its immemorial character appears also in the well-known legend in the *Rigsmal-saga* of the separate creation of jarl, karl, and thrall. These represent the three classes of mankind according to old Teutonic ideas—the noble, the simple freeman, and the bondman. The kingly house, where there is one, is not a distinct class; it is simply the noblest of the noble. For, as almost everywhere else, this Teutonic nobility admits of degrees, though it is yet harder to say in what the degrees of nobility consisted than to say in what nobility consisted itself. The older nobility is independent of the possession of land; it is independent of office about the sovereign; it is hard to say what were the powers and privileges attached to it; but of its existence there is no doubt. But in no part of Europe can the existing nobility trace itself to this immemorial nobility of primitive days; the nobility of mediæval and modern days springs from the later nobility of office. The nobles of modern Europe are rather *thegnas* than *eorlas*. The eorl of the old system would doubtless commonly become a thegn under the new, as the Roman patrician took his place in the new *nobilitas*; but others could take their place there also. The Old-English laws point out ways by which the churl might rise to thegn's rank, and in the centuries during which the change went on we find mention—complaining mention—both in England and elsewhere, at the court of Charles the Simple and at the court of Æthelred, of the rise of new men to posts of authority. The story that Earl Godwine himself was of churlish birth, whether true or false, marks the possibility of such a rise. A still wilder tale spoke of Hugh Capet as the son of a butcher of Paris. Stories like these prove even more than the real rise of Hagano and Eadric.

England

In England the nobility of the thegns was to a great extent personally displaced, so to speak, by the results of the Norman Conquest. But the idea of nobility did not greatly change. The English thegn sometimes yielded to, sometimes changed into, the Norman baron, using that word in its widest sense, without any violent alteration in his position. The notion of holding land of the king became more prominent than the notion of personal service done to the king; but, as the land was held by the tenure of personal service, the actual relation hardly changed. But the connexion between nobility and the holding of land comes out in the practice by which the lord so constantly took the name of his lordship. It is in this way that the prefixes *de* and *von*, descriptions in themselves essentially local, have become in other lands badges of nobility. This notion has died out in England by the dropping of the preposition; but it long lived on wherever Latin or French was used. And before long nobility won for itself a distinguishing outward badge. The device of hereditary coat-armour, a growth of the 12th century, did much to define and mark out the noble class throughout Europe. As it could be acquired by grant of the sovereign, and as, when once acquired, it went on from generation to generation, it answers exactly to the *jus imaginum* at Rome, the hereditary badge of nobility conferred by the election of the people. Those who possessed the right of coat-armour by immemorial use, or by grant in regular form, formed the class of nobility or gentry,—words which, it must again be remembered, are strictly of the same meaning. They held whatever privileges or advantages have attached in different times and places to the rank of nobility or gentry. In England indeed a variety of causes hindered nobility or gentry from ever obtaining the importance which they obtained, for instance, in France. But perhaps no cause was more important than the growth of the peerage (see PEERAGE). That institution at once set up a new standard of nobility, a new form of the nobility of office. The peer—in strictness, the peer in his own person only, not even his children—became the only noble; the ideas of nobility and gentry thus became divorced in a way in which they are not in any other country. Those who would elsewhere have been counted as the nobility, the bearers of coat-armour by good right, were

hindered from forming a class holding any substantial privilege. In a word, the growth of the peerage hindered the existence in England of any nobility in the Continental sense of the word. The esquires, knights, lesser barons, even the remote descendants of peers, that is, the *noblesse* of other countries, in England remained gentlemen, but not noblemen,—simple commoners, that is, without legal advantage over their fellow-commoners who had no *jus imaginum* to boast of. There can be no doubt that the class in England which answers to the *noblesse* of other lands is the class that bears coat-armour, the gentry strictly so called. Had they been able to establish and to maintain any kind of privilege, even that of mere honorary precedence, they would exactly answer to Continental nobility. That coat-armour has been lavishly granted and often assumed without right, that the word "gentleman" has acquired various secondary senses, proves nothing; that is the natural result of a state of things in which the *status* of gentry carries with it no legal advantage, and yet is eagerly sought after on social grounds. If coat-armour, and thereby the rank of gentry, has been lavishly granted, some may think that the rank of peerage has often been lavishly granted also. In short, there is no real nobility in England; for the class which answers to foreign nobility has so long ceased to have any practical privileges that it has long ceased to be looked on as a nobility, and the word nobility has been transferred to another class which has nothing answering to it out of the three British kingdoms. This last class in strictness takes in only the peers personally; at the outside it cannot be stretched beyond those of their children and grandchildren who bear the courtesy titles of lord and lady.

No attempt has been here made to trace out the history of nobility in the various countries and, we must add, cities of Europe. All that has been attempted has been to point out some general truths, and to refer to some specially striking instances. Once more, it must be borne in mind that, while it is essential to the idea of nobility that it should carry with it some hereditary privilege, the nature and extent of that privilege may vary endlessly. In the last century the nobility of France and the nobility of Poland alike answered to the very strictest definition of nobility; but the political positions of the two were as broadly contrasted as the positions of any two classes of men could be. The nobility of France, keeping the most oppressive social and personal privileges, had been shorn of all political and even administrative power; the tyrants of the people were the slaves of the king. In Poland sixty thousand gentlemen, rich and poor, famous and obscure, but all alike gentlemen, rode out to choose a king by a unanimous vote, and to bind him when chosen by such conditions as they thought good. Those sixty thousand, like the *populus* of Rome, formed a narrow oligarchy as regarded the rest of the nation, but a wild democracy among themselves. Poland, in short, came nearer than any kingdom or country of large extent to the nature of an aristocracy, as we have seen aristocracy in the aristocratic cities. The chief power of the state was placed neither in the prince nor in the nation at large; it was held by a noble class. The kingly power in Poland, like the ducal power at Venice, had been so narrowed that Poland, though she still kept a king, called herself a republic no less than Venice. And whatever was taken from the king went to the gain of the noble order. But the nobility of a large country, even though used to act politically as an order, could never put on that orderly and legal character which distinguishes the true civic patriciates. It never could come so nearly as a civic patriciate could to being something like the rule of the best in any sense of those words.

France.

Poland.

The tendency of modern times has been towards the breaking down of formal hereditary privileges. In modern commonwealths, above all, they have been thought to be essentially inconsistent with republican institutions. The truth of the matter is rather that the circumstances of most modern commonwealths have been unfavourable to the preservation, and still more to the growth, of privileged bodies. Where they existed, as in Switzerland, they have been overthrown. Where they did not exist, as in America, everything has made it more and more impossible that they should arise. And, as modern changes have commonly attacked the power both of kings and of nobles, the common notion has come that kingship and nobility have some necessary connexion. It has seemed as if any form of nobility was inconsistent with a republican form of government, while nobility, in some shape or other, has come to be looked on as a natural, if not a necessary, appendage to a monarchy. And as far as regards the social side of kingship this is true. A court seems more natural where a chain of degrees leads gradually up from the lowest subject to the throne than when all beneath the throne are nearly on a level. And from one point of view, that from which the kingly house is but the noblest of the noble, kingship and nobility are closely allied. But in the more strictly political view monarchy and nobility are strongly opposed. Even the modified form of absolute monarchy which has existed in some Western countries, while it preserves, perhaps even strengthens, the social position of a nobility, destroys its political power. Under the fully-developed despotisms of the East a real nobility is impossible; the prince raises and thrusts down as he pleases. It is only in a commonwealth that a nobility can really rule; that is, it is only in a commonwealth that the nobility can really be an aristocracy. And even in a democratic commonwealth the sentiment of nobility may exist, though all legal privilege has been abolished or has never existed. That is to say, traditional feeling may give the members of certain families a strong preference, to say the least, in election to office. We have seen that this was the case at Athens; it was largely the case in the democratic cantons of Switzerland; indeed the nobility of Rome itself, after the privileges of the patricians were abolished, rested on no other foundation. It is important to bring these historical facts into notice, as they are likely to be confused or forgotten among modern practical tendencies the other way. (E. A. F.)

NOCERA INFERIORE, formerly NOCERA DEI PAGANI, a city of Italy in the province of Salerno at the foot of Monte Albino, 22½ miles east-south-east of Naples on the railway to Salerno, which lies only 10 or 11 miles distant. In 1881 it had a communal population of 15,858, that of the town was 12,830; but the interest of the place is almost exclusively historical.

Nuceria Alfaterna, first mentioned as assisting the Samnites in 315 B.C., was a few years later (308) besieged and captured by Fabius. In 216 Hannibal completely destroyed the city and dispersed its inhabitants; but the town, having been repeopled at some unknown date, appears again as a flourishing municipium in the time of Cicero. In 73 B.C. it was plundered by Spartacus, and under Augustus it received a Roman colony (Nuceria Constantia), afterwards recruited by Nero. At an early date the city became an episcopal see, and in the 12th century it sided with Innocent II. against Roger of Sicily, and suffered severely for its choice. A colony of Saracens introduced by Frederick II. probably gave rise to the epithet by which it was so long distinguished, as well as to the town of Pagani, which lies about a mile to the west. In 1385 Pope Urban VI. was besieged in the castle by Charles of Durazzo. Nocera was the birthplace of Solimena the painter; and in the list of its bishops appears the name of Paulus Jovius.

Nocera Inferiore must not be confounded with Nocera Umbria (the ancient Nuceria Camellaria), an old episcopal city 14 miles from Foligno.

NODDY, the name applied, originally by sailors, to a sea-bird from its showing so little fear of man as to be accounted stupid. It is the *Sterna stolida* of Linnæus, and the *Anous stolidus* of modern ornithology, having the figure of a TERN (*q.v.*), and belonging to the sub-family *Sterninæ*, but is heavier in flight, with shorter wings and the tail less deeply forked. The plumage is of a uniform sooty hue, excepting the crown of the head, which is light grey. The Noddy is very generally distributed throughout the tropical or nearly tropical oceans, but occasionally wanders into colder climates, and has been met with even in the Irish Sea. It breeds, often in astounding numbers, on low cays and coral-islets, commonly making a shallow nest of sea-weed or small twigs, which may be placed on the ground, on a tuft of grass, or in the fork of a tree, while sometimes it lays its eggs on a bare rock. Mr Saunders (*Proc. Zool. Society*, 1876, pp. 669-672) admits four other species of the genus:—*Anous tenuirostris*, supposed to be confined to the southern part of the Indian Ocean, from Madagascar to West Australia; *A. melanogenys*, often confounded with the last, but having nearly as wide a range as the first; and *A. leucocapillus*, hitherto known only from Torres Strait and the Southern Pacific. These three have much resemblance to *A. stolidus*, but are smaller in size, and the two latter have the crown white instead of grey. The fourth species, *A. cæruleus* (with which he includes the *A. cinereus* of some authors), differs not inconsiderably, being of a dove-colour, lighter on the head and darker on the back, the wings bearing a narrow white bar, with their quill-feathers blackish-brown, while the feet are reddish and the webs yellow. Three more species—*A. superciliosus* from the Caribbean Sea and Gulf of Mexico, *A. plumbeigularis* from the Red Sea, and *A. galapagensis* from the Galapagos—have been added by Mr. Sharpe (*Philos. Transactions*, clxviii. pp. 468, 469), who also considers (*Proc. Zool. Society*, 1878, p. 272) *A. cinereus* of the Eastern Pacific to be distinct from *A. cæruleus* of Australia and the Western Pacific. (A. N.)

NODIER, CHARLES (*c.* 1780-1844), a writer of greater intrinsic merit and more importance in the history of French literature than is generally recognized, was born at Besançon somewhat less than ten years before the outbreak of the Revolution, but the exact date is strangely uncertain. Besançon for the place and the 29th of April for the day of the month appear to be agreed upon, but the year is sometimes given as 1780, sometimes as 1781, and sometimes as 1783. The earliest seems the most probable. His father was a lawyer of some distinction and had been a teacher of law, and after the outbreak of the Revolution he was appointed mayor of Besançon and consequently chief police magistrate. He seems, from some euphemistic expressions of his friends, to have rather lent himself as an instrument to the tyranny of the Jacobins than to have shared their principles; but his son was for a time an ardent citizen, and is said to have been a club member when he could at the most have been twelve years old. His education in these troublesome times was necessarily haphazard, but appears to have been sufficient. His love of books began very early, and he combined with it, what is not perhaps very often characteristic of the bibliophile proper, a strong interest in natural science. The dates of his early life are given very sparingly, and the chief authority for the details of it is his own *Souvenirs*, a not very trustworthy source. Having obtained and then lost the post of librarian in his native town, he went to Paris and plunged into literature. He had published a dissertation on the antennæ in insects as early as 1798 at Besançon. Entomology continued to be a favourite study with him, but he varied it with philology and pure literature—*Le Peintre de Salzbourg* dates from this early period—and even political writing. A "skit" on Napoleon in 1803 got him into trouble, which was not very serious. He was obliged, or thought himself obliged, to quit Paris, and for some years lived a very unsettled life at Besançon, Dôle (where he married), and other places. In 1811 he appears at Laibach in the singular character of editor of a polyglot journal, the *Illyrian Telegraph*, published in French, German, Italian, and Slav. Then he returned to Paris, and the restoration found him, or made him, an ardent royalist. Literary and journalistic work of all kinds filled up his time, until in 1823 he was appointed to the librarianship of the Bibliothèque de l'Arsenal. He was not disturbed in this post by the revolution of July, but, on the contrary, was elected a member of the Academy in 1833, and made a member of the Legion of Honour in 1843, a year before his death, which happened on 27th January 1844. These twenty years at the arsenal were by far the most important and fruitful of Nodier's life. He had much of the Bohemian in his composition, and the wandering and unsettled life that he had led was more favourable to the cultivation of this feature of his character than to the production of solid work. His post at the arsenal was not very lucrative, and even after his appointment his way of life is said by some chroniclers not to have been extraordinarily regular. But he had the advantage of a settled home in which to collect rare books (for which he had a real vocation), and to study them; and, what was of still more importance, he was able to supply a centre and rallying place to a knot of young literary men of greater individual talent than himself—the so-called Romantics of 1830—and to colour their tastes and work very decidedly with his own predilections. Much older than most of them, possessing a literary reputation already formed, though resting on no single work of great importance, with very decided idiosyncrasies and a considerable power of personally influencing his associates, Nodier must be credited with no small part in the making of the men of 1830.

His own literary work is abundant, but much of it is obsolete, much more mere miscellanies, much injured by hasty production, and some, it is said, is not due to himself. His best and most characteristic work, some of which is exquisite in its kind, consists partly of short tales of a more or less fantastic character, partly of nondescript articles, half bibliographic, half narrative, the nearest analogue to which in English is to be found in some of the papers of De Quincey. The best examples of the latter are to be found in the volume entitled *Mélanges tirés d'une Petite Bibliothèque*, published in 1829 and afterwards continued. Of his tales the best are *Smarra* (1821), *Histoire du Roi de Bohême et de ses sept Châteaux* (1830), *La Fée aux Miettes* (1832), *Inès de las Sierras* (1837), *Légende de Sœur Béatrix* (1838), together with some fairy stories published in the year of his death, and *Franciscus Columna*, which appeared after it. The *Souvenirs de Jeunesse* (1832), already referred to, are interesting but untrustworthy, and the *Dictionnaire Universel de la Langue Française* (1823), a book of considerable merit, which, in the days before Littré, was one of the most useful of its kind, is said to have been not wholly or mainly Nodier's. His chief tales are accessible in three or four volumes of the Bibliothèque Charpentier, and the best yield to few things in French for charm of style and especially for the rendering of fantastic and picturesque sentiment, but they are very unequal. There is a so-called collection of *Œuvres Complètes*, in 12 vols., 1832, but at that time much of the author's best work had not appeared, and it included but a part of what was actually published.

NOETUS, a presbyter of the church of Asia Minor about 230 A.D., was a native of Smyrna, where (or perhaps in Ephesus) he became a prominent representative of the particular type of Christology which is now technically called modalistic monarchianism (see vol. xvi. p. 719). His views, which led to his excommunication from the Asiatic church, are known to us chiefly through the controversial writings of Hippolytus, his contemporary.

NOIRMOUTIER, an island of France belonging to the department of Vendée, and protecting the Bay of Bourgneuf on the south-west. Between the island and the mainland is a sandbank laid bare at low water, and crossed by an embankment and carriage road, which is continually kept

in good repair. It was not till about 1766 that people found they could walk across to the island, which lies from north-north-west to south-south-east, and is 11 miles long, its breadth varying from 1 mile in the south part to 3 or 4 miles in the north. It appears to be formed of alluvial deposits gradually accumulated round a rock of no great size situated at the meeting-place of the Gascony and Brittany currents. The area now amounts to 18 square miles, of which about a sixth part is occupied by dunes. The total population was 7726 in 1881. There are two communes: Noirmoutier and Barbâtre. The former has about 2029 of its 5908 inhabitants gathered together in a little town with narrow and winding streets. Its castle was once the residence of the abbot of Her. In the church there is a crypt of the 11th century. A mile to the north of the town lies a pleasant watering-place, rendered picturesque by the La Chaise woods (evergreen oaks and pines), and a grand confusion of rocks, among which the sea has scooped out many a delightful little beach.

A dolmen, several menhirs, and the ruins of a Gallo-Roman villa with its hot baths show that the island must have been occupied at an early date; but the first fact in its recorded history is the foundation of the Benedictine monastery of Her by St Philibert about 680. From this monastery the name Noirmoutier (Moustier) is derived. It had already attained to great prosperity when it was pillaged by the Normans in 825 and 843. In 1205 the abbey of Notre Dame la Blanche was built at the north extremity of the island to take the place of a Cistercian convent established in the Île du Pilier, at that time attached to Noirmoutier by a dyke. This abbey was ruined by the Protestants in 1562. In 1676 the island was captured by the Dutch. Having been seized by Charette during the war of Vendée, it was recovered by the republican general, Haxo, who caused the Vendean leader, d'Elbée, to be shot.

NOLA, a city of Italy in the province of Caserta (Terra di Lavoro), is pleasantly situated on the plain between Mount Vesuvius and the Apennines, 14 miles east-north-east of Naples on the road to Avellino, and 20½ miles south-west of Cancello on the railway to the same town. The more conspicuous buildings are the ancient Gothic cathedral (restored in 1866), with its lofty tower rebuilt since the fire of 1860, the cavalry barracks, the ex-convent of the Capuchins at a little distance from the city, and the seminary in which is preserved the famous Oscan inscription known as the Cippus Abellanus (from Abella). Two fairs are held in Nola, on 14th June and 12th November; and the 26th of July is devoted to a great festival in honour of St Paulinus, one of the early bishops of the city. The population of the city was 10,771 in 1871, and 8489 in 1881; that of the commune 11,395 in 1871, and 11,931 in 1881.

Nola (Νῶλα) was one of the oldest cities of Campania. At the time when it sent assistance to Neapolis against the Roman invasion (328 B.C.) it was probably occupied by Oscans in alliance with the Samnites; but it had evidently passed through an Etruscan period, and had possibly received a Greek colony from Chalcis. The Romans made themselves masters of Nola in 313 B.C. In the Second Punic War it thrice bade defiance to Hannibal; but in the Social War it was betrayed into the hands of the Samnites, who kept possession till Marius, with whom they had sided, was defeated by Sulla. Whatever punishment Sulla may have inflicted, Nola "remained a municipium, with its own institutions and the use of the Oscan language." At a later date it became a Roman colony. Marcus Agrippa and Augustus died at Nola. Sacked by Genseric in 455, and by the Saracens in 806 and 904, captured by Manfred in the 13th century, and damaged by earthquakes in the 15th and 16th, Nola lost much of its importance. The remains of two great amphitheatres described by Ambrosio Leone in the first part of the 16th century were used by Carlo Caraffa and Orso Orsini in 1664 to build their palaces in Naples and Nola. Giordano Bruno and the sculptor Giovanni Marliano were natives of the city; and some of the latter's works are preserved in the cathedral.

NOLLEKENS, JOSEPH (1737-1823), sculptor, was born 11th August 1737 in London, where his father, a native of Antwerp, the "old Nollekens" of Horace Walpole, was a painter of some repute. In his thirteenth year he entered the studio of the sculptor Scheemakers, and practised drawing and modelling with great assiduity, ultimately gaining various prizes offered by the Society of Arts. In 1760 he went to Rome, and he executed a marble bas-relief, Timoclea before Alexander, which obtained a prize of fifty guineas from that society in 1762. Remunerative commissions began to come in, Garrick and Sterne being among the first English visitors who sat to him for busts; among his larger pieces belonging to this early period perhaps the most important is the Mercury and Venus chiding Cupid. Having returned to England in 1770, he was admitted an associate of the Royal Academy in 1771, and elected a member in the following year. By this time he had become known to George III., whose bust he shortly afterwards executed, and henceforward, until about 1816, he was continually and very profitably employed as the most fashionable portrait sculptor of his day. His busts were on all hands acknowledged to be excellent likenesses, and there was generally a softness in the expression and a gracefulness in the handling which never failed to please. He himself thought highly of his early portrait of Sterne. Among many others may be specially named those of Pitt, Fox, the prince of Wales (afterwards George IV.), Canning, Perceval, Benjamin West, and Lords Castlereagh, Aberdeen, Erskine, Egremont, and Liverpool. He also found leisure to elaborate a number of marble groups and statues, amongst which may be mentioned those of Bacchus, Venus taking off her Sandal, Hope leaning on an Urn, Juno, Pætus and Arria, Cupid and Psyche, and (his own favourite performance) Venus anointing Herself; all, however, although remarkable for delicacy of workmanship, are deficient in vigour and originality, and the drapery is peculiarly weak. The most prominent personal characteristic of Nollekens seems to have been his frugality, which ultimately developed into absolute miserliness. He died in London on 23d April 1823, leaving, it is said, a fortune of some £200,000.

NOLLE PROSEQUI (sometimes shortened into *nol. pros.*) is a technical term of English law, the meaning of which varies as it is used with reference to civil or criminal cases. In civil cases it applies only to actions in the Queen's Bench Division, and there signifies a formal undertaking by the plaintiff that he will proceed no further with the action (*se ulterius nolle prosequi*). The more modern practice in such cases is to proceed by way of discontinuance. In proceedings either by indictment or by information, a *nolle prosequi* or stay of proceedings may be entered by the attorney-general. The *nolle prosequi* is a matter purely for his discretion, and will not be granted unless very good ground be shown for his interference. The object of it generally is to obtain a stay of proceedings against an accomplice in order to procure his evidence. This object is, however, more usually effected by the prosecution offering no evidence and the judge directing an acquittal.

In America the term bears the same meaning as in England, with one exception. The attorney-general has not the same discretion with which English law invests him. Although in some States the prosecuting officer may enter a *nolle prosequi* at his discretion, in others the leave of the court must be obtained.

NOLLET, JEAN ANTOINE, French physicist, was born at Pimprèz (now in Oise) on 19th November 1700, and died at Paris in 1770. He was of peasant origin, and was educated for the church, entering holy orders and ultimately attaining the rank of abbé; but his tastes all lay in the direction of experimental research, especially on the subject of electricity (see vol. viii. p. 6). In 1734 he was admitted a member of the London Royal Society, four years later he entered the Academy of Sciences at Paris, and in 1753 he was appointed to the newly-instituted

chair of experimental physics in the Collége de Navarre. Nollet's strength lay in popular exposition rather than in profound investigation, but he cannot be denied the credit of having greatly helped by his influence and example the cause of electrical science.

NOMANSLAND. See KAFFRARIA, vol. xiii. p. 817.

NOMINALISM. See SCHOLASTIC PHILOSOPHY.

NONCONFORMITY, LAW RELATING TO. The history of the gradual relief of nonconformists in England from their disabilities will be found under ENGLAND, and under the heads of the various denominations, *e.g.*, BAPTISTS, INDEPENDENTS, METHODISM, QUAKERS, &c. See also OATHS. It is proposed here to note simply the present legal aspects of nonconformity apart from its history, that is, the matters in which the law as to nonconformists still differs from that applicable to members of the Church of England. The differences may be conveniently grouped under six heads.

(1) *Judicial notice.* The courts, both temporal and spiritual, take judicial notice of the tenets and authorities of the Church of England, the crown being head of the law and of the church. Where the tenets and authorities of a nonconformist body come in question, they must be proved by evidence. By Lord Lyndhurst's Act, 7 and 8 Vict., c. 45, where no particular religious doctrine or mode of worship has been prescribed by the deed or instrument of trust the usage of the congregation for twenty-five years is to be taken as conclusive evidence of the doctrine and worship which may be properly observed in such meeting-houses. (2) *Tribunal.* Offences against the law ecclesiastical (not being crimes) committed by clergy of the Church of England as a rule come by letters of request from the bishop of the diocese before the Arches Court of Canterbury or the Chancery Court of York (of both of which the same person is now judge). Similar matters arising in nonconformist bodies can only be tried by the ordinary secular courts, and generally depend upon the question whether a minister has done any act which is not in accordance with the rules governing the particular body of which he is a minister. A nonconformist body is in law nothing more than a voluntary association, whose members may enforce discipline by any tribunal assented to by them, but must be subject in the last degree to the courts of the realm. Brawling in a church by a person in holy orders is an offence within the Church Discipline Act, 3 and 4 Vict., c. 86, and falls under the cognizance of the spiritual courts; similar conduct by a nonconformist minister in his own place of worship can only be punished as an offence under 9 and 10 Vict., c. 59. (3) *Status of ministers.* A nonconformist minister is not in holy orders, and his chapel is not a consecrated building. His status is, however, recognized to a limited extent. By the Toleration Act, 1 Will. and M., c. 18, a minister, preacher, or teacher of a nonconformist congregation is exempt from certain parochial offices, as that of churchwarden. He is also exempt from serving in the militia or on a jury. These privileges only attach where the place of worship of which he is a minister has been duly registered, 18 and 19 Vict., c. 81, unless in the case of bodies subject to special legislation, as Quakers. Registration is not required in the case of consecrated buildings. By 45 and 46 Vict., c. 50, s. 12, a nonconformist minister cannot be elected an alderman or councillor. He cannot take a degree in divinity at Oxford, Cambridge, or Durham, 34 and 35 Vict., c. 26, and so is debarred from holding any professorship of divinity in those universities. (4) *Marriage.* Marriage by a person in holy orders was probably necessary at common law, at any rate from the Reformation up to 1836. (See MARRIAGE.) And from the date of Lord Hardwicke's Marriage Act, 26 Geo. II., c. 33 (1753), up to 1836 the ceremony must have been performed in a consecrated building. The first Act of Parliament that relieved dissenters (other than Jews and Quakers) from these restrictions was the Marriage Act of 1836, 6 and 7 Will. IV., c. 85. Since that Act the ceremony of marriage may be performed in a nonconformist place of worship, but it must be after due notice to the superintendent registrar and in his presence or in that of a registrar, and the building must be one that is duly certified for marriages. These preliminaries (except the first, and that only where the marriage is not by banns, licence, or special licence) are not necessary where the marriage takes place in a church. Marriage by banns, licence, or special licence cannot take place except in a church. (5) *Burial.* By the Burial Laws Amendment Act, 1880, 43 and 44 Vict., c. 41, burial may take place in a churchyard without the rites of the Church of England. But in such a case notice must be given in a specified form, which is unnecessary where the burial service is conducted by a clergyman of the Church of England. (6) *Parish offices.* By 1 Will. and M., c. 18, s. 5, a dissenter chosen churchwarden and scrupling to take the oaths may execute his office by deputy. His acceptance of office is made optional by the Act; there is nothing to prevent his discharging it if he see fit to do so. This seems to be still the law, although a declaration was substituted for the oath by 5 and 6 Will IV., c. 62, s. 9.

The Colonies.—In crown colonies ecclesiastical jurisdiction may be conferred by the sole authority of the crown. In colonies which have parliamentary representation the crown cannot give to a metropolitan bishop jurisdiction or coercive legal authority over suffragan bishops or over any other person. In colonies of the former kind the Church of England may still preserve the privileges which attach to her in the mother country; in colonies of the latter kind she is in the same position as any other religious body, simply a voluntary association. Since the Irish Church Act, 1869, 32 and 33 Vict., c. 42, the Church of Ireland has been practically in the same position as the Church of England in colonies which have representative government.

NONJURORS in English history are the small minority of the beneficed clergy who incurred the penalties of suspension and deprivation for refusing to swear allegiance to William and Mary in 1689. The party, which was headed by Archbishop Sancroft and Bishop Ken, with five other members of the episcopal bench, included such men as Jeremy Collier, George Hickes, William Sherlock, Charles Leslie, and Henry Dodwell. See ENGLAND, vol. viii. p. 378.

NONNUS, Greek epic poet, author of the *Dionysiaca*, was a native of Panopolis in the Egyptian Thebaid. He can scarcely have been earlier than the 5th century of our era, but probably wrote in the first half of it, as his versification is imitated by Proclus, who was born 412 A.D. Nothing is known of his personal history, but his extensive mythological erudition almost proves him to have been a grammarian. His principal work, the *Dionysiaca*, an epic in forty-eight books on the history of Bacchus, is a vast storehouse of legendary fable, embellished, especially in the long episode of Bacchus's Indian expedition, with not a little of the poet's own invention. From one point of view it may be described as the swan-song of the ancient mythology; its spirit, at the same time, is anything but Hellenic. In its vast and formless luxuriance, its beautiful but artificial versification, its delineation of action and passion to the entire neglect of character, it resembles the colossal epics of India, while its glittering but too often frigid conceits bring it near to the Italian bastard epic of Marino and his school. Like his countryman and near contemporary Claudian, Nonnus is a writer of copious learning and still more copious fancy, eminent in invention, in description, and in melody, whose faults may be charged upon his age, while his merits are his own. This is more particularly the case with the author of the *Dionysiaca*, whose reforms in versification originated with himself, while they were accepted by all succeeding poets. In his hands, says Hermann, the Homeric hexameter, greatly corrupted by time and licence, though losing something of its dignity, recovered its elegance and harmony, and was framed to so strict a pattern that no one ignorant of prosody could henceforth attempt to write an epic. His influence on the vocabulary of his successors was likewise very considerable. We also possess under his name a paraphrase of the Gospel of St John, which is chiefly interesting as apparently indicating that, notwithstanding his mythological lore, Nonnus conformed to Christianity. The style is not inferior to that of his epic, but, employed in embellishing the simple narrative of the evangelist, it produces an impression of extreme bombast and want of taste.

The first edition of Nonnus was published by Falkenburg at Antwerp in 1569 from a MS. procured at Taranto by Sambucus, an Hungarian. The standard edition is Graefe's (Leipsic, 1819-26); but the most useful is that by Count de Marcellus (Paris, 1856), accompanied by valuable notes and prolegomena, and a French prose translation. The analyses by Ouvaroff (St Petersburg, 1817) and Koehler (Halle, 1853) are useful aids to the study of so long and intricate a poem. The paraphrase on St John is edited

by Passow (1834), by Marcellus (1861), and in Migne's *Patrologia*. For Nonnus's metrical innovations see Hermann, *Orphica*, pp. 869-691; and Lehrs, *Quæstiones Epicæ*.

NONPAREIL, the name under which, from its supposed matchless beauty, a little cage-bird, chiefly imported from New Orleans, has long been known to English dealers (*cf.* Edwards, *Gleanings*, i. p. 132). It is the *Emberiza ciris* of Linnæus, and the *Cyanospiza ciris* of most recent ornithologists, belonging to a small group, which, in the present state of knowledge, cannot with certainty be referred either to the Buntings or to the Finches, while some authors have regarded it as a TANAGER (*q.v.*). The cock has the head, neck, and lesser wing-coverts bright blue, the upper part of the back yellow, deepening into green, and the lower parts generally, together with the rump, bright scarlet, tinged on the latter with purple. This gorgeous colouring is not assumed until the bird is at least two years old. The hen is green above and yellow beneath; and the younger cocks present an appearance intermediate between the adults of both sexes. The species, which is often also called the Painted Bunting, after wintering in Central America or Mexico, arrives in the southern States of the American Union in April, but does not ordinarily proceed to the northward of South Carolina. In Louisiana, where it is generally known to the French-speaking inhabitants as the *Pape*—as it was to the Spaniards of Florida as the *Mariposa pintada* (painted butterfly)—it is said to be very abundant; and on its appearance in spring advantage is, or was, taken of the pugnacious disposition of the males (which so often accompanies a brilliant sexually-distinct plumage) to capture them alive in great numbers by means of the stuffed skin of one so placed in connexion with a cage-trap that they instantly fall into the latter on attacking what they conceive to be a rival. In this way many thousands are said to have been taken formerly. The prisoner usually reconciles himself to his fate, and in a few days will utter his sprightly though not very powerful song; and, if provided with a mate and proper accommodation, will breed and rear a family in confinement. Belonging to the same genus as the Nonpareil is the Indigo-bird, *Cyanospiza cyanea*, which, as a summer visitant, is widely diffused from the Missouri to the Atlantic, and extends into the provinces of Ontario and New Brunswick, being everywhere regarded with favour. Though wanting most of the bright hues of its congener, the Indigo-bird has yet much beauty, the adult cock being nearly all over of a deep blue, changing, according to the light, to green. The hen is brown above and ochreous-white beneath. This species is represented in the western part of the continent by the Lazuli-Finch, *C. amœna*, the male of which has the upper parts greenish-blue, the wings barred with white, a pectoral band of light chestnut extending to the flanks on each side, and the lower parts white. Of the three remaining species of the genus, *C. versicolor* shows in the male a plumage beautifully varied with brownish-red, violet, and blue; *C. leclancheri* is bluish-green above and yellow beneath, with an orange breast; while *C. rositæ*, though quite distinct, comes nearest in coloration to *C. ciris*. These three have a more southern range than the other three; but the first of them is believed occasionally to cross the Mexican frontier into the United States. None of the species of *Cyanospiza* are thought to occur further south than the isthmus of Panama. (A. N.)

NONSUIT (*i.e.*, *non suit*, he does not pursue) is the name given to a judgment whereby an issue is determined against the plaintiff. It was a term peculiar to the English common-law courts before the Judicature Acts, and was simply the expression of the opinion of the court that, apart from the merits, the plaintiff's case was incomplete. It did not in any way act as a bar to his bringing another action for the same cause. It might be entered either at the wish of the plaintiff himself (to whom it was of course much more beneficial than judgment for the defendant) or by direction of the court against the will of the plaintiff. The matter now is of no great importance, for, although judgment of nonsuit still exists, it has, since the Judicature Acts, the same effect as a judgment on the merits, unless the court otherwise directs. This effect of a nonsuit was specially provided for by the rules of the Supreme Court of 1875. The rules of 1883 do not deal with nonsuit, but no doubt the practice which has existed between 1875 and 1883 will still be followed.

NOODT, GERHARD (1647-1725), a celebrated jurist, was born at Nimeguen in 1647. He began his studies in his native town, continued them at Leyden and Utrecht, and finished them at Franeker, where he took his doctor's degree in law. After passing through successive grades of promotion he was ultimately appointed to a law chair at Leyden. It was in the character of a writer on jurisprudence, however, that he acquired his reputation. His Latin style, modelled after the best writers, was pure and precise; he had, for his time, an intimate acquaintance with the laws, manners, and customs of ancient Rome; his speculations were guided by a simple desire for truth, and his political opinions animated by a spirit of unusual toleration. His numerous works, as they successively appeared, soon rose to the rank of standard authorities. Two of his political treatises were translated into French by Barbeyrac, and appeared at Amsterdam in 1707 and 1714, under the respective titles of *Pouvoir des Souverains* and *Liberté de Conscience*; and his jurisprudential writings, to which he was still adding when cut off in 1725, were held in high estimation, not in Holland only, but also in Germany and Scotland, till quite the end of last century. The first edition of his collected works was published at Leyden in 1724, and the last in 1767. That of 1735 and those subsequent contain a life of the author by Barbeyrac.

NORD, the most northern of the departments of France, formed out of Flanders, French Hainault, and the district of Cambrais (Cambrésis), lies between 50° and 51° 6′ N. lat., and between 2° 5′ and 4° 15′ E. long., but in such a way that, while it has a length from south-east to north-west of 112 miles, its breadth is nowhere more than 40 miles, and contracts to 4 at the point where it is crossed by the Lys. Bounded N.W. and N. for 21 miles by the North Sea, it has the Belgian provinces of West Flanders and Hainault on the N.E. and E., the departments of Aisne and Somme on the S., and that of Pas-de-Calais on the W. The Flanders portion to the west of the Scheldt is very flat, the hill at Cassel, only 575 feet high, rising like a mountain, and looking north towards Dunkirk over a stretch of 155 square miles of richly fertile lowlands, which about a thousand years ago were still covered by the sea. To the south-east of the Scheldt the country has the character of the neighbouring district of Ardennes, is better wooded, and contains the highest point in the department (875 feet). The greater part of Nord is in the Scheldt basin, but certain portions belong to those of the Sambre (Meuse), the Oise (Seine), and the little coast-streams the Aa and the Yser. The Scheldt, flowing by Cambrai, Bouchain, Valenciennes, and Condé, receives the Scarpe, which touches Douai, Marchiennes, and St Amand. The Lys, which does not join the Scheldt till it has entered Belgium, passes Armentières, and receives the Deule, on which Lille is situated. The Sambre passes Landrecies and Maubeuge. The Aa falls into the port at Gravelines. The climate of Nord is colder than that of France in general, the mean temperature being 49° or 50° Fahr. The rainfall is 12 inches at Dunkirk and a little more

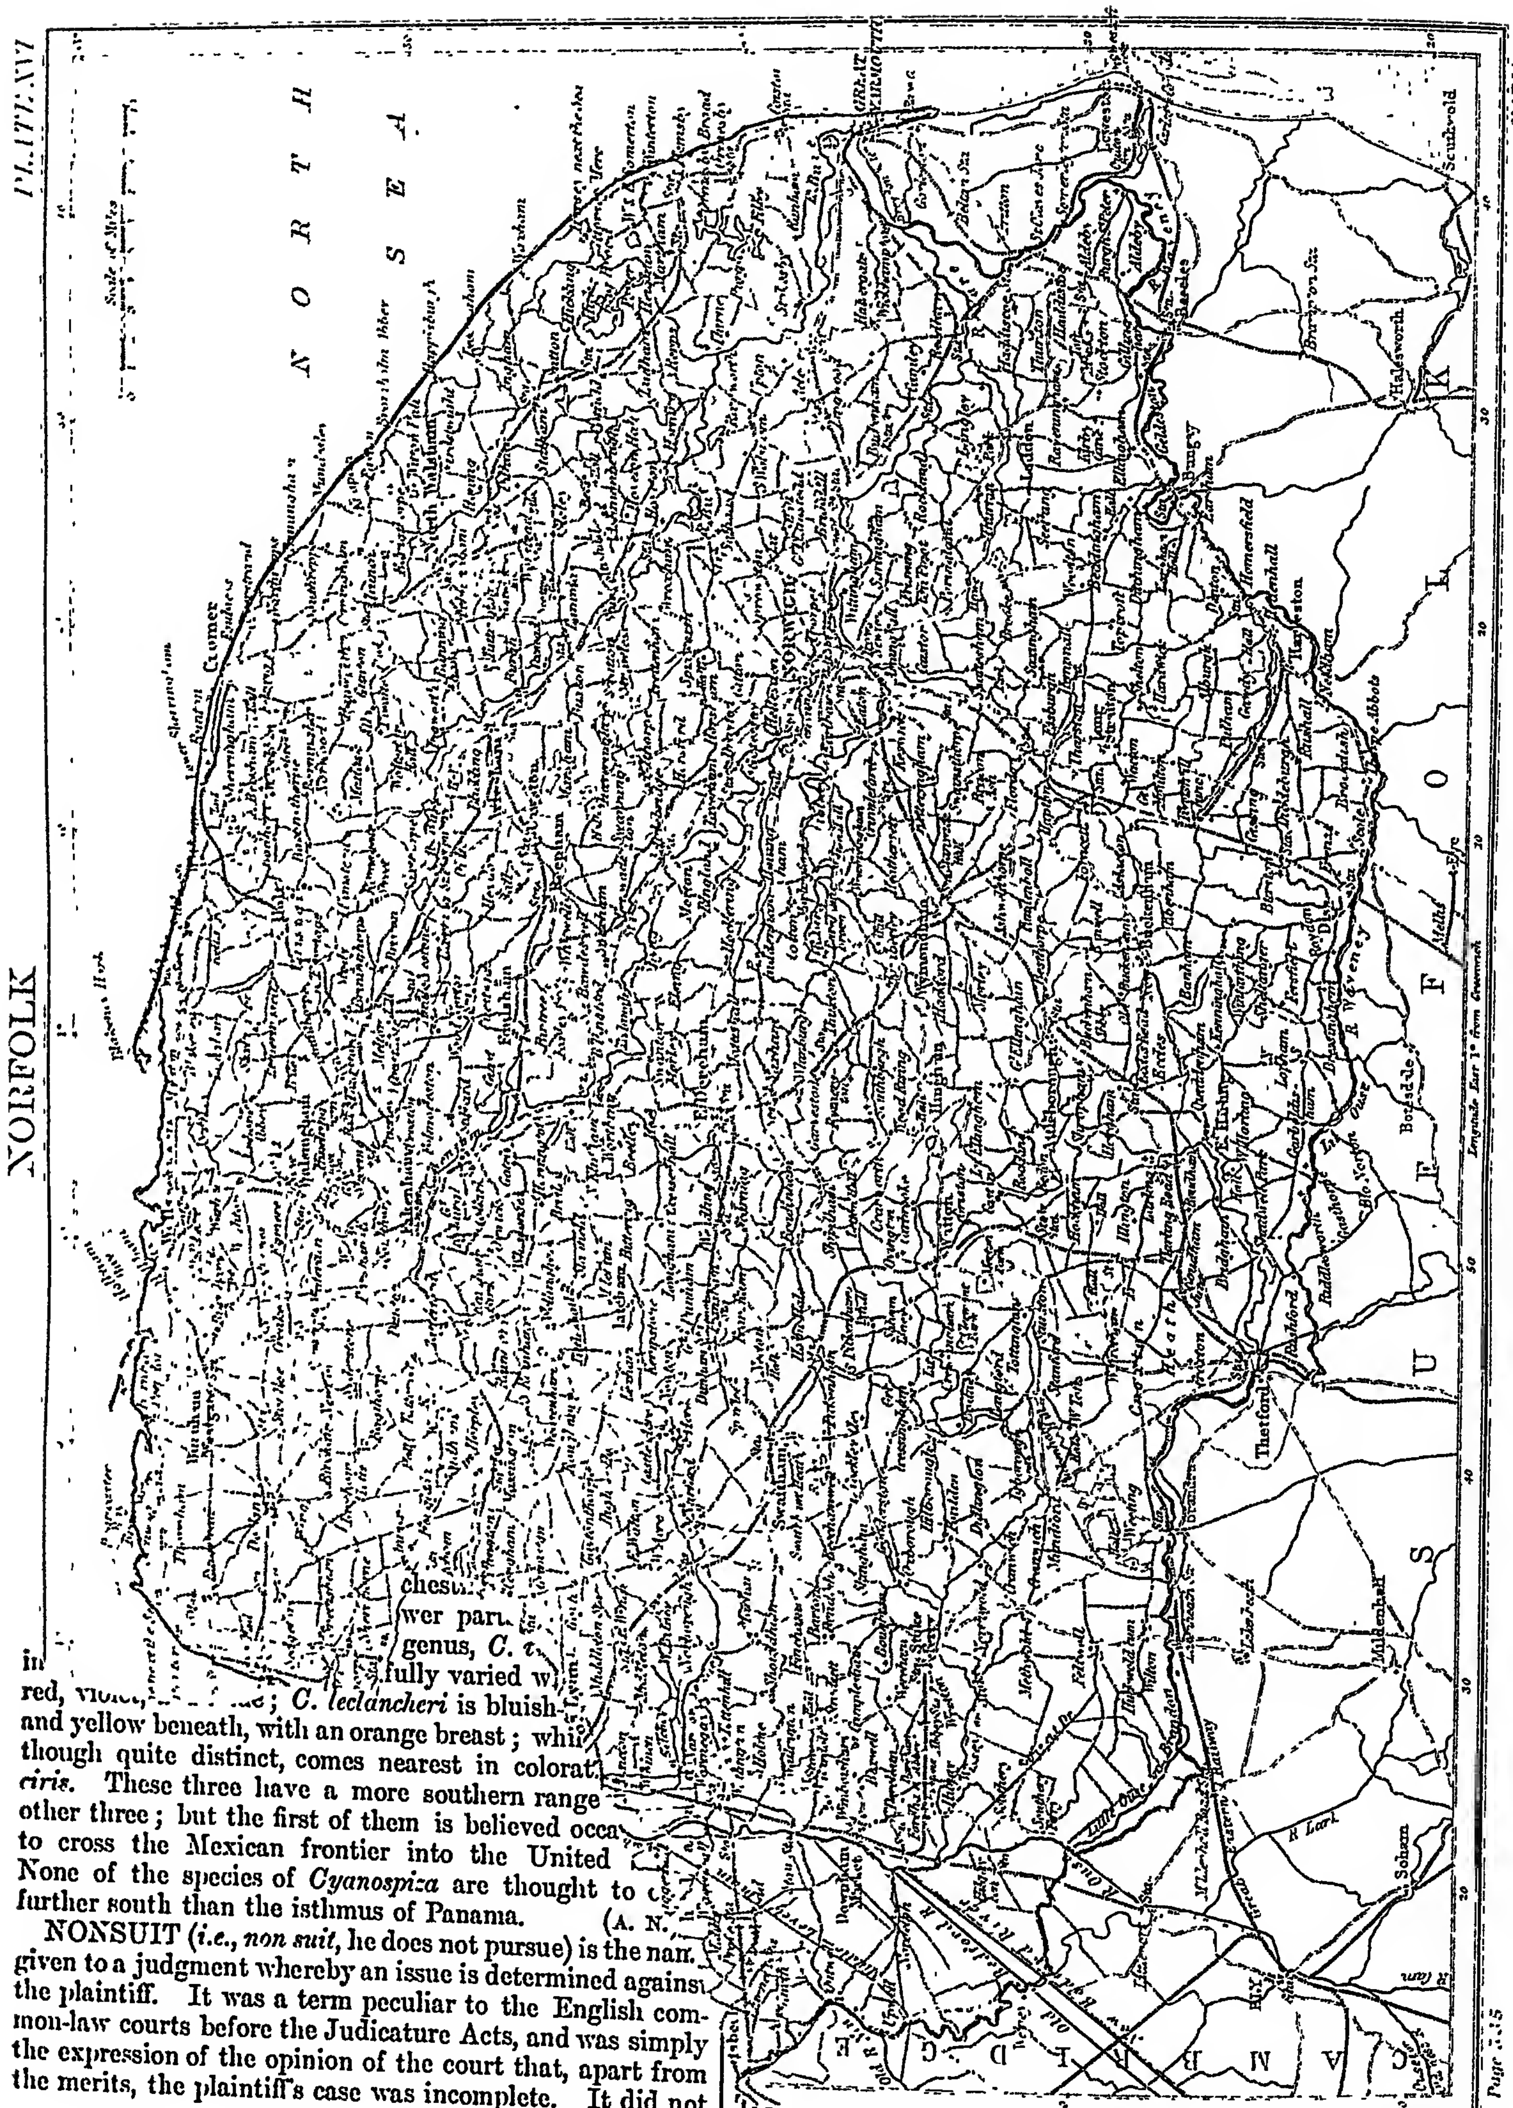
NONSUIT (*i.e., non suit*, he does not pursue) is the name given to a judgment whereby an issue is determined against the plaintiff. It was a term peculiar to the English common-law courts before the Judicature Acts, and was simply the expression of the opinion of the court that, apart from the merits, the plaintiff's case was incomplete. It did not



at Lille. In the arrondissement of Avesnes, rain is more abundant, and cold more severe. In population (1,603,259 inhabitants in 1881) and in agricultural and industrial importance Nord is second only to the department of the Seine.

Of the total area (2193 square miles), two-thirds are arable, one-sixth under pasture, and one-eleventh consists of forest. The live-stock comprises 93,000 horses, asses, and mules, 240,000 cattle, 125,000 sheep, 78,000 pigs, 29,000 goats, and 75,000 dogs. The grain crops yield about 19,250,000 bushels, potatoes about half as much. Beetroot, flax, tobacco, chicory, colza, rape-seed, and hops are all of importance. The natural pastures support a good breed of Flemish cows. Stone, marble, clay, and sand are obtained in the department; but its mineral wealth lies rather in its coal-pits, for the most part belonging to the Anzin Company, which employs 20,000 workmen, and raises 3½ million tons per annum. Iron mines also are worked in the arrondissement of Avesnes. The best mineral waters are those of St Amand. There are numerous foundries, rolling-mills, steel-works, file-works, agricultural implement factories, and engineering works. More than 240,000 tons of pig-iron and 279,000 tons of malleable iron, cast iron, rails, sheet-iron, and Bessemer steel were produced in 1881. Copper foundries and zinc rolling-mills also exist. Spinning is more extensively prosecuted in Nord than in any other department, Lille and its suburbs being the principal seat of the industry. About 12,000 persons are employed in flax and tow spinning, 8000 in cotton spinning, and 4000 to 5000 in the manufacture of sewing-thread. Roubaix and Tourcoing spin wool, cotton, and silk. Jute spinning employs more than 20,000 bobbins at Dunkirk. In Roubaix alone there are upwards of 300 weaving factories; carpets (Tourcoing and Roubaix), linen (Armentières), ribbons, damask, muslins, tulles, laces, &c., are all largely manufactured, and there are also sugar-factories, distilleries, oil-works (scattered throughout the department), 1000 breweries, glass-works, soap-works, dye-works. The exports of the department comprise corn, fruit, eggs, vegetables, and butter to England, oil-cake, linseed, oils, colza seed. Consuming 4,500,000 tons of coal, it has to supplement its own production by importing from Pas de Calais, Belgium, or England. Most of the foreign trade passes through Dunkirk, a much larger port than Gravelines. Abundant means of transit exist throughout the department. The total length of the navigable rivers and canals is 325 miles, and railways to a total length of 450 miles have been constructed between all the most important localities.

Nord forms the archiepiscopal diocese of Cambrai, is comprised in the first or Lille region of corps d'armée, and depends on the court of appeal at Douai. It is divided into seven arrondissements (Avesnes, Cambrai, Douai, Dunkirk, Hazebrouck, Lille, and Valenciennes), 61 cantons, and 663 communes. The number of communes of importance especially for their industries is very large—St Amand les Eaux (11,184 inhabitants), with mineral waters and an old abbey; Anzin (10,043), near Valenciennes; Armentières (25,089); Bailleul (12,712), with antiquities; Bavai (1863), the ancient *Bagacum*; Bergues (5335), with its old fortifications and a splendid belfry of the 16th century; Bourbourg (565), with an obelisk in memory of the victory of Philip Augustus in 1214; Cassel (4276); Le Cateau Cambrésis (9564); Condé (4621), a fortified town with coal-mines; Cysoing (3160), with a monument of the battle of Fontenoy (1745); Denain (17,202), with coal-pits, iron-works, and a monument of Villars's victory (1712); Fourmies (15,052), with spinning and weaving of woollen goods; Gravelines (8416); and Landrecies, a garrison town on the Sambre.

NORDERNEY (*i.e.*, northern island), the most important of the fringe of sand-islands along the coast of East Friesland, belongs to the Prussian province of Hanover. It is 8 miles long and about 1 mile broad, and supports a seafaring and fishing population of (1880) 2114 souls, of genuine old Frisian stock. The village at the south-west end of the island is one of the most popular sea-bathing places in Germany, and is visited annually by 9000 visitors, for whose accommodation numerous hotels and lodging-houses have been built. On the south side rises a lighthouse 175 feet high. At low tide Norderney may be reached from the mainland by driving or walking.

NORDHAUSEN, a flourishing town in Prussian Saxony, in the district of Erfurt, is situated on the Zorge, at the south base of the Harz mountains, and at the west end of the Goldene Aue (Golden Plain), a fruitful valley watered by the Helme. It is built partly on the slope of the mountains and partly on the plain, and the upper and lower parts of the town are connected by flights of steps. Among the churches the most noteworthy are the cathedral, a late Gothic edifice with a Romanesque crypt, and the church of St Blasius, containing two pictures by Lucas Cranach. Near the mediæval town-house stands a Roland's column, the ancient symbol of free commercial intercourse and civic liberty. The chief importance of the place arises from its distilleries, which yearly produce about 8,000,000 gallons of brandy. The breweries are also important, and there are manufactures of leather, tobacco, cotton and linen goods, carpets, chicory, and chemicals. Nordhausen is sometimes called the Cincinnati of Germany on account of its extensive export trade in pork, corned beef, ham, and sausages. In 1880 it contained 26,198 inhabitants, of whom 23,943 were Protestants, 1255 Roman Catholics, and 494 Jews.

Nordhausen, one of the oldest towns in North Germany, was surrounded with walls in the 10th century, and is spoken of as a free imperial town in 1220. Several diets, tournaments, and assemblies of princes were held here during the 12th, 13th, and 14th centuries. It appears to have usually placed itself under the protection of a prince of the empire, and in 1697 we find the elector of Brandenburg selected for this purpose. It was annexed to Prussia in 1803 and again finally in 1815, having in the interim belonged to the kingdom of Westphalia.

NÖRDLINGEN, a town of West Bavaria in the district of Schwaben und Neuburg, is situated on the Eger, 40 miles to the north of Augsburg. It was formerly an imperial town, with an independent territory of 35 square miles in extent, and is still surrounded with walls and towers. The most interesting buildings are the Gothic Hauptkirche and the late Gothic town-house, both of which contain paintings by Schäufelein, who was a native of Nördlingen. There are here manufactures of carpets (sold as Tyrolese carpets), linen and woollen goods, and agricultural implements; and a brisk trade is carried on in geese, goose feathers, cattle, and grain. In 1880 the population was 7837, including 6990 Protestants.

From 898, when we first find it mentioned, down to 1215 Nördlingen was subject to the bishop of Ratisbon; but soon after the latter date it acquired the freedom of the empire. It was annexed to Bavaria in 1803. Two battles were fought near Nördlingen during the Thirty Years' War, in the former of which (1634) the Swedes sustained their first defeat on German soil, losing 12,000 men. A full account of these battles is given by Colonel Malleson in the *Army and Navy Magazine*, November 1883.

NORFOLK, an eastern maritime county of England, is bounded N. and E. by the North Sea, S.E. and S. by Suffolk, S.W. by Cambridge, and W. by Lincoln. It is of an irregular oval form, its greatest length east and west being 67 miles, and its greatest breadth about 42 miles. The area is 1,356,173 acres, or 2119 square miles. Plate XVI.

Coast-line.—Nearly two-thirds of the boundary of the county is formed by tidal water. There are few bays or inlets, and on the northern coast no river mouths. For the most part the coast-line is flat and low, and has been greatly encroached on by the sea, several villages having been engulfed since the time of William the Conqueror. From the mouth of the Yare to Happisburgh the shore is low and sandy and is skirted by sandbanks. Thence for 20 miles it is formed of cliffs consisting of clay and masses of embedded rocks, the average height being about 50 feet, although in some cases an altitude of 200 feet is reached. These cliffs are succeeded by a low shingly or sandy coast stretching as far as St Edmund's Point. The shores of the Wash are formed of mudbanks, which are left dry at low water. West of Lynn a considerable extent of land has within recent years been reclaimed from the sea, and farther south an old Roman embankment stretches into Lincolnshire. At various points off the coast there are submarine forests, especially in Brancaster Bay and in the neighbourhood of Cromer and Happisburgh. Fossilized remains of large mammals are sometimes dragged up by the nets of fishermen, and mammoth tusks measuring from 6 to 9 feet have been found at Knole Sand off Happisburgh.

Surface and Geology.—The surface is principally an undulating plain with rising grounds skirting the river valleys and low chalk downs in the north and north-west. On the west along the Cambridgeshire border there is a stretch of fen land extending from Welney and Hilgay fen to the Wash. The watershed is nearly in the centre of the county. The principal rivers are the Yare, in the east, with its tributaries, the Bure, the Wensum, and the Waveney; and the Ouse, in the west, with its tributaries, the Little Ouse, the Wissey, and the Nar. The Yare and its tributaries frequently expand near the sea into broads or meres, covered for the most part by sedges and bulrushes, which afford shelter for a great variety of water-fowl, including the water-hen, wild duck, heron, bittern, king-fisher, mallard, snipe, and teal. The Yare is navigable for small vessels as far as Norwich, the Waveney to Beccles, and the Bure to Aylsham. The Ouse is tidal to Denver, and its tributaries are all to some extent navigable.

Nearly the whole of Norfolk is occupied by chalk, but on account of drift deposits it forms a comparatively small proportion of its surface. It exists in three forms: chalk marl, which forms part of Hunstanton cliff; lower or hard chalk, much used in west Norfolk for the construction of cottages; and upper chalk, or chalk with flint, which constitutes the bulk of the formation. The other members of the Cretaceous system in Norfolk are gault and lower greensand, which crop out beneath the chalk to the west of the county, and are succeeded by the Kimmeridge clay of oolitic age, which stretches along the coast of the Wash from Hunstanton to King's Lynn, and south nearly to Downham. The Tertiary formation is represented by bands of sand, clay, and shingle in the neighbourhood of Norwich, which contain a fine series of fossils. The drift deposits include the lower glacial beds in the north-east, stretching south to the Yare and Wensum, the middle glacial beds in the neighbourhood of Yarmouth, and the upper glacial beds, consisting of boulder clay, occupying the centre, south, and south-west of the county. A considerable extent of surface is covered by valley gravels. In west Norfolk they occupy sometimes the old beds of rivers which flowed nearly at right angles to those of the present day. In these gravels many flint implements have been found. The fen beds in the south-west were at one time nearly all under water, but this has been carried off by a system of drainage first begun in the reign of Charles I.

The county is not rich in minerals. It is supposed that beds of coal may probably exist at a depth of 1500 feet. Lime and chalk for building are plentiful. Potter's clay and good brick earth are obtained. In the fen district there is still a supply of peat. Marl is found in the valley of the Bure, and sand suitable for the manufacture of glass in the neighbourhood of Snettisham.

Climate and Agriculture.—On account of the exposed position of the coast to east and north-east winds, the climate, especially in winter and early spring, is much colder than in the adjacent counties. The air is, however, generally dry, and unhealthy fogs are not common, except in the marshy districts. Norfolk contains a greater variety of soil than any other county in England. In the north and west the soil is generally chalky; towards the south-east it is a light sand, assuming occasionally the form of blowing sand, but elsewhere capable of cultivation and of average fertility. In the centre and east the prevailing soil is loam of a very varying quality, chiefly light and workable, but sometimes composed of stiff chalky boulder clay. Alluvial clays and loams occur on the borders of Lincolnshire and Cambridgeshire, and stretch along the river valleys. The marsh lands along the coast are so subject to inundation as to make cultivation difficult; they afford, however, capital pasturage for stock.

Notwithstanding the natural defects of soil, farming is in a very advanced condition, and, by means of draining, subsoil ploughing, skilful rotation, and the liberal use of artificial manures and feeding stuffs, excellent crops are raised in many districts of the county. The farms are for the most part large and the farm buildings superior. The prevailing system of tenure in west Norfolk is by leases ranging from seven to twenty-one years; in other parts of the county yearly agreements mostly prevail. According to the agricultural returns of 1883, the area of cultivation was 1,087,270 acres,—a percentage of about 80 of the total area. Corn crops occupied 438,273 acres, green crops 202,060, rotation grasses 166,891, permanent pasture 264,938, and fallow 15,051. About seven-eighths of the area under corn crops is occupied by wheat and barley, the areas of the two being pretty nearly equal, 179,270 acres and 196,483 acres respectively in 1883, while oats occupied only 32,307 acres. As much attention is paid to the grazing of cattle and to the rearing and fattening of sheep, turnips and swedes are extensively grown—occupying 135,116 acres in 1883—while mangolds occupied 46,442 acres, and vetches 11,868 acres, but potatoes only 5269 acres.

The number of horses in 1883 was 62,613, of which 44,232 were used solely for agricultural purposes. Cattle in the same year numbered 117,497, of which 29,040 were cows and heifers in milk or in calf. Large numbers of lean cattle, principally Irish shorthorns, are brought into the county mainly for winter grazing. The old Norfolk polled stock has been recently revived and is now recognized as a distinct breed. Good pasture lands are found in many districts of the county, especially along the river-beds and in the neighbourhood of the fens. Sheep in 1883 numbered 559,146, and pigs 111,349.

According to the latest return the total number of proprietors in the county was 26,648, possessing 1,234,884 acres, yielding an annual rental of £2,403,795. The estimated extent of common or waste lands possessed by no owner was 12,870 acres. Of the owners 16,552, or about 60 per cent., possessed less than one acre. Eleven proprietors possessed upwards of 10,000 acres—viz., earl of Leicester, 43,025; Marquis Townshend, 18,130; marquis of Cholmondeley, 16,995; Rev. H. Lombe, 13,832; Lord Hastings, 12,738; earl of Orford, 12,341; Lord Walsingham, 11,983; Lord Suffield, 11,829; Sir Thomas Hare, 11,033; earl of Kimberley, 10,801; Anthony Hamond, 10,039.

Manufactures.—At an early period Norfolk was one of the principal seats of the cloth trade in England, worsted deriving its name from having been first manufactured at Worstead. The weaving of silk and wool is still carried on at Norwich and also shawl weaving, although the staple trade of the town is now boots and shoes. Silk is also manufactured at Yarmouth, Wymondham, and North Walsham. Flour-mills are numerous all over the county, and there are agricultural implement works at Norwich, Lynn, Thetford, East Harling, North Walsham, Walsingham, and East Dereham. Lime-burning, brick-making, tanning, malting, and brewing are carried on in various districts. The extensive mustard and starch works of Colman & Co. are at Norwich. One of the chief hindrances to the commercial progress of the county is the dangerous nature of the sea-coast, and its unsuitability for the formation of harbours. A large trade is carried on, however, at Yarmouth, which is the outlet for the produce of a very extensive district. The other principal port is Lynn, and there is a small trade at Burnham, Cromer, and Wells. The exports are chiefly agricultural produce, fish, and manufactured goods, and the imports timber, oil-cake, and provisions. Yarmouth possesses one of the most important herring-fisheries in England.

Railways.—The county is intersected in all directions by lines of the Great Eastern Railway, and more recently by the Eastern and Midland Railway.

Administration and Population.—Norfolk comprises 33 hundreds, the city of Norwich (87,842), the municipal borough of King's Lynn (18,539), the principal part (37,151) of Great Yarmouth (46,159), and the principal part (3228) of Thetford (4032), both of which extend into Suffolk. There are also seven urban sanitary districts —Diss (3846), Downham Market (2633), East Dereham (5640), North Walsham (3234), Swaffham (3643), Thetford (4032), and Wells (2645). The county has one court of quarter-sessions and is divided into twenty-five petty and special sessional divisions.

The city of Norwich and the boroughs of King's Lynn and Great Yarmouth have their own police. One parish, a part of a parish, and a part of an ecclesiastical district are in the diocese of Ely, a part of a parish in the diocese of Lincoln, and the rest of the county in the diocese of Norwich. The county contains 736 parishes, with parts of nine others. For parliamentary purposes it is divided into North Norfolk, South Norfolk, and West Norfolk, each division returning two members; and two members are also returned for the parliamentary boroughs of Norwich city in the southern division and of King's Lynn in the western division. The population in 1801 was 273,371, which in 1821 had increased to 344,365, in 1851 to 442,714, in 1871 had decreased to 438,656, and in 1881 had risen again to 444,749, of whom 215,266 were males and 229,483 females. The number of inhabited houses in 1881 was 100,372, and the average number of persons to the acre 0·33.

History and Antiquities.—At the Roman conquest Norfolk was inhabited by the Cenomanni, a tribe of the Iceni. The numerous groups of pits on the heaths and along the coast, such as "Grimes Graves" near Wecting and the "shrieking pits" on Aylmerton heath, appear to have been ancient villages. The whole of the district was brought to own allegiance to the Romans during the campaign of Aulus Plautius; but on account of the indignities offered to their queen, Boadicea, the Iceni revolted, and, joining with the Trinobantes, seized *Camulodunum* (Colchester), an important Roman colony, massacring every Roman on whom they could lay hands. The Romans had their revenge shortly afterwards in a battle (62 B.C.) in which the power of the Britons was finally completely crushed. The name of the tribe was retained in the Incehilde Way, an old British road passing westward from the Norfolk coast, which was utilized by the Romans. The county was traversed by four other Roman roads, and was the seat of five principal Roman stations *Brannodunum* (Brancaster), *Garianonum* (Caistor, near Yarmouth), *Venta Icenorum* (Caistor, St Edmund), *Sitomagus* (Thetford), and *Ad-Tuam* (Tasburgh). Coins and other remains have been found at all these places. In the Teutonic settlement Norfolk was occupied by the Angles, and in 870 the kingdom of East Anglia fell in turn before the Danes (see vol. viii. p. 284). New ravages were committed by the Danes from time to time; and in 1004 Sweyn brought his fleet up the river to Norwich, which he plundered and burned. After the Norman Conquest Ralph de Waher or Guader was created earl of Norfolk, but on his rebellion in 1057 the estates and title were conferred on Roger Bigod. Subsequently the title was in disuse, but it was at length revived and bestowed on Thomas Plantagenet, fifth son of Edward I. During a vacancy in the earldom John le Littester, a dyer, rose in rebellion and joined the commons under Wat Tyler. After the suppression of the rebellion the earldom with the title duke of Norfolk was bestowed on the Mowbray family, who held it till the latter part of the 15th century, when it passed by marriage to the Howards. The duke of Norfolk still exercises a peculiar and permanent jurisdiction, and appoints two coroners for his liberties.

There are few or no traces of Saxon architecture in the county, unless the towers of Dunham-Magna and Newton-by-Castleacre be assigned to this period. The round towers which are specially characteristic of the district are probably Norman. Although there are several fine specimens of Norman architecture in the county in addition to Norwich cathedral, and a few good examples of Early English, the majority of the churches are Decorated or Perpendicular, or a mixture of both styles. The most notable features of the churches are the flint and stone panels, the fine rood-loft screens, and the numerous brasses. Norfolk possessed an unusually large number of monastic foundations, but of these the remains are few and comparatively unimportant. The cathedral-church of Norwich was originally connected with a very richly-endowed Benedictine monastery. A foundation of nearly equal importance was that of Augustinian canons at Walsingham, where there are remains of the church, the refectory, and a Perpendicular gateway. The other principal remains are those at Baeton, Beeston, Binham, Carrow, Castleacre, Thetford, and Wymondham. Of the old Norman keeps there are entrenchments and remains of the building at Castleacre, while Castle Rising is still a magnificent ruin, and Norwich Castle has been restored. Among the more interesting old mansions are the halls of Hunstanton, Oxborough, Blickling, Heydon, and Barningham. The larger mansions, such as Sandringham, Holkham, Rainham, Cossey, Gunton, Houghton, and Shadwell, are, however, of comparatively modern date. Among the eminent persons connected with Norfolk are Sir Edward Coke, Lord Cranworth, John Skelton, the earl of Surrey, Sir Thomas Browne, Sir Thomas Gresham, Roger L'Estrange, Horace Walpole, Tom Paine, Theodore Hooke, Mrs Opie, Porson, Harriet Martineau, Bulwer Lytton, Elizabeth Fry, Fowell Buxton, Sir Francis Palgrave, Sir Cloudesley Shovell, Lord Nelson

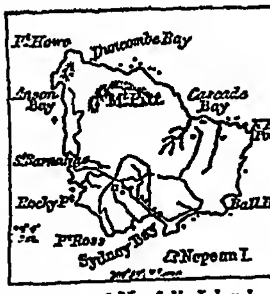
NORFOLK, a city and port of entry of the United States in Norfolk county, Virginia, opposite Portsmouth, on the north bank of Elizabeth river, an arm of Chesapeake Bay. It is the terminus of the Norfolk and Western Railroad (408 miles) and the Norfolk Southern Railroad (74 miles), has easy access to the Dismal Swamp Canal (from Elizabeth City to the Pasquotank river), and the Albemarle and Chesapeake Canal, navigable for vessels of 500 tons, and is connected by regular lines of steamers with Richmond, Baltimore, Philadelphia, Boston, Providence, Washington, and New York. The city lies low, and is somewhat irregular in its arrangement, but the streets are generally wide. The city hall, with a cupola 110 feet high, the custom-house and post-office, the Norfolk academy, the masonic temple, the mechanics' hall, and some of the banks are the most conspicuous of the secular buildings. Apart from its naval yard, one of the largest in the United States, Norfolk has but few manufacturing establishments, but it carries on a large trade in cotton, fruits, vegetables, and oysters for the northern markets, as well as in maize, wheat, and sugar. Though the harbour has 26 feet of water at high tide, the fairway up to the city is narrow. The population was 14,620 in 1860, 19,229 in 1870, and 21,966 in 1880.

Founded in 1705, Norfolk was incorporated as a borough in 1736, and as a city in 1845. In 1776 it was burned by the British. At the opening of the Civil War it was the chief naval depôt of the Confederates, but at an early date in the contest the vessels and yard were destroyed, and in May 1862 the town was occupied by the Federal forces.

NORFOLK ISLAND, with the much smaller Nepean Island and Phillip Island, lies about 29° 3′ S. lat. and 167° 58′ E. long, 400 miles north-north-west of New Zealand, on a submarine tableland extending 18 miles to the north, and 25 miles to the south, with an average breadth of 18 miles. Measuring about 6 miles in length from north-west to south-east, Norfolk Island has an area of 8607 acres, or 13½ square miles. The breakers of the Pacific beating on its high cliff-bound coast render it difficult or even impossible to land except at two places, and even there not without danger. With a general elevation of 400 feet above the sea the surface of the island rises in the north-west into Mount Pitt, whose double summit is 1050 feet in height. The soil, of decomposed basalt, is well watered and wonderfully fertile. A rich undulating pasture-land clothed with clumps of trees and copses gives a park-like appearance to the general aspect of the country. The Norfolk Island pine (*Eutassa excelsa*), a magnificent tree, with a height at times of 200 feet and a girth of 30, forms a fine avenue between Sydney and St Barnabas, though of the forest that clothed the slopes of Mount Pitt only a few of the larger trees are left. A small species of palm is known as the Norfolk Island cabbage. The underwood is largely composed of lemon trees; and guavas, bananas, peaches, and pine-apples are to be had in abundance. Sweet potatoes are the staple crop, but common potatoes, maize, yams, and even barley and oats are cultivated. The climate is genial and healthy, the thermometer rarely sinking below 65°. In 1862 the population was 268; in 1871, 481; and in 1880, 663. The descendants of the Pitcairn Islanders, who form two-thirds of the inhabitants, have their chief settlement on the south side, on Sydney Bay, where the buildings of the old penal establishment were placed at their disposal. A thousand acres on the west side of the island are held by the mission station of St



Map of Norfolk Island.

Barnabas, founded by Bishop Patteson, where 150 Melanesian boys and girls receive education.

The following are the main facts in the history of Norfolk Island. 1774. Island discovered by Captain Cook. 1788. Taken possession of by Philip G. King of the "Stirling" and twenty-four convicts from New South Wales. 1805. Settlement abandoned by order issued in 1803. 1826. Island made penal settlement for New South Wales convicts. 1842. Island transferred from New South Wales to Tasmania. 1856. Pitcairn Islanders to the number of 194 take the place of the convicts. 1867. Melanesian mission station settled at St Barnabas. 1882. Memorial church to Bishop Patteson erected at a cost of £5000, the windows being designed by Burne Jones and executed by W. Morris.

NORICUM was the ancient name of the country south of the Danube, around the rivers Inn and Drave, and extending on the south to the banks of the Save. The original population appears to have been Illyrian, but in the great emigration of the Gauls the country was occupied by a Celtic people, Taurisci or Norici. The latter name seems to be derived from their town of Noreia, now Neumarkt. The country is mountainous, and the soil poor, but it is rich in iron, and has always been one of the great European centres of the trade. A great part of the Roman weapons were made of Noric steel. The country was conquered by the Romans under Tiberius and Drusus in 15 B.C., but for a time retained its old constitution and the name of Regnum Noricum. See AUSTRIA, BAVARIA, CARINTHIA, &c.

NORMANBY, CONSTANTINE HENRY PHIPPS, MARQUIS OF (1797-1863), bore an eminent, though not a leading, part in some of the greatest movements of this century. As governor of Jamaica he had charge of the distribution of the huge compensation to owners upon the abolition of slavery in the West Indies; it fell to him as lord-lieutenant of Ireland to give effect to the Catholic Emancipation Act; he was English ambassador at Paris during the revolution of 1848, and minister in Tuscany in the years immediately preceding the struggle for Italian unity. The son of the first earl Mulgrave, and born 15th May 1797, he passed through Harrow and Trinity College, Cambridge, and sat for the family borough of Scarborough as soon as he attained his majority. But, speaking in favour of Catholic emancipation, and dissenting in other points from the family politics, he thought proper to resign his seat, and went to live in Italy for some two years. Returning in 1822, he was elected for Higham Ferrers, and made a considerable reputation by political pamphlets and by his speeches in the House. He was returned for Malton at the general election of 1826, and enrolled himself among the supporters of Canning. Previous to this, in 1825, he made his appearance as a novelist with *Matilda*; and three years later, in 1828, he produced another, *Yes and No*. Of the brilliant band of fashionable novelists who started up as by a common impulse in those years, including Ward, Lister, Bulwer, Disraeli, Lord Normanby was probably the least impressive; yet his *Matilda* ran through four editions in a year. There is a certain stiffness in the construction of his novels, as if he were either deficient in the story-teller's vivacity and fertility or, oppressed by his own sense of dignity, over-fastidious in his theory of composition. The novels are comparatively short, and move forward steadily to tragic catastrophes that present themselves ahead from a very early stage in the journey. The moral is so obtrusive that they may almost be called sermons in disguise. Especially is this true of *Yes and No*, in which two opposite types of character, the man who says "Yes" with too great facility, and the man who says "No" with too great obstinacy and suspiciousness, are very skilfully contrasted. It was chiefly character that he aimed at, as became a statesman, and his characters were drawn with fulness and keen insight, though not without too much appearance of labour.

A speech put into the mouth of one of his characters expresses very fairly Lord Normanby's political creed, a creed not uncommon among the aristocracy at the time of the Reform Bill: "I can't help thinking it but befits a gentleman to move methodically forward with the main body of the age in its regular march of mind, neither seeking foolish forlorn hopes in advance, nor lagging disgracefully in the rear." Acting on this principle, Lord Normanby reached the zenith of his career between the age of thirty and forty; after that he began to lag and to decline in political reputation. He succeeded his father as Earl Mulgrave in 1831, was sent out as captain-general and governor of Jamaica in the same year, and, in spite of certain defects of manner, gained such credit as an administrator that he was appointed lord-lieutenant of Ireland in 1835. It is significant of the reputation he then held that his appointment was received with enthusiasm as the beginning of a new order in Ireland; and during his three years of office, one of the most peaceful periods in the history of Ireland, great improvements were made. It is disputed how much was due to him and how much to his subordinate Thomas Drummond. He was created marquis of Normanby in 1838, and held successively the offices of colonial secretary and home secretary in the last years of Lord Melbourne's ministry. From 1846 to 1852 he was ambassador at Paris, and from 1854 to 1858 minister at Florence. He died in London, 28th July 1863. The publication in 1857 of a journal kept in Paris during the stormy times of 1848 (*A Year of Revolutions*) brought him into violent controversy with Louis Blanc on questions of fact as well as of policy; and his controversies with Lord Palmerston and Mr Gladstone, after his retirement from the public service, on questions of French and Italian policy, showed him to have fallen behind "the regular march of the mind" of his age.

NORMANDY (*Terra Northmannorum, Northmannia, Normannia, Normendie, Normandie*) is the name which was given to part of northern Gaul in consequence of its occupation in the early part of the 10th century by the Northmen, whose name was on Gaulish soil gradually changed into Normans. Till that time the land which has ever since borne the name of Normandy had no distinct name, nor any separate political being. In ecclesiastical geography it answers very nearly, but not quite exactly, to the province of Rouen. This includes the archdiocese of Rouen and the six suffragan dioceses of Evreux, Lisieux, Séez, Bayeux, Coutances, and Avranches. Politically it was, at the time of the Scandinavian settlement, part of the great duchy of France, of which it took in nearly the whole of the sea-coast. The name "Neustria" is sometimes used as equivalent to Normandy; but of the old Neustria Normandy formed only a small part. As France was cut off from Neustria, so Normandy was cut off from France.

Geographical boundaries.

Normandy, in its widest extent, reached on the eastern side to the rivers Eu and Epte, of which the Eu empties itself into the English Channel near the town of that name, while the Epte flows in the opposite direction and joins the Seine near Vernon. These streams form the boundary during nearly, but not quite, the whole of their course. Along the Epte the boundary of the duchy forsakes that of the ecclesiastical province, as the diocese of Rouen stretched a considerable way on the French side of that river. To the west Normandy is parted from Britanny by the border stream of Couësnon, but the shape of the coast makes the actual frontier very small. To the south the boundary of Normandy towards the duchy of France and the great counties which were parted off from it mainly followed the ecclesiastical frontier. But the diocese of Séez stretched beyond the duchy, while the conquests of William I. added to Normandy part of the diocese of Le Mans, and therefore

of the province of Tours. The land thus marked out took in the districts of Caux, Talou, Rouen, Evreux, Lisieux, Bayeux (Bessin), Avranches, and Coutances (Cotentin, *pagus Constantinus*), with the greater part of the Hiesmois and about half the Vexin. This last was often a disputed ground between Normandy and France.

Sea-board. But the main feature of the country is its sea-coast and its great river. A glance at the map (Plate XIII., vol. ix.) will show that the coast of Normandy, long as it seems, is little more than the mouth of the Seine. To the west that mouth is guarded by the peninsula of Coutances, the Danish land which, it has been remarked, is the only peninsula in Europe, besides the older Danish land, which points to the north. To the west this peninsula presents a bold front to the Atlantic, forming with the Breton coast a bay in which lie the Norman islands, Jersey, Guernsey, Alderney, Sark, and some smaller ones. Normandy, in fact, was the seaboard of France in the strict sense, the coast lying between Britanny on the one side and Flanders on the other. It is that part of the Continent which lies most directly opposite Britain. The Norman duchy, in short, as long as it had an independent being, was interposed between England and France; and in that position lies the key to its whole history.

Towns. The chief city of the duchy was always the ecclesiastical metropolis of Rouen (*Rothomagus*), the great city of the lower Seine. It is to be noticed that Rouen, like the cities of southern Gaul, keeps its own local name and has not taken the name of a tribe. Evreux, Séez, Bayeux, Lisieux, Avranches, preserve tribe names. The name *Constantia* or Coutances belongs of course to the later Roman nomenclature of imperial times. Other towns which figure in Norman history, as Caen, Falaise, Alençon, are of later origin. Havre de Grâce dates only from the 16th century, long after the loss of Norman independence.

Modern divisions. In the divisions of modern France, Normandy answers to the departments of Lower Seine (cap. Rouen), Eure (cap. Evreux), Orne (cap. Alençon), Calvados (cap. Caen), Manche (cap. St Lo), and to the modern dioceses of Rouen, Evreux, Séez, Bayeux, and Coutances. The boundaries of Rouen and Evreux have been changed; Lisieux has been joined to Bayeux, and Avranches to Coutances. The archbishop of Rouen still keeps the title of primate of Normandy; otherwise the name of the duchy has gone out of formal use.

Early Scandinavian settlements. It must be remembered that the land to which the Northmen thus permanently gave their name was only one of several Scandinavian settlements in Gaul, though it was the greatest and the only lasting one. Nor was the whole of the land which became the Norman duchy occupied at once. The whole second half of the 9th century was largely taken up in both Gaul and Britain with Scandinavian inroads, which in both countries led to important Scandinavian settlements. Settlement in Britain came first, and the great settlement in Gaul seems to have been made after its model. By the peace of Wedmore, Ælfred found his own West-Saxon kingdom untouched and indeed enlarged. But a large part of England, over which he claimed at most a vague external supremacy, was left to the Danish invaders. Their king embraced Christianity, and, like his English predecessors, accepted a formal West-Saxon supremacy. A variety of later causes made the history of the Scandinavian settlement in England to differ widely from that of the Scandinavian settlement in Gaul; but in their beginnings the two are exactly alike. The smaller Scandinavian settlements, those of Hasting at Chartres, of Ragnald at the mouth of the Loire, had no historical importance. The settlement of Rolf at Rouen grew into the duchy of Normandy. The treaty of Clair-on-Epte followed the model of that of Wedmore. The Scandinavian invader embraced Christianity, and he became the man of the king of the Western kingdom. But he received no part of the king's immediate territory. His settlement was made wholly at the cost of the duke of the French. The only difference was that the duke of the French still went on reigning at Paris, though no longer at Rouen, while the English dynasties of Mercia, East Anglia, and Deira came altogether to an end. But the two settlements are exactly alike in this, that the converted Northman becomes the man of the king, though the settlement is not made at the cost of the king's immediate dominions. In both cases the king is strengthened, though in different ways. The West-Saxon king received an actual increase of immediate territory in the shape of that part of Mercia which formed the lordship of Æthelred and Æthelflæd. The Carolingian king received no increase of territory, but his position was distinctly bettered when the great and threatening duchy of France was split into the two rival duchies of France and Normandy. That Normandy was cut off from France in the strict sense, from the duchy of the house of Paris, is a point in its history which must always be remembered. It is the key to that abiding rivalry between France and Normandy which was inherent in the position and history of the two lands. No momentary policy on the part of their rulers could ever get over it. It lived on in truth to become no unimportant element in the general history of Europe. The close connexion which arose between Normandy and England handed on to England the inheritance of rivalry which had first begun between France and Normandy, an inheritance which England kept in its fulness for ages after its separation from Normandy. It is likely enough—considering the position of the two kingdoms, we may call it certain—that, had a separate state of Normandy never existed, a rivalry between England and France would have arisen out of some other cause. As a matter of fact, it was out of the older rivalry between France and Normandy that it did arise.

Settlement of Clair-on-Epte. The settlement of Clair-on-Epte and the beginning of the Norman state are commonly placed in the year 912. There seems some reason to think that it may have happened a few years later. There is no thoroughly trustworthy account. The writers in the Western kingdom plainly say as little as they can about the matter; they disliked the very name of the "pirates," as the Normans are called by Richer of Rheims down to the end of the century and beyond it. The earliest writer on the Norman side is Dudo, dean of St Quentin, who wrote late in the century, a rhetorical writer of the courtly school. But there is no doubt that the chief of the Scandinavian settlers was Rolf (in various spellings), known in Latin as Rollo and in French as Rou, a viking leader to whom many earlier exploits, real or mythical, are attributed. He received, as a grant from Charles the Simple, king of Carolingia or the Western kingdom, a tract of land of which Rouen was the centre and head, a tract certainly stretching as far as the Epte to the east, most likely stretching as far as the Dive to the west. It is an important part of the case that, though the land was cut off from the duchy of France, yet the grant was a grant from the king and not from the duke of the French, and that the king and not the duke received Rolf's homage. The two princes were presently at war, Robert, duke of the French, having been elected as opposition-king in 922. Rolf. Rolf seems to have stuck faithfully to his own lord, King Charles, alike against Robert and against Robert's son Hugh, called the Great, and the king, Rudolf of Burgundy, whom Hugh set up. The Normans were thus at war with France almost from the moment of their settlement,

and they were rewarded by a further acquisition of territory at the expense of the French duchy, namely, the Bessin or land of Bayeux. France was now nearly or wholly cut off from the sea. The Norman princes further claimed, by virtue of these early grants, a supremacy over both Britanny and Maine, which they were never able fully or lastingly to enforce.

Of the nature of the settlement made by the Northmen in the part of Gaul which they changed from France to Normandy we can judge only by the results. The new state for a while had no recognized territorial name. To the end of the century it is simply "Terra Northmannorum." "Northmannia," a name which with Einhard meant Denmark, which in Adam of Bremen commonly means Norway, becomes, in the shapes of "Nortmannia," "Normannia," "Normendie," and the like, fully established in the next century as the name of the Norman land in Gaul. In English chronicles it appears as "Ricardes land," from the princes of that name; it is not "Normandi," "Normandie," "Normandig," "Normandige," till after the Norman Conquest. The chief again has no certain titles; at Rheims he was "princeps Northmannorum," or, more heartily, "dux piratarum." In the next century he becomes regularly "dux" or "comes Normannorum"; that is, he was "dux" as regards the Norman people, "comes" as regards his overlord the Western king. The people become definitely "Normanni," "Normend." It is not easy to say to what extent the Scandinavian settlers became mingled with the earlier occupiers of the land, or again how far those earlier inhabitants were of Frankish and how far of Celtic descent. It is plain that the land was parted out among Scandinavian landowners very much as in the Danish districts of England, and many places, just as in those districts, keep the name of the first Scandinavian lord. And it can hardly fail that, after the long harryings which went before the actual settlement, the population of the lands which lay open to the Northmen must have become scanty, and many parts are likely to have been quite forsaken. On the other hand, it is certain that before the end of the 10th century there was an oppressed peasantry in the land, and it is hardly likely that descendants of the original conquerors could have sunk so low in so short a time. The actual tillers of the soil were most likely to a great extent descendants of the earlier inhabitants; that is, they would belong to the same mixed nationality as the people of the duchy from which Normandy had been cut off, to that mixture of Celtic, Latin, and Teutonic elements which has formed the modern Frenchman. Yet in Normandy, as elsewhere, the tendency would come in which makes the actual cultivators of the soil sink rather than rise, and it is by no means unlikely that the later peasantry of Normandy were largely the descendants of the Scandinavian conquerors. Anyhow, a nobility gradually sprang up among the Normans themselves, consisting chiefly, it would seem, of those who could claim any kind of kindred or affinity, legitimate or illegitimate, with the ducal house. Some of the greatest Norman houses sprang from kinsfolk of wives or mistresses of the dukes who were themselves of very lowly degree. This is always likely to happen when a nobility is first forming. Early in the 11th century the order of "gentlemen" as a separate class seems to be forming as something new. By the time of the conquest of England the distinction seems to have been fully established.

The Norman, with the softened form of his name, is distinguished from the Northman by his adoption of the French language and the Christian religion. In the case of Rolf himself, as in the case of Guthrum, his baptism formed one of the terms of the agreement. The convert took the name of Robert, from the duke of the French, who acted as his godfather; but, as in other cases of baptized Danes, he was still always spoken of by his earlier name. Whether Rolf himself learned French we are not told; his language at the time of his homage is spoken of as English. This doubtless means any Low-Dutch or Scandinavian tongue, as opposed alike to High-Dutch and to French. Among his followers the twofold change took place with very different degrees of speed in different parts of the duchy. At Rouen and Evreux and in the eastern part generally, the first grant to Rolf, the change seems to have been very speedy. In some other parts circumstances made it much slower. Thus, at Bayeux it would seem that an earlier Saxon colony coalesced with the Scandinavians; at all events, a Teutonic tongue of some kind lived on there long after Rouen had come to speak no tongue but French. In the Cotentin, a still later acquisition, both the Northern speech and the Northern creed were kept up by fresh settlements from Scandinavia. The result was a wide distinction between the eastern and the western, the French and the Scandinavian, parts of the duchy, which led to important political consequences as late as the reign of the Conqueror.

William Longsword.

The Cotentin, with its appendage of the Channel Islands, seems not to have been added to the land of the Northmen till after the accession of its second duke, William surnamed Longsword, about 927. Whether Rolf died, or abdicated, or was killed in battle, and the exact date of his son's accession, do not seem clearly fixed. The certain point is that William became the man of King Charles in 927, and that he refused all allegiance to the rival king, Rudolf of Burgundy, as long as Charles lived. His own reign lasted till 943. It is one of the most confused periods in the history of Gaul, and a good deal of the confusion is owing to the shifting policy or caprice of William himself. He changed sides more than once in the struggles between Lewis, the Carolingian king at Laon, and the more powerful Duke Hugh of Paris. At last, there can be little doubt, he was murdered by the practice of Count Arnulf of Flanders. In Normandy itself the history and effects of his reign are more marked. We see the struggle between the heathen or Danish party and the Christian, which may be also called the French, party. By this must be understood the party of the French speech and French civilization, not at all a party in the political interest of France. Its policy was to make Normandy a Christian and French-speaking state, an independent member of the Western kingdom, alongside of France and Flanders. The two parties are distinctly marked as geographical. The first years of William's reign are marked by a revolt of the heathen party, who demand the cession of the lands west of the Risle. The Christian and French-speaking duke might reign in the region which had adopted his creed and tongue; the western Normandy should form a separate state, heathen and Scandinavian. Though all this rests on the not very high authority of Dudo, it bears the stamp of truth; it falls in with facts earlier and later; it is not the kind of story to grow up in the hands of a rhetorical panegyrist. William, successful over the rebels, appears as a Christian, not without fits of special devotion, and as anxious to take his place among the great princes of the Carolingian kingdom, notwithstanding the reproach of pirate origin that still cleaves to him. Yet he does not show himself the enemy of the other side. Himself speaking both tongues, he has his son Richard sent to Bayeux to gain a fuller mastery of the Northern speech, and he seems even to have admitted fresh settlement from the North in the western part of the duchy. The deep and clearly intentional darkness in which contemporary writers at Rheims leave the Norman history of this period makes any minute knowledge of this reign quite hopeless. But

The Heathen and the Christian Party.

we may safely set it down as a time of struggle between the two elements in the land, a time in which things, on the whole, tended to the strengthening of the Christian, French, eastern element,—the influence of Rouen and not that of Bayeux.

Richard the Fearless. It was the long reign of William's son, Richard the Fearless, which finally settled the position of Normandy and which had no small influence on the position of France. We must always remember that Normandy and France were alike vassal states of the Western kingdom, the kingdom of the Carolingian king at Laon, a king who, in all but the moral influence of his kingly dignity, was a prince of far smaller power than either of his mighty vassals. Normandy, rent away from France, bound by direct homage to the king at Laon, had hitherto been on the whole an ally of the king who dwelled beyond the dominions of the duke. The fifty years of Richard's reign changed all this. For the events of its early days we are not left wholly to Dudo; the writers at Rheims tell us enough to show that the division between the heathen and the Christian Normans was still strongly marked. The heathen party, strengthened by a new band of settlers from the North, got hold of the young Richard and persuaded or compelled him to fall back to his heathen worship. Richard was the son of William by a Breton mother, one who stood to his father in that doubtful relation which was called the Danish marriage, and who might be spoken of as wife or concubine at pleasure. At Rheims she bore the harsher name; yet it is a matter of avowed record that her son was received as his father's successor by King Lewis. But the young duke —it is hard not to give him the title, though it is perhaps premature—was presently got hold of by the heathen party, who were just then strengthened by a fresh settlement from the North. The Christians sought help both at Laon and at Paris; king and duke entered the land, seemingly in concert, in two successive years (943, 944). The heathens were defeated; the king occupied Rouen and the whole Norman land, doubtless with the intention of keeping it. Nothing could better suit the king of Laon than to rule at Rouen as well, and to hem in the duke of Paris on both sides. The Norman writers tell a romantic tale of the escape of young Richard from captivity at Laon. What is more certain is that Normandy soon rose against Lewis, and that, by the help of a Danish leader, in whom the Normans see the famous king Harold Blaatand, the king was defeated and made a prisoner. The policy of Hugh of France now obtains possession of Lewis and a commendation of Richard to himself. Lewis was released on surrendering Laon; his kingdom was cut down to Compiègne. In 946, in alliance with the Eastern king Otto, the future emperor, Lewis invaded France and Normandy, but the forces of the two kings failed before both Paris and Rouen.

These events fixed the position of the Norman duchy for some time. It is not clear whether Richard, along with the other princes, renewed his homage to Lewis; it seems certain that he became the man of the duke of the French. Things are thus turned about; Rouen, lately friendly to Laon and hostile to Paris, is now friendly to Paris and hostile to Laon. Normandy is the faithful and powerful ally of France under its successive dukes, Hugh the Great and Hugh Capet. The Norman duke is the son-in-law of the elder, the brother-in-law of the younger, of the French princes. It does not appear that Richard ever did homage to King Lothair, the successor of Lewis; he once at least, in 961, appeared in arms against him. At last, in 987,

France, head of Gaul. came the change which united the duchy of France with the Western kingdom. Hugh of Paris was chosen to succeed to the crown of the last Lewis of Laon. This revolution, so often mistaken for a mere change of dynasty, was in fact the making of a nation. And in the making of that nation the Norman duchy had no small share. The close union between Normandy and France which had been brought about by Hugh the Great had a double result. It made Normandy French; in the end it made Gaul French. Up to this time Carolingia had been a kingdom of many nations and languages. The kings of Laon were still German; they relied on German memories, on the slight German element still left in their kingdom, on the support of the German king beyond the Rhine. The great county of Flanders, stretching much further to the south than the present use of that name, was a land of the Nether-Dutch speech. The Bretons in the extreme west kept the Celtic tongue which they had brought over from the greater Britain. The lands south of the Loire, nominally part of the kingdom, but seldom playing any part in its history, kept their own variety of the Romance speech, and a national spirit altogether distinct from anything in northern Gaul. Most central of all lay the duchy of France, the land of which Paris was the centre and the cradle, the land of the new-born French speech and French nationality. The supremacy of Gaul was not likely to fall either to its Celtic or to its Nether-Dutch element; it might well fall either to its High-Dutch, its French, or its Aquitanian element. The close alliance between Hugh and Richard, between France and Normandy, determined to which element it should fall. Had Normandy remained Scandinavian, France, hemmed in between Teutonic Laon and Teutonic Rouen, might never have reached to the headship of Gaul. But Richard's French alliance settled the question between French and Scandinavian in Normandy. Normandy, itself become French, turned the balance in favour of the French element; it ruled that France should be the head power of Gaul, that the duke of the French and the king of the French should be the same person. Normandy becomes French. The first creation of Normandy, a power shorn off from France and shutting out Paris and the whole duchy from the sea, had been a frightful blow to the French power. But the loss was more than made up when the policy of Hugh the Great won back as an ally what he had lost as a ruler, when he was chosen king by the help of the Norman duke, and when his election as king meant the final establishment of France as the leading state of Gaul, of French as its leading speech, of Paris as its ruling city.

This good understanding between France and Normandy, at all events between the kings of the French and the dukes of the Normans, lasted through the reign of Richard the Fearless, through the reigns of the second and third Richard and that of Robert, till the accession of Robert's son, William the Bastard, afterwards known as the Conqueror and the Great, in 1035. The duke is now the most faithful and the most cherished vassal of the king. His vassalage is not doubtful. If Richard the Fearless, after the recovery of his duchy, no longer acknowledged the supremacy of King Lewis of Laon, he had cordially commended himself to Duke Hugh of Paris. When the second Hugh became king, it would have been a mere question of words whether the homage of the Norman vassal was due to the French lord in his kingly or in his ducal character. More than once during this period the Norman dukes appear as the powerful helpers of the Parisian kings. They date their charters by the years of the kings, and recite the consent of their lords to their grants and other acts. All this is to be carefully noticed, because at a later period of Norman history, the period when Norman history is most closely connected with English history, all is different.

Yet English dealings both with France and Normandy began early. In the disputes of the early days of Lewis, his uncles Æthelstan and Eadmund successively interfered on his behalf, and, so far as France and Normandy were

the enemies of Lewis, this was English interference directed against both Normandy and France. But direct dealings between England and Normandy begin at a later time, in the latter days of Richard the Fearless. A dispute between Richard and the English king Æthelred which arose about 991 is said to have been hindered by the intervention of Pope John XV. from growing into a war. There can be little doubt that the quarrel arose out of the close connexion which still went on between Normandy and the Scandinavian North. The Danish invaders of England were received with welcome in Norman havens and were allowed to sell the plunder of England to Norman buyers.

Richard the Fearless died in 996, known to the last at Rheims only as duke of the pirates. Yet he had made his duchy Christian and French. It might be too much to say that every trace even of heathen worship, much less of Danish speech, had died out from the lands of Bayeux and Coutances. The speech at least, we may be sure, lingered some time longer, the more so as we hear of fresh Danish settlements in the latter days of Richard. And, even if speech as well as creed died out, the two left behind them the tradition of local distinction and local enmity between the eastern and the western parts of the duchy. The true Normandy, the land which was still in some measure Teutonic, began on the left bank of the Dive. But Normandy as a state was Christian and French. The French speech of Rouen gradually supplanted the Danish speech of Bayeux. Yet, as commonly happens in such cases, a few Teutonic words, chiefly words of seafaring life, now crept into the Romance tongue of northern Gaul, in addition to the far greater infusion which had found its way in ages before as a result of the Frankish conquest. In Normandy itself the local nomenclature became Teutonic to an extent which makes itself felt on the map. Scandinavian endings like *toft* and *by* live on in the shape of *tôt* and *bœuf*, and they are constantly coupled, like the *by* of Lincolnshire and the *ton* of Pembrokeshire, with the names of Scandinavian settlers. Even in the most French part of the duchy, some places, like Caudebec and Dieppe—the *cold beck* and the *deeps*—keep Teutonic names under a very slight disguise. And the Conqueror's own Falaise, bearing a name which has passed into the general vocabulary of the French tongue, is simply the Teutonic *fals*, whether the name dates from Frankish or from Norman settlement.

Richard the Good. Of one effect of the reign of Richard the Fearless we get a picture in the peasant revolt (which has been already spoken of) which marked the beginning of the reign of his son Richard the Good (997). A peasant revolt implies masters, and harsh masters. It is hard to say how far the distinction of oppressor and oppressed coincided with distinction of race; but it is certain that the movement had some special and promising features. The peasants of Normandy set up a *commune*—or something to which later writers gave a name which became afterwards so well known—more than sixty years before the burghers of Le Mans did the like. We seem to be reading the history of Friesland or of the Three Lands rather than that of any part of the Western kingdom. But the revolt was fully and harshly put down, and the rule of the "gentlemen" was made safe. It is noticed that Richard the Good would have none but gentlemen about him. This seems to mark the final establishment in Normandy, as in other lands, of the new nobility, the nobility of office, or rather the nobility of kindred to the sovereign. We soon begin to trace the history of the great Norman families, only one or two of which can be seen, and that dimly, before Richard the Good. It illustrates the origin of Norman nobility that Rudolf of Ivry, who put down the revolt, was the duke's uncle, but only because his father, a miller, had married the cast-off wife or mistress of William Longsword. So at least the story goes, and a story of this kind is sure to have this kind of truth; such a rise as it describes was possible and likely. After all, it may be that the revolt was not a mere failure. Villainage in Normandy was both lighter and died out earlier than in most parts of France.

The thirty years of the reign of Richard the Good continue the period of unbroken friendship between Normandy and France, and also between Normandy and Britanny. But we find the Norman duke warring, sometimes on his own account, sometimes as the ally of the French king, with his neighbour of Chartres, and in the more distant lands of the ducal and even the royal Burgundy. His relations with the North and with England are of more consequence. Richard is charged with bringing two heathen sea-kings, one of whom is said to have been afterwards the famous Saint Olaf, as helpers against Chartres; we hear also of a second quarrel with Æthelred, and even of an English invasion of the Cotentin. It is more certain that in 1002 Æthelred married Richard's sister Emma, a marriage which may be set down as the first link in the chain of events which led to the Norman conquest of England. Eleven years later, when Æthelred was driven from his kingdom, he found shelter with his wife and her children at the court of his brother-in-law. Soon after Æthelred's death and Cnut's establishment in England, Emma married Cnut. Unbroken peace reigned between Cnut and Richard, and Emma's children by Æthelred, Ælfred and Eadward and their sister Godgifu, were brought up at the court of their Norman uncle,—another stage in the drama of the Norman Conquest.

Robert, father of the Conqueror. The short reign of Richard's son Richard (1026-1028) was marked only by disputes between the duke and his brother Robert, count of Hiesmes, who presently succeeded to the duchy. He too maintained the French alliance, and restored King Henry to his crown when he was driven from it by his stepmother Constance. But friendly relations both with Britanny and England now ceased. Robert seems to have married and put away Estrith, the sister of Cnut, either before her marriage with Earl Ulf or more likely after his death. This led to a quarrel between Robert and Cnut, and to an attempted invasion of England on behalf of the banished Æthelings, the sons of Æthelred and Emma. Robert at last made the pilgrimage to Jerusalem, and died on his way back in 1035. He had already made the great men of Normandy swear to the succession of his natural son William, born to him of Herleva of Falaise before his accession to the duchy. William the Bastard, one day to be the Conqueror, was about eight years of age at the death of his father.

Succession of William. There can be no doubt that the succession of William was most unwillingly accepted. It was the acceptance of one who was at once bastard and minor. The law of hereditary succession was nowhere very distinctly defined; but it is clear that the notion of some kind of hereditary succession, as distinguished from election even within a particular family, had made much greater advances in Normandy than it had in England. No princes were more lax as to marriage than the Norman dukes; both William Longsword and Richard the Fearless were the offspring of unions which were very doubtful in the eye of the church, and Richard the Good and the other children of Richard the Fearless were legitimated only by the after-marriage of their parents. But the son of Robert and Herleva was pre-eminently the Bastard; there was no pretence of marriage of any kind. He was accepted, so far as he was accepted, simply because there was no candidate whose right was so distinctly better than his as to unite the whole country on his behalf. Of the other members

of the ducal kindred, some were themselves of doubtful legitimacy, while others could claim only through the female line. The result was that the minority of William was a time of utter anarchy, of plots, rebellions, public and private crimes of every kind, but that the young duke was never altogether set aside for any other claimant. And now for the first time since the very earliest days of the Norman state we find France unfriendly. The whole relations between the two powers change from the time of William's accession. It could not be in the beginning the personal act of the boy William himself. But the fact that William came to the duchy as a child had very likely a good deal to do with the change. The alliance had never been a natural one; it had been alliance between prince and prince rather than between people and people, and now, during William's minority, there was no prince in Normandy ready to do to the ruler of France such good service as had been done by earlier Norman princes. While the princes were personal friends circumstances might make it convenient to forget that Normandy was a land lopped away from France; as soon as those circumstances had passed away the French kings and the French people again remembered that Rouen barred the way between Paris and the sea. For a while each power stood in need of the other. Normandy owed to France its introduction into the Christian and Romance-speaking world. France owed to Normandy its new position among the powers of Gaul. As the remembrance of these benefits on each side passed away, the far more natural feeling of rivalry and dislike showed itself again. After the accession of William there still are periods of friendship between France and Normandy; but they alternate with more marked periods of enmity. The steady and faithful alliance is at an end; it is significant that the name of the French king disappears from the charters of the Conqueror. If an immediate occasion of quarrel was at any time needed, it could always be found in the disputed frontier of the Vexin, the border district between Rouen and Paris. Old grievances are rubbed up again. Norman pride tells the tale of the Norman settlement, of the humiliation of the dukes and kings of Francia. French enmity finds scornful epithets for the intruders who had cut off so goodly a land and so great a city from French dominion.

The first sign of this revival of the older and more natural feeling was shown when King Henry took advantage of the weakness of Normandy to advance his fortune at its expense. From this time the relations between king and duke are, among a good many shiftings, more often hostile than friendly. It was also during William's minority that the attempt of the Ætheling Ælfred on the English crown took place. He went with Norman companions, and in some accounts the enterprise swells into a Norman invasion. At all events, it marks another step towards a greater Norman invasion.

The ill feeling towards William finally broke out when he had reached an age to act for himself. This was in 1047, and the movement is one of special interest and importance, as bringing out more strongly than anything else the long-abiding distinction between the two parts of the duchy. Eastern or French Normandy, the land of Rouen and Evreux, clave to William; western or Teutonic Normandy, the land of Bayeux and Coutances, rose against him. The stirrer up of strife was Guy of Brionne, son of Reginald, count of the Burgundian palatinate, by a daughter of Richard the Good. The plan seemingly was that Guy should supplant William in the eastern district, and should leave the barons of the west to themselves. William asked and obtained help of his lord, the king of the French. It is not easy to see why Henry, who had hitherto acted an unfriendly part towards Normandy and who before long acted it again, should have stepped in, when the dismemberment of the duchy would seem to have been just what he would have wished. However this may be, the rebels were overthrown in the fight of Val-ès-dunes by the joint forces of king and duke; the power of William over his duchy was fully established; and, though a difference may to this day be seen between the two parts of Normandy, they never again appeared in open strife against one another.

Establishment of his Power.

That part of the reign of William which comes between the battle of Val-ès-dunes and the invasion of England was the great day of Normandy as a wholly distinct and practically independent power. Under the wise and vigorous rule of its great duke the duchy became one of the most flourishing parts of Gaul and of Europe. We can now for the first time call up a fairly distinct picture of the country. The great Norman families, many of whom afterwards won a second establishment in England, now stand out distinctly. They are wealthy and powerful, but under William's rule they are made to feel that they have a master. Many of them, as we have seen, were the duke's kinsfolk; some were favourites of his own advancing. The counts of Eu and of Evreux, the lords of Beaumont, Grantmesnil, and Conches, the viscounts of Avranches and Saint-Sauveur, stand out among many others. Greater than all was the mighty house that was formed by the union of the houses of Montgomery and Bellême, a house holding lands both of Normandy and of France, and ranking rather with princes than with ordinary nobles. Of those raised by William himself, we see his personal favourite William Fitz-Osbern of Breteuil, and his half-brother Robert, to whom he gave the county of Mortain, while his other half-brother Odo held the bishopric of Bayeux. These were the sons of Herleva by her husband Herlwin of Conteville, whom she married after the death of Duke Robert. That side of the feudal theory by which the noble holds of the prince and does military service for the lands which he holds was never better carried out than it was in Normandy under William. But under him the great lords were not only vassals but subjects. The reign of law was enforced; the towns grew and trade flourished; the settlement of foreigners was encouraged; Duke William in his own duchy showed all the great qualities which enabled him to become the conqueror and the ruler of England, without that darker side of his character which necessarily followed on his position as conqueror.

His Dealings with the Church.

Nowhere do these qualities stand out more clearly than in his dealings with the church. William was neither the enemy nor the slave of the ecclesiastical power. He held the supremacy over the spiritual estate with a firm hand. He had the great advantage that the prelates of Normandy were his vassals and subjects, holding their temporal estates of him and not of a king or emperor beyond his dominions. He was advocate of all his own churches; he bestowed them at his will, and held firmly to the right of investiture. But he was a church-reformer in the best sense. He chose the best men from all lands for the bishoprics and abbeys in his gift. Among those whom he promoted and befriended are the great names of Lanfranc and Anselm. Up to this time the Norman bishoprics had been used as provisions for cadets and kinsmen of the ducal family, a custom of which the promotion of his own half-brother Odo during his minority was one of the last and most scandalous examples. Devout and strict in his own life, William backed up every effort for the enforcement of discipline and the improvement of morals. His reign was the great time for the foundation of the Norman monasteries. Some, as Jumièges, Cerisy, Bernay, Mont St Michel, are of older date; but now every noble became the founder of

a monastic house. The duke's own foundation of St Stephen's at Caen was among the foremost. In short, during the reign of William Normandy was looked on as an ecclesiastical paradise. It is certain that in no part of Europe was law, temporal and ecclesiastical, more strictly enforced.

Wars.

This time was also a time of wars, during which the borders of the duchy were enlarged. For a short time the friendship with France went on. William repaid the king's help at Val-ès-dunes by help in his wars with Geoffrey of Anjou. This led to a long rivalry between Anjou and Normandy, which largely took the shape of a struggle for the county of Maine, which lay between the two. As early as 1048 William extended his frontier in that direction; in 1063 he obtained possession of Le Mans and the whole county. Meanwhile he had two wars with France. Henry encouraged Norman rebels, and twice, in 1054 and 1058, he invaded Normandy, each time to suffer defeat. At the time of the invasion of England Normandy was strengthened by the weakness of its neighbours. The crown of France had passed to the minor Philip, and Anjou was divided and torn in pieces by civil disputes. The duchy, under its great duke, was at the very height of its power, prosperity, and renown when the duke of the Normans won himself a higher title.

Position of Normandy after the Conquest of England.

The conquest of England by William had no direct effect on the internal condition of Normandy; but it altogether changed the position of the duchy as a European power. Save for three short intervals, it never was again a wholly distinct power with a prince to itself. So far its position may be said to have been lowered; but, on the other hand, it became part of a power far greater than the single duchy of Normandy had ever been. For a while England in some sort followed Normandy; the common sovereign of the two lands could use the strength of England for Norman purposes. Then, under the Angevin house, Normandy and England alike became parts of one of those motley dominions, like that of Burgundy under the Valois dukes or of Austria in yet later times, in which a crowd of separate states are brought together without any tie but that of a common ruler. The result was that Normandy, after handing on to England its tradition of enmity towards France, itself fell back into its old union with France. And it must not be forgotten that Normandy after the Conquest of England was in itself much less strong than Normandy before the Conquest of England. A great part of the goodness, so to speak, of the land had crossed the sea into the conquered kingdom.

The rule of King William in his duchy was on the whole less prosperous than that of Duke William had been. His later years were clouded by revolts and occasional defeats. Maine revolted in 1073, and one stage of the revolt is memorable, because William had to strive, not with a rival prince, but with a commonwealth. Le Mans set up the first *commune* north of the Loire. But city and county were won back, largely by the work of Englishmen, whom the Conqueror, after overthrowing their own freedom, used to put down freedom elsewhere. In 1076 he was defeated in an attempt on Dol by the forces of Britanny and France. The next year followed the revolt of his own son Robert, and a border warfare on the frontier of Mortagne. In 1083 a single castle in Maine, that of Sainte-Susanne, successfully withstood him for three years. In 1087 the old dispute with France about the Vexin again arose, and cost William his life at Mantes. But, though this is a different picture from the uninterrupted success of the earlier part of his reign, there is no reason to think that the general peace and prosperity of the duchy was at all disturbed. The fighting was wholly on the borders, and it must have done much less damage to the country at large than the two French invasions of the earlier period.

Anarchy after William's Death.

With the death of the Conqueror the most flourishing state in western Europe became the most wretched. William's successor Robert was incapable of government. The land fell back into the same kind of anarchy which had been during William's minority. It was torn in pieces by private wars. More remarkable was the attempt of the city of Rouen to claim the position of a separate commonwealth, as Le Mans had done some years before. Some parts of the duchy were saved from anarchy by dismemberments which transferred them to other rulers. Robert sold the Cotentin to his brother Henry, by whom it was lost and recovered more than once. His other brother, King William of England, in two invasions occupied a large part of the country. Maine revolted again, but the *commune* of Le Mans was not restored; independent counts ruled once more. At last in 1097 Robert went with the crusade, and mortgaged the whole duchy to William, who occupied the country and restored some kind of order. He recovered and lost Maine more than once in warfare with its count, Helias. The death of William Rufus in 1100 again separated Normandy, England, and Maine. Robert came back to Normandy, but his misgovernment again raised up enemies against him. Henry invaded Normandy, and by the battle of Tinchebrai in 1106 the kingdom and the duchy were again united. It seems that Henry scrupled to take the title of duke while Robert lived, and he lived a captive in England till a year before the death of Henry himself in 1135. But Henry was none the less the ruler of Normandy, and he made the Normans pledge themselves to the succession of his children.

Under the Norman Kings of England.

It was now no longer the duke of the Normans who reigned in England, but the king of the English who reigned in Normandy. England, deeply influenced and changed as she had been by the Norman Conquest, had now, under the English-born Henry, recovered her position as a power. Men at the time looked on Normandy as conquered by England, and saw in Henry's victory on Norman ground the reversal of his father's victory on English ground forty years before. And there was a sense in which this was true, even though Henry's foreign policy was directed far more to Norman than to English objects. England as a power was far greater than Normandy, and it was growing less and less Norman. It was as king of the English that the sovereign of Normandy appeared to the world at large. And under his rule the advantage which an island has over a continental dominion was plainly shown. The two great Norman rulers of the day, Henry of England and Roger of Sicily, each kept his island kingdom in perfect peace, and used his continental territory as a battle-ground. Henry's Norman rule was for many years disturbed by the claims of his nephew William, the son of Robert, whose side was taken both by several foreign princes and by a rebellious party in the duchy. Another cause of dispute was found in the affairs of another nephew, Theobald count of Chartres, son of Henry's sister Adela. Out of these questions several wars arose between Henry and Lewis VI. of France (1109-1137), supported commonly by the successive counts of Flanders, among whom William, the son of Robert, himself appears, as he held that county for a short time before his death (1127-1128). But there were intervals of peace. The treaty of Gisors in 1113 reads almost as if Lewis, in ceding to Normandy the borderland of Bellême, ceded with it all rights of superiority over the duchy. Yet in 1120 Henry found it convenient to make his son William, who had in 1115 received the homage of the Normans as his successor, himself do homage to the French overlord. William died almost directly afterwards in the White Ship, and in 1126 Henry procured the assent of his nobles to the succession of his daughter Matilda as lady of England and Normandy. She was

now the childless widow of the emperor Henry V., who had been a firm ally of his father-in-law. The next year Henry married his daughter to Geoffrey Plantagenet, son of Falk, count of Anjou and Maine. Anjou, whose counts had been such dangerous neighbours to Normandy, was thus to be united to the duchy and to the kingdom. These schemes in the end took effect. On Henry's death in 1135 the claims of Matilda were cast aside; the rule of a woman was too great a novelty for either kingdom or duchy. England chose Henry's nephew Stephen, the younger brother of Theobald of Chartres. Normandy inclined to Theobald. himself, but accepted the choice of England. The legitimate male line of the Conqueror was now extinct, and the stronger feeling with regard to legitimate birth which had grown up within the last hundred years hindered any such succession as that of the Conqueror himself. In earlier times Robert of Caen, Henry's natural son, renowned in England as earl of Gloucester, would have been a more obvious choice than either Matilda or Stephen. Now he could only assert the rights of his sister, and so plunge England into anarchy. The strife, which in England took a shape for which civil war is far too good a name, took in Normandy the less frightful shape of foreign invasion and conquest. Stephen's claim was from the first disputed in arms by Matilda's husband Geoffrey. Stephen showed himself in Normandy only for a moment in 1137, when his son Eustace did homage to King Lewis. Geoffrey gradually possessed himself of Normandy, partly by French and Flemish help (1139-1145). Five years afterwards he resigned the duchy to his son Henry, who the next year succeeded his father in Anjou and Maine. The next year (1152) he married Eleanor, the divorced wife of Lewis VII. (1137-1180), in her own right countess of Poitou and duchess of Aquitaine. By the union of all these territories a dominion was formed unlike anything which had been seen before in Gaul, but which, as has been remarked already, has had its parallel in later times. Duke Henry, in right of his father, his mother, and his wife, gathered together a crowd of dominions which made him far more powerful than his lord, the king of the French. But there was no connexion between the several duchies and counties that he held beyond the fact that he held them. And when presently the duke became a king the lack of unity became greater still. By the agreement which settled the strife of Stephen and Matilda, the crown of England passed at the death of Stephen to the son of Matilda. In 1154 began the memorable thirty-five years' reign of Henry II. of England. But the king of England was also himself duke of Normandy, count of Anjou, Maine, and Touraine, and in his wife's name count of Poitou and duke of Aquitaine. During his reign and that of his eldest son the connexion between England and the Continent was at once closer and wider than it ever was before or after.

Under the Angevin Dukes.

With the formation of the great Angevin dominion, the being of Normandy as a separate power comes to an end. The mere union with England had not that effect in anything like the same degree. While the same man was king of the English and duke of the Normans, but had no dominions beyond his kingdom and duchy, there was nothing in the relation to wound Norman national pride. The common sovereign took his highest title from England; but his policy was apt to be directed at least as much by Norman as by English interests, and the men of Normandy could not forget that England was the conquest of their fathers. And, if English feeling could from one side look on Normandy as a conquered land and on Tinchebrai as the reversal of Senlac, it was equally easy to look on Tinchebrai as a strife between Norman and Norman, in which it was a mere accident that the chosen chief of one and the stronger Norman party, himself the son of the greatest of Norman princes, happened also to be king of the island kingdom. After all, a conquest of England by Normandy or of Normandy by England was a less grievance than a conquest of Normandy by Anjou. Normans and Angevins hated one another with the hatred of neighbours; nothing could be so utterly offensive to all Norman national feeling as the triumphant entry of Geoffrey into Rouen. Each accession which the Angevin prince made to his dominions made matters worse. Normandy became more and more a simple unit in the long roll-call of the possessions of its sovereign, and a unit marked out in a special way. It was not, like England, the possession which gave its ruler his rank among princes. It was not, like Anjou, the home of his direct forefathers. It was not, like Maine, the land of his own birth. What marked it out from his other possessions was that, while he had received all the rest by some form or other of peaceful succession, Normandy alone was a conquered land.

It is not likely that the rule of its Angevin dukes ever called forth much loyalty in the Norman duchy. There was no sign of open discontent, and Henry and Richard were not princes to be lightly thrown aside. The real greatness of the father, the shadowy glory of the son, went for something, even with subjects who had no special love for them or their house. On the death of Richard in 1199 the succession of John was admitted in Normandy, as in England, without dispute. To bring this about it was perhaps reason enough that Anjou took the side of Arthur. But John's victory at Mirabeau put an end to any hope of a division of the dominions of the Angevin house. And when Arthur, in the expressive phrase of Roger of Wendover, "vanished," when the French king took on himself the part of his avenger and declared John to have forfeited all fiefs that he held of the French crown, there was no zeal in Normandy to withstand French invasion. The king-duke, to be sure, himself showed as little zeal as any man; but the Normans of an earlier day, with or without the help of their prince, would assuredly have made a stouter resistance than the subjects of John made to Philip Augustus. With wonderful speed (1203-1204) Continental Normandy passed away from an Angevin duke to a French king. One was as much and as little a stranger as the other; and a union with the dominions of the Continental overlord might seem less ignominious than the position of one among many Continental provinces of the island king.

Forfeited to France.

The whole duchy, however, was not lost. The mainland passed to the king of the French; the islands still clave to their duke. Guernsey, Jersey, Alderney, and their smaller fellows have ever since remained possessions of the kings of England, but forming no part of their kingdom. They still keep their own language, constitution, and laws, and they have never been incorporated with the United Kingdom. It is somewhat singular that the kings of England, still holding as they did part of the Norman duchy, should have so soon given up their Norman title. This was done when the treaty of Xaintes (Saintes) between Henry III. and Saint Lewis was finally carried out in 1259.

Hands on to England the Quarrel with France.

Normandy now ceases for a while to have a distinct history. But its earlier history largely influences the history which was to come. England, as England, had no real quarrel with France; but the abiding quarrel between France and Normandy had drawn England within its range. The kings and the people of England, used to fight with France in a Norman quarrel, kept on the feeling of rivalry towards France, even after Normandy itself had gone over to the other side. The fact that the English kings kept Aquitaine after the loss of Normandy—for the inheritance of Eleanor was not forfeited by the crime of her son—was the immediate occasion of many of the later disputes between England and France.

But the traditional feeling was handed on from the days when Englishmen and Normans fought side by side against Frenchmen. In Normandy itself the memory of the connexion with England soon died out. We read, and it seems strange as we read, of the quarrel which, in the days of Edward I., arose between the crowns of England and France out of the disputes between Norman subjects of France and Gascon subjects of England. But the national feeling of the English towards France was none the less an inheritance handed on from the Norman fights of Varaville and Noyon.

From the time of John's forfeiture Normandy ceased to be a separate state. It was a dominion of the king of France, though often granted out as a separate apanage to members of the royal family. The land fell back upon its natural geographical position as the northern seaboard of France, though now the seaboard of a France that had been vastly enlarged since the land of the Northmen had been cut off from the old French duchy. The value of such a province to the kingdom was beyond words; but it was now simply a province of France, keeping much that was characteristic, holding to a strongly-marked provincial life, but not parted off by any distinction that can be called national. One cause of the ease with which the land went back to its old position in the days before Rolf doubtless was that so much of the national strength had been used up in the settlements in England and Sicily. The life of the Normans as a people—though a people, strictly so called, they hardly formed—is very far from being shut up within the duchy of Normandy.

Still, the union between Normandy and France—at all events, the possession of Normandy by the French kings of the house of Paris—was not to be altogether unbroken. The duchy was for a while to go back again to the descendants of its ancient dukes. The Normans had forgotten their connexion with England, but it was not always forgotten by English kings and statesmen. The remarkable thing is that the thought of reunion does not show itself till a much later time, when the immediate tradition must have passed away. In the two great English invasions of France Normandy plays an important part; but it does not appear that the descendants of Rolf and William were any more welcome in their ancestral duchy than in other parts of the French dominion. But Normandy holds quite a different position in the two great parts of the Hundred Years' War. Under Edward III. it was often the scene of war, because geographical causes naturally made it so; but it was so only as any other part of France might happen to be. The war of Crécy and Poitiers was not in any special way a war for Normandy. Edward was rather a French prince claiming the crown of France than an English king seeking the aggrandizement of his kingdom. When the settlement of Bretigny was made Normandy was not among the lands that were given up to England. It was otherwise with Henry V. He was before all things an English king bent on extending the power of England. If he wished to make Continental conquests, Normandy, both from geographical position and from historical associations, —associations which became keener in some sort as they grew more distant,—was the land which before all others invited his ambition. His war with France, his formal union of the crowns of England and France, were, we may be sure, only means towards his real design, the annexation of Normandy to the crown of England. In every negotiation he was ready to waive his claim to the French crown; he always insisted on the cession of the Norman duchy in full sovereignty. His war was before all things a war for Normandy. In his serious invasion of 1417—to be distinguished from the earlier military promenade which led to the fight of Agincourt—he gave himself out, though he gave himself out in vain, as the lawful duke of the duchy.

Reconquest by Henry V.

He thoroughly subdued the duchy as his first work, and from 1418 to 1450 Normandy again became a possession of the English crown. The treaty of Troyes, in its 17th clause, speaks of Normandy as a land conquered from the kingdom of France, yet as actually being at the time a separate possession of the king of England, a land which, by the 21st clause, he was bound, on succeeding to the kingdom of France, to reunite with that kingdom. By that treaty England and France were to be united on the same terms as Sweden and Norway, Hungary and Austria, in later times; but by this clause Normandy is to be part of the kingdom of France, neither part of the kingdom of England nor a separate possession of the common king. Henry never succeeded to the crown of France; he died heir and regent of that kingdom. Normandy therefore was not reunited to France, and Henry, on his deathbed, revealed the object of his whole career. He was prepared for the loss of France, but not for the loss of Normandy. Things might take their course in other ways, but the guardians of his child were to conclude no peace with Charles of France unless Normandy was ceded to the crown of England in full sovereignty. Henry VI. succeeded to both kingdoms; he uses the style of both, and never uses the style of the Norman duchy; yet in documents of his time the duchy is in a marked way distinguished from the kingdom of France. Such phrases as "oure saide royaume of Fraunce and oure saide duchie of Normandie" are common. In the journal of the embassy in 1445,[1] "Guyenne et Normandie et les autres terres esquelles les rois Dangleterre avoient droit avant la question de la couronne" are pointedly distinguished from the lands which were held or claimed by the English kings only by virtue of their claim to the French crown. That Henry V.'s object, the lasting union of England and Normandy, would have been no gain to England needs no proof; but there can be little doubt that the thirty years of English occupation were a gain to Normandy. As far as was possible in a time of war—yet war between France and England was a less evil than war between Burgundians and Armagnacs—King Henry and John duke of Bedford secured to their conquest a far better administration and more of general wellbeing than it had had or than it had again under French rule. But by this time Normans had become Frenchmen. The best English rule was but the rule of a stranger, and the land willingly went back to that dominion of the house of Paris from which it had twice been cut off, at times five hundred years apart.

From this time the history of Normandy is simply part of the history of France. It is the record of such events in French history, some of the most important events in later French history among them, as took place within the bounds of Normandy. The duchy still kept a certain separate being, and its people still kept a large measure of separate feeling. Philip of Comines remarks that the Normans were always best pleased to have a duke of their own. But such a duke of Normandy, son or brother of the reigning king of France, holding a mere apanage and not a sovereign fief, remained a French subject, and had not the same independent position as a duke of Burgundy or Britanny. Philip of Comines further remarks on the wealth of the duchy—the fruit possibly in some measure of the administration of King Henry and Duke John. Normandy brought in a third of the whole income of the French crown. To this day Normandy is easily seen, by those who look below the surface, to be in many things a separate land from France; compared with southern Gaul, it has much in common with England. But the history

[1] Stevenson's *Letters and Papers of Henry the Sixth*, i. 129.

of Normandy as a European power ends with the Angevin conquest in the 12th century. Since then it has never stood alone, even as it might still be said to stand alone under the Conqueror and under Henry I. The question from that time was whether Normandy should be a dependency of England or an integral part of France. The latter was in every way the more natural condition. The reunion under Henry V. was a striving against manifest destiny. It shows what a great man can do and what he cannot. (E. A. F.)

NORMANS is the softened form of the word "Northman," applied first to the people of Scandinavia in general, and afterwards specially to the people of Norway. In the form of "Norman" (*Northmannus, Normannus, Normand*) it is the name of those colonists from Scandinavia who settled themselves in Gaul, who founded the Norman duchy, who adopted the French tongue and French manners, and who from their new home set forth on new errands of conquest, chiefly in the British Islands and in southern Italy and Sicily. From one point of view the expeditions of the Normans may be looked on as continuations of the expeditions of the Northmen. As the name is etymologically the same, so the people are by descent the same, and they are still led by the old spirit of war and adventure. But in the view of general history Normans and Northmen must be carefully distinguished. The change in the name is the sign of a thorough change, if not in the people themselves, yet in their historical position. Their national character remains largely the same; but they have adopted a new religion, a new language, a new system of law and society, new thoughts and feelings on all matters. Like as the Norman still is to the Northman, the effects of a settlement of Normans are utterly different from the effects of a settlement of Northmen. There can be no doubt that the establishment of the Norman power in England was, like the establishment of the Danish power, greatly helped by the essential kindred of Normans, Danes, and English. But it was helped only silently. To all outward appearance the Norman conquest of England was an event of an altogether different character from the Danish conquest. The one was a conquest by a people whose tongue and institutions were still palpably akin to those of the English. The other was a conquest by a people whose tongue and institutions were palpably different from those of the English. The Norman settlers in England felt no community with the earlier Danish settlers in England. In fact the Normans met with the steadiest resistance in a part of England which was largely Danish. But the effect of real, though unacknowledged, kindred had none the less an important practical effect. There can be no doubt that this hidden working of kindred between conquerors and conquered in England, as compared with the utter lack of all fellowship between conquerors and conquered in Sicily, was one cause out of several which made so wide a difference between the Norman conquest of England and the Norman conquest of Sicily.

These two conquests, wrought in the great island of the Ocean and in the great island of the Mediterranean, were the main works of the Normans after they had fully put on the character of a Christian and French-speaking people, in other words, after they had changed from Northmen into Normans. The English and the Sicilian settlements form the main Norman history of the 11th century. The 10th century is the time of the settlement of the Northmen in Gaul, and of the change in religion and language of which the softening of the name is the outward sign. By the end of it, any traces of heathen faith, and even of Scandinavian speech, must have been mere survivals. The new creed, the new speech, the new social system, had taken such deep root that the descendants of the Scandinavian settlers were better fitted to be the armed missionaries of all these things than the neighbours from whom they had borrowed their new possessions. With the zeal of new converts they set forth on their new errand very much in the spirit of their heathen forefathers. If Britain and Sicily were the greatest fields of their enterprise, they were very far from being the only fields. The same spirit of enterprise which brought the Northmen into Gaul seems to carry the Normans out of Gaul into every corner of the world. Their character is well painted by a contemporary historian of their exploits.[1] He sets the Normans before us as a race specially marked by cunning, despising their own inheritance in the hope of winning a greater, eager after both gain and dominion, given to imitation of all kinds, holding a certain mean between lavishness and greediness—that is, perhaps uniting, as they certainly did, these two seemingly opposite qualities. Their chief men, he adds, were specially lavish through their desire of good report. They were moreover a race skilful in flattery, given to the study of eloquence, so that the very boys were orators, a race altogether unbridled unless held firmly down by the yoke of justice. They were enduring of toil, hunger, and cold whenever fortune laid it on them, given to hunting and hawking, delighting in the pleasure of horses, and of all the weapons and garb of war. Several of these features stand out very clearly in Norman history. The cunning of the Normans is plain enough; so is their impatience of restraint, unless held down by a strong master. Love of imitation is also marked. Little of original invention can be traced to any strictly Norman source; but no people were ever more eager to adopt from other nations, to take into their service and friendship from any quarter men of learning and skill and eminence of every kind. To this quality is perhaps to be attributed the fact that a people who did so much, who settled and conquered in so large a part of Europe, has practically vanished from the face of the earth. If Normans, as Normans, now exist anywhere, it is certainly only in that insular fragment of the ancient duchy which still cleaves to the successor of its ancient dukes. Elsewhere, as the settlers in Gaul became French, the emigrants from Gaul became English, Irish, Scottish, and whatever we are to call the present inhabitants of Sicily and southern Italy. Everywhere they gradually lost themselves among the people whom they conquered; they adopted the language and the national feelings of the lands in which they settled: but at the same time they often modified, often strengthened, the national usages and national life of the various nations in which they were finally merged.

Character of the Normans.

Their faculty of adaptation.

But Geoffrey hardly did justice to the Normans if he meant to imply that they were simple imitators of others. Their position was very like that of the Saracens. Hasty writers who forget the existence of the eastern Rome are apt to claim for the Saracens of Baghdad, or more commonly for those of Cordova, a monopoly of science and art at some time not very clearly defined by dates. In so doing they slur over the real position and the real merit of the Saracens with regard to science and art. In neither department did any Saracen, strictly speaking, invent anything; but they learned much both from Constantinople

[1] Geoffrey Malaterra, i. 3—"Est quippe gens astutissima, injuriarum ultrix, spe alias plus lucrandi, patrios agros vilipendens, quæstus et dominationis avida, cujuslibet rei simulatrix, inter largitatem et avaritiam quoddam medium habens. Principes vero delectatione bonæ famæ largissimi, gens adulari sciens, eloquentiis in studiis inserviens in tantum, ut etiam ipsos pueros quasi rhetores attendas, quæ quidem, nisi jugo justitiæ prematur, effrenatissima est; laboris, inediæ, algoris, ubi fortuna expedit, patiens, venationi accipitrum exercitio inserviens. Equorum, cæterorumque militiæ instrumentorum, et vestium luxuria delectatur. Ex nomine itaque suo terræ nomen indiderunt. North quippe Anglica lingua aquilonaris plaga dicitur. Et quia ipsi ab aquilone venerant terram ipsam etiam Normanniam appellarunt."

and from Persia, and what they learned they largely developed and improved. The Normans did just the same. They adopted the French tongue, and were presently among the first to practise and spread abroad its literature. They adopted the growing feudal doctrines of France, and worked them, both in Normandy and in England, into a harmonious system. From northern Italy, as it would seem, they adopted a style of architecture which grew in their hands, both in Normandy and in England, into a marked and living form of art. Settled in Gaul, the Scandinavian from a seafaring man became a landsman. Even in land-warfare he cast aside the weapons of his forefathers; but he soon learned to handle the weapons of his new land with greater prowess than they had ever been handled before. He welcomed the lore of every stranger. Lanfranc brought law and discipline; Anselm brought theology and philosophy. The gifts of each were adopted and bore fruit on both sides of the Channel. And no people ever better knew how to be all things to all men. The Norman power in England was fonnded on full and speedy union with the one nation among whom they found themselves. The Norman power in Sicily was founded on a strong distinction between the ruling people and the many nations which they kept in peace and prosperity by not throwing in their lot with any one among them.

Enterprise. The quality which Geoffrey Malaterra expresses by the word "effrenatissima" is also clearly marked in Norman history. It is, in fact, the groundwork of the historic Norman character. It takes in one case the form of ceaseless enterprise, in another the form of that lawlessness which ever broke ont, both in Normandy and in every other country settled by Normans, when the hand of a strong ruler was wanting. But it was balanced by another quality which Geoffrey does not speak of, one which is not really inconsistent with the other, one which is very prominent in the Norman character, and which is, no less than the other, a direct heritage from their Scandinavian forefathers. This is the excessive litigiousness, the fondness for law, legal forms, legal processes, which has ever been characteristic of the people. If the Norman was a born soldier, he was also a born lawyer. Randolf Flambard, working together the detached feudal usages of earlier times into a compact and logical system of feudal law, was as characteristic a type of the people as any warrior in the Conqueror's following. He was the organizer of an endless official army, of an elaborate technical system of administration, which had nothing like it in England before, but which grew up to perfection under Norman rulers. But nothing so well illustrates this formal side of the Norman character as the whole position of the Conqueror himself. His claim to the crown of England is something withont earlier precedent, something as far as possible removed from the open violence of aggressors who have no pretexts with which to disguise their aggression. It rested on a mass of legal assumptions and subtleties, fallacious indeed, but ingenious, and, as the result proved, effective. His whole system of government, his confiscations, his grants, all that he did, was a logical deduction from one or two legal principles, arbitrary certainly in their conception, but strictly carried out to their results. Even Norman lawlessness in some sort took a legal shape. In the worst days of anarchy, in the minority of William or under the no-reign of Robert, the robber-baron could commonly give elaborate reasons for every act of wrong that he did.

Litigiousness.

It is perhaps less wonderful that this characteristic should have been left out in a picture of the Normans in Apulia and Sicily than if it had been left out in a picture of the Normans in Normandy and England. The circumstances of their Apulian and Sicilian conquests certainly did not tend to bring out this feature of their character so strongly as it was brought out by the circumstances of their English conquest. Possibly the same cause may have kept the chronicler from enlarging on their religious character; yet in Sicily at least they might pass for crusaders. Crusaders in fact they were before crusades were preached. Norman warriors had long before helped the Christians of Spain in their warfare with the Saracens of the Peninsula, and in Sicily it was from the same enemy that they won the great Mediterranean island. Others had done a kindred work in a more distant field as helpers of the Eastern emperors against the Turks of Asia. All these might pass for religious wars, and they might really be so; it needed greater ingenuity to set forth the invasion of England as a missionary enterprise designed for the spiritual good of the benighted islanders. The Norman, a strict observer of forms in all matters, attended to the forms of religion with special care. No people were more bountiful to ecclesiastical bodies on both sides of the Channel; the foundation of a Benedictine monastery in the 11th century, of a Cistercian monastery in the 12th, seemed almost a matter of course on the part of a Norman baron. The Conqueror beyond doubt sincerely aimed at being a religious reformer both in his duchy and in his kingdom, while it is needless to say that his immediate successor was exceptionally ungodly, whether among Normans or among other men. But among their countrymen generally strict attendance to religious observances, a wide bounty to religious foundations, may be set down as national characteristics. On the other hand, none were less inclined to submit to encroachments on the part of the ecclesiastical power, the Conqueror himself least of all.

Observance of Religious Forms.

We thus see in the Scandinavian settlers in Gaul, after they had put on the outward garb of their adopted country, a people restless and enterprising above all others, adopting and spreading abroad all that they could make their own in their new land and everywhere else,—a people in many ways highly gifted, greatly affecting and modifying at the time every land in which they settled, but, wherever they settled, gradually losing themselves among the people of the land. The Norman, as a visible element in the country, has vanished from England, and he has vanished from Sicily. The circumstances of his settlement in his two great fields of conquest were widely different; his position when he was fully established in his two insular realms was widely different; but the end has been the same in both cases. Neither island has for ages been in any sense a Norman land, and the tongue which the Norman brought with him into both has not for ages been spoken in either. Norman influence has been far stronger in England than in Sicily, and signs of Norman presence are far more easily recognized. But the Norman, as a distinct people, is as little to be seen in the one island as in the other. His disappearance in both cases is an illustration of one of the features which we have spoken of in the Norman character, the tendency which in fact made Normans out of Northmen, the tendency to adopt the language and manners of the people among whom they found themselves. But, as far as outward circumstances are concerned, we may say that the same effect has been brought abont by different and almost opposite causes. The whole circumstances of the conquest of England constrained the conquerors to become Englishmen in order to establish themselves in the conquered land. In William's theory, the forcible conquest of England by strangers was an untoward accident. The lawful heir of the English crown was driven against his will to win his rights by force from outside. But he none the less held his crown as an English king succeeding according to English law. Moreover every Norman to whom he granted lands and offices held them by English law in a much truer sense

The Conquest of England and that of Sicily compared.

than the king held his; he was deemed to step into the exact position of his English predecessor, whatever that might be. This legal theory worked together with other causes to wipe out all practical distinction between the conquerors and the conquered in a wonderfully short time. By the end of the 12th century the Normans in England might fairly pass as Englishmen, and they had largely adopted the use of the English language. The fashionable use of French for nearly two centuries longer was far more a French fashion than a Norman tradition. When the tradition of speaking French had all but died out, the practice was revived by fashion. Still the tradition had its effect. The fashion could hardly have taken root except in a land where the tradition had gone before it.

The Normans in England therefore became Englishmen, because there was an English nation into which they could be absorbed. The Normans in Sicily could hardly be said to become Sicilians, for there assuredly was no Sicilian nation for them to be absorbed into. While the Normans in England were lost among the people of the land, the Normans in Sicily were lost among their fellow-settlers in the land. The Normans who came into Sicily must have been much less purely Norman than the Normans who came into England. The army of Duke William was undoubtedly very far from being wholly made up of Normans, but it was a Norman army; the element which was not Norman, though considerable, was exceptional. But we may doubt whether the Norman invaders of Sicily were Norman in much more than being commanded by Norman leaders. They were almost as little entitled to be called pure Scandinavians as the Saracens whom they found in the island were entitled to be called pure Arabs. The conquest of England was made directly from Normandy, by the reigning duke, in a comparatively short time, while the conquest of Sicily grew out of the earlier and far more gradual conquest of Apulia and Calabria by private men. The Norman settlements at Aversa and Capua were the work of adventurers, making their own fortunes, and gathering round them followers from all quarters. They fought simply for their own hands, and took what they could by the right of the stronger. They started with no such claim as Duke William put forth to justify his invasion of England; their only show of legal right was the papal grant of conquests that were already made. The conquest of Apulia, won bit by bit in many years of what we can only call freebooting, was not a national Norman enterprise like the conquest of England, and the settlement to which it led could not be a national Norman settlement in the same sense. The Sicilian enterprise had in some respects another character. By the time it began the freebooters had grown into princes. Sicily was won by a duke of Apulia and a count of Sicily. Still there was a wide difference between the duke of the Normans and the duke of Apulia, between an hereditary prince of a hundred and fifty years' standing and an adventurer who had carved out his duchy for himself. And, besides this, warfare in Sicily brought in higher motives and objects. Though crusades had not yet been preached, the strife with the Mussulman at once brought in the crusading element; to the Christian people of the island they were in many cases real deliverers; still, the actual process by which Sicily was won was not so very different from that by which Apulia had been won. Duke William was undisputed master of England at the end of five years; it took Count Roger thirty years to make himself undisputed master of Sicily. The one claimed an existing kingdom, and obtained full possession of it in a comparatively short time; the other formed for himself a dominion bit by bit, which rose to the rank of a kingdom in the next generation. When Count Roger at last found himself lord of the whole island, he found himself lord of men of various creeds and tongues, of whom his own Norman followers were but one class out of several. And the circumstances of his conquest were such that the true Normans among his following could not possibly lose themselves among the existing inhabitants of the island, while everything tended to make them lose themselves among their fellow-adventurers of other races, among whom, by the time the conquest was ended, they could hardly have been even a dominant element.

As far then as concerned the lands in which the settlements were made, the difference lay in this, that, as has been already said, while there was an English nation, there was no Sicilian nation. The characteristic point of Norman rule in Sicily is that it is the rule of princes who were foreign to all the inhabitants of the island, but who were not more foreign to the inhabitants of the island than different classes of them were to one another. The Norman conqueror found in Sicily a Christian and Greek-speaking people and a Mussulman and Arabic-speaking people. The relations between the two differed widely in different parts of the island, according to the way in which the Saracens had become possessed of different towns and districts. In one place the Christians were in utter bondage, in another they were simply tributary; still, everywhere the Mussulman Saracen formed the ruling class, the Christian Greek formed the subject class. We speak of the Saracen very much as we speak of the Norman; for of the Mussulman masters of Sicily very many must have been only artificial Arabs, Africans who had adopted the creed, language, and manners of Arabia. In each case the Arab or the Norman was the kernel, the centre round which all other elements gathered and which gave its character to the whole. Besides these two main races, Greek and Saracen, others came in through the Norman invasion itself. There were the conquerors themselves; there were the Italians, in Sicily known as Lombards, who followed in their wake; there were also the Jews, whom they may have found in the island, or who may have followed the Norman into Sicily, as they certainly followed him into England. The special character of Norman rule in Sicily was that all these various races flourished, each in its own fashion, each keeping its own creed, tongue, and manners, under the protection of a common sovereign, who belonged to none of them, but who did impartial justice to all. Such a state of things might seem degradation to the Mussulman, but it was deliverance to the native Christian, while to settlers of every kind from outside it was an opening such as they could hardly find elsewhere. But the growth of a united Sicilian nation was impossible; the usual style to express the inhabitants of the island is "omnes" or "universi Siciliæ populi." In the end something like a Sicilian nation did arise; but it arose rather by the dying out of several of the elements in the country, the Norman element among them, than by any such fusion as took place in England. That is, as has been already said, the Norman as such has vanished in two different ways. In England the Norman duke came in as a foreign intruder, without a native supporter to establish his rule over a single nation in its own land. He could not profess to be, as the count of Sicily could honestly profess to be, a deliverer to a large part of the people of the land. But, coming in by a title which professed to be founded on English law, establishing his followers by grants which professed no less to be founded on English law, he planted a dynasty, and established a dominant order, which could not fail to become English. The Normans in England did not die out; they were merged in the existing nation. The Normans in Sicily, so far as they did not die out, were merged, not in a Sicilian nation, for that did not exist, but in the common mass of settlers of Latin speech and rite, as dis-

Elements of Sicilian Population.

tinguished from the older inhabitants, Greek and Saracen. The Norman conquest of England was at the moment a curse; the Norman conquest of Sicily was at the moment a blessing. But the gradual and indirect results of the Norman conquest of England are easily to be seen to this day, and they have been largely, though indirectly, results for good. Its chief result has been, not so much to create anything new as at once to modify and to strengthen what was old, to call up older institutions to a new life under other forms. But whatever it has done it has done silently; there has not been at any time any violent change of one set of institutions for another. In Sicily and southern Italy there is hardly any visible Norman influence, except the great historic fact which we may call the creation of Sicily and southern Italy in their modern sense. The coming of the Norman ruled that these lands should be neither Saracen nor Greek, nor yet Italian in the same sense as northern Italy, but that they should politically belong to the same group of states as the kingdoms and principalities of feudal Europe. William assuredly did not create the kingdom of England; Roger assuredly did create the kingdom of Sicily. And yet, notwithstanding all this, and partly because of all this, real and distinct Norman influence has been far more extensive and far more abiding in England than it has been in Sicily.

In Sicily then the circumstances of the conquest led the Norman settlers to remain far more distinct from the older races of the land than they did in England, and in the end to lose themselves, not in those older races of the land, but in the settlers of other races who accompanied and followed them. So far as there ever was a Sicilian nation at all, it might be said to be called into being by the emperor-king Frederick II. In his day a Latin element finally triumphed; but it was not a Norman or French-speaking element of any kind. The speech of the Lombards at last got the better of Greek, Arabic, and French; how far its ascendency can have been built on any survival of an earlier Latin speech which had lived on alongside of Greek and Arabic this is not the place to inquire.

Use of Languages in England and in Sicily.

The use of language and nomenclature during the time of Norman rule in the two countries forms a remarkable contrast, and illustrates the circumstances of the two as they have just been sketched. The chroniclers of the conquest of Apulia and Sicily use the Norman name in every page as the name of the followers of the conquerors from Hauteville. It was the natural name for a body of men who must, by the time the conquest of Sicily was over, have been very mixed, but whose kernel was Norman, whose strength and feelings and traditions all came from a Norman source. But if we turn to Hugo Falcandus, the historian of Sicily in the 12th century, the Norman name is hardly found, unless when it is used historically to point out (as in Muratori, vii. 260) that the royal house of Sicily was of Norman descent. Of the various "Siciliæ populi," we hear of Greeks, Saracens, Lombards, sometimes of Franci, for by that time there were many French-speaking settlers in Sicily who were not of Norman descent. There is a distinction between Christians and Saracens; among Christians there seems to be again a distinction between Greeks and Latins, though perhaps without any distinct use of the Latin name; there is again a further distinction between "Lombardi" and "Franci"; but Normans, as a separate class, do not appear. In England there is no room for such subtleties. The narratives of the conquest of England use both the Norman and the French names to express the followers of William. In the English chronicles "French" is the only name used. It appears also in the Bayeux Tapestry, and it is the only word used when any legal distinction had to be drawn between classes of men in the English kingdom. "Franci" and "Angli" are often opposed in Domesday and other documents, and the formula went on in charters long after all real distinction had passed away. That is to say, there were several purposes for which it was convenient to distinguish "English" and "French"—the last name taking in all the followers of the Conqueror; there were no purposes for which there was any need to distinguish Normans as such, either from the general mass of the people or from others who spoke the French tongue. We can see also that, though several languages were in use in England during the time of Norman rule, yet England was not a land of many languages in the same sense in which Sicily was. In the 12th century three languages were certainly spoken in London; yet London could not call itself the "city of threefold speech," as Palermo did. English, French, Latin, were all in use in England; but the distinction was rather that they were used for three different purposes than that they were used by three distinct races or even classes. No doubt there was a class that knew only English; there may have been a much smaller class that knew only French; any man who pretended to high cultivation would speak all as a matter of course; Bishop Gilbert Foliot, for instance, was eloquent in all three. But in Sicily we see the quite different phenomenon of three, four, five classes of men living side by side, each keeping its own nationality and speaking its own tongue. If a man of one people knew the speech of any of the others, he knew it strictly as a foreign language. Before the Norman Conquest England had two official tongues; documents were drawn up sometimes in English, sometimes in Latin, now and then in both. And the same usage went on after the Conquest; the use of English becomes gradually rarer, and dies out under the first Angevins, but it is in favour of Latin that it dies out. French, the language which the Normans brought with them, did not become an official language in England till after strictly Norman rule had passed away. French documents are unknown till the days of French fashion had come in, that is, till deep in the 13th century. So it was in Sicily also; of all the tongues of Sicily French was the most needful in the king's court ("Francorum lingua quæ maxime necessaria esset in curia," says Hugo Falcandus, 321); but it was not an official tongue. The three tongues of Palermo are Greek, Arabic, and Latin. King Roger's clock is commemorated in all three. Documents were drawn up in such and so many of these tongues as was convenient for the parties concerned; not a few private documents add a fourth tongue, and are drawn up in Greek, Arabic, Latin, and Hebrew. In neither case is the actual speech of the conquerors one of the tongues in formal use. French, as a separate tongue from Latin, already existed as a literary speech, and no people had done more than the Normans to spread it as a literary speech, in both prose and verse. But neither in England nor in Sicily did official formalism acknowledge even French, much less Italian, as a fit tongue for solemn documents. In England, English, French, Latin, were the three tongues of a single nation; they were its vulgar, its courtly, and its learned speeches, of which three the courtly was fast giving way to the vulgar. In Sicily, Greek, Arabic, Latin and its children, were the tongues of distinct nations; French might be the politest speech, but neither Greek nor Arabic could be set down as a vulgar tongue, Arabic even less than Greek.

Normans in Scotland.

The different positions then which the conquering Norman took in his two great conquests of England and of Sicily amply illustrate the way in which he could adapt himself to any circumstances in which he found himself, the way in which he could adopt whatever suited his purpose in the institutions of any other people, the way in which he commonly lost his national being in that of some other people. From England moreover he spread into Scotland.

Wales, and Ireland, and in each land his settlement put on a somewhat different character, according to the circumstances of the land. In Scotland he was not a conqueror, but a mere visitor, and oddly enough he came as a visitor along with those whom he had himself overcome in England. Both Normans and English came to Scotland in crowds in the days of Margaret, Edgar, and David, and Scottish national feeling sometimes rose up against them. In Scotland again the Norman settlers were lost in the mixed nationality of the country, but not till they had modified many things in the same way in which they modified things in England. They gave Scotland nobles and even kings; Bruce and Balliol were both of the truest Norman descent: the true Norman descent of Comyn might be doubted, but he was of the stock of the *Francigenæ* of the Conquest. **Wales.** In Wales the Norman came as a conqueror, more strictly a conqueror than in England; he could not claim Welsh crowns or Welsh estates under any fiction of Welsh law. The Norman settler in Wales therefore did not to any perceptible extent become a Welshman; the existing relations of England and Wales were such that he in the end became an Englishman, but he seems not unnaturally to have been somewhat slower in so doing in Wales than he was in England. At least Giraldus Cambrensis, the Norman Welshman or Welsh Norman, was certainly more alive to the distinction between Normans and English than any other of his contemporaries. **Ireland.** In Ireland the Norman was more purely a conqueror than anywhere else; but in Ireland his power of adaptation caused him to sink in a way in which he sank nowhere else. While some of the Norman settlers in Ireland went to swell the mass of the English of the Pale, others threw in their lot with the native Irish, and became, in the well-known saying, *Hibernis ipsis Hiberniores*.

Norman architecture in England and in Sicily. There is yet one point in which we may profitably go back to our comparison between England and Sicily. Both countries are rich in works of architecture raised during the time of Norman rule. And the buildings of both lands throw an instructive light on the Norman national character, as we have described it. Few buildings, at least few buildings raised in any reasonable style of architecture which makes use of the arched construction, can be less like one another than the buildings of the Norman kings in England and the buildings of the Norman kings in Sicily. In Sicily the Normans found the two most outwardly civilized of the nations of Europe, the two which had as yet carried the arts to the highest pitch. The Greek had created the column: the Roman had developed it; the Roman Greek or Greek Roman had taught the column to bear the cupola; the Saracen had taught it to bear arches of his own favourite pointed shape. Out of these elements the Saracens of Sicily had formed a noble and beautiful style, grand and simple in its construction, rich and graceful in its characteristic detail. With the Saracen and the Greek to his subjects, the Norman had really no need to innovate; he had simply to bid the men of the land to go on working for him instead of for any other. The palaces and churches of the Norman kings at Palermo and Monreale and Cefalu and Messina are in style simply Saracenic; they were most likely the work of Saracen builders; they were beyond doubt built after Saracenic models. In these buildings, as in those of Aquitaine, the pointed arch is the surest sign of Saracenic influence; it must never be looked on as marking the approach of the Gothic of the North. With that form of art the pointed style of Sicily has nothing in common. A Sicilian church has nothing in common with a French or an English church; it is sometimes purely Oriental, sometimes a basilica with pointed arches. But, if the Saracen gave the lines of the building, the Greek gave the mosaic decorations of its walls. In such a case the ruling people, rather the ruling dynasty, had really nothing to add to what they found ready for them. They had simply to make Saracen and Greek work in partnership. In England, on the other hand, the Normans did really bring in a new style of their own, their own form of Romanesque, differing widely indeed from the Saracenic style of Sicily. This Norman form of Romanesque most likely had its origin in the Lombard buildings of northern Italy. But it took firm root on Norman soil; it made its way to England at an early stage of its growth, and from that time it went on developing and improving on both sides of the Channel till the artistic revolution came by which, throughout northern Europe, the Romanesque styles gave way to the Gothic. Thus the history of architecture in England during the 11th and 12th centuries is a very different story from the history of the art in Sicily during the same time. There were no Greeks or Saracens in England; there was no Greek or Saracen skill. England indeed had, possibly in a somewhat ruder form, the earlier style of Romanesque once common to England with Italy, Gaul, and Germany. To this style it is no wonder that the Normans preferred their own, and that style therefore supplanted the older one. A comparison of Norman buildings in England and in Normandy will show that the Norman style in England really was affected by the earlier style of England; but the modification was very slight, and it in no way affected the general character of the style. Thus, while the institutions of England in the 12th century were English with very considerable Norman modifications, the architecture of England in that century was Norman with a very slight English modification. The difference then is plain. Where, as in Sicily, the Normans felt that they could not improve, they simply adopted the style of the country. Where, as in England, they felt that they could improve, they substituted for the style of the country their own style,—that is, a style which they had not created but which they had adopted, which they had made thoroughly their own, and which they went on improving in England no less than in Normandy. That is, the discerning Norman, as ever, adapted himself, but adapted himself in an intelligent way, to the circumstances of each land in which he found himself. And this comes out the more clearly if we compare Norman work in England and in Sicily with Norman work in at least some parts of Apulia. At Bari, Trani, and Bitonto we see a style in which Italian and strictly Norman elements are really mingled. The great churches of those cities are wholly unlike those of Sicily; but, while some features show us that we are in Italy, while some features even savour of the Saracen, others distinctly carry us away to Caen and Peterborough. It is plain that the Norman settlers in Apulia were not so deeply impressed with the local style as they were in Sicily, while they thought much more of it than they thought of the local style of England. In each of the three cases there is adaptation, but the amount of adaptation differs in each case according to local circumstances. In Normandy itself, after the separation from England, architecture becomes French, but it is French of a remarkably good type. The buildings of the latest French style keep a certain purity and sobriety in Normandy which they do not keep elsewhere.

Of all the points here insisted on that which it is most necessary to bear in mind is the Norman power of adaptation to circumstances, the gift which in the end destroyed the race as a separate race. English history is utterly misconceived if it is thought that an acknowledged distinction between Normans and English went on, perhaps into the 14th century, perhaps into the 17th. Long before the earlier of those dates the Norman in England had done his work; he had unwittingly done much to preserve and

strengthen the national life of a really kindred people, and, that work done, he had lost himself in the greater mass of that kindred people. In Sicily his work, far more brilliant, far more beneficent at the time, could not be so lasting. The Norman princes made Sicily a kingdom; they ruled it for a season better than any other kingdom was ruled; but they could not make it a Norman kingdom, nor could they themselves become national Sicilian kings. The kingdom that they founded has now vanished from among the kingdoms of the earth, because it was only a kingdom and not a nation. In every other way the Norman has vanished from Sicily as though he had never been. His very works of building are hardly witnesses to his presence, because, without external evidence, we should never have taken them to be his. In Sicily, in short, he gave a few generations of unusual peace and prosperity to several nations living side by side, and then he, so to speak, went his way from a land in which he had a work to do, but in which he never was really at home. In England he made himself, though by rougher means, more truly at home among unacknowledged kinsmen. When in outward show he seemed to work the unmaking of a nation he was in truth giving no small help towards its second making. (E. A. F.)

NORMANTON, a township in the West Riding of Yorkshire, is situated on the Calder river, and on several railway lines, 3 miles (by rail) north-east of Wakefield and 24 south-south-west of York. The church of All Saints, an ancient stone structure in the Norman and Perpendicular styles, with a square tower rebuilt in 1717, contains a number of interesting monuments. The grammar school was founded about the end of the 16th century. Traces still remain of a moat surrounding the town and connected with a Roman encampment which at one time occupied its site. A mound in the neighbourhood called Haw Hill is supposed to be a barrow. There are numerous collieries in the neighbourhood. The population of the urban sanitary district (1227 acres) in 1871 was 3448, and in 1881 it was 8038. The parish of Normanton (2517 acres) includes three townships,—Normanton, Snydale, and Newland. Altofts (1698 acres), where Sir Martin Frobisher resided, was made into a separate parish in 1879.

NORRIS, JOHN (1657-1711), the disciple of Plato and Malebranche, was born in 1657 at Collingbourne-Kingston in Wiltshire, where his father was then incumbent. He was educated at Winchester School, and entered at Exeter College, Oxford, in 1676. In 1680 he took his degree and was elected to a fellowship at All Souls' College. He first made himself known in the university, Anthony Wood tells us, by a translation of Robert Waryng's philosophical poem, *Effigies Amoris*, entitled *The Picture of Love Unveiled*. This appeared in 1682, and was followed in 1683 by his first original work, *An Idea of Happiness*. With Plato, he places the highest happiness or fruition of the soul in the contemplative love of God—"that primitive and original Beauty, Perfection, and Harmony." Norris's poems, mostly composed about this time, are, in the main, expressions of his habitual mood of devout but somewhat abstract contemplation. They have little poetic richness, but their grave style is often not without impressiveness, and works itself out at intervals into a felicitous stanza or a memorable line. A few pieces (such, for instance, as *The Parting*) might claim even a higher praise. The poems appeared in 1684 as the first part of a volume of *Poems and Discourses occasionally written*. Three years later a new and enlarged edition was published with the title, *A Collection of Miscellanies*; and in this form the volume was popular enough to go through nine editions. In the midst of these graver productions Norris found leisure to give vent to his hereditary Tory and High-Church feeling in a satire on the Whigs and a Latin tractate aimed at the Calvinistic dissenters. All through his life his intense intellectual activity seemed to make it almost a necessity for him to mingle in whatever controversy was going on. But philosophy and philosophical theology formed his central interest. Malebranche's *Recherche de la Vérité*, which had appeared in 1674, made an easy conquest of the Oxford fellow, to whom its doctrine appeared no more than the consistent and clarified modern expression of that Platonized Christianity which met him alike in St John, in Plotinus, and in Augustine, the father whom he "loved to speak after." Perhaps it would be more correct to say that Norris reads his favourite authors in the light of the theory derived from Malebranche. It is at least doubtful whether he would have reached any definiteness of philosophic theory for himself without the aid of the French thinker. He makes no secret of his discipleship. Malebranche, he says, "is indeed the great Galileo of the intellectual world. He has given us the point of view, and whatever further detections are made, it must be through his telescope." Norris's readings in modern philosophy were not confined, however, to Malebranche; he had studied the works of Descartes himself, and most of what had been written for and against Cartesianism on the Continent. Of English thinkers. More and Cudworth, the so-called Cambridge Platonists, had influenced him most; and in 1685 his study of their works had ripened into a correspondence with the former. After More's death Norris published the correspondence between them as an appendix to his Platonically conceived essay on *The Theory and Regulation of Love* (1688).

Some time before this Norris had taken orders, and in 1689, on being presented to the living of Newton St Loe, in Somersetshire, he married, and resigned his fellowship. In the same year he published *Reason and Religion*, the first of his riper works. The *Reflections upon the Conduct of Human Life*, which he wrote (also in 1689) "by way of letter to an excellent lady, the Lady Masham," did not advance his interests in that quarter; for the lady, whose eyes were only weak, was nettled at being set down in the preface as blind. In 1690 Norris published a volume of *Discourses upon the Beatitudes*, which proved decidedly popular, and induced the author to follow it up by three more volumes of *Practical Discourses* between 1690 and 1698. The year 1690 is memorable as the year of the publication of Locke's *Essay*, and the book came into Norris's hands just as his volume of *Discourses* was passing through the press. He at once appreciated its importance, but its whole temper was alien from the modes of thought in which he had been reared, and its main conclusions moved him to keen dissent. He hastened to "review" it in an appendix to his sermons. These *Cursory Reflections* constitute Norris the first critic of the *Essay*; and they anticipate some of the arguments that have since been persistently urged against Locke from the transcendental side. Though holding to the "grey-headed, venerable doctrine" of innate ideas as little as Locke himself, Norris finds the criticism in the first book of the *Essay* entirely inconclusive, and points out its inconsistency with Locke's own doctrine of evident or intuitively perceived truths. He also suggests the possibility of subconscious ideation, on which Leibnitz laid so much stress in the same connexion. He next complains that Locke neglects to tell us "what kind of things these ideas are which are let in at the gate of the senses." In other words, while giving a metaphorical account of how we come by our ideas, Locke leaves unconsidered the intellectual nature of the ideas or of thought in itself. Unless we come to some conclusion on this point, Norris argues, we have little chance of being right in our theory of how ideas "come to be united to our mind." He also puts his finger upon the weakness

of Locke's doctrine of nominal essences, showing how it ignores the relation of the human mind to objective truth, and instancing mathematical figures as a case "where the nominal essence and the real essence are all one."

In 1691 Norris was transferred to Bemerton, a pleasant rural charge near Salisbury, where George Herbert had been parish priest in the earlier part of the century. A few miles distant is Langford Magna, where from 1704 onwards Norris had a congenial metaphysical neighbour in the person of Arthur Collier, the future author of *Clavis Universalis*. The remaining twenty years of Norris's life were spent at Bemerton, the flight of time marked only by the works that still came in rapid succession from his pen. In 1691-92 he was engaged in controversy with his old enemies the "Separatists," and with the Quakers, his Malebranchian theory of the divine illumination having been confounded by some with the Quaker doctrine of the light within. In 1697 he wrote *An Account of Reason and Faith*, one of the best of the many answers to Toland's *Christianity not Mysterious*. Norris adopts the distinction between things contrary to reason and things above reason, and maintains that the human mind is not the measure of truth. In 1701 appeared the first volume of the systematic philosophical work by which he is remembered, *An Essay towards the Theory of the Ideal or Intelligible World*. The first volume treats the intelligible world absolutely; the second, which appeared in 1704, considers it in relation to human understanding. In 1708 Norris wrote *A Philosophical Discourse concerning the Natural Immortality of the Soul*, defending that doctrine against the assaults of Dodwell. But after the completion of his *magnum opus* his appearances in print became less frequent. His health was not robust, and perhaps he was a little disappointed at his failure to reach the larger public. Norris died in 1711 at the comparatively early age of 54.

It will hardly be claimed for Norris that he was either an original thinker or a master of style. As Molyneux writes to Locke, he is "overrun with Malebranche and Plato;" his philosophy is hardly more than an English version of Malebranche, enriched by wide reading of "Platonic" thinkers of every age and country. His style is too scholastic and self-involved. Nevertheless he was an acute and strenuous thinker. His *Theory of the Intelligible World* is an attempt to explain the objective nature of truth, which he blamed Locke for leaving out of regard. By the intelligible world Norris understands the system of ideas eternally existent in the mind of God, according to which the material creation was formed. This ideal system he identifies with the Logos—the second person of the Trinity, the light that lighteth every man that cometh into the world. For it is these ideas and their relations that are alone the object-matter of science; whenever we know, it is because they are present to our mind; or, as Malebranche says, we see all things in God. Material things are wholly dark to us, except so far as the fact of their existence is revealed in sensation. The matter which we say that we know is the idea of matter, and belongs, like other ideas, to the intelligible world. When stripped of its semi-mythical form of statement, Norris's emphatic assertion of the ideal nature of thought and its complete distinction from sense as such may be seen to contain an important truth. He stands somewhat aside from the main course of English philosophical thought. But, as the disciple and correspondent of More, he is, in a sense, the heir of the Cambridge Platonists, while, as the first critic of Locke's *Essay*, he may be said to open the protest of the church against the implicit tendencies of that work. He occupies a place, therefore, in the succession of churchly and mystical thinkers of whom Coleridge is the last eminent example. (A. SE.)

NORRISTOWN, a borough of the United States, capital of Montgomery county, Pennsylvania, lies on the north bank of the Schuylkill river, opposite Bridgeport (with which it is connected by two bridges), and 16 miles north-west of Philadelphia by the Germantown and Norristown branch of the Philadelphia and Reading Railroad. It is a well-built and pleasant town, and contains blast-furnaces and rolling-mills, wool and cotton mills, glass-works, an oil refinery, and various other manufacturing establishments, considerably indebted for their success to the water-power of the Schuylkill river. The hospital for the insane of the south-eastern district of Pennsylvania is situated here. The most conspicuous buildings are the marble county court-house (1855), the music-hall, and the jail. The population was 6024 in 1850, 8848 in 1860, 10,753 in 1870, and 13,063 in 1880. The town occupies the site of the old Swedes' Ford, and owes its name to Isaac Norris, who purchased the ground from William Penn. It was incorporated as a borough in 1812, and enlarged in 1853.

NORRKÖPING, the "Manchester of Scandinavia," a town of Sweden in the province of Östergötland, 113 miles south-west of Stockholm by rail, situated on both banks of the Motala, the wide and rapid emissary of Lake Wetter, and not far from the head of Bråvik Fjord. The river, which here forms the two islands of Laksholm and Bruxholm, is spanned by a number of bridges. Having been burned by the Russians in 1719 and visited by further conflagrations in 1812, 1822, and 1826, the whole town, since rebuilt, has quite a modern appearance, with wide and regular streets. Among the more conspicuous buildings are St Olaf's church (erected by Gustavus Adolphus in 1616, and rebuilt after 1765-67); St Hedwig's, built by the German colony in 1670; the town-house, dating from the beginning of the 19th century; the theatre, the Gustavus orphanage, and the palatial high school (1868). The industrial importance of Norrköping has steadily increased from the close of the 18th century Woollen cloth is the great staple (thirty-three factories in 1876), but cotton goods, paper, sugar, flour, tobacco and snuff, soap, starch, &c., are also manufactured. Steamers, gun-boats, and ironclads, as well as smaller craft, are constructed in the ship-yards on the lower Motala. At the close of the 17th century Norrköping was a place of from 5000 to 6000 inhabitants; after the Russian invasion it sank to 2600, but afterwards gradually rose, until in 1861 the total amounted to 20,828, and in 1878 to 27,410.

A bull of Pope Lucius III. shows that Norrkoping existed in 1185. Margaret held a meeting of the states in the town in 1404. Its fortress, known as Knappingsberg, was destroyed in 1567. At the meeting of the states in 1604 Duke Charles assumed the Swedish crown as Charles IX.; and not long afterwards Duke John of Ostergötland introduced German craftsmen into Norrkoping, and thus originated its industrial activity. Under Charles XII. the town suffered not only from war but from pestilence,—2700 of its inhabitants perishing in 1710-11.

NORTH, Lord (1732-1792). Frederick North, second earl of Guilford, but better known by his courtesy title of Lord North, was prime minister of England during the important years of the American War. The only son, by his first marriage, of Francis, seventh Lord North (grandson of Lord Keeper North), who was created earl of Guilford in 1752, Frederick was born on 13th April 1732, and after being educated at Eton and Christ Church, Oxford, was sent to make the grand tour of the Continent. On his return he was, though only twenty-two years of age, at once elected M.P. for Banbury, of which town his father was high steward; and he sat for the same town in parliament for nearly forty years. In 1759 he was chosen by the duke of Newcastle to be a lord of the treasury, and continued in the same office under Lord Bute and George Grenville till 1765. He had shown himself such a ready debater that on the fall of the first Rockingham ministry in 1766 he was sworn of the privy council, and made paymaster-general by the duke of Grafton. His reputation for ability grew so high that in December 1767, on the death of the brilliant Charles Townshend, he was made chancellor of the exchequer. His popularity with both the House of Commons and the people continued to increase, for his good temper was never ruffled, and his quiet humour perpetually displayed; and, when the retirement of the

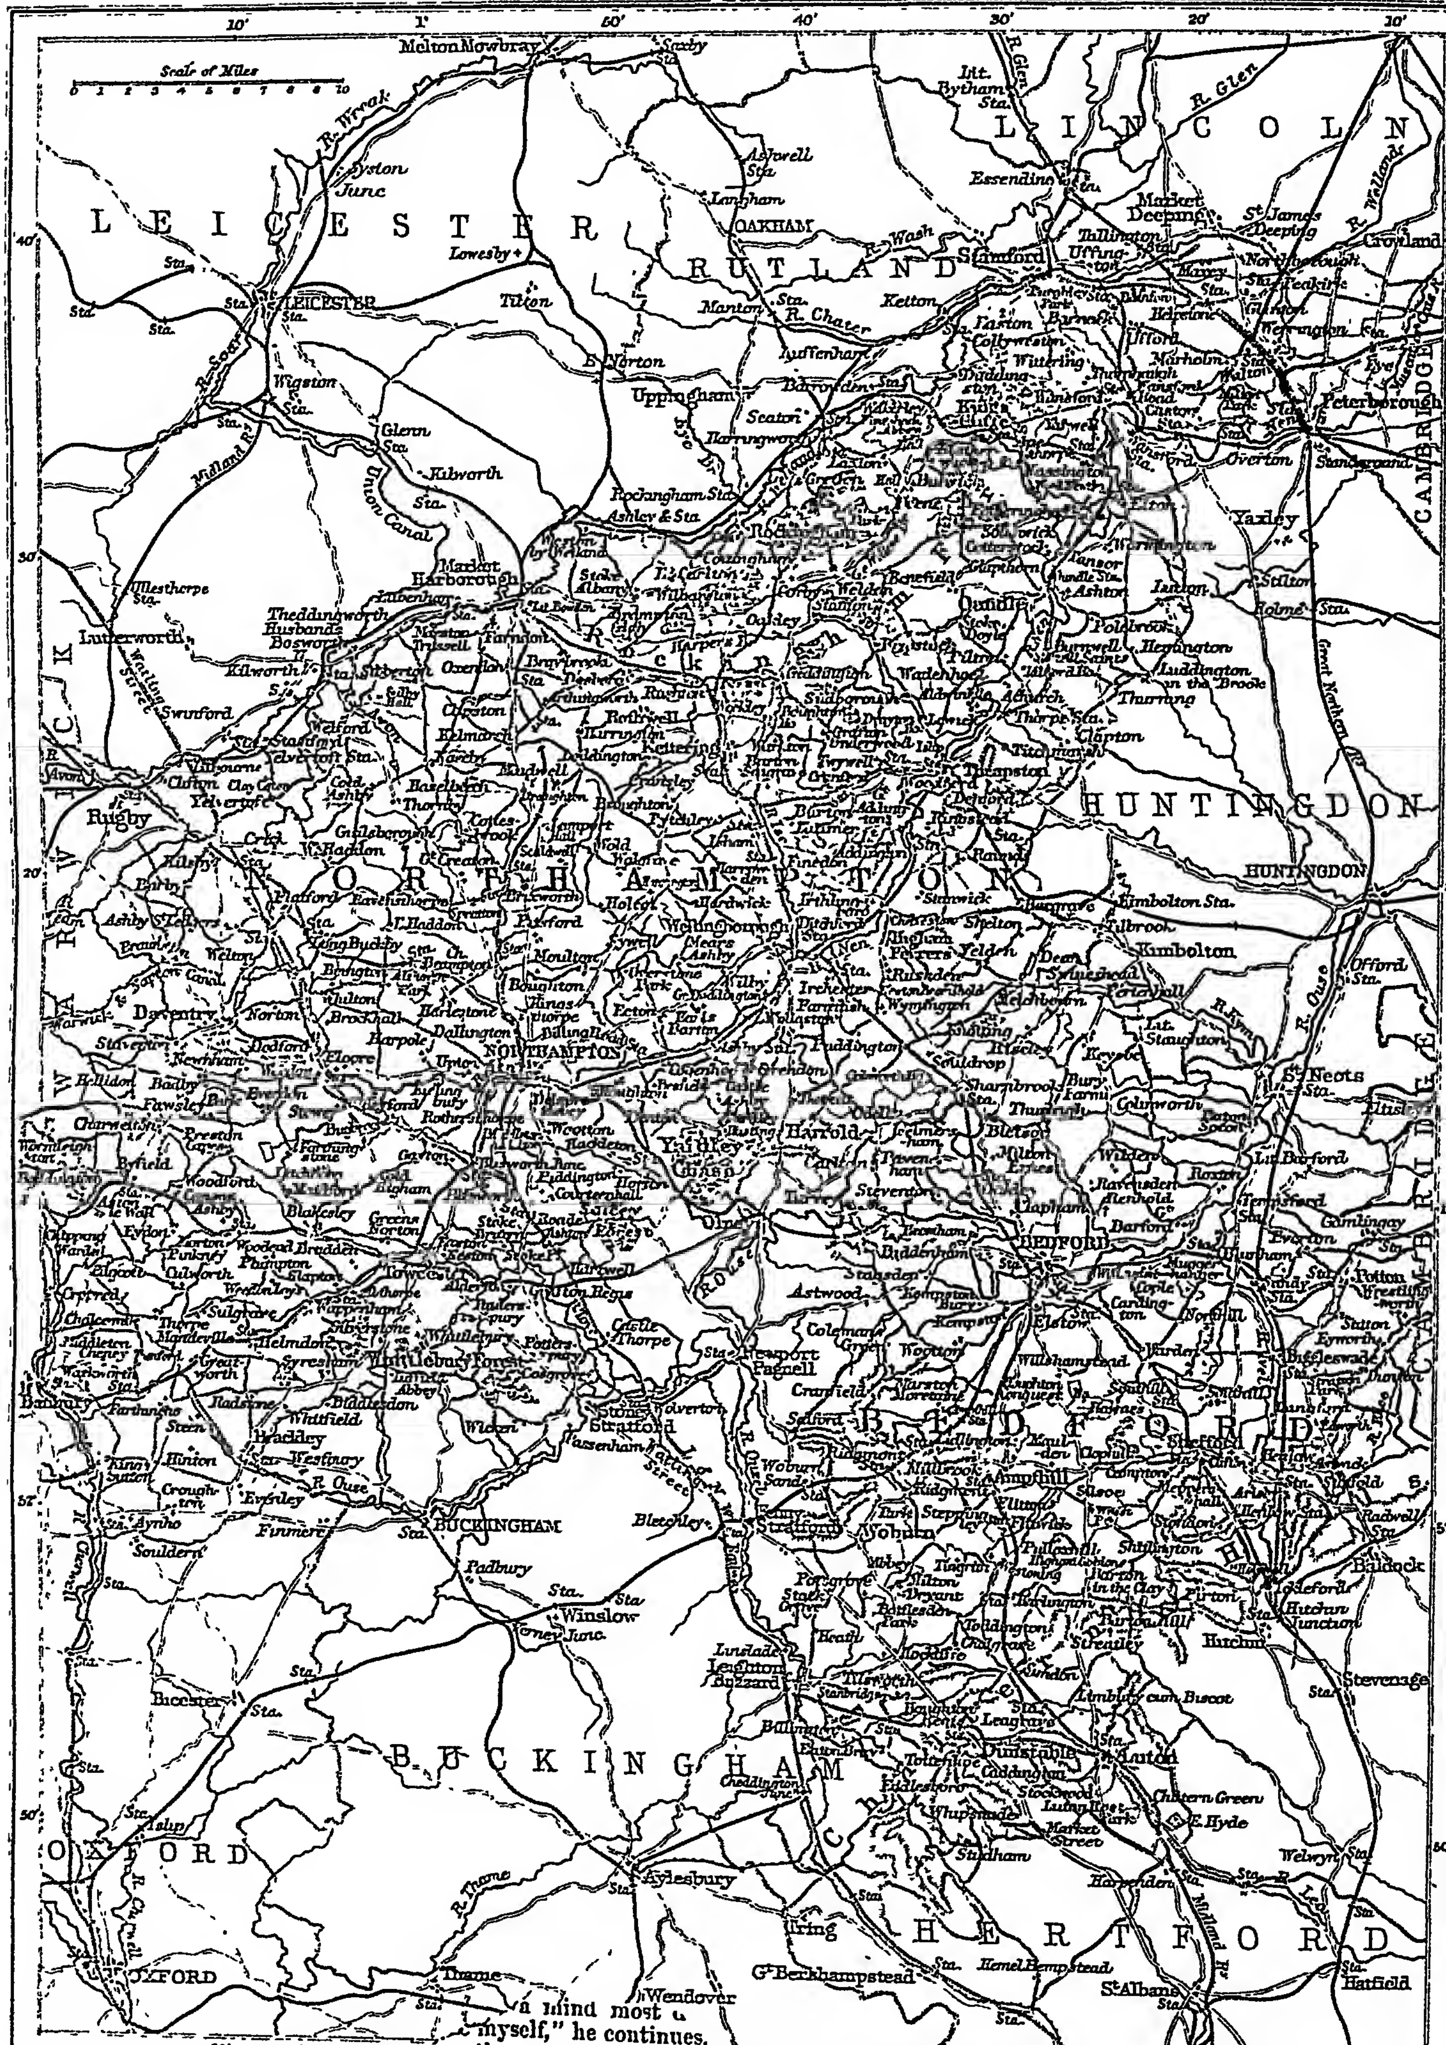
duke of Grafton was necessitated by the hatred he inspired and the attacks of Junius, no better successor could be found for the premiership than the chancellor of the exchequer. Lord North succeeded the duke in March 1770, and continued in office for twelve of the most eventful years in English history. George III. had at last overthrown the ascendency of the great Whig families, under which he had so long groaned, and determined to govern as well as rule. He knew that he could only govern by obtaining a majority in parliament to carry out his wishes, and this he had at last obtained by a great expenditure of money in buying seats, and by a careful exercise of his patronage. But in addition to a majority he must have a minister who would consent to act as his lieutenant, and such a minister he found in Lord North. How a man of undoubted ability such as Lord North was could allow himself to be thus used as a mere instrument cannot be explained; but the confidential tone of the king's letters seems to show that there was an unusual intimacy between them, which may account for North's compliance. The path of the minister in parliament was a hard one; he had to defend measures which he had not designed, and of which he had not approved, and this too in a House of Commons in which all the oratorical ability of Burke and Fox was against him, and when he had only the purchased help of Thurlow and Wedderburne to aid him. The most important events of his ministry were those of the American War of Independence. He cannot be accused of causing it, but one of his first acts was the retention of the tea-duty, and he it was also who introduced the Boston Port Bill in 1774. When the war had broken out he earnestly counselled peace, and it was only the earnest solicitations of the king not to leave his sovereign again at the mercy of the Whigs that induced him to defend a war which from 1779 he knew to be both hopeless and impolitic. At last, in March 1782, he insisted on resigning after the news of Cornwallis's surrender at Yorktown, and no man left office more blithely. He had been well rewarded for his assistance to the king: his children had good sinecures; his half-brother, Brownlow North, was bishop of Winchester; he himself was chancellor of the university of Oxford, lord-lieutenant of the county of Somerset, and had finally been made a knight of the Garter, an honour which has only been conferred on three other members of the House of Commons, Sir R. Walpole, Lord Castlereagh, and Lord Palmerston. Lord North did not remain long out of office, but in April 1783 formed his famous coalition with his old subordinate, Fox, and became secretary of state with him under the nominal premiership of the duke of Portland. He was probably urged to this coalition with his old opponent by a desire to show that he could act independently of the king, and was not a mere royal mouthpiece. The coalition ministry went out of office on Fox's India Bill in December 1783, and Lord North, who was losing his sight, then finally gave up political ambition. He played, when quite blind, a somewhat important part in the debates on the Regency Bill in 1789, and in the next year succeeded his father as earl of Guilford. He did not long survive his elevation, and died peacefully on 5th August 1792.

It is impossible to consider Lord North a great statesman, but he was a most good-tempered and humorous member of the House of Commons. In a time of unexampled party feeling he won the esteem and almost the love of his most bitter opponents. Burke finely sums up his character in his *Letter to a Noble Lord*: "He was a man of admirable parts, of general knowledge, of a versatile understanding, fitted for every sort of business; of infinite wit and pleasantry, of a delightful temper, and with a mind most disinterested. But it would be only to degrade myself," he continues, "by a weak adulation, and not to honour the memory of a great man, to deny that he wanted something of the vigilance and spirit of command which the times required."

For Lord North's administration, by far the best authority is *The Correspondence of George III. with Lord North*, edited by W. Bodham Donne, 2 vols., 1867. The histories of the period may also be consulted, particularly Lord Mahon's *History of England from* 1713 *to* 1783, Sir T. E. May's *Constitutional History of England from the reign of George III.*, and Lord Brougham's admirable sketch in his *Statesmen of the Reign of George III.*

NORTH, SIR DUDLEY (1641-1691), political economist, was third son of Dudley, fourth Lord North, who published, besides other things, *Passages relating to the Long Parliament*, of which he had himself been a member. He was born 16th May 1641. In his early years he was carried off by Gipsies and recovered with some difficulty by his family,—an incident curiously similar to that which befell Adam Smith in his infancy. He entered the mercantile profession, engaged in foreign trade, especially with Turkey, and spent a number of years at Constantinople and Smyrna. Some notices of the manners and customs of the East were printed from his papers by his brother. Having returned to London with a considerable fortune, he continued to prosecute trade with the Levant. His ability and knowledge of commerce attracted the attention of the Government, and he was further recommended by the influence of his brother Lord Guilford. During the Tory reaction under Charles II. he was a pliant instrument in the hands of the court, and was one of the sheriffs forced on the city of London with an express view to securing verdicts for the crown in the state trials of the period. He obtained the honour of knighthood, and was appointed a commissioner of customs, afterwards of the treasury, and again of the customs. Having been elected a member of parliament under James II., "he took," says Roger North, "the place of manager for the crown in all matters of revenue." After the Revolution he was called to account for his alleged unconstitutional proceedings in his office of sheriff, and did not show much highmindedness in his defence. He died 31st December 1691.

The work by which he has obtained an honourable place in the history of political economy is his *Discourses upon Trade, principally directed to the cases of the interest, coinage, clipping and increase of money.* This tract was published anonymously in 1691. It is supposed that for some unknown reason it was suppressed soon after its appearance; however this may be, it became very scarce, so that, in his brother's words, "it hath been ever since utterly sunk, and a copy not to be had for money." It does not seem to have been much noticed on its publication, or used by subsequent writers. A copy was purchased at the sale of the Rev. Rogers Ruding, author of a work on the coinage, and from this a gentleman of Edinburgh printed some copies for distribution. Other copies of the original impression were afterwards discovered, and from them J. R. M'Culloch edited the tract in the *Select Collection of Early English Tracts on Commerce* printed by the Political Economy Club of London in 1856. North is named by Roscher as one of that "great triumvirate" which in the 17th century raised the English school of economists to the foremost place in Europe, the other members of the group being Locke and Petty. His tract, Roscher further remarks, reads like a chapter of the *Wealth of Nations.* It does, indeed, in a very remarkable manner anticipate the doctrines of Adam Smith and the later free-trade school. Its author was quite free from the errors and prejudices of the mercantilism which was dominant in his day, and which had misled on some subjects even so able a writer as Child, against whom, though without naming him, North's arguments on the legal limitation of the rate of interest appear to be in part directed. At the end of the preface to the *Discourses* are brought together a number of propositions, embodying the author's views, which he announces as "paradoxes, no less strange to most men than true in themselves." They are so remarkable for the time at



"a mind most ...
... myself," he continues,
... honour the memory of a great
... nat he ... something of the vigilance and spirit
... nd which the times required."

which they appeared, more than eighty years before Smith's great work, that they deserve to be quoted in full.

"That the whole world as to trade is but as one nation or people, and therein nations are as persons. That the loss of a trade with one nation is not that only, separately considered, but so much of the trade of the world rescinded and lost, for all is combined together. That there can be no trade unprofitable to the public, for, if any prove so, men leave it off; and wherever the traders thrive, the public, of which they are a part, thrive also. That to force men to deal in any prescribed manner may profit such as happen to serve them; but the public gains not, because it is taking from one subject to give to another. That no laws can set prices in trade, the rates of which must and will make themselves; but, when such laws do happen to lay any hold, it is so much impediment to trade, and therefore prejudicial. That money is a merchandise, whereof there may be a glut as well as a scarcity, and that even to an inconvenience. That a people cannot want money to serve the ordinary dealing, and more than enough they will not have. That no man shall be the richer for the making much money, nor have any part of it, but as he buys it for an equivalent price. That the free coinage is a perpetual motion found out whereby to melt and coin without ceasing, and so to feed goldsmiths and coiners at the public charge. That debasing the coin is defrauding one another, and to the public there is no sort of advantage from it, for that admits no character, or value, but intrinsic. That the sinking money by alloy or weight is all one. That exchange and ready money are the same, nothing but carriage and re-carriage being saved. That money exported in trade is an increase to the wealth of the nation, but spent in war and payments abroad is so much impoverishment. In short, that all favour to one trade or interest against another is an abuse, and cuts so much of profit from the public." The tract closes with these weighty words: "No people ever yet grew rich by policies; but it is peace, industry, and freedom that bring trade and wealth, and nothing else."

NORTH, Roger (1650-1733), in writing his *Examen* of Kennet's *History of England*, and the "Lives" of his brothers, Lord Keeper Guilford, Sir Dudley North, and John, master of Trinity College, Cambridge, became one of the original authorities for the political and social history of the reigns of Charles II. and James II. He was a weak man, a humble worshipper of his elder brothers, and especially of the lord keeper, by whose politic energy the family of North had been raised from a very decayed condition; but the simplicity of his prejudices and the laborious minuteness of his details, notwithstanding the forensic pedantry of his style, give his writings some value. Whatever his great brother did he thought both right and noteworthy; hence he is a useful contributor to the moral history of the period.

NORTH, Sir Thomas, son of Edward North, first Baron North of Kirtling, is memorable as the author of the English version of Plutarch's *Lives* that supplied Shakespeare with materials for his classical plays. Materials for a biographical notice are extremely scanty; and neither the exact date of his birth nor that of his death is known. His literary career was long, for he was living in decayed old age in 1603 when a third edition of his Plutarch was published, with a supplement of other translated biographies. His first appearance in literature was in 1557, when Wayland published for him a translation of Guevara's *Diall of Princes*, a compendium of moral counsels pleasantly interwoven with incidents in the life of Marcus Aurelius. The English of this work is one of the earliest specimens of the more ornate, copious, and pointed style for which educated young Englishmen had acquired a taste in their Continental travels and studies, and which such fashionable tutors as Ascham and Wilson inculcated by both precept and example. North translated from a French copy of Guevara. The first edition of his Plutarch, translated from the French of Amyot, appeared in 1579.

NORTH ADAMS, a township, manufacturing village, and important railway junction of the United States in Berkshire county, Massachusetts, on the Hoosac river, 143 miles from Boston by the Troy and Boston Railroad. Cotton and wool-weaving and shoemaking are the leading industries. The population of the township, formerly included in Adams township, was 10,191 in 1880. About a mile to the east of the village the Hudson's Brook is arched over for a considerable distance by a romantic cave from 30 to 60 feet in height. Nathaniel Hawthorne, who spent the summer of 1838 at North Adams, gives a fine description of the spot.

NORTHALLERTON, a market town and parliamentary borough in the North Riding of Yorkshire, is situated on a small stream, the Sun Beck, a tributary of the Wiske, and on the North-Eastern Railway, about 40 miles north of Leeds and 17 north of Ripon. It consists principally of a long and wide street running north and south. The church of All Saints is a large cruciform structure in the Early English and Perpendicular styles, with a square tower 80 feet in height rising from the centre. There is a grammar school of royal foundation. Among the charities are a hospital founded in 1476 by Richard Moore and a cottage hospital opened in 1877. A town-hall was erected in 1874. There are no traces of the fortified palace of the bishops of Durham, of the White Friars monastery founded in 1354, or of the Austin priory founded in 1341. The town possesses a manufactory of brattice cloth. The population of the parliamentary borough in 1871 (10,381 acres) was 4961, and in 1881 it was 5445. The population of the urban sanitary district (3650 acres) in the same years was 3164 and 3692 respectively.

Northallerton is supposed to have been a Roman station and subsequently a Saxon burgh. In Domesday it is called Alvertune and Alreton. The prefix "North" was added to distinguish it from Allerton Mauleverer. Near it took place (22d August 1138) the Battle of the Standard, when the Scots under King David were defeated by the English with a loss of 12,000 men. The town was given by William Rufus to the bishops of Durham. The demolition of their palace was ordered by Henry II. In 1318 the Scots under Robert Bruce plundered the town. It was occupied by Charles I. during the Civil War, and in 1745 the English army encamped on Castlehill above it.

NORTHAMPTON, an inland county of England, is bounded N. by Lincoln, N.W. by Rutland and Leicester, W. by Warwick, S.W. and S. by Oxford, S.E. by Buckingham, and E. by Bedford, Huntingdon, and Cambridge. It has an area of 629,912 acres, or about 982 square miles. Its greatest length from north-east to south-west is about 70 miles; in breadth it varies from 7 to 26 miles. The surface is hilly and undulating, but the hills are for the most part small and rounded and the undulations monotonous, notwithstanding that the country is richly cultivated and in some parts finely wooded. The highest summits are Albury (804 feet) and Naseby (697 feet). In the western and south-western districts the scenery becomes almost picturesque, and in the centre and east, where greater monotony prevails, numerous fine trees add a pleasing aspect of richness. For a long period Northampton has been famed for its ash trees, and there are also some very old oaks, as well as a few fine avenues of elm. The north-eastern extremity belongs to the great fen district. The county forms the principal watershed of central England, nearly all the more important rivers of this region having their sources within its boundaries. The Avon with a westward course forms for some distance the northern boundary of the county, till near Lilbourne it passes into Warwickshire. The Nene passes southward through Northampton, whence it takes an easterly course, skirting the eastern boundary of the county. The Welland flows in an easterly direction, forming the boundary of the county with Leicester, Rutland, and Lincoln. The Cherwell, after passing into Oxfordshire, forms for a considerable distance the southernmost portion of the western boundary with that county; the Leam forms a portion of the boundary with Warwickshire. The Ouse, which rises near Brackley, soon afterwards leaves the county, but again touches it near Stony Stratford, separating it for some distance

Plate XVII.

from Buckingham. The Grand Junction Canal, which is connected with the Oxford Canal, enters the county at Braunston on the borders of Warwickshire and passes by Daventry and Blisworth into Buckinghamshire, a branch connecting it with Northampton. The Grand Union Canal unites with the Grand Junction near Daventry and runs north until it joins the Leicester Canal at Foxton, branches passing to Welford and Market Harborough.

Geology.—Lias forms the foundation of Northamptonshire, and above it rest the Oolite formations which crop to the surface throughout the greater part of the county. Lias prevails as the surface formation in the west and north-west. Its total thickness is about 800 feet, the Lower Lias clays which stretch in from Warwickshire having a thickness of 500 to 600 feet, the Middle Lias or marlstone of about 30 feet, and the Upper Lias clays, which form numerous outliers scattered over the marlstone plateau and also appear along the beds of several of the streams, a thickness of from 150 to 200 feet. Immediately above the lias come the inferior Oolite beds of Northamptonshire sand, which reach their greatest thickness in the neighbourhood of Northampton. The sandstone is strongly impregnated with oxide of iron, supposed to have been deposited by the percolations of water through the stone. Brown hæmatite iron is also found at Addington. The iron of Northamptonshire was made use of by the Romans, but the rise of the modern industry dates from about 1850. In 1881 iron was worked at thirty different places in the county, the total quantity obtained being 1,270,544 tons with an estimated value of £176,427. About one-fourth is smelted in the district, but the greater quantity is sent raw to Merthyr-Tydfil and Staffordshire. East and north-east of the county sandstone is largely quarried for building purposes, and is both easily worked and richly coloured. It is highly fossiliferous, containing many species not known in other districts. The upper division consists of a nearly white silicious sandstone frequently intercalated with clay. Above the sandstone rest beds of Lincolnshire limestone, and, where it is absent, a sandy clay. The slopes of the hills are frequently capped with cornbrash, sometimes overlaid with Oxford clay. Various isolated portions are covered with drift deposits. Where sandstone and limestone join the clay numerous springs occur, the proximity to which has in many cases determined the sites of villages and towns.

Soil and Agriculture.—The climate of Northamptonshire is mild and genial, while the absence of lofty hills renders it much drier than many other inland districts. The prevailing soil is a rich brown but light and crumbling mould, sometimes with a rocky subsoil. The richest soil is the black mould of the fen district, which is specially suited for grass, as are all the heavier soils. Nearly all the land is capable of cultivation, although there is some stiff wet soil on the slopes of the hills. In 1883 there were 559,536 acres, or about 88 per cent. of the total area under cultivation, of which no fewer than 304,654 acres were under permanent pasture, many of the heavier soils having been laid down during the past few years. Leases are the exception, and on this account grass land is more in request than arable. The farms in general are not large. Isolated houses are rare, both farmers and labourers living for the most part in villages. The farm buildings are thus frequently inconveniently situated as well as badly constructed, although improvements in both respects are being introduced. The usual rotation of crops is fallow, wheat, beans, and oats on heavy soils; but on the lighter soils wheat, pease or barley, with clover and roots, on a four or five years' rotation is the system generally adopted. Frequently the land is left three years in grass. Of the 158,445 acres under corn crops in 1883, 59,613 were under wheat, 50,866 under barley or bere, 21,914 under oats, 16,770 beans, and 6121 pease. Green crops occupied only 38,143 acres, 23,923 of these being under turnips and swedes, 4894 under mangolds, and only 2520 under potatoes. Clover occupied 34,137 acres, and fallow 24,157. Horses in 1883 numbered 21,901, of which 16,209 were used solely for agricultural purposes. Cattle numbered 117,790, of which 26,036 were cows and heifers in milk or in calf, the fattening of cattle being the chief occupation of the Northamptonshire farmer. The favourite stock for breeding purposes is the shorthorn, which has now almost entirely superseded the longhorn; but the most common custom is to buy in Hereford, Scotch, Welsh, and Irish cattle in the spring and fatten them off the rich pasture with or without artificial food, a few being retained and fed up for the Christmas market. In autumn additional cattle are bought in to eat the coarse grass off the pastures, and these are usually retained during winter. Sheep in 1883 numbered 413,075, of which 255,737 were one year old and above. The most common breed on the rich pastures is the improved Leicester, which is preferred on account of its length of wool; but the Southdown, on account of its superior flesh, is also largely kept.

According to the latest returns the land was divided among 14,665 proprietors, possessing 592,771 acres, with a gross estimated rental of £1,637,370, an average of about £2 15s. 3d per acre. Of the owners 10,010, or about 79 per cent., possessed less than one acre each; 33 proprietors possessed between 2000 and 5000 acres, 11 between 5000 and 10,000, and the following over 10,000 each:—Hon. G. W. Fitzwilliam, 18,116; duke of Buccleuch, 17,965; Earl Spencer, 17,031; Lord Overstone, 15,046; and the marquis of Exeter, 13,546.

Manufactures.—The iron industry is of great importance, and, though only a small proportion of the metal is smelted in the county, the number of furnaces in blast is increasing. The staple and the only manufacture of importance is that of boots and shoes, which is chiefly carried on in Northampton and the towns and villages in the centre of the county and along the eastern border.

Railways.—The main lines of the London and North-Western, the Great Northern, and the Midland Railways pass through portions of the county, and branch lines traverse it in all directions.

Administration and Population.—In Domesday Northampton is mentioned as containing 30 hundreds, but it then included a considerable part of Rutlandshire. These divisions were first reduced to 28, and in the reign of Henry II. to 20, their present number. The county includes the municipal boroughs of Daventry (3859) and Northampton (51,881); the principal part (20,123) of the city of Peterborough, which was incorporated under the Municipal Act in 1874; part (1171) of the borough of Stamford, of which the greater part is in Lincolnshire; part (2412) of the borough of Banbury, the greater part of which is in Oxfordshire; the borough of Higham-Ferrers (1468); and the urban sanitary districts of Hardingstone (4866), Kettering (11,095), Oundle (11,196), and Wellingborough (13,794). Before the Reform Act of 1832 Northamptonshire sent nine members to parliament, two for the shire, two each for the city of Peterborough and the boroughs of Northampton and Brackley, and one for the borough of Higham-Ferrers. By that Act the number was fixed at eight, Brackley and Higham-Ferrers being disfranchised, while the county was formed into two divisions, a northern and a southern, each returning two members. There are two courts of quarter-sessions, one for the county and the other for the liberty or soke of Peterborough, and nine petty and special sessional divisions, exclusive of the liberty of Peterborough. The boroughs of Northampton and Stamford have commissions of the peace and separate courts of quarter-sessions. The boroughs of Daventry and Higham-Ferrers form parts of the petty and special sessional divisions of Daventry and Wellingborough, the county justices having concurrent jurisdiction. The county contains 344 civil parishes, with parts of four others. It is almost entirely in the diocese of Peterborough. The population of Northamptonshire in 1801 was 131,757, which in 1821 had increased to 162,483, in 1871 to 243,891, and in 1881 to 272,555 (135,662 males and 136,893 females). The number of inhabited houses in 1881 was 57,540, and the average number of persons to an acre 0·43.

History and Antiquities.—The Coritani, who at the time of the Roman invasion inhabited Northamptonshire, are supposed to have been dependent on the Iceni. Of this period the only remains are a few traces of camps and earthworks, the principal being those at Borough Hill near Daventry, where some rude pottery of supposed British origin has been discovered; at Arbury Hill near Staverton; and at Rockingham, on the site of the present old castle. Under

the Romans Northamptonshire formed part of *Flavia Cæsariensis*. It was crossed by two great Roman roads, the Watling Street and the Ermine Street: the former entered the county near Stony Stratford and passed by Towcester and Weedon to Lilbourne, where it crossed the Avon; the latter crossed over from Castor near Peterborough into Lincolnshire. From the large number of remains discovered within its limits Northamptonshire would appear to have been very extensively occupied by the Romans. The principal Roman stations within its limits were Irchester, on the north side of the Nene, where numerous pieces of pottery, coins, and slabs with inscriptions have been found: Castor, the seat of a celebrated Roman pottery, the extent of which and the finish of whose workmanship are attested by the tesselated pavements and other relics, as well as by the kilns for bricks and earthenware, that have been dug up; Benaventa, supposed to be Borough Hill, where excavations have brought to light traces of very extensive buildings: Lactodurum, supposed to be Towcester, where, however, very few Roman remains are now visible; Isannavatis, probably at Burnt Walls, a large field covered with remains of Roman buildings; and Tripontium, supposed to be Lilbourne, where there are traces of camps on both sides of the river. There were also encampments at Arbury Hill, Barrow Hill, Castle Dykes, Chesterton, Guilsborough, Hunsborough, Rainsborough, Sulgrave, and Wallow Bank, besides numerous small camps and posts at other places, especially along the valley of the Nene, which is thickly strewn with tesselated pavements and other remains.

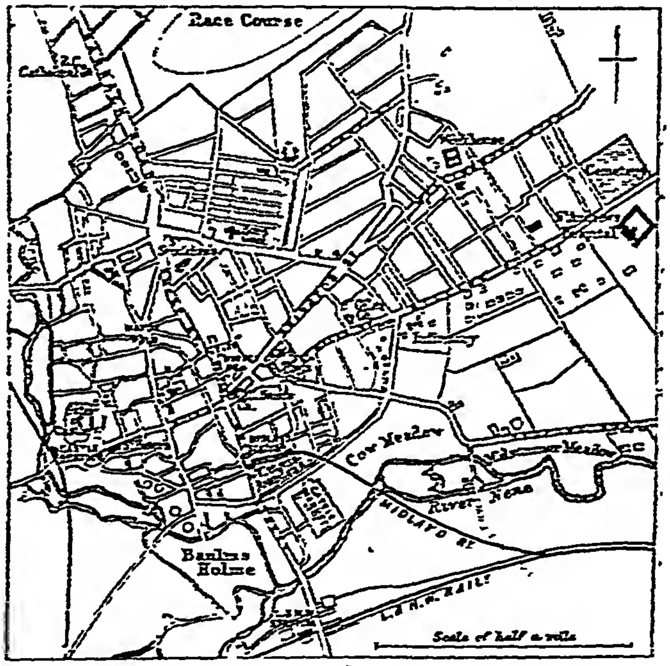
Northampton formed part of Middle Anglia, and was included in the Saxon kingdom of Mercia. In the time of Tostig, and according to some at an earlier period, it was attached to Northumberland, and formed no part of Mercia. When the Northumbrians in 1065 rebelled against Tostig and chose Morkere for their earl they marched southwards to Northampton, where they were met by Harold and received from him the confirmation of Morkere in the earldom; but the shires of Northampton and Huntingdon were detached from it, and bestowed on Siward's young son Waltheof, who became earl of Northampton and Huntingdon. After the Conquest the district became, on account of its extensive forest, a favourite resort of the kings of England, who occupied the castles of Northampton and Rockingham. During the Civil War Northamptonshire was the scene of many skirmishes in addition to the great fight at Naseby, while the battle of Edgehill took place on its borders.

Although Northamptonshire was rich in monastic foundations, remains, except of the abbey-church of Peterborough, afterwards the cathedral, are of small importance, the principal being the foundation and parts of the walls of St James's Abbey at Duston near Northampton, part of the church of the Cistercian abbey of Pipewell near Daventry and of the Cluniac priory at Daventry, and the priory church at Ashby. At Geddington, and also at Northampton, there is an Eleanor cross in good preservation. For the architecture of its churches Northampton holds a place scarcely inferior to any other English county. To the Saxon period belong the tower of Earls Barton church, which stands on an eminence, probably the mound of an old English strong-house; the tower and other portions of Brigstock; the ground plan and other portions of Wittering; the remarkable tower of Barnack; and Brixworth church, constructed in part of Roman materials, and supposed to include part of a Roman basilica. Of Norman, besides the cathedral of Peterborough, the finest examples are St Peter's and St Sepulchre's, Northampton, and the tower of Castor. Higham-Ferrers, formerly a collegiate church, Early English and Decorated, is one of the most remarkable churches in the county, both on account of the beauty of its architecture and the number of monuments and brasses it contains. Of the other churches, most of them representing more than one style of architecture, Early English, Decorated, and Perpendicular, the standard of excellence is generally so high that it is impossible to select a few for special notice in preference to others.

The last surviving fragments of the enclosing wall of Northampton Castle were only demolished in 1878. A gateway at Rockingham, and earthworks at Higham-Ferrers and Brackley are worthy of mention. Some castellated ruins remain of Fotheringhay Castle, which was founded soon after the Conquest by Simon de St Liz, was rebuilt by Edmund, son of Edward III., and for many years was a favourite residence of the princes of the house of York. To it Mary Queen of Scots was removed in September 1586, and it was the scene of her trial in the October following, and of her execution, 8th February 1587. The current statement that the castle was razed by James I. after his accession to the English throne is a mistake, but it was allowed to go to decay, and its materials were gradually used for other buildings. Barnwell Castle, founded by William the Conqueror, and an interesting example of the defensive construction of the period, is still a fine ruin, which includes four of the round towers and an imposing gateway. Holdenby Manor House, where Sir Christopher Hatton was born, and where Charles I. was staying when he was carried away by Cornet Joyce, has been demolished. Among the ancient mansion-houses are Castle Ashby, the seat of the Comptons, the oldest portion belonging to the reign of Henry VIII.; Althorp, the seat of the Spencers, of various dates; Drayton House, of the time of Henry VI.; the vast pile of Burghley House, founded by Lord Burghley, but more than once altered and enlarged; and Kirby Hall, built by Sir Christopher Hatton.

There are histories of Northamptonshire by Norden (written 1610, pub. 1720), Bridges (1762, 1791), Baker (vol. i. 1822, 2 parts of vol. ii. 1841), and Whellan (1849, 2d edition 1874). See also Sternberg, *The Dialect and Folklore of Northamptonshire* (1851); *Architectural Notices of the Churches in the Archdeaconry of Northampton* (1848-49); Hudson, *Brasses of Northamptonshire* (1853); and North, *Church Bells of Northamptonshire* (1878).

NORTHAMPTON, a municipal and parliamentary borough, and the county town of Northamptonshire, is situated on the slope and summit of an eminence rising above the river Nene, on the main line of the London and North-Western Company, on several branch railway lines, and on a branch canal connecting it with the Grand Junction Canal, 65 miles north-north-west from London. It is divided into four nearly equal parts by two main streets, each about a mile in length, running north and south and east and west, and crossing each other at right angles. In the centre of the town there is a very spacious market square, with a fine drinking fountain, erected in 1860 on the site of the old cross, destroyed by the fire of 1675 which levelled a great part of the town. The older houses are substantially built of stone, the newer ones of brick with stone facings. Formerly there were seven parish churches, but of these only four now remain, All Saints, St Giles's, St Peter's, and St Sepulchre's. All Saints was rebuilt after the fire of 1675, but retains its old Decorated Gothic embattled tower, which scarcely harmonizes with the style of the modern building, the principal feature of which is the fine Ionic portico. The



Plan of Northampton.

church of St Giles's was originally a cruciform structure of the beginning of the 12th century, but has been greatly changed, and, besides a fine Norman doorway, contains specimens of Early English, Decorated, and Perpendicular. St Peter's, near the ancient castle, is supposed to be of the same date with it, and its interior is a fine specimen of Norman architecture. St Sepulchre's, one of the four round churches still remaining in England, is supposed to have been built by the Knights Templars at the close of the 11th century. The Roman Catholic cathedral, in the Gothic style, was founded in 1844, and greatly enlarged in 1863. Among the educational establishments are a free grammar school (1552), a Government school of art (1871), and a blue-coat school, in addition to charity, church, and school-board schools. The charitable foundations comprise St John's Hospital, founded in the 12th century; St Thomas Hospital, founded 1450, in honour of Thomas Becket; the general

infirmary (1747), the general lunatic asylum (1837), the union workhouse (1837), and the Royal Victoria Dispensary (1844). Among the public buildings are the town-hall in the Gothic style (1864), the county-hall in the Grecian, the corn exchange buildings in the Italian, the county jail, the borough jail, the barracks, and the theatre. There is a fine public promenade, and a racecourse with an area of 117 acres. A new cattle market was opened in 1873. Northampton is unrivalled in England for the manufacture of boots and shoes. There are also currying works, breweries, maltings, iron-foundries, flour and paper mills, and brick and tile works. The population of the municipal borough (area 1342 acres) in 1801 was 7020, which in 1831 had increased to 15,357, in 1851 to 26,658, in 1871 to 41,168, and in 1881 to 51,881, of whom 25,249 were males and 26,632 females. The parliamentary borough was enlarged in 1868 to 2046 acres, and the population in 1871 was 45,080, which in 1881 had increased to 57,544.

There is a tradition that Northampton was founded by Belinus, a British king, while according to some it is of Roman origin. Neither of these suppositions is supported by any tangible evidence. In the *Saxon Chronicle* it is called Hamptune. From 917 to 921 it was in possession of the Danes, and in 1010 was nearly wholly destroyed by Sweyn. After the Norman Conquest it was defended by embattled walls, bastion towers, and a strong fortress. Northampton has been more than once the scene of a parliament. The priory of St Andrew, founded before the Norman Conquest, was rebuilt by Simon de St Liz, and was of very great extent. During the Civil War the town was fortified for the Parliament. The borough received its charter of incorporation from Henry II., which was subsequently extended by the 38 of George III., and this continued to be the governing charter until the passing of the Municipal Act of 1835, when the government was vested in a mayor, six aldermen, and eighteen councillors, the town being divided into three wards. Northampton has returned two members to parliament since the time of Edward I.

NORTHAMPTON, a city of the United States, the county seat of Hampshire county, Massachusetts, is situated on the west side of the Connecticut river, 17 miles by rail north of Springfield, and is connected with Hadley by a bridge 1230 feet long. The village of Northampton lies in rich alluvial meadow-land, about a mile from the bank of the river, and with its semi-rural streets and venerable trees has the reputation of being one of the prettiest villages in New England. Of note among its buildings are Smith College (1871; endowment, \$500,000) for the higher education of women, the free public library (18,000 volumes) and memorial hall, the Clarke institution for deaf-mutes (1867; endowment, \$300,000) on rising ground to the west, and the State lunatic asylum (1858; 460 patients). A tramway runs 3 miles to Florence, a manufacturing village producing sewing-machines, silk goods, paper, &c. The population of the township was 5278 in 1850, 6788 in 1860, 10,160 in 1870, and 12,172 in 1880.

Nonotuck, bought from the Indians in 1653, became the village of Northampton in 1654, and was incorporated as a city in 1883. Jonathan Edwards was pastor from 1727 to 1750, and David Brainerd died under his roof in 1747. Timothy Dwight, Arthur, Benjamin, and Lewis Tappan, and W. D. Whitney were born at Northampton.

NORTHAMPTON, HENRY HOWARD, EARL OF (c. 1539-1614), the second son of the earl of Surrey, the poet, born about 1539, was restored in blood by the first parliament of Elizabeth. He bore a high character for learning, but during the greater part of Elizabeth's reign he remained in obscurity, sharing the fortunes of his family. Towards the end of the century he attached himself first to Essex and afterwards to Cecil, and took part in the secret correspondence of the latter with James VI. of Scotland. When James became king of England, Lord Henry Howard at once sprang into favour. Though a Catholic in principle, he was ready to attend the Protestant service to please the king, and it is probable that he was one of the few who, in consideration of the services which they were able to render, were authorized by the authorities of that church to take this course. He was a good flatterer, and in 1603 he became a privy councillor. In 1604 he was made lord warden of the Cinque Ports and earl of Northampton. In 1608 he became lord privy seal, and in 1612 one of the commissioners of the treasury.

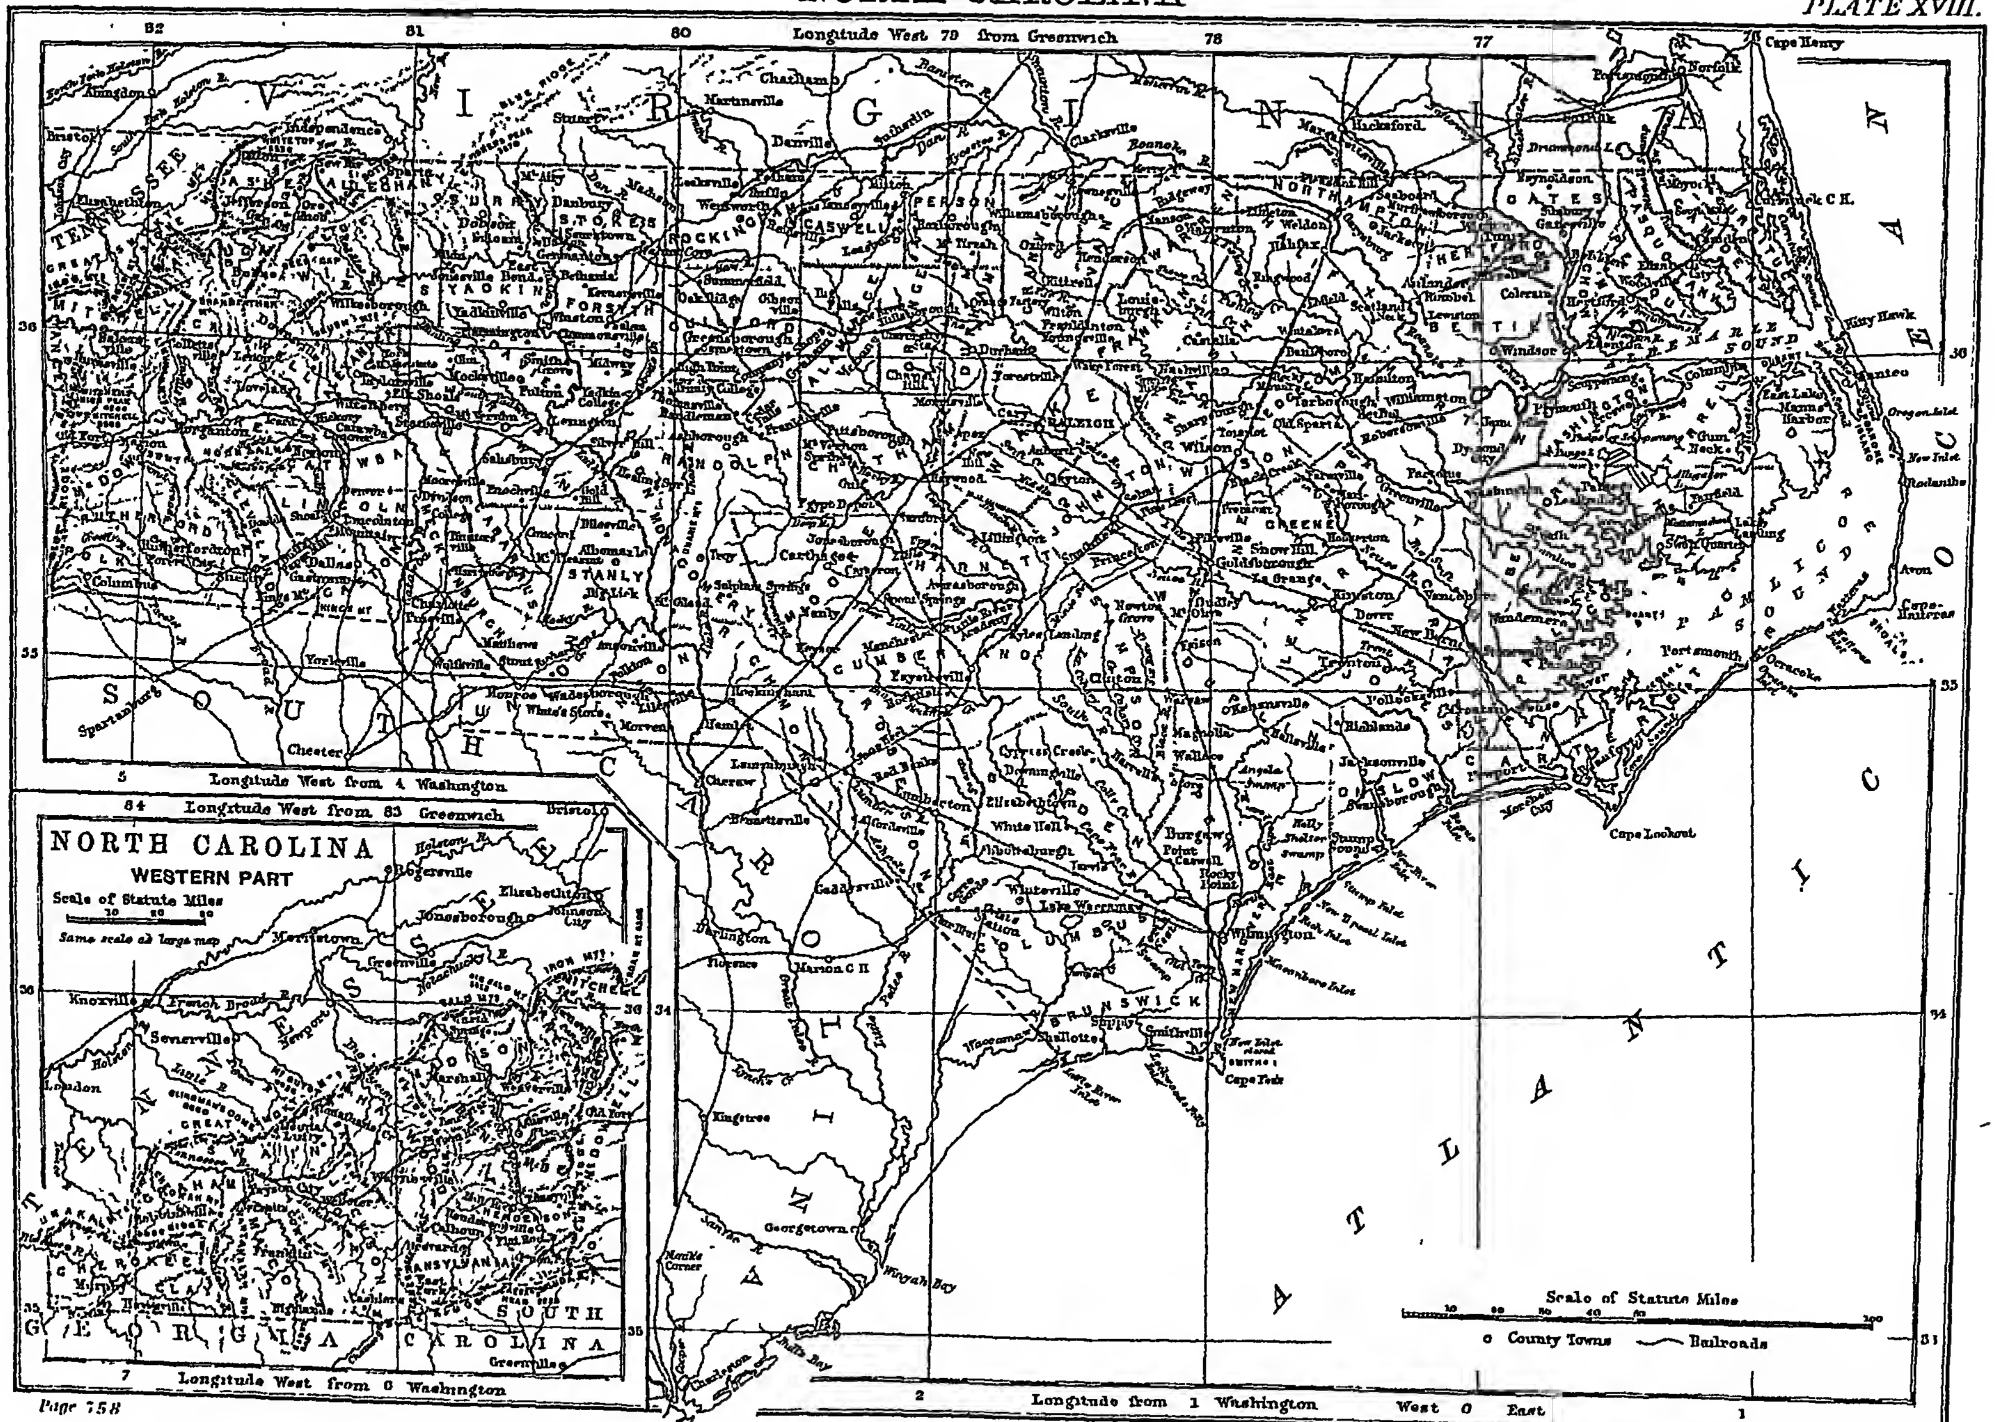
In politics he gave his support to the Spanish alliance and to the toleration of the Catholics, believing, as was said by a Catholic agent, that the restoration of the Catholic religion in England was the only bulwark against Puritan democracy. After the signature of the treaty with Spain in 1604 he accepted a pension from the king of Spain. After Salisbury's death in 1612 he won over Carr, who was then earl of Rochester, to his interests by countenancing the favourite's intimacy with his great-niece, Lady Essex, and by supporting the divorce which made a marriage possible between them. Rochester, who soon became earl of Somerset, placed himself completely at Northampton's service in supporting an alliance with Spain. Northampton died in 1614, before the detection of the murder of Overbury, which brought about the fall of Somerset, and ultimately the exclusion from office of the Howard family.

NORTHAMPTON, SPENCER COMPTON, EARL OF (1601-1643), born in 1601, was the son of the Lord Compton who obtained a large fortune by his wife, the daughter of Sir John Spencer, the rich lord mayor, and who was created earl of Northampton in 1618. The young Lord Compton accompanied Prince Charles to Spain in 1623. He succeeded to the earldom in 1630. Though he sometimes appeared at court ceremonies, he preferred a home life. In the Civil War he took the king's side, opposing Lord Brook in Warwickshire in 1642, and taking part in the battle of Edgehill. When Banbury was taken he was placed in command of the garrison, and was active on the Royalist side in Staffordshire and Northamptonshire, as well as in his own county of Warwick. On 19th March 1643 he was dismounted in the fight at Hopton Heath near Stafford. His life was offered to him, but he answered that "he scorned to take quarter from such base rogues and rebels as they were," and was immediately slain.

NORTH BIERLEY, an urban sanitary district in the West Riding of Yorkshire, England, about 2 miles south of Bradford, includes the villages of Bierley Lane, Wibsey, and Low Moor, and other smaller hamlets. There are extensive collieries in the district as well as blast and puddling furnaces and rolling-mills, the ironworks at Low Moor employing between 3000 and 4000 persons. The church of the Holy Trinity at Low Moor was erected in 1606 in the Early English style, but has undergone restoration. The manor of North Bierley originally belonged to the Swillingtons of Swillington, who were strong adherents of the house of Lancaster. The population of the urban sanitary district (area 4309 acres) in 1871 was 18,616, and in 1881 it was 26,935; that of the township of North Bierley (area 3342 acres) in the same years was 14,433 and 15,620.

NORTH CAROLINA, one of the original thirteen States Plate
that formed the American Union, is situated on the Atlantic XVIII.
seaboard between 33° 50′ and 36° 33′ N. lat. and between 75° 27′ and 84° 20′ W. long. It stretches 500 miles east and west across the entire breadth of the Atlantic slope of the Appalachians in a long narrow rudely triangular belt, its western extremity, less than 20 miles wide, resting on the highest plateau and summits of that continental system of mountains, while its eastern end spreads out to a breadth of 200 miles in a low, level, and gently undulating plain on the Atlantic coast, with a curving shore-line of more

NORTH CAROLINA



than 300 miles. Its area is 52,286 square miles, of which 3620 are covered by water.

Physical Features.—The western section is a rugged mountainous plateau; it forms a narrow, irregular, much indented trough, lying between the bifurcating chains of the western and dominant arm of the southern prolongation of the Appalachians,—the Smoky Mountains and the Blue Ridge,—the former being the western boundary of the State. The length of this plateau from north-east to south-west is more than 200 miles, its breadth 15 to 50 miles, and its area nearly 6000 square miles. The Smoky chain has a general elevation of from 5000 to 6000 feet, rising in many summits to 6500 feet and upwards, but is broken down by half a dozen deep water-gaps or cañons to the level of 2000 and even 1200 feet. The Blue Ridge, which constitutes the eastern boundary of the plateau, is a very sinuous and angular and straggling mountain chain, with a general elevation of from 3000 to 4000 feet and upwards, a few of its higher summits, about midway in the State, reaching nearly 6000 feet.

These two bounding chains are connected by many north and south cross-chains, of equal elevation with themselves, or greater, and separated by deep valleys. On one of these cross-chains, called the Black Mountains, is Mitchell's Peak, the highest point east of the Mississippi, its altitude being 6688 feet (400 feet above Mount Washington in New Hampshire). The cross-valleys or river-basins have an altitude of from 2000 to 3000 feet, with smaller benches and marginal plateaus of from 3500 to 4000 feet. Seen from the east or Atlantic side, the Blue Ridge appears as a steep, ragged, and broken escarpment, springing suddenly 2000 to 3000 feet above the Piedmont plateau at its base. This plateau has along its western margin an altitude of 1200 to 1500 feet above sea-level, and is mountainous, with high and precipitous spurs projected eastward and southward from the Blue Ridge. A few of these extend in irregular straggling ranges all across the breadth of the Piedmont section, which is 60 to 75 miles wide, and carries an elevation of 1000 feet to its eastern margin.

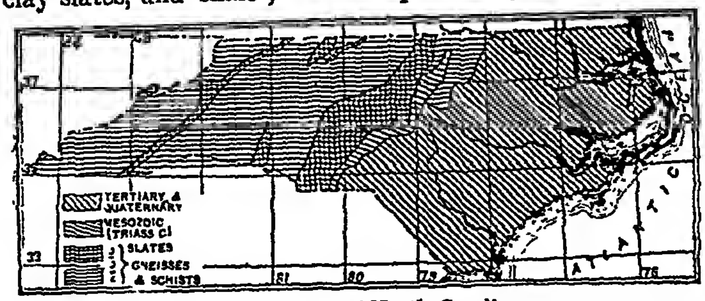
This middle region of the State is a country of hills and valleys and rolling uplands, its prominent topographical features being a succession of broad-backed swells with eastward or south-eastward trends, constituting the water-sheds between a number of large rivers, which take their rise in the Piedmont or on the flanks of the Blue Ridge, and reach the Atlantic through a system of wide valleys, 300 to 500 feet below the intervening divides. The area of this region is about 20,000 square miles; its altitude, descending gradually from 1000 to about 200 feet, averages about 650 feet. Eastward, to the sea, lies a great champaign, 100 to 120 miles wide, and 20,000 square miles in area. The surface is generally quite level, but in places undulating and hilly towards the western border, especially near the larger rivers. Towards the coast it is diversified by numerous and extensive sounds, bays, rivers, lakes, marshes, swamps, and islands, the whole surface for 50 miles inland from Hatteras and the eastern shore being less than 20 feet above sea-level. The sea is walled off from this low-lying territory by a long linear chain of sand-islands or dunes, ranging from 75 to 100 feet and upwards in height, and separated in half a score places by inlets which connect the sounds with the ocean.

Rivers and Drainage.—The features above described give the main outlines of the drainage system, the Blue Ridge being obviously the chief factor. The streams which rise east of that chain empty into the Atlantic, either directly through the territory of this State or by crossing also that of South Carolina; those which rise west of it seek the Mississippi and the Gulf of Mexico, partly by way of the Tennessee, many of whose chief affluents have cut their way in a north-westerly course across the mountain plateau and through the Smoky range, and partly by way of the Ohio, leaving the plateau in a north-easterly direction and reaching that river by the Kanawha through Virginia. Several of the most considerable rivers take their rise in the midland region. The numerous rivers of the eastern section, as they approach the sounds and the sea, broaden into bays of 2, 3, and 5 miles width, through which the movement of the tide is felt to a distance of 50 and 60 miles inland, and many of them are navigable for more than a hundred miles to the lower falls near the western border of the alluvial region.

Climate.—In climate North Carolina resembles France and Italy. The position of the eastern end on the Atlantic and its projection southward beyond the parallel of 34°, together with the near approach of the Gulf Stream, give this part of the State a sub-tropical climate, its isotherm (66°) being that of the southern half of the Gulf States and of Nicolosi in Sicily, while the great elevation and inland recession of the western section bring its climate to that of the cold temperate zone, the isotherm for the higher plateaus (51°) being that of New England and Upper Canada. The average annual mean temperature of the State is 59°; for the eastern region it is 61°, for the middle 58°, and for the mountainous region 52°. The summer temperature is, for the State 77°, and for the several regions respectively 79°, 77°, 70°; and the winter temperature, 43° for the State, and for the regions named 46°, 44°, 38°. During a recent winter of unusual severity the thermometer several times indicated 30° and 40° below zero in Michigan and New England, while in North Carolina 10° *above* zero was reached but once. The average of the minimum temperature for the State is 15°, for the middle region 13°, and for the west 8°; a record of 10° is rarely made east of the Blue Ridge, or of 0° west of it. The mean annual rainfall is nearly double that of England and France, the average for the State being 52 inches, and for the east, middle, and west respectively 60, 45, 58 inches. This precipitation is distributed nearly uniformly through the different seasons, with a slight preponderance in the amount of summer rain and a correspondingly less quantity in the autumn. Notwithstanding this large amount of rainfall, the tables of humidity show that the climate is as dry as that of France; and the cultivation of the vine, cotton, silk, &c., furnishes the strongest practical proof of the fact. The prevalent winds are westerly, south-west winds being more common in the east, north-west winds in the middle, and west winds in the mountain region. The rain-bearing winds are mostly from the west and south-west, but the winter rains often come from the north-east. Situated westward of the track of the Atlantic cyclones, and sheltered by high mountains and by distance from the western tornado, the State enjoys almost complete immunity from these destructive visitations. The climate is favourable to human health, except in limited malarial tracts in the lowlands on some of the rivers. The death-rate for this State is less than the average for the United States, and one of the two areas where consumption is unknown is found here.

Geology.—The geological structure of the State is very simple; the formations are arranged quite regularly in zones parallel to the Appalachian axis and the Atlantic coast, and belong almost entirely to two horizons, the Archæan (or Azoic) and the Tertiary. The rocks of the several subdivisions of the former, the Laurentian, Montalban, Huronian, &c., occupy the western and middle regions and succeed each other in broad terranes, consisting of granites, gneisses, and schists, separated by narrow belts of quartzites, limestones, sandstones, and slates. The dip of these rocks is almost uniformly eastward and generally at a

high angle. Across the middle of the State lies an extensive zone, 20 to 40 miles wide, of the Archæan slates, with a predominance of chlorite and felsite slates, schists, clay slates, and shales, with steep westerly dips. This is



Geological Map of North Carolina.

succeeded in the region of Raleigh by another terrane of gneisses and schists about 20 miles wide, inclined eastward at high angles and disappearing southward and eastward under the Tertiary formation, and giving place in turn, farther eastward, to an equal breadth of slates and felsites, (with occasional bosses of granite), which are only seen where they have been uncovered in the beds and bluffs of the larger rivers. The whole eastern region is mantled over with a thin covering of Tertiary rocks. These consist of sands, gravels, and clays, and of shingle beds and earths rudely stratified, towards the western border. The thickness of this formation ranges from a few feet to 25 and 50 feet, occasionally reaching 100 and 200 feet. Throughout the eastern and larger part of the division, in the ravines and in the beds and banks of the streams, are numerous outcrops of Middle Tertiary marls, Lower Tertiary shell-limestones, and coarse chalk beds. And in the southern half of this section, in the river beds and near the water-line of their banks, the Cretaceous formation appears in beds of half-compacted greensand, occasionally filled with shells. Overlying the Tertiary are sporadic patches of Quaternary clays, gravels, and shingle beds, the latter chiefly near the great channel ways of the rivers, where they sometimes reach a thickness of 30 and 50 feet. The Mesozoic formation is represented by two long narrow trough-like terranes of Triassic sandstones, conglomerates, clay slates, and shales, with bituminous coal. One of these, 5 to 6 miles wide with a south-easterly dip of 10° to 20°, enters the State from South Carolina a few miles west of the Pedee river and, passing within 10 miles (west) of Raleigh, disappears within 15 miles of the Virginia line; the other, about 40 miles long and 2 to 4 miles wide, lies along the valley of the Dan river, nearly east and west in direction and near the Virginia line. These beds have a north-westerly dip of 30° to 70°. The rocks of these two belts have a thickness of several thousand feet and are evidently the remnant fringes of a broad, flat anticlinal which has suffered extensive erosion. These two outcrops converge in the direction of the Richmond coal-beds, and were no doubt once continuous with them and with the Mesozoic of New Jersey and Connecticut. The former of these belts carries a 6-foot seam of bituminous, the other a 3-foot seam of semi-bituminous coal. Both are of good quality, but have been little worked. The Palæozoic rocks are entirely wanting, and the Primordial cross the State line from Tennessee only in a few places along the Smoky Mountains.

Minerals.—In consequence of the wide distribution of the older rocks there is a notable abundance and variety of minerals. More than 180 species have been discovered, some of great rarity; and one of them has recently yielded to science two new metallic chemical elements. Nearly a score different species of gems have been found, including the diamond, ruby, sapphire, emerald, beryl, lazulite, amethyst, garnet, agate, and zircon. There occur also many minerals having special applications in the useful arts, viz., mica, corundum, asbestos, baryte, chromic iron, garnet, zircon, kaolin, black oxide of manganese, talc, pyrophyllite, &c. Mica is found in large veins or dykes in all the terranes of Montalban gneisses, but the most extensive and valuable mines are found in the mountain region, where workable veins are numerous and extensive and the sheets of mica of unusual size and excellence. Corundum is about as widely distributed as mica, and occurs in the same series of rocks, as well as in some of the slate belts. The chief sources of supply of both corundum and mica for the arts, in the United States and in Europe, are the deposits of the mountains of this State. In this region are also numerous beds of white and variously-coloured marbles. Building stones of every variety are found in nearly all the sections, and whetstone, millstone, and grindstone grits, as well as potter's clay and fire-clay; and in the seaboard section are immense beds of peat. Iron, copper, and gold ores are coextensive with the outcrops of the metamorphic rocks. Several parallel ranges of magnetic and hæmatite iron-ore beds cross the State in a north-east direction, in both the middle and the mountain regions. These ores are of a high grade and are in great demand at the Bessemer furnaces in Pennsylvania and elsewhere. Beds of limonite are numerous and extensive in all parts of the State. Blackband ore is associated with the coal, and spathic ore occurs as the gangue of several copper and gold mines in the middle region. Iron for domestic consumption has been manufactured for a hundred years in the middle region and half as long in the other sections. Gold occurs in both placers and veins from Halifax county on the upper margin of the eastern champaign, within 110 miles of the sea-coast, through all the intermediate sections to Cherokee county in the extreme south-west. The more extensive and productive deposits are found in the midland region in the southern half of the great slate belt, and in the central part of the Piedmont region among the foot hills and spurs of the mountains. These placers consist of coarse shingle in the beds of the streams and the bordering level bottoms; climbing the slopes and benches of the hills adjacent, they pass insensibly from half-stratified shingle, gravel, and sand beds into unstratified earths with mingled fragments of stone. These deposits cover several hundred square miles of territory, and are of Quaternary or more recent age. Compared with those of California, they are of very slight thickness, generally not above 5 or 10 to 20 feet, and only occasionally reaching 40 and 50 feet. The most important and valuable vein mines are also found in the midland region. One of these, the Gold Hill mine near Salisbury, has been wrought to a depth of 750 feet, and its total produce exceeds two million dollars of bullion. In the same section are several noted silver mines,—Silver Hill, Silver Valley, and others. Many of the gold veins of the midland region carry also copper ores, and there are numerous copper veins in various parts of the middle and western regions. The more common ore is chalcopyrite, but there are also important lodes of grey copper.

Soils.—The soils of the eastern region are transported sands, gravels, and clays, of Tertiary and Quaternary origin, the assorted detritus of the abraded hills of the metamorphic rocks in the midland country to the westward. The upland soils of the region (the common characteristic cotton soils) are generally sands and loams of moderate fertility, with here and there considerable areas in long narrow ridges or oval patches called pine barrens, that are very sandy and sterile. Between these, on the benches and lower levels, stretch wide and fertile alluvial tracts, especially along the borders of the streams and the shores of the sounds and bays. On the flattish swells between the lower reaches of the great bay-like rivers and around the margins of the lakes, as well as along the borders of many of the creeks, are extensive tracts of swampy lands with a black peaty soil of great depth and inexhaustible fertility. These soils resemble those of the prairies of the north-western States, but contain a larger percentage of organic matter, and are more produc-

tive and more durable, producing 50 to 60 bushels of corn (maize) to the acre for a hundred years in succession without rotation and without manure. In the middle and western regions of the State the soils are of every variety of texture and composition and of every grade of fertility. They may be generally described as clayey, sandy, and gravelly loams; but there is a considerable proportion of clay soils, not only in the alluvions of the numerous creek and river bottoms, which are commonly of this description, but on the uplands as well; these are the more productive and durable. There are no prairie lands in the State, and the highest and ruggedest mountains are covered with soil and forests to their summits.

Forests.—The whole area of the State was originally forest-covered, and about two-thirds of it is still in the primitive condition, except that the woods are much denser in consequence of the cessation of the annual burnings by which the Indians kept down the brush and preserved them in an open park-like condition. The great variety of soils, together with the wide range of climate, gives rise to a remarkably rich and varied flora. While the higher mountains of the western section are covered with forests of spruces and firs and other trees common to Canada and the lake States, the seaboard section borrows from the Gulf States their live oak and long-leaf pine, their magnolias and palmettos. Of twenty-two species of oak found in the United States east of the Rocky Mountains, nineteen occur here; of eight pines, all are found in one section or another; of five maples, all; of nine hickories, six; of seven magnolias, all; of five birches, three; and so on. And nearly every one of the twenty kinds of timber used in New York ship-yards is found here. There are three well-marked and broadly-distinguished forest regions in the State, corresponding to the three geographical divisions. Pines, chiefly the species *australis* and *tæda*, constitute the characteristic feature of the eastern forests, giving place in the lower swampy tracts, especially in the seaboard section, to the cypress and juniper. Oaks predominate in the middle and western regions, but the mountain forests contain oak, chestnut, hemlock, and white pine. The oaks, however, are also found in some of their species as a subordinate constituent of the forests throughout the eastern region, and several species of pine (chiefly *P. mitis*) are frequently mingled with the oaks to the western extremity of the State. The chestnut (*Castanea vesca*) is very abundant, and, reaching a diameter of 8 to 10 feet and a height of 80 and 100 feet, often constitutes extensive forests throughout the mountains. The poplar (*Liriodendron tulipifera*) is found in all the sections, but is most abundant in the western, where it equals the chestnut in dimensions. Hickories are distributed throughout the State wherever the soil is above average quality. This timber exceeds all the others in weight and strength. The total number of species of trees found in the State is 112, and there are just twice as many of shrubs, many of them 20 feet and upwards in height, which together give these forests everywhere an aspect of wonderful richness and variety, "comparing favourably with almost any portion of the tropics."[1] Among the trees are many valuable and popular cabinet woods, such as the walnut, holly, cherry, ash, cedar, birds-eye-maple, sycamore, &c. These forests are rapidly increasing in value as those of the northern States disappear and as the demand for timber increases.

Population.—In 1790, at the first United States census, the population was 390,000. In 1860, the year before the beginning of the Civil War, it had risen to 992,622, of whom 361,522 were coloured. In 1870 it was 1,071,361, an increase during this decade of less than 8 per cent. In 1880 it was 1,399,750 (531,277 coloured, and 1230 Indians). The foreign-born population numbered but 3742. The increase during the ten years 1870-80 was 30·6 per cent.; the number of persons to the square mile was 29. The people of this State are among the most rural in the United States. The largest city does not contain 20,000 people, and only four exceed 4000, viz., Wilmington, 17,350; Raleigh, 9265; Charlotte, 7094; New Berne, 6443.

Industries.—Agricultural pursuits engage three-fourths of the inhabitants, cotton and rice being staple products of the east, and hay, live stock, buckwheat, and other north-temperate zone products, of the mountain region; in one section or another may be found every agricultural product grown between the great lakes and the Gulf, except the orange. Indian corn occupies the largest acreage, and this and the other cereals are common to all sections. Cotton is raised in two-thirds of the counties. It is the chief market crop of the eastern and of the southern half of the middle region. The limit of cotton culture has extended northward 20 to 50 miles in the last fifteen years, and the produce has increased nearly threefold. In the northern half of the middle and Piedmont districts tobacco replaces cotton as the market crop. Within ten years its culture has extended into a large portion of the mountain region. The northern tier of counties, next to the Virginia border, is known as the Bright Tobacco Belt,—the larger part of the yellow or gold-leaf tobacco of commerce being produced in this narrow zone. This crop has also largely increased in the last ten years. The cultivation of the vine is also increasing in all sections of the State. According to Humboldt's thermal criteria the whole State lies within the zone most favourable to this industry. His conclusions are confirmed by experience in every part of the State, and by the fact that several of the most popular grapes have originated here, such as the Catawba, Isabella, and Scuppernong.

The following table gives the principal crops and their relative amounts at the two last enumerations:—

	1870.	1880.	
Indian corn	18,454,215	28,019,839	bushels.
Wheat	2,859,879	3,397,393	"
Oats	3,220,105	3,838,068	"
Rye	352,006	285,160	"
Potatoes, Irish	738,803	722,773	"
" sweet	3,071,840	4,576,148	"
Rice	2,059,281	5,609,191	pounds
Tobacco	11,150,087	26,986,213	"
Cotton	144,935	389,598	bales.

The total number of farms in 1880 was 157,609; the average size 142 acres.

Mining and other Industries.—These, although of very subordinate interest, have long given occupation to a small portion of the population. Gold was first discovered in 1819, and between that date and 1850 hundreds of gold and copper mines were opened in the middle and western sections, and many thousands of the population were occupied in these industries. The total product of the gold mines between those dates is estimated at about $10,000,000. In the last few years mining industries have received a new impulse. Iron ores are mined on a considerable scale for export, many new gold and copper mines have been opened, and the amount of the output of the various mining industries is increasing very notably. Mica mining began fifteen years ago in the mountain region, and has grown to considerable importance, much the larger part of this material found in commerce being produced here. The annual yield is about 40,000 ℔, and is continually increasing.

The fisheries of the eastern rivers and sounds are large and profitable, and give employment to several thousand people. And in this region the getting of lumber, both in the pine forests and in the cypress and juniper swamps, has been an important source of profit since its first settlement.

The manufactures of North Carolina occupy a very subordinate place, and are mainly domestic and auxiliary to the one dominant agricultural interest. The value of the total annual output, as given by the census of 1880, is $20,095,037. Of this sum $2,554,482 is derived from the manufacture of cotton goods, $2,215,154 from that of tobacco, $1,758,488 from turpentine and tar.

Railroads and Waterways.—In ten years the number of miles of railroad has been nearly doubled and is now within a few score miles of 2000. There are 1000 miles of waterways open to steamboat navigation, including rivers, bays, sounds, and canals, forming a nexus of lines of communication extending over the whole eastern and seaboard region and connecting with the various ports along the coast from Wilmington to Norfolk in Virginia.

Government, Taxes, Education.—The executive power is vested in a governor, lieutenant-governor, secretary of state, auditor, treasurer, superintendent of public instruction, and attorney-general, who are elected by ballot and hold office four years. The legislative power is vested in a general assembly, which consists of a senate of 50 members and a house of representatives of 120 members, who are elected for two years and hold biennial sessions. The judicial power is vested in a supreme court, superior courts, and courts of justices of the peace. The supreme court consists of a chief justice and two associate justices. The State is divided into nine judicial districts, and there is one superior court judge to each. The judges of the supreme and superior courts are elected by popular vote for a term of eight years. The justices of the peace, who administer the law in the counties, are appointed by the legislature. A capitation tax, which may not exceed $2, is levied for the support of a system of education. Other State taxes are levied *ad valorem*, and amount at present to 25 cents on each $100 worth of property, and this on a very low valuation. The public debt is $5,706,616. The total assessed valuation of property is $156,100,202; the real value is about $300,000,000. A system of public schools is established by law and supported by funds derived from State taxes, and increased by county and municipal levies. The schools are required to be kept open four months in the year. The receipts of the school fund for 1880 were $553,464.

History.—The coast of North Carolina was the scene of the first effort of the English to colonize America. In the years 1585 to 1587 Sir Walter Raleigh despatched hither five fleets in succession, and planted three small colonies, which disappeared one after the other and left no trace. In consequence of these failures, due in large measure to the peculiar conformation of this difficult coast and the want of good harbourage, the next expedition, twenty years later, was directed to strike the coast farther north, about the mouth of the James river, where the first permanent settlement was effected; and no further attempt at direct colonization from Europe was made for three quarters of a century. Thus, instead of being the first of the American colonies in point of time, the colony of

1 See Dr Cooper, in "Forests and Forest Trees of North America," *Smithsonian Report*, 1858.

Carolina came very near being the last. The southern boundary of the colony of Virginia was the parallel of 36° 30′ N. lat., although the whole continent was still called by that name, and all the country south of this limit to the Gulf was granted by Charles II. in 1663 and 1665 to a company of English noblemen styled the lords proprietors, with full powers of colonization and government. In this territory, called Carolina in compliment to the royal grantor, the colony of Carolina was planted by them under a new form of colonial government called the proprietary government, consisting of a governor appointed by themselves, a legislative assembly elected by the freeholders, and a council of twelve, six appointed by the governor and six by the assembly. Colonists were eagerly solicited for the new "plantations" by liberal grants of lands, and by a guarantee of full religious liberty and of exemption from taxation except with the consent of the legislature. These favourable terms were so much in contrast with the state of things in some of the other colonies, especially in Virginia, where tithes were rigorously exacted for the support of the Established Church, dissent punished as a crime, and laws enacted which allowed only the alternatives of conformity or enforced exile, that the new colony soon received a large accession of Quakers and other Dissenters. In 1669 the first legislative assembly met, and a new and remarkably liberal government was successfully organized. The next year an attempt was made to introduce a new system of government and form of social order called the Fundamental Constitutions, drawn up by the celebrated philosopher John Locke at the request of the lords proprietors; but this and several subsequent attempts were so stoutly resisted by the colonists that the absurd and tyrannous scheme was formally abandoned in 1693. And so strong was the spirit of liberty that one of the lords proprietors who had been sent over as governor was deposed and exiled for extortion, and another governor with his council was imprisoned for misgovernment and infringement of the guaranteed rights of the colony, a new governor and legislature elected, and the government carried on for two years by the colonists themselves. In 1729 the proprietary was replaced by the royal authority, the form of government remaining unchanged. At this date also the territory of Carolina was formally divided into the two colonies of North and South Carolina. The population at this time, estimated at 13,000, was mostly limited to the seaboard region, within 50 miles of the coast. Ten years later a great tide of emigration set in upon the interior and midland country, both from the older settlements to the north, especially from Virginia and Pennsylvania, and from the British Islands and the continent of Europe; so that in less than forty years the population wanted little of 300,000, and at the beginning of the revolution of 1776 a continuous chain of settlements extended from the sea-coast to the mountains. The new-comers were generally of the best class of immigrants, Scotch, Scotch-Irish, English, Swiss, Germans, and Dutch. They were Presbyterians, Moravians, Lutherans, Huguenots, and Quakers. Devoted to liberty and impatient of tyranny and of privilege, these people were attracted to the colony not alone or chiefly by the fame of its broad and fertile "mesopotamias" and its salubrious climate, but above all else by the liberal and popular form of its government, especially by its freedom of religion. When attempts were made, as they frequently were, in violation of guaranteed rights, to establish the English Church and collect church rates, they were everywhere met with stubborn and not always passive resistance. The execution of the famous Stamp Act in 1766 was forcibly resisted, and the royal vessel bringing the obnoxious papers was not even allowed to enter port. Extortion practised by the officers of the crown in some of the interior counties led to repeated remonstrances and appeals for redress to the governor and afterwards to parliament, and finally ended in 1771 in insurrection and open war. The controversy culminated in the battle of Alamance, in which the recusants were defeated by Governor Tryon. And thus, in one way and another, a spirit of suspicion or resentment, of irritation or open hostility, was constantly kept alive in the colony. This spirit found expression in the famous Mecklenburg resolutions adopted by the Scotch-Irish settlers about Charlotte in May 1775, in which "all laws and commissions by authority of king and parliament" are declared to be annulled and vacated, and a new government was organized for the county recognizing only the authority of the provincial congress. Thus North Carolina was fully ripe for measures of open and combined resistance when movements were begun towards a union of the colonies for this purpose, and was the first of all the colonies to instruct its delegates to the continental congress to vote for formal independence of the British crown. Early in 1776 the militia of the colony met and defeated on the lower Cape Fear river a body of 1500 British troops under skilful officers, directed by the royal governor and supported by a British fleet of thirty sail off the port of Wilmington. The colony furnished its full quota of troops to the continental armies north and south, and lost most heavily in the fall of Charleston. But beyond this, situated far from the seat of war and weakened by the pressure of several recent settlements of adherents of the British crown, the colony did not bear a conspicuous part in the revolution until in the later campaigns, during the closing years of the war, its territory became the theatre of the conflict. The defeat and capture of an important detachment of Cornwallis's army under Ferguson at King's Mountain in 1780 by a sudden gathering of untrained backwoodsmen and hunters, chiefly from the mountain settlements, checked the victorious march of the British; and a similar volunteer gathering of her yeomanry from all the surrounding region at the battle of Guilford Court House in 1781 contributed largely to give the victory of Cornwallis the character of a defeat, and forced his speedy retreat to the coast and ultimately to Yorktown for the final catastrophe.

On the formation of the Federal Union, North Carolina, having had abundant and long experience of usurpation and misgovernment, did not make haste to enter the new compact, but moved with slow and cautious steps, and was one of the last of the colonies to adopt the constitution. At the breaking out of the war between the States in 1861, North Carolina, strongly averse to secession, sought by every means to avert the conflict, remaining unmoved after all the surrounding States had seceded, and was forced into the struggle last of all the Southern States, and when there remained only the alternative of a choice of sides. Being near the seat of war and yet for the most part outside of it, the State contributed more largely to the commissary supplies of the Confederacy, and also sent into the field a larger number of troops and lost more men in battle than any other State, her soldiers having a conspicuous share in all the great battles from Bull Run to Petersburg. Since the close of the war, which left her utterly bankrupt, North Carolina has entered on a career of prosperity unexampled in her previous history. Population has increased far more rapidly than at any previous period, the number of miles of railroad has been doubled, the area of land under cultivation enlarged, agriculture improved in its methods and results, and industries diversified to an extent and with a rapidity never known before. (W. C. K.)

NORTHCOTE, JAMES (1746-1831), historical and portrait painter, was born at Plymouth on the 22d October 1746. Though he early showed an inclination for art, his father, a poor watchmaker of the town, insisted that he should be bound with himself for an apprenticeship of seven years. During his spare hours the boy was diligent with brush and pencil, and on the expiry of the term, in 1769, he started as a portrait painter. Four years later he went to London, and was admitted as a pupil into the studio and house of Reynolds, who had been the object of his warmest admiration from early boyhood. At the same time he studied from the round and the life in the Academy schools, making, it would seem, rather slow progress in the technical processes of art. In 1775 he left Reynolds, and about two years later, having acquired the requisite funds by portrait-painting in Devonshire, he set out for Italy. There he remained for three years, studying the portraits of Titian, looking, as he tells us, twice at Michelangelo for every time he looked at Raphael, and forming the resolution that in the future he would paint portraits for bread and historical subjects for fame. On his return to England he revisited his native county, and then settled in London, where Opie and Fuseli were his rivals. He was elected associate of the Academy in 1786, and full academician in the following spring. The Young Princes murdered in the Tower, his first important historical work, dates from 1786, and it was followed by the Burial of the Princes in the Tower, both paintings, along with seven others, being executed for the Shakespeare gallery of Alderman Boydell. The Death of Wat Tyler, now in the Guildhall, was exhibited in 1787; and shortly afterwards Northcote began a set of ten subjects, entitled the Modest Girl and the Wanton, which were completed and engraved in 1796. They were suggested by the Pamela of Richardson and the Idle and Industrious Apprentices of Hogarth,—a painter for whom Northcote professed little admiration. The series was popular at the time, but neither in truth of dramatic conception nor in technical qualities does it approach the parallel works of the older master. Among the productions of Northcote's later years are the Entombment and the Agony in the Garden, besides many portraits, and several animal subjects, like the Leopards, the Dog and Heron, and the Lion, which were more successful than the artist's efforts

in the higher departments of art, as was indicated by Fuseli's caustic remark on examining the Angel opposing Balaam—"Northcote, you are an angel at an ass, bnt an ass at an angel." The works of the artist number about two thousand. By unwearied diligence, combined with extreme frugality, he was enabled to accumulate, before his death on 13th July 1831, a fortune of £40,000.

His works possess a certain dignity, and they tell their story clearly; but they are marred by defective drawing and dull colouring, and by the gross anachronisms and inconsistencies in costume common to the historical painters of the period. Northcote was emulous of fame as an author, and his first essays in literature were contributions to *The Artist*, edited by Mr Prince Hoare. In 1813 he embodied his recollections of his old master in a *Life of Reynolds*. His *Fables*—the first series published in 1828, the second posthumously in 1833—were illustrated with woodcuts by Harvey from Northcote's own designs. In the production of his *Life of Titian*, his last work, which appeared in 1830, he was assisted by William Hazlitt, who previously, in 1826, had given to the public in the *New Monthly Magazine* his recollections of Northcote's pungent and cynical "conversations," the bitter personalities of which caused much trouble to the painter and his friends.

NORTHFLEET, a village and urban sanitary district in the county of Kent, forming part of the parliamentary borough of Gravesend, is situated on the Thames and the North Kent Railway, 20 miles east of London and 2 west of Gravesend. The church of St Botolph, chiefly in the Later Decorated style, dates from the middle of the 13th century; bnt the nave is of later date, and the old tower, having fallen down, was rebuilt in 1628. The church contains a brass of the 14th century and other interesting monuments. The nave and chancel have undergone modern restoration. Huggens College, with residences for forty decayed gentry, was established in 1847. A factory club for the use of those engaged in the chemical works was opened in 1878. Besides chemical manufactures there are chalk, lime, cement, and brick works, and a large shipbuilding yard. Rosherville pleasure-gardens are in the neighbourhood. The population of the nrban sanitary district (3934 acres) in 1871 was 6515 and in 1881 it was 8790.

NORTH SEA. The North Sea or German Ocean lies between Great Britain and the continent of Europe. It communicates with the North Atlantic by the Straits of Dover in the south, and by the Pentland Firth and the various openings between the Orkney and Shetland Islands in the north. Between the Shetlands and Norway it passes by a wide opening into the sub-polar basin, now generally known as the NORWEGIAN SEA (*q.v.*), of which indeed it may be regarded as a southern extension. It has communication with the Baltic by the Skagerrack and the Cattegat. The shores of the North Sea have from the earliest times been inhabited by brave and hardy races of men famous for their maritime exploits; and at the present day it is surrounded by many of the most prosperous and enterprising commercial nations, and is, in consequence, one of the most important highways of the world. Its fisheries give employment to thousands of persons, and are the most valuable that exist. Lighthouses are situated on nearly every available point where they are required, and there are numerous light-ships along the coasts.

The North Sea lies between the parallels of 51° and 61° N. lat. and 2° 30′ W. and 8° E. long., its greatest length being abont 600 miles, its breadth (from St Abb's Head to the shores of Denmark) 360 miles, and its area abont 140,000 square miles. It may be said to be without islands if we except the Orkneys, the Shetlands, and those islands which are situated along the coasts. Its coasts present considerable variety in appearance and geological formation. Scandinavia, composed of ancient rocks, is elevated, deeply indented by fjords, and skirted with numerous islands. The coasts of Britain are bold and rocky in the north, while towards the south they present a succession of low rocky or chalky cliffs and sandy beaches. Denmark, Germany, Holland, and Belgium have low shores, composed of recent formations, and deeply indented. Many parts of Holland and Belgium are indeed below the level of the sea, and are protected from inundation by artificial dykes and extensive natural sand dunes. The sea has repeatedly broken through these artificial and natural barriers and submerged large tracts of country. The Dollart Zee and the Zuyder Zee were formed in this way in 1277 and 1282. Some of the most important rivers of Europe enter the North Sea, as the Elbe, Weser, Ems, Rhine, Scheldt, Thames, Humber, Tyne, Tweed, Forth, and Tay. If we inclnde the Baltic, which enters into it, we may regard the North Sea as receiving the drainage of about one-fourth of the European continent.

Its greatest depth is in a deep gully following closely the trend of the southern portion of the Scandinavian peninsula, where soundings of 160, 200, 300, and 400 fathoms are common. It has been suggested that this deep gully, which extends into the Skagerrack, may have been the bed of a river at a time when the continent of Europe stood at a higher level, and that the Elbe and some of the other rivers now entering the Baltic and North Sea may have united and flowed into the Norwegian basin of the Atlantic throngh this depression. With the exception of this gully the depth of the North Sea is less than 100 fathoms. It is to be noticed, however, that the bottom of the whole basin is very irregular. The southern half is the shallower, and, generally speaking, the depths in this portion are greater on the eastern and western sides than in the centre, where the Dogger Bank is situated. On this bank the depth is from 8 to 16 fathoms, whereas in the "Silver Pit" immediately to the south there is a depth of 45 fathoms. Similar irregularities are met with in varions other parts of this sea-bed, and are called by the fishermen "pits" and "banks," with various distinguishing names. In the northern half the depth gradually increases towards the north, until a depth of 2000 fathoms is reached in the Norwegian Sea. It is probable that these irregularities met with in the bottom of the North Sea are chiefly dne to the moraines and detrital matter left by the great glacier which filled it during the Glacial period. There are besides a great number of shoals and sandbanks lying along the coasts of Holland, Belgium, France, and Britain, which assume the form of ridges running in a direction nearly parallel to the shores, and consist of sand and detrital matter brought down by rivers and arranged apparently by tide streams. The deposits vary considerably in their composition. In the shallow parts a sand predominates, composed of fragments of quartz, felspars, micas, hornblende, augite, magnetite, and calcareous fragments consisting of triturated pieces of mollusc shells, Echinoderms, Polyzoa, Alcyonarian spicules, calcareous Algæ, and many Foraminifera. In the deeper water we generally find a mud or clay composed of the above-mentioned mineral and organic fragments, with the addition of fine argillaceous matter, very minute mineral particles, and Diatom frustules. In some places we have stones and gravel, and indeed stones may be met with in all the varieties of deposit.

Fogs, mists, and rain occur at all seasons. The winds are variable, the moisture-laden winds from the south-west being the most prevalent, and storms are freqnent. The currents depend chiefly upon the direction of the winds, and the navigation is most difficult. The great tidal wave from the Atlantic on reaching the British Islands breaks into two portions, one passing through the Straits of Dover and the other round the north of Scotland into the North Sea. These two portions meeting produce nodal lines, where they partially neutralize each other, for instance in

the Straits of Dover, and less distinctly in lines stretching from the Wash and Moray Firth to the north of Denmark. The North Sea lies between the January isotherms of 31° and 40°, and the July isotherms of 55° and 65° Fahr., so that the difference between the mean winter and summer temperature is about 24°. The temperature of the surface water ranges in January between 39° and 45° Fahr., and in July between 53° and 63°. Hence the contrast between the temperature of the water and that of the air is greater in winter than in summer, and indeed except during the warmest months the air is colder than the water. In the southern part of the North Sea, south of the Dogger Bank, where the sea is comparatively shallow, there is in summer only a difference of a degree or so between the surface and the bottom water, the bottom water being a little the colder. The difference is greatest in the hollows like the "Silver Pit," where the depth reaches 45 fathoms. The temperature along the British coast appears to be in summer about 3° colder both at the surface and at the bottom than along the coast of Denmark. We have no very reliable information as to the temperature of the water at different depths during the winter months, but we know it takes a very long time before the cooling of the surface water affects the temperature at the depth of a few fathoms, therefore it is most probable that the water at the bottom in the southern part of the sea is much warmer than the surface or intermediate water, and this is likely to be the case especially in the "pits" where the depth is greatest. This is very probably the chief reason why such large catches of soles and other fish are made in these "pits" during very cold winters.

North of the Dogger Bank there is a very considerable difference of temperature between the surface and the bottom water in summer. Off Aberdeen there is a difference of 11°, the surface temperature in summer being 56° Fahr.

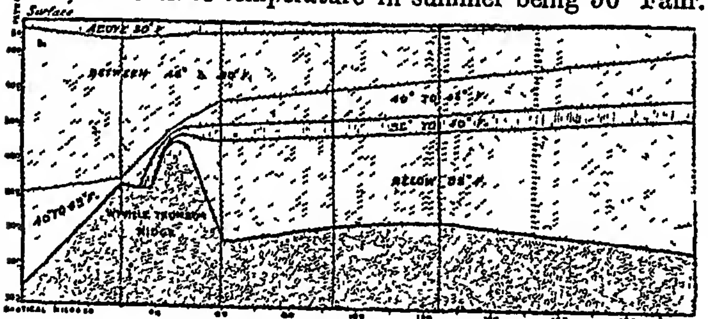


Fig. 1.—Distribution of temperature in the Faroe Channel.

and the bottom 45°, while in the Norwegian gully there is a difference of 17°. Farther north in the Norwegian Sea, at a depth of 300 or 400 fathoms, the water is below 32° Fahr. all the year round. The specific gravity ranges

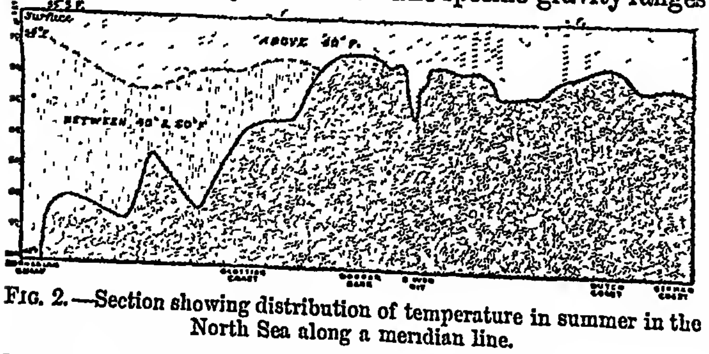

Fig. 2.—Section showing distribution of temperature in summer in the North Sea along a meridian line.

between 1·0249 and 1·0270, the saltest water being found at the bottom in the Norwegian gully. The lightest water is found in the Skagerrack where the Baltic water enters the North Sea, and in the southern half of the sea where the Continental rivers discharge their waters.

The North Sea has an abundant flora. Algæ in great abundance and variety grow on all the shores and in all the shallower waters, while a few species are found at depths of even 50 and 100 fathoms. The surface and subsurface waters swarm with Diatoms, Peridinias, Coccospheres, and other minute Algæ. It is a matter of observation that where there is a low specific gravity, indicating a mixture of fresh with salt water, there is usually a great abundance of Diatomaceæ in the surface waters. This is the case in bays and estuaries, and in the arctic and antarctic regions, where melting ice lowers the specific gravity. The North Sea has all the characteristic features of a great bay, and has a great abundance of plant life. Its surface or intermediate waters are at times quite discoloured by the enormous abundance of Diatoms or Peridinias which are met with in vast floating banks. The cause of the rapid and great development of these minute organisms at particular times and places appears to depend on physical conditions which are not at present understood. With such a vast food supply it is not surprising that a prolific fauna swarms in the North Sea. Everywhere on the bottom we find Foraminifera, Sponges, Cœlenterates, Echinoderms, Worms, Polyzoa, Tunicata, Molluscs, Crustacea, and Fishes. At all depths in the intermediate water we find Protozoa, Medusæ, Copepods, Amphipods, Schizopods, Sagitta, and various other pelagic animals, together with a great abundance of the larvæ of animals living on the bottom. The invertebrates living on the bottom and in the water at various depths, in their adult as well as in their larval stages, supply food for those fishes which are so much desired for the table. Most valuable food fish, as the cod, haddock, herring, sprat, holibut, sole, coal-fish, and many others, frequent the North Sea, and are captured in great numbers by the fishermen of all the nations occupying the seaboard. There are also important fisheries for crustaceans such as lobsters, crabs, prawns, and shrimps, and for molluscs such as oysters, mussels, whelks, and periwinkles. Whales and porpoises are numerous, and sea-birds are found in vast numbers on the islands along the shores. The annual value of the North Sea fisheries of various kinds is enormous. In a recent lecture the duke of Edinburgh estimated that the labours of British fishermen supplied annually "fish food amounting to about 615,000 tons weight, which at £12 per ton represents a money value of £7,380,000." By far the larger part of this comes from the North Sea. If we consider that these waters are also fished by Norwegians, Danes, Germans, Dutchmen, Belgians, and Frenchmen, we may form some idea of its fertility. It is very probable that the annual value of all the fisheries exceeds £25,000,000.

No systematic investigation of the North Sea has yet been undertaken, and in consequence our knowledge is in many respects very meagre. This is all the more astonishing when we remember the value of the fisheries and the enterprise of the nations engaging in them. The Admiralty employed a ship for several seasons to examine the currents and tides; the results are published in the North Sea pilot and admiralty tide tables. The German ship "Pommerania" was engaged during the year 1872 in examining the North Sea. See *Die Expedition zur physicalisch-chemischen und biologischen Untersuchung der Nordsee im Sommer* 1872 (Berlin, 1875). (J. MU.)

NORTHUMBERLAND, the northernmost county of Plate
England, is of a somewhat triangular form, roughly re- XIX.
sembling that of England itself. It lies between 54° 47′ and 55° 46′ N. lat. and 1° 25′ and 2° 41′ W. long., and is in its extremes about 70 miles long and 53 broad. Its area is 2016 square miles, ranking it fifth among English counties. Northumberland lies entirely on the easterly slope of the country. Its boundaries are the German Ocean, Scotland, and the counties of Cumberland and Durham. In physical aspect it is a tumbled incline of fells and ridges, intersected by valleys and subsiding eastwards from the hill-borders of Scotland and Cumberland into lessening undulations and a shelving coast. The Cheviot range (separating Northumberland from Scotland) is divided by

nature into two groups. What may be called the northern Cheviots are green hills of conical and high-arched forms, finely grouped, with the peat-capped Cheviot itself (2676 feet) at their centre, deep steep glens radiating into all parts of their mass, and generally more or less of hollow and enclosed ground separating them from the slopes at their base. The southern Cheviots (south-westwards from Thirlmoor) are the highest part of the county,—moory hills, lower and more confluent, and sometimes curiously equal-topped. On the Cumberland side of the county these watershed heights sink into a monotonous rolling tract, separated only by the river Irthing from the "wastes" of Bewcastle. They again swell up in the south-west towards Killhope Law (2208 feet) and the Pennine range. Few eminences break the general incline, which stretches in a far-spread billowy sea of confluent hills that for six months of the year mingle their browns, russets, and duns in a pattern of Oriental richness, and at all times communicate a fine sense of altitude and expanse. The Simonside Hills (1447 feet) form one not very conspicuous exception. The configuration of much of these uplands has a certain linearity in its details due to groups and ranges of ridges, crags, and terrace-like tiers, picturesquely termed "edges" (escarpments) by the country folk, and generally facing the interior, like broad ends of wedges. The line of pillared crags and prow-like headlands between the North and South Tynes along the verge of which the Romans carried their wall is a fine specimen. Passing eastwards from the uplands we exchange the moors for enclosed grounds, "drystone" walls for hedgerows, rare sprinklings of birch for a sufficiently varied wooding, and towards the south-east we approach the smoke of the coal-field and the roar of the Tyne.

The chief rivers and valleys are the Derwent, the Irthing, the Tyne (with its North and South branches, the Allendales, and Redesdale), the Wansbeck with its twin the Font, the Coquet, the Alne, the Till with its feeders the Breamish, Glen, and College, and the Tweed. The Tyne is the "coaly Tyne" only from Wylam downwards. For 19 miles (its tidal portion) it has been dredged into a small estuary,—"a river of coal, iron, and chemicals." The rivers and streams in general are greatly diversified with numbers of rocky gorges and rich "denes." The deepest glen-scenery is at the head of the Breamish and College burns; and the North Tyne gathers its waters from surrounding moorlands into a vale of surpassing beauty.

The coast is a succession of sands, flat tidal rocks, and low cliffs. Its bays are edged by blown sandhills; its borders are severely wind-swept. Several islands lie over against it. Holy Island, the classic Lindisfarne, 1051 acres in extent, but half "links" and sandbanks, is annexed to the mainland and accessible to conveyances every tide. The Farne Islands are a group of rocky islets farther south, —the scene of many saintly austerities, and of the nobler devotion of Grace Darling.

Geology.—The core of the county, in a geological aspect, is the northern Cheviots from Redesdale head nearly to the Tweed. Its oldest rocks are gritty and slaty beds of Silurian age, about the head of the rivers Rede and Coquet and near the Breamish south of Ingram,—a part of the great Silurian mass of the southern uplands of Scotland. Even before the times of the Old Red Sandstone these rocks had been crushed and folded, upraised into a continental land, and much wasted. The largest hollows in that ancient continent held the great lakes in which the "Old Red" was deposited. Volcanic activity near one of the lake-group (now to be known as Lake Cheviot) resulted in the felspathic porphyrites passing into the syenites and granites that form the mass of the northern Cheviots.

Round this core there now lie relays of Carboniferous strata dipping east and south, much faulted and repeated in places, but passing into Coal-measures and Magnesian Limestone in the south-eastern part of the county. The dawn of the Carboniferous ages saw the volcanic piles of the Cheviots becoming shapeless with waste. Then ensued a general settling down of the land, the gathering of a long series of deposits around its subsiding borders, the burying of Cheviot-land, and the gradual formation of the whole great succession of the Carboniferous system. The builders thereof were three. After every sufficient subsidence the limestone sea that covered Derbyshire sent incursions of marine life northwards; the waste of the land in the north then spread out in sheets of sand and silt; and over the mud-flats thus prepared came slow migrations of dense plant-growth. Limestones, sandstones, shales, and coals were the result; and the whole system now consists of—(1) the Carboniferous Limestone series in three divisions, first detected by the accurate eye of George Tate of Alnwick; (2) the Millstone Grit; and (3) the Coal-measures. Lowest in Northumberland lies Tate's Tuedian group, the first envelope of sinking Cheviot-land. Some reddish shore-like conglomerates lie in places at its base, as at Roddam Dene; its shales are often tinged with distemper greens; its coals are scarcely worthy of the name; its limestones are thin, except near Rothbury; and its marine fossils are few and incursive. The Tuedian group is overlaid by the Carbonaceous group; its shales are carbonaceous-grey, its coals, though mostly small, very numerous, its limestones often plant-limestones, and its calcareous matter much diffused. Upon this lies the Calcareous group; its lime occurs in well-individualized marine beds, cropping up to the surface in green-vested strips; its fossils are found in recurrent cycles, with the limestones and coals forming their extremes. These three groups now range round the northern Cheviots in curved belts broadening southwards, and occupy nearly all the rolling ground between the Tweed and the South Tyne, the sandstones forming the chief eminences. The middle division becomes thinner and more like the Coal-measures in passing northwards, and the upper division, thinning also, loses many of its limestones. The Millstone Grit is a characterless succession of grits and shales. The Coal-measures possess the same zone-like arrangement that prevails in the Limestone series, but are without limestones. They also are divided, very artificially, into three groups The lowest, from the Brockwell seam downwards, has some traces of Gannister beds, and its coal-seams are but thin. The famous Hutton collection of plants was made chiefly from the roof-shales of two seams,—the Bensham and the Low Main. The unique Atthey collection of fishes and Amphibia comes from the latter. The Coal-measures lie along the coast in a long triangle, of which the base, at the Tyne, is produced westwards on to the moors south of that river, where it is wedged against lower beds on the south by a fault. The strata within the triangle give signs of departing from the easterly dip that has brought them where they are, and along a line between its apex (near Amble) and an easterly point in its base (near Jarrow) they turn up north-eastwards, promising coal-crops under the sea.

The top of the Coal-measures is wanting. After a slight tilting of the strata and the denudation that removed it, the Permian rocks were deposited, consisting of Magnesian Limestone, a thin fish-bed below it, and yellow sands and some Red Sandstone (with plants of Coal-measure species) at the base. These rocks are now all but removed. They form Tynemouth rock, and lie notched-in against the 90-fathom dyke at Cullercoates, and again are touched (the base only) at Seaton Sluice. No higher strata have been preserved. The chief faults of the county extend *across* it. Its igneous rocks, other than the Cheviot porphyrites and a few contemporaneous traps in the lowest Carboniferous, are all intrusive. An irregular sheet of basalt forced between

planes of bedding (perhaps at the close of the Carboniferous period) forms the crag-making line of the Great Whinsill, which, with many shifts, breaks, and gaps, extends from Greenhead near Gilsland to the Kyloe Hills. Numbers of basalt dykes cross the county, and were probably connected with the plateau of Miocene volcanic rocks in the Hebrides. Everywhere the Glacial period has left rocks rounded and scored, and rock-fragments from far and near rubbed up into boulder-clay. The glaciers at first held with the valleys, but as the ice-inundation grew they spread out into one sheet,—the Cheviot tops, heavily ice-capped, alone rising above it. Two great currents met in confluence around these hills,—one from across the western watershed, the other skirting the coast from the north. Boulders from Galloway, Criffel, the English lake district, and other places adjacent, and from the Lammermuirs and Berwickshire, lie in their track. Of moraines there are only a few towards the hills. The "great submergence" has left no unequivocal signs of its presence. Glaciated shell-fragments have been detected at Tynemouth. Laminated brick clays occur among the boulder-clays. Sheets and mounds of gravel of the nature of kames exist here and there on the low grounds, and stretch in a chain over the low watershed between Haltwhistle and Gilsland, sparsely dotting also some more upland valleys. An upper boulder-clay, containing flints, skirts the coast.

The older valleys are all pre-Glacial, and may date from the Miocene period. They are much choked up with Glacial deposits, and lie so deep below the surface that, if they were cleared-out arms of the sea, one of them, 140 feet deep at Newcastle, would extend for miles inland. After the departure of the glaciers the streams here and there wandered into new positions, and hence arises a great variety of smooth slope and rocky gorge. In the open country atmospheric waste has hollowed out the shales at their outcrops, leaving the sandstones, &c., as protruding "edges," roughened here and there into crags. In the lower grounds, where this surface-dissection first began, the "edges" have much run together; on the heights, whose turn came last, they are often prominent and crest-like, but have glacier-rounded brows. Many old tarns are now sheeted over with peat. The sloping peat-fields are often the sites of straggling birch-woods, now buried.

Minerals, &c.—The main portion of the great northern coal-field that extends into Northumberland is an uneven triangle, with its base stretching 14 miles inland from the mouth of the Tyne, and its apex on the coast 24 miles northwards. There are eighteen or twenty seams of workable thickness, all of them of varieties known as bituminous or "caking" coal, amounting in the aggregate to nearly 60 feet in thickness. The familiar "Wallsend" was the product of a seam now worked out (the High Main), and its name has sunk into a trade term. The Low Main or Hutton seam ranks first in thickness and value; it runs nearly through the whole length of the northern coal-field, and yields at one point or another the best description of three varieties of coal, viz., household, gas, and steam coals,—in Northumberland chiefly steam coal. The seams below it, including five seams averaging about a yard in thickness, are still unworked at Newcastle. The best coking coals are furnished from the lower seams. Three little coal-basins lie against a fault on the moors south of the Tyne. In the Limestone series there also exist coal-seams of some value, worked here and there, generally singly and for land sale purposes. The Scremerston lower coals, eight of which are workable seams with an aggregate thickness of 23 feet, form a little coal-field in the Carbonaceous group in the north of the county. Numberless little seams are dug into by farmers and shepherds for their own use, chiefly in the same group in the southern half of the county. According to the mineral statistics the output of coal from the 176 collieries worked in Northumberland in 1882 was 14,518,789 tons, as against 36,299,597 tons from the whole coal-field, and 156,499,977 tons from the United Kingdom. The net quantity of coal in Northumberland available for the future was estimated before the Coal Commission in 1870 as 2,576,000,000 tons, besides 403,000,000 tons under the sea within 2 miles of land. About 350 millions of tons have since been realized. The rate of production is increasing annually.

The "lead-measures" in Northumberland chiefly lie in South Tynedale and Allendale, and belong to the Upper Limestone series or Yoredale rocks. From these lead-mines in 1882 there were raised 6817 tons of ore, having a value of £54,719. The product of the ore was 5252 tons of lead and 9547 ounces of silver. The industry has recently suffered from the effects of foreign competition.

The Cleveland ironstone and cheap foreign import have repressed iron-mining in Northumberland. An abundance of nodular calcareous ironstone in the Upper Limestone series awaits future development. For many years a shale bed at Redesdale furnished Sir W. G. Armstrong with some of his best materials, but it was abandoned in 1877.

Among other mineral products are building freestones in profusion; millstone grits, not at all restricted to the strata bearing the name; fireclays, chiefly of value among the Coal-measures; brick clays from glacial beds; and disintegrated shales. The Whinsill yields hard paving-stones and kerbstones; Newcastle grindstones, from a hard sandstone near the town, are as familiar as "Wallsend"; and limekilns are numerous in the broad belt occupied by the upper limestones. The uplands are rich in springs issuing from the sandstones and limestones. Chalybeate springs or "red wells" abound; "sulphur wells" (sulphuretted hydrogen) are by no means rare.

Natural History.—The fauna and flora of the county have been worked out with a care and completeness chiefly due to the Naturalists' Field Clubs of Tyneside and Berwickshire. The catalogue of plants in Northumberland (with Durham) contains 936 species out of the 1425 of the British list, Ireland excluded. The facies of the flora is intermediate between the northern and southern types of the island. Forty-six species enter Northumberland from the south which do not reach Scotland. There is a distinct preponderance of damp-loving kinds. No plants are restricted to the county. Numerous aliens, enumerated as 117 species, grow upon the large ballast-hills beside the Tyne and elsewhere, and there are 87 other "casual introductions." The cloudberry ripens on most of the watershed hills above 1250 feet.

The richness of bird-life in the county is accounted for by the situation of the coast in a frequented track of migration to and from the north, and by the diversity of its own physical features. Of the entire catalogue of British birds, in all about 395 species, two-thirds (267) have been met in Northumberland and Durham, 91 of which are residents, 40 spring and autumn migrants that come to nest, 54 autumn and winter visitants, and 79 casual visitants. Moorfowl abound on the fells, though less numerously than of old.

Among the larger fauna of the county are the half-wild white cattle of Chillingham Park, the representatives, according to the best authorities, of the aboriginal cattle of the British forests, and degenerated descendants of the great Urus, or *Bos primigenius*.

Climate.—The climate is bracing and healthy. In spring east winds prevail over the whole county. The lambing season in the higher uplands is fixed for the latter half of April, and is even then often too early. In summer and autumn west winds are general. The mean temperature in the shade at Alnwick and North Shields in the winter and summer quarters of the year, during four years of observation, was as follows:—Alnwick, summer

52°·9, winter 35°·9; North Shields, summer 55°·1, winter 39°·0. At Greenwich during the same years it stood as—summer 59°·9, winter 39°·4. The rainfall gradually increases as the country rises from the coast. The average rainfall during the six years 1877-82 was:—at Tynemouth (65 feet above the sea), 27·78 inches; in Newcastle (105 feet), 30·25 inches; near Belford (240 feet), 30·41 inches; near Haltwhistle (380 feet), 40·41 inches; near Rothbury (400 feet), 37·50 inches; at Allenheads (1353 feet), 47·65 inches; and at Broadstruther (1672 feet), about five miles north of the Cheviot, 60·93 inches. East winds, in summer, bring rain to the interior. The smell from the coal-field, the lighter grime of which is detected as far as Cumberland, is taken by the shepherd for a sign of wet.

Governmental and Ecclesiastical Divisions.—Northumberland comprises the nine wards (answering to hundreds and wapentakes) of Bamburgh, Glendale, Coquetdale, Morpeth, Tynedale, Castle, Norhamshire, Islandshire, and Bedlingtonshire. The last three formed detached portions of Durham until 1844. It contains 76 mother-parishes and 162 benefices, together forming (with Alston and Nenthead in Cumberland) the diocese of Newcastle, erected in 1882. There are 541 civil parishes in which poor-rate is separately levied. The county has one court of quarter-sessions, is divided into 13 petty and special sessional divisions, and for parliamentary purposes into a northern and a southern division, each of which returns two members. Berwick-upon-Tweed (which has been joined to this county for election purposes) and Newcastle-upon-Tyne have separate courts of quarter-sessions and commissions of the peace, and, together with Morpeth and Tynemouth, the latter of which has also a commission of the peace, are municipal and parliamentary boroughs. Berwick and Newcastle each return two members, and Morpeth and Tynemouth each one.

Population and People.—The population in 1881 numbered 434,086 persons, 215,882 males and 218,204 females,—showing an increase since 1871 of 47,440 persons, and of 256,008 since the first census in 1801. The average number of persons to an acre was 0·34, and of acres to a person 2·97. The number of inhabited houses was 70,632. The population of its chief towns was as follows:—Newcastle-upon-Tyne, 145,359 (or with Gateshead upon the Durham side, 211,162); North Shields and Tynemouth, 44,118; Berwick-on-Tweed, 13,998; Alnwick, 7440; Morpeth, 6946; and Hexham, 5919. The Tyne ports are rapidly becoming one continuous town. Walker had a population of 9522 persons, Wallsend 6515, and Willington Quay 5105. Persons engaged as miners or in mine service numbered 21,607, of whom 20,752 were coal-miners. Persons engaged in agriculture numbered 16,991.

In physique the Northumbrian is stalwart and robust, and seldom corpulent. The people have mostly grey eyes, brown hair, and good complexions. The inhabitants of the fishing villages appear to be Scandinavian; and parts of the county probably contain some admixture of the old Brit-Celt, and a trace of the Gipsy blood of the Faas of Yetholm. The natives have fine characteristics: they are clean, thrifty, and plodding, honest and sincere, shrewd, and very independent. Their virtues lie rather in solidity than in aspiration.

Northumbrian speech is characterized by a "rough vibration of the soft palate" or pharynx in pronouncing the letter *r*, well known as the *burr*, a peculiarity extending to the town and liberties of Berwick, and absent only in a narrow strip along the north-west. Over the southern part of the county there is the same duplication of vowel-sounds, such as "peal" for "pool," that is met in the English counties adjacent. Many charming Old-English forms of speech strike the ear, such as "to butch a beef," *i.e.*, to kill a bullock, and curious inversions, such as "they not can help." There is the Old-English distinction in the use of "thou" to familiars and "ye" to superiors.

Ownership of Land.—According to the *Owners of Land Returns* 1873, the distribution of land-property in Northumberland was as follows:—there were 22 proprietors of more than 10,000 acres; of 100 and less than 1000, 597; of 10 and less than 100, 771; of 1 and less than 10, 820; and of less than 1, 10,036. The gross estimated rental was £2,144,743. Six proprietors held lands exceeding 20,000 acres. The duke of Northumberland, the largest land-proprietor in England, held 181,616 acres; the earl of Tankerville, Chillingham Park, held 28,930; Sir John Swinburne of Capheaton, 28,657; Walter C. Selby of Biddlestone, 25,327; Sir W. C. Trevelyan (now Sir Charles) of Wallington, 21,342; and the lords of the Admiralty, who held the old Derwentwater estate, 20,642. The mansions and parks attached to these estates are all beautiful or interesting. Biddlestone is uplying, but in some respects is the original of Scott's Osbaldistone Hall.

Agriculture, &c.—More than half of the county is pastoral. South of the river Coquet there is a single broad tract of cultivation towards the coast that sends lessening strips up the valleys into the interior. From the Coquet northwards another breadth of enclosed ground stretches almost continuously along the base of the Cheviot hills. In the basin of the Till it becomes eminently fertile, and towards the Tweed the two breadths unite. In the porphyritic Cheviots the lower hills show a great extent of sound surface and good grass. The average hill-farms support about one sheep to two acres. A coarser pasturage covers the Carboniferous hills, and the proportion of stock to surface is somewhat less. Their highest fells are a rough-and-tumble of bogs, hags, and sandstone scars, with many acres dangerous to sheep and worth less than nothing to the farmer. The lower uplands are a patchwork of coarse grasses (mown by "the muirmen" into "bent-hay") and heather, or, in the popular terms, heather and "white ground," for it is blanched for eight months in the year. Heather is the natural cover of the sandstones (which form most of the eminences) and of the sandy glacier-débris near them. The limestone crops are bright green strips or *gairs*. Sheets of boulder-clay are common on the eastern sides of eminences, in the valleys, and on the low grounds. On the uplands they grow bents; lower down they are apt to be cold and strong, but are much relieved by patches and inworkings of gravel, especially north of the Wansbeck. The prevalent stream-alluvium is sandy loam, with a tincture of peat. The arable regions are very variable. Changes of soil are probably as numerous as fields. Fencing has now reached the watershed tracts; draining is following; but there is room to doubt whether the latter will be altogether an unmixed good. The peat mosses act retentively, like sponges, softening the air, nourishing the early-springing deer-grass and cotton-grass, and preventing precipitation of drainage on the rivers, which are now more liable to floods than formerly.

Northumberland contains 1,290,312 acres. In the *Agricultural Returns* for 1883 the cultivated area of the county stands as 712,615 acres, exclusive of orchards and market gardens, embracing—corn crops, 126,439 acres (wheat 19,980, barley 40,696, and oats 58,959); green crops, 55,292 acres (turnips and swedes 46,066, and potatoes 5384); clover, sanfoins, and grasses under rotation, 84,562 acres; permanent pasture not under rotation, exclusive of heath or mountain land, 431,031 acres. Of orchards there were 184 acres; of market gardens, 659; of nursery gardens, 81; and of woods (in 1881), 39,977. Since 1866 55,626 acres have been reclaimed from mountain land. The corn area has meanwhile diminished by 27,277 acres, and turnip-culture has not increased; but the permanent pastures are more extensive by nearly one-fourth, or 101,207 acres. The turnip-culture of the northern parts of the county takes rank with the best districts in Scotland. A five- or four-course shift is the usual rotation.

By the census of live-stock (1883) the returns are as follows:—horses and ponies, 18,147, including 13,538 used for agricultural purposes; cattle, 93,550, of which 21,930 were in milk or in calf; sheep, 890,230, including 336,702 under one year old; pigs, exclusive of those kept in towns and by cottagers, 14,888. The sheep, which are celebrated, fall into three groups. The half-breds—crosses between the Leicester (or Shropshire) and Cheviot breeds—occupy the lower enclosed grounds, the pure Cheviots are on the uplands, and the hardier blackfaced breeds lie out on the exposed heathery heights. The cattle are chiefly shorthorns and Galloways.

The size of the agricultural holdings was returned in 1875 and 1880. Holdings of 50 acres and under numbered in these years 3070 and 3329 respectively; of 100 to 300 acres, 1313 and 1273; of 1000 acres and upwards, 38 and 36. Leases of fourteen and nineteen years "usually without compensation clauses, and more or less restricted as to cropping," have hitherto been in fashion. In the large part of the county owned by the duke of Northumberland (nearly one-seventh of the whole) there obtains a system of yearly agreements, except in the case of hill-pastures. In the recent uncertain years annual arrangements have been more in favour generally. Large farms have now much absorbed the smaller holdings of earlier times. In Allendale the mining population includes many small occupiers, and the commons are still unbroken. In other parts of the county the commons have mostly been divided. Between 1702 and 1877 commons to the number of 59, and with an aggregate extent of 194,917 acres, are known to have been enclosed. There is no authentic account of the unenclosed remainder.

The management of many Northumbrian farms is excellent, "far in advance of ordinary practice." Wages are high, but "the cost per acre of labour does not exceed and is often much lower than that of districts where wages are from 25 to 40 per cent. lower. This is attributable to (1) the superior quality of the labour, both physical and moral, (2) the extensive use of women-workers (the employment of whom is not found to be demoralizing when properly safe-guarded), and (3) more systematic and economical management" (Coleman, *Report, Royal Commission*, 1882).

The practice of paying wages in kind has passed greatly into disuse. Some of the shepherds still receive "stock-wages," being allowed to keep forty or fifty sheep and several cows on their employers' farms in lieu of pay. This arrangement, which makes them really copartners, has probably done much to render them the singularly fine class of men they are.

Manufactures, &c.—The manufactures of this county chiefly come from the Tyne, which is a region of ironworks, blast-furnaces, shipbuilding-yards, ropeworks, coke-ovens, alkali-works, and manufactories of glass, pottery, and fire-bricks, from Newcastle to the sea (see NEWCASTLE). There is great activity in all trades concerned in pit-sinking and mine-working. In the other parts of the county there are a few small cloth-mills, a manufactory of

tan-gloves at Hexham, some potteries, and numbers of small brick and tile works.

Fisheries.—The Tyne is the most productive salmon-netting river from a commercial point of view in England and Wales. The richness of its fisheries is mentioned in the time of Henry I. According to Professor Huxley's report, the estimated catch in 1882 was 41,110 salmon and 10,336 salmon-trout. The salmon catch has doubled within the last four years, and is not known to have been exceeded except in three abnormal years, 1871-73. The fish taken by the Berwick Salmon Fishery Company in 1882 were 8808 salmon, 3104 grilse, and 12,390 trout. Bull-trout abound in the Coquet. The sea-fisheries include herrings, whitefish, and some crabs and lobsters. In 1872 the number of boats employed was 1163, chiefly cobles. Beyond Holy Island the boats and fishing are essentially Scotch.

Antiquities, &c.—The pre-Roman antiquities of Northumberland are camps, cairns, standing-stones (both monoliths and fragmentary circles), sculptures on rock, hand-made pottery, and weapons, ornaments, &c., of stone, bronze, iron, jet, glass, and gold. The camps are entrenched enclosures rudely rounded or quadrate, with their main entrances and those of the hut-circles, or foundations of huts, always facing sunrise. They differ from the camps of the Romans in their want of symmetry, and in an absence of plan in distribution, due to the desultory clan-warfare of their inhabitants. The primitive village of Greaves Ash near the Breamish, the strong defensive earthwork at Elsdon, and the camps at Old Bewick, Lordenshaw near Rothbury, and Warden Hill near Hexham are a few instances from among the great numbers that are preserved on the eminences girdling the northern Cheviots and on the lower untilled grounds. Traces of occupation by Romans, Saxons, and marauders of later times sometimes mingle with the remains of the original occupants. The sculptured cups and circles, now familiar to antiquaries, were first brought into observation at Rowtin Linn near Ford in 1852. Numerous instances and varied designs have since been found, both on "fast" rock and on slabs associated with burials. The uplands are dotted with round barrows and cairns containing cists and interments, sometimes cremated, sometimes inhumed, and in some instances both together. The county scarcely affords material as yet for a separation into periods of stone, bronze, and iron. The older interments are associated only with stone, but not necessarily precedent to bronze; in the "late Celtic" or "early iron" ages all three were in use together.

In Roman military antiquities this is the premier county of Britain. For the great wall between the Tyne and the Solway, see Hadrian's Wall. The Roman road from London nearly bisects the county, and still goes familiarly under the name of "the Watling Street." It passes numbers of quadrangular camps, three of which were permanent stations. Its eastern branch, the Devil's Causeway, leaves it near the Tyne for Berwick. In the south-west of the county lay the Maiden Way, making for Liddisdale. Coal, iron, and lead appear to have been worked by the Romans. Numerous heaps of heavy iron slag, mingled with charcoal, are the sites of little "bloomeries" on the uplands. They may be of different ages, from that of the Britons downwards.

Of Anglo-Saxon buildings the Danes left almost nothing. The crypt of Wilfrid's abbey of St Andrew at Hexham is one undoubted remnant; portions of several other churches are very doubtfully pre-Norman. Some thousand Saxon *stycas* found buried at Hexham, the "fridstool" there, and an ornate cross now shared between Rothbury and Newcastle are the other principal vestiges of Saxon times. The Black Dyke, a bank and ditch crossing the line of the Roman wall about three miles east of the Irthing, is supposed by some antiquaries to be the continuation of the Catrail at Peel Fell; the latter was the probable boundary-fence between the Saxon Bernicia and the British Strathclyde.

The ecclesiastical architecture of the county suffered greatly at the hands of the Scots. Not a few of the churches were massive structures, tower-like in strength, and fit to defend on occasion. Lindisfarne Priory, the oldest monastic ruin in the county, dates from 1093. Hexham Abbey Church (early 12th century), raised over the crypt of Wilfrid's cathedral, has been termed a "text-book of Early English architecture;" it lacks the nave, destroyed by the Scots under Wallace. Of Brinkburn Priory the church remains, and has been well restored. Hulne Abbey, now surrounded by the sylvan loveliness of the Alnwick demesnes, was the first Carmelite monastery in Britain. Besides these there are fragments of Newminster Abbey (1139), Alnwick Abbey (1147), and others. An exquisitely graceful fragment of Tynemouth church is associated with some remains of the older priory. Among churches ought first to be named St Nicholas's, Newcastle (1350), the prototype of St Giles's, Edinburgh, and now the cathedral-church of the new diocese. There is a massive Norman church at Norham, and other Norman and Early English churches at Mitford, Bamburgh, Warkworth, Alnwick (St Michael's), &c., most of them with square towers. The stone roof of the little church at Bellingham, with its heavy semicircular girders, is said to be now unique.

"It may be said of the houses of the gentry herein," writes old Fuller, "'quot mansiones, tot munitiones,' as being all castles or castle-like." Except a few dwellings of the 16th century in Newcastle, and some mansions built after the Union, the older houses are all castles. A survey of 1460 mentions thirty-seven castles and seventy-eight towers in Northumberland, not probably including all the bastle-houses or small peels of the yeomen. At the Conquest Bamburgh, the seat of the Saxon kings, was the only fortress north of York. Norham Castle was built in 1121. None of the baronial castles are older than the time of Henry I. A grass mound represents Wark Castle. Alnwick Castle is an army of walls and towers covering about five acres. The interior was restored in Italian palace style by the late Duke Algernon. Warkworth, Prudhoe, and Dunstanburgh castles are fine groups of ruins. Dilston Castle has still its romantic memories of the earl of Derwentwater. Belsay, Haughton, Featherstone, and Chipchase castles are joined with modern mansions. The peel-towers of Elsdon, Whitton (Rothbury), and Embleton were used as fortified rectory-houses. Seaton Delaval was the work of Vanbrugh.

The place-names of the county may be viewed as its etymological antiquities. The Danish test-word *by* we find to be absent. Saxon *tons, hams, cleughs* (clefts or ravines), and various patronymics are met with in great numbers; and the Gaelic *knock* (hill) and Cymric *caer, dwr* (water), *cefn* (ridge), *bryn* (brow), &c., mingle with the Saxon. Many curiosities of nomenclature exist, some strange, some expressive, *e.g.*, Blink-bonny, Blaw-wearie, Skirl-naked.

A few gleanings of folk-lore still remain for the discriminating collector. The virtues of certain holy wells in ailments or barrenness and of a south-running stream in sickness, the powers of Irish men and cattle over snakes and snake-bites, and the growing of boulders in the earth like bulbs are still latently believed in by many; and there is a general aversion to burying on the sunless side of the churchyard, which is left to suicides and unchristened infants.

The literary antiquities are the Border ballads. "I never heard the old song of Percy and Douglas, that I found not my heart more moved than with a trumpet" (Sir Philip Sidney).

Bibliography.—See Hodgson's unfinished county *History*, 1820-40, a marvel of minute local fidelity; Hodgson Hinde's *General History*, added thereto, 1858; also Skene's *Celtic Scotland*, Green's *Making of England*, and Freeman's *Norman Conquest*, as more recent authorities. In antiquities: Bruce, *Roman Wall*, 1874, *Wallet Book*, 1863, *Lapidarium*, 1875, and *Descriptive Catalogue of Antiquities at Alnwick Castle*, 1880; Hartshorne, *Feudal and Military Antiq. of Northumberland*, 1858; Wilson, *Churches of Lindisfarne*, 1874; Wallis, *Natural Hist. and Antiq. of Northumberland*, 1769; Greenwell, *British Barrows*, 1877; and the *Archæologia Æliana*, being proceedings of the Antiquarian Society of Newcastle. In natural history: Tate and Baker, "Flora of Northumberland," &c., vol. vi. of *Tyneside Naturalists' Transactions*; Hancock, "Birds of Northumberland," in vol. xii.; "Catalogue of the Mammalia," in vol. vi.; and much valuable matter on antiquities, natural history, &c., both in these and in the *Berwickshire Naturalists' Transactions*; and Storer, *Wild White Cattle of Britain*, 1879. In geology: the maps of the Geological Survey (now completed), and memoirs which will accompany them; G. Tate, careful and clear-sighted, in Tate and Baker's "Flora"; Bruce's *Roman Wall*, 4th ed. In agriculture: Coleman's *Report to the Royal Commission*, 1882; John Gray of Dilston, "Report," *Agricultural Journal*, 1841; Bailey and Culley, 1813. On dialect, &c., Murray, "Northumbrian Speech," *Philological Journal*, 1870-72; Brockett's *Glossary of North Country Words and Phrases*, 1846. *Murray's Handbook* is a very useful but not very accurate companion for the traveller in Northumberland. The library of the Lit. and Phil. Society at Newcastle is one of the best provincial libraries in the kingdom. (H. M.)

NORTHUMBERLAND, Kingdom of. The history of Anglo-Saxon England is the history, not of a heptarchy of independent and equal or nearly equal kingdoms united by any kind of federal bond, but of the rise and progress of the kingdom of Northumberland from the end of the 6th to the middle of the 8th century under Ethelfrith and the descendants of Edwin of Deira, the predominance of Mercia during the latter half of the 8th century under Offa, and the gradual union of England under the descendants of Egbert of Wessex between the close of the 8th century and the Norman Conquest. The present article is chiefly concerned with the first of these periods chronologically, and geographically with the portion of Britain which under the Northumbrian kings at the time of their greatest power extended from the Humber to the Forth, and was bounded on the east by the German Ocean, and on the west by an irregular and gradually receding line, at times overstepped, of the country more or less mountainous retained by the Celts of Strathclyde and Cumbria between the Clyde and the Mersey (see Plate II., vol. viii.). The first settlements of the Angles in these regions and the foundation of the kingdoms of Bernicia and Deira have been spoken of in vol. viii. p. 270. Bernicia and Deira were Celtic names, Bryneich and Deifr, somewhat modified; the former kingdom corresponded generally with the modern counties of Durham and

Northumberland and the Lothians, the latter with Yorkshire, and when the two became united in one kingdom it received the name of Northumberland.

The history of Bernicia between the establishment of Ida as its king and the reign of his grandson Ethelfrith (592-617), and of Deira prior to the reign of Edwin (616-633), the son of Ælla, is obscure. The skilful piecing together of the notices of Nennius, Bede, and the early English chroniclers by Palgrave, Lappenberg, Skene, and others cannot be regarded as a completely successful reconstruction of the chronology of the Northumbrian kings. The chief difficulty, though only one of many, is that six of twelve sons of Ida are said to have reigned in Bernicia from his death (559) to the accession of Ethelfrith, his grandson (592 or 594), a period of only thirty-three or thirty-five years, which, though not quite incredible, appears short in comparison with the parallel reigns of Ælla of Deira (559-588) and his son Edwin (616-633), while their names and order of succession do not agree in the earliest authorities. Another is that Bebba, the British princess from whom Bamburgh, the chief fortress of Bernicia, was named, was according to the *Saxon Chronicle* wife of Ida, but according to Nennius of Ethelfrith. Whatever may be the truth as to the earlier history, more light dawns with Ethelfrith, in whose reign the attempt to unite Bernicia and Deira commenced. "The most powerful and covetous of glory of kings," as he is called by Bede, Ethelfrith "wasted the race of the Britons more than all the chiefs of the Angles, and made more land than any of them subject to or inhabited by Angles, exterminating or subduing the indigenous tribes" (Bede, i. 34). By one of these victories, that of Catræth? (596), commemorated in the verse of Aneurin, he overcame the Britons, who were driven back into Cumbria, and by another at Dægsastan (?Dawston in Liddisdale) over Aidan, king of the Scots of Dalriada, in 603, he put a stop to incursions of the Scots down to Bede's own day. A third victory at Caerleon (Chester on the Dee) 613?, followed by the slaughter of the monks of Bangor, marks the fact that the Northumbrian Angles were still heathens fighting against Christian Celts. It was these successes that led to the extension of Northumberland to the borders of Cumberland and Westmoreland, and the first permanent inclusion of part at least of the district between the Tweed and the Forth in the kingdom of the northern Angles. Ethelfrith married a sister of Edwin and daughter of Ælla of Deira, and after Ælla's death, during the minority of Edwin, seized Deira, over which he reigned for twelve years. The young Edwin took refuge first amongst the Britons and afterwards with Redwald, king of East Anglia, who restored him to his kingdom by the defeat and death of Ethelfrith at a battle on the Idle, a tributary of the Trent, in 617. This turn of fortune drove Eanfrid, Oswald, and Oswy, the sons of Ethelfrith, into exile amongst the northern Celts, and Edwin, like Ethelfrith, ruled over the whole Angles north of the Humber to the Forth; for, whether Edinburgh was his foundation or a fortress of the Celts (Dunedin), the tradition which linked its modern name with his can scarcely be without meaning. Through his example the Angles were converted to Christianity by Paulinus, a monk sent from Canterbury with letters from Boniface V. to the king and his wife Ethelberga, the daughter of Ethelbert of Kent. The story of the origin of the Northumbrian Church, with its incidents of the destruction of the idols by the heathen archpriest Coifi, the speeches at the council of the witan which decided in favour of the new faith, the host of catechumens eager for baptism in the nearest rivers, the Glen in Bernicia, the Swale in Deira, and the Trent in the country of the Lindissi, the erection of a stone church dedicated to St Peter at York surrounding the wooden oratory in which Edwin had himself been baptized, afterwards itself enclosed in the minster, forms one of the most vivid passages of Bede. As the scene of these incidents was his native country, and their time about half a century before his birth, there is no reason to doubt the substantial truth of a narrative derived at first, or at furthest at second hand.

"Deda, a priest of Bardney, a man of singular veracity," he mentions in one place, "told me that one of the oldest persons (in the province of the Lindissi, modern Lincoln) had informed him that he himself had been baptized by Paulinus at noon in the presence of Edwin, with a great multitude of the people, in the river Trent . . . he was also wont to describe the personal appearance of Paulinus, tall of stature, a little stooping, his hair black, his visage meagre, his nose very slender and aquiline, his aspect both venerable and majestic."

The same historian testifies to the dignity of Edwin's reign, shown by the "tufa," or standard of feathers on a spear-head, borne before him in war and peace. A woman with a new-born child might walk through his dominion without harm, and cups were provided at the springs on the wayside for travellers. Such a time was fitted for the reception of the new religion of peace, but Edwin's days ended in war, and he perished at Heathfield (Hatfield in Yorkshire) in a battle against the heathen host led by Penda, king of Mercia, and the British King Ceadwalla (633). His death permitted the return of the sons of Ethelfrith. The eldest, Eanfrid, who is supposed to have been in exile amongst the Picts, obtained Bernicia, while Deira fell to Osric, the son of his uncle Alfric. Eanfrid, who relapsed to paganism, held his kingdom only a year; and in 634 Ceadwalla defeated Osric at York, and killed by treachery Eanfrid, who had made overtures of peace. Eanfrid's brother Oswald recovered both Bernicia and Deira by the great victory of Heavenfield near Hexham in 635. "The most Christian king of the Northumbrians," as Bede emphatically calls him, Oswald restored Christianity throughout his whole territory, but under the monastic form he had learnt during his exile in Iona, and with the usages as to Easter and the tonsure which distinguished the Celtic from the Roman Church. At his request Aidan, a monk of Iona, came to instruct the Angles in the Christian faith, and was in 634 or 635 consecrated as bishop of Lindisfarne, the Holy Island, which became the Iona of the eastern coast.

The powerful and wise rule of Oswald not only reunited Bernicia and Deira, but subjected races of all the four languages (for we may be sure Bede's expression "*all* the nations of the four languages" is an hyperbole), the Britons, the Picts, the Scots, and the Angles, to his dominion.

In 642 he fell in a battle against Penda of Mercia at Maserfield, which, whether it be the place of that name now called Winwick in Lancashire or Oswestry (Oswald's tree) in Shropshire, shows that he was still further enlarging his realm. His successor Oswy revenged his death by the defeat and death of Penda at the river Winwaed, now Winmore, near Leeds (655), which resulted in the conversion of Mercia. In his reign Wilfrid, an energetic and ambitious monk, persuaded the Northumbrians at the council of Whitby to conform to the Roman usage as to Easter and the tonsure, and Colman, the third Celtic bishop of Lindisfarne, returned to Iona with the Scottish monks and the relics of Aidan. The successful advocate of the Roman rites became bishop of York, with a diocese including all Northumberland and the Pictish subjects of Oswy, thus completing the scheme of Gregory I. and Augustine for the ecclesiastical organization of England.

On the death of Oswy in 670 the Picts revolted, but his son Egfrid succeeded in quelling the revolt and in extending his father's kingdom both against the Mercians

on his southern and the Pictish kings on his northern border. In 684, tempted by his good fortune, he sent his general Beret to ravage Ireland, then, says Bede, a peaceful and friendly country, which implies that his dominions had now touched some parts of the western shores, and next year he himself invaded the territory of the northern Picts, where he was defeated and slain by their king Bredei or Brude at Nechtan's Mere (Dunnichen? in Forfarshire) in 685. The result was that not only the Picts recovered their own land and ceased to pay tribute, but some of the Britons also became independent. The Northumbrian Church under the able leadership of Wilfrid shared in the extension of the kingdom, and it also shared in its repulse. A bishopric established under Trumwine at Abercorn in Linlithgowshire, in the country of the Angles, but close to the arm of the sea dividing the Angles and the Picts (Bede, iv. 26), had to be abandoned. The Forth was destined to be the limit of Northumbrian sovereignty to the north.

Shortly before the close of this reign a dispute between the king and Wilfrid led to the division of the diocese of York into two bishoprics—York, of which Bosa was made bishop, and that of Lindisfarne or Hexham, whose first bishop was Eata. A new bishopric was erected for the district of the Lindissi (Lincoln), who had been conquered by Egfrid. To this or the next reign belong the earliest fragmentary memorials of the Northumbrian or Northern English dialect which have come down to our time—the Runic inscription of the crosses at Ruthwell and perhaps those at Thornhill in Dumfriesshire and at Bewcastle in Cumberland. It was during the same period that CÆDMON (*q.v.*), a monk of Whitby, the earliest English poet, died (680), and BEDE (*q.v.*), the monk of Wearmouth and Yarrow, the earliest English historian, except the anonymous authors of the *A.S. Chronicle*, Aldhelm, and Eddi, the writer of Wilfrid's life, was born (672 or 674). To their influence, and to the learned—which succeeded the warlike—epoch of Northumberland during the next century down to the death of Alcuin of York in 804, may be ascribed the fact that, while Saxon Wessex became the dominant state, the language and the land south of the Forth received from the Angles the name of English and England.

Egfrid was succeeded by his brother Aldfrid, an illegitimate son of Oswy (685-705), who "retrieved," in the words of Bede, "the ruined state of the kingdom, though within narrower bounds." It was in his reign that Cuthbert, a monk of Melrose, which had been founded by Bishop Eata, became bishop of Lindisfarne. His preaching commenced the Christianization of the country between the Forth and the Tweed, and his fame quickly gathering a legendary halo of miracles led to his being adopted as the patron saint of Durham and the north of England, as well as of southern Scotland. While no serious attempt was made to regain the lost territory in the country of the Northern Picts, Egfrid, his son Osred (705-716), and Osred's successors, Coenred (716-718), Osric (718-729), and Ceolwulf (729-737), some of whom were descendants of a different branch of the family of Ida, gradually extended the limits of their kingdom to the west, and, following the coast, established themselves in Galloway and as far as Cunningham (Bede, v. 12), the northern district of modern Ayrshire. Shortly before 731, when Bede concluded his history, an Anglian see had been created at Whithorn (*Candida Casa*) in Galloway, of which Pechthelm was the first bishop, and which lasted till 803.

The last of the important kings of Northumberland, Eadbert (737-758), pushed his arms as far as the Clyde, defeating the Britons in Kyle, and, in alliance with Angus Macfergus, king of the Picts, took Allclyd (Dumbarton), the chief town or fortress of the Strathclyde Britons, in 756. These were uncertain conquests.

The epoch of Northumbrian greatness closes with Oswy. It is significant that two of the last-named kings, Ceolwulf and Eadbert, resigned the crown for the tonsure. External circumstances combined with the enervation of the royal race to produce the decline of Northumberland. Its southern neighbour, Mercia, was ruled by two powerful kings,—Ethelbald, who ravaged Northumberland in 737, and after his death the great Offa (757-796), the contemporary of Charlemagne; while a series of Northumbrian kings, of whom we know little save the names and the dates of their mostly violent deaths—Oswulf (758), Ethelwald (765), Alchred (774), Ethelred (779), Alfwold (788), Osred (792), another Ethelred (796), whose wife, Ethelfreda, was a daughter of Offa—wasted in intestine struggles the kingdom of their predecessors.

On its northern boundary a vigorous line of Pictish kings, beginning with Angus Macfergus (731-761), the ally of Eadbert against the Britons of Strathclyde, whose chief seat was Scone, threatened, and there is no doubt often passed, the boundary of the Forth, but the Angles retained Lothian during the 8th and the first half of the 9th century, and it was not till a century after the union of the Scots and Picts under Kenneth Macalpine (844), in the reign of Indulph (954-962), that Edinburgh became Scottish instead of Northumbrian ground. In 793 the heathen Northmen signalized the commencement of the attacks which were for several centuries to vex the coast of Britain by the sack of Lindisfarne, and in the following year of Yarrow. Though this descent was repelled, the Danish vikings with increased numbers renewed their raids in the following century. Before its close the southern half of Northumberland had received a large infusion of Danish population. Their distant kinship in race and not so distant likeness of language favoured their settlement in the territory of the Angles. With the close of the 8th century the history of the kingdom of Northumberland practically ends, though a few names of kings of pure Anglian race are recorded in the 9th century.

It may be convenient to trace the subsequent fate of this kingdom and its parts. In 827 Eadred, king of Northumberland, submitted to Egbert, the founder of the greatness of Wessex, and agreed to pay tribute in order to stay the progress of that kingdom at the Humber.

In 875 the Danish host, now too large for and weary of mere raids, divided itself between Guthorm, who led his division against southern England, where its final repulse by Alfred made him the hero of his race, while Healfdene, with no Alfred amongst the Angles to oppose him, conquered Northumberland and settled his followers on the east coast, throughout the whole of ancient Deira, the southern part of ancient Bernicia, and as far west as the central districts of Anglian Cumberland. Wherever the "by" replaced the older name or gave a new name to the settlement, wherever the "t" still lingers instead of "the" as the article, linguistic scholars see certain marks of Danish occupation. This occupation retarded the northern advance of the Wessex kings, the descendants of Alfred, and a century elapsed before Edward the Elder in 924 received again at Bakewell in Derbyshire the homage of the Northumbrians, as Egbert in 827 is said to have done almost at the same point, whose position on the extreme southern border of Northumberland is significant. This homage is recorded in the contested passage of the *A.S. Chronicle*: "And then chose him for father and lord the king of the Scots and the whole nation of the Scots and Regnwald and the sons of Eadulf and all those who dwell in Northumbria, as well Angles as Danes, Northmen, and others." But the dispute as to the precise nature and extent of the submission does not concern the present subject so much as the evidence it affords of the mixed population of Northumberland, and of the absence of any prominent sovereign of the whole country whose name could be mentioned by the Chronicle. In the reign of Athelstan, the son of Edward the Elder, the great victory of Brunanburgh (937), by which he defeated the united forces of Olaf Cuaran, the son of Sitric, the Danish king or earl, his father-in-law Constantine, king of the Scots, another Olaf, the son of Godfry, king of the Irish Danes, and the British prince of Cumbria, made the conquest of Northumberland south of the Solway and the Tweed more of a reality. Norse mercenaries under Egil, the hero of the Icelandic saga, fought in the army of Athelstan, and a few years

later the aid of Eric Blood-Axe, son of Harold the Fairhaired, had to be purchased by giving him the rule over Northumberland, which he was intended, but was unable, to hold as a barrier against the Scots and Danes. The conquest of the Northumbrian Danes was only completed in 954, when Eadred, the third son of Edward the Elder, who was king of Wessex, was able to substitute Oswulf, an earl of his own choice, for their last king, Eric, who is called by the English chroniclers simply "the son of Harold," and is supposed by Adam of Bremen to have been the son of Harold (Blue-tooth) king of Denmark, but by the best modern writers to be Eric Blood-Axe, who had returned to Northumberland and was slain at Stanemoor (954).[1] Eadgar (959-975), the successor of Eadred, divided Northumberland into two earldoms, which answered roughly to the ancient Deira and Bernicia, but probably more nearly to the modern county of York, of which Oslac was earl, and modern Northumberland and Durham, which Oswulf retained. The dismemberment of the ancient kingdom had commenced in the earlier reign of Edmund, who in 945 ceded Cumbria to Malcolm I. of Scotland on condition that he should be "his fellow-worker both by land and sea," a remarkable expression in the A.S. Chronicle, indicating alliance rather than homage.

Lothian was either ceded between 970 and 975 by Eadgar to Kenneth, the son of Malcolm I., upon condition that it should retain its Anglian speech and customs, which is the account given by John of Wallingford, or conquered by the defeat of Eadulf Cudel, its ruler in the time of Canute, by Malcolm II. at the battle of Carham in 1018, as is stated by Simeon of Durham. It seems not impossible that both statements may be true, and that an earlier almost compulsory union was followed by a more complete annexation. For England was already threatened by the last and most formidable invasion of the Danes, which was to end in its conquest by Canute (1017). This conquest for a brief space included not only Northumberland but Scotland (1031-35). In the confused period between the Danish and the Norman conquests of England, the succession of the Northumbrian earls appears to have been this. The two earldoms of Oslac and Oswulf had been united under Waltheof (975), who was deposed by Æthelred in favour of Waltheof's son Uhtred (1000). Uhtred defeated the Scots near Durham, and received the hand of Ælgifa, Æthelred's daughter. He submitted to Canute, but was slain soon after his submission by a private enemy, and Eric, the husband of Canute's sister Gytha, became earl, though the northern portion of his earldom was left to the charge of Eadulf Cudel, a brother of Uhtred, whose signal defeat at Carham, we have seen, finally united Lothian to Scotland. Two obscure sons of Eadulf, Ealred and a second Eadulf, afterwards appear as earls in Bernicia in the time of Hardicanute. Both were assassinated, the latter by Siward the Strong, a Danish follower of Canute, who married a daughter of Ealred, and in 1041 reigned over all Northumberland. He was the famous earl in the narrative of whose exploits it is difficult to separate legend from history, but to the latter apparently belongs his alliance with Malcolm Canmore, and the aid he gave in recovering his father's kingdom from Macbeth, the representative of the Celtic party in Scotland. On his death in 1055, Edward the Confessor appointed Tostig, one of the sons of Godwin, earl of Northumberland, including the detached shires of Northampton and Huntingdon. Deposed by the Northumbrians, he took refuge with his brother-in-law, the Flemish Baldwin, at Bruges. After taking part in the early designs of William the Conqueror against England, he joined in the expedition of Harold Hardrada against his brother Harold, and was slain at Stamfordbridge (25th September 1066). After the Conquest Yorkshire was incorporated in England. Morkere the son of Ælfgar earl of Mercia, and Copsige, a thane who had acted as deputy of Tostig, still retained the northern districts, and, though they submitted to William, the subjugation was almost nominal. Northumberland, Cumberland, Westmoreland, and Durham were not sufficiently subdued to be included in the Domesday survey, though some parts of southern Westmoreland and Cumberland are contained in the description of the West Riding of Yorkshire, and parts of Lancashire in that of Cheshire. Frequent risings and constant changes of its earls prove the difficulty which the Norman kings experienced in governing the unruly northern province: Robert of Comines was slain at Durham in 1069; Cospatric was deprived for rebellion in 1070; Waltheof, who also rebelled, was executed in 1076; Walcher, who held it along with the bishopric of Durham, was murdered in 1080; Alberic resigned the dignity in 1085, and was succeeded by Robert de Mowbray, after whose forfeiture in 1095 Northumberland was united by Rufus to the crown. In the reign of Henry II. the earldom was conferred on Henry, earl of Huntingdon, the son of David I. of Scotland; after his death it was surrendered in 1154 by Malcolm IV., but its possession was always coveted and sometimes almost obtained by the Scottish kings, until the final result of the wars of the Plantagenets was to leave Scotland independent, but to fix its boundaries north of the Tweed, the Cheviots, and the Solway. Richard II. in 1377 regranted the earldom to Henry Percy, and the memory of its former independence probably prompted the ambition of the earls of this powerful house, which played so great a part in English history in the 15th and 16th centuries (see PERCY).

To sum up the results of a somewhat complex and here necessarily compressed history. The ancient kingdom of Northumberland, formed by the union of all the north-eastern part of Britain between the Humber and the Forth under the Anglian kings, and the more or less complete conquest of the British or Cymric western part between the Mersey and the Clyde, was ruled by the Anglian kings from the middle of the 6th to the 9th century. A great portion of it was resettled by the Danes towards the close of that century. It was conquered by the West-Saxon kings in the 10th century, but they had to allow its Danish earls to remain its real governors until shortly before the Norman Conquest, and before its close, or in the beginning of the 11th century, to cede the northern part of Cumbria and the northern part of Bernicia beyond the Tweed to the Scottish kings. Of their dominions the former, Galloway (the shires of Wigtown, Kirkcudbright, and part of Dumfries), became for a time an outlying district, but after David I. an integral part, though it retained for some time longer its Celtic speech and customs, while the latter, Lothian, preserving its Anglian speech and customs, became the seat of the court and the source of the civilization of Scotland. The portion of the Northumbrian kingdom which remained English was divided into the shire of York, the earldom or county of Northumberland in the modern sense, and the later counties of Cumberland, Westmoreland, and part of Lancashire. The preponderating influence in government as in language passed during the Middle Ages, and still continues to belong, to southern England, which possesses the capital London, its greatest river the Thames, and its most fertile lands. The discovery of the coal and ironstone, the sinews of manufactures, in the North, and the later development of the Mersey, the Clyde, the Humber, the Tyne, and the Forth, as the channels of commerce in modern times, have revived the importance of the districts comprised within the ancient kingdom of Northumberland. Whatever may be its future, its earliest history forms a memorable chapter in that of Great Britain.

Of original authorities the *Anglo-Saxon Chronicle* and Bede are the most important, but the former was written in Wessex, and magnifies the West-Saxon kings. After Bede, Simeon of Durham is the most trustworthy English chronicler of northern affairs. Eddi's *Life of Wilfrid* and Bede's *Life of Cuthbert* are of value for the history of the church. The *Chronicles of the Picts and Scots*, edited by Mr Skene for the record series of the Lord Clerk Register, Adamnan's *Life of Columba*, and the *Scottish Chronicles* of Fordun and Wynton, supplement, unfortunately in a fragmentary manner, the English writers. Some additional information may be anticipated from the edition of the passages in the Norse sagas bearing upon English history to be published in the English series of chronicles and memorials. The best modern writers to consult for Northumbrian history are Lappenberg, *History of the Anglo-Saxons* (1880); Skene, *History of Celtic Scotland*, vol. i. (1876); Robertson, *Scotland under her Early Kings*; Freeman, *History of the Norman Conquest*, and *Old English History for Children* (1869); and J. R. Green's *The Making of England*. (Æ. M.)

NORTH-WESTERN PROVINCES, THE, a lieutenant-governorship of British India, lying between 23° 51′ and 31° 5′ N. lat. and between 77° 3′ and 84° 43′ E. long., is bounded on the N. by Tibet, on the N.E. by Nepál and Oudh, on the S. by the Chutiá Nágpur districts of Bengal, Rewah, the Bundelkhand states, and the Central Provinces, and on the W. by Gwalior, Rájputána, and the Punjab, with an area under British administration of 81,858 square miles. The administrative headquarters and seat of the lieutenant-governor are at Allahábád.

Physical Aspects.—The North-Western Provinces occupy, roughly speaking, the upper basin of the Ganges and the Jumna. The province of OUDH (*q.v.*) has since 1877 been

[1] See Munch, *Chronicle of Man*, p. 39; and Vigfusson, *Corpus Poeticum Boreale*, i. p. 259, ii. p. 494 (Oxford, 1883).

under the administrative charge of the lieutenant-governor at Allahábád, but in respect of its land and courts it still remains a distinct chief-commissionership. With this exception, the North-Western Provinces include the whole upper portion of the Gangetic basin from the Himálayas and the Punjab plain to the Vindhyán plateau and the low-lying rice-fields of Bengal. Taken as a whole, the lieutenant-governorship consists of the richest wheat-bearing country in India. It contains many of the most famous cities of Indian history and is studded with thriving villages, interspersed at distances with large commercial towns. Except during the hot months, when the crops are off the fields, the general aspect is that of a verdant and well-tilled but monotonous plain, merging into hilly or mountainous country at the extreme northern and southern edges of the basin.

The extreme north-western or Himálayan region comprises the native state of Garhwál, with the British districts of Dehra Dún, Garhwál, and Kumáun. The economic value of this mountainous tract is confined to the growth of tea in Kumáun and the export of forest produce. South of the Himálayas, from which it is separated by valleys or *dúns*, is the Siwálik range, which slopes down to the fruitful plain of the Doáb (two waters), a large irregular horn-shaped tongue of land enclosed between the Ganges and Jumna. The great boundary rivers flow through low-lying valleys fertilized by their overflow or percolation, while a high bank leads up to the central upland, which, though naturally dry and unproductive except where irrigated by wells, has been transformed into an almost unbroken sheet of cultivation by various canals and their distributaries. This favoured inter-fluvial region may be fitly regarded as the granary of upper India. North of the Ganges, and enclosed between that river and the Himálayas and Oudh, lies the triangular plain of Rohilkhand. This tract presents the same general features as the Gangetic valley, varied by the damp and pestilential submontane region of the Tarái on the north-east, at the foot of the Kumáun hills. South of the Jumna is the poor and backward region of Bundelkhand, comprising the districts of Jaláun, Jhánsi, Lálitpur, Hamírpur, and Bánda, besides several petty native states under the administrative control of the Government of India. The soil is generally rocky and unfertile, and the population impoverished, scanty, and ignorant. The southernmost portion of Bundelkhand is much cut up by spurs of sandstone and granite hills, running down from the Vindhyán system; but the northern half near the Jumna has a somewhat richer soil, and comes nearer in character to the plain of the Doáb. Below the junction of the Ganges and the Jumna at Allahábád the country begins to assume the appearance of the Bengal plains, and also once more expands northwards to the foot of the Nepál Himálayas. This tract consists of three portions, separated by the Ganges and the Gogra. The division south of the Ganges comprises portions of Allahábád, Benares, and Gházípur, together with the whole of Mírzápur, and in general features somewhat resembles Bundelkhand, but the lowlands along the river bank are more fertile. The triangular tract between the Ganges and the Gogra and the boundary of Oudh is the most fertile corner of the Gangetic plain, and contains the densest population. It comprises part of Allahábád, Jaunpur, parts of Benares and Gházípur, and the whole of Azamgarh. The trans-Gogra region, comprising Basti and Gorakhpur districts, presents a wilder, submontane appearance. But even here cultivation has widely extended, and the general aspect is that of a well-tilled and verdant plain.

Besides the three great rivers—the Ganges, Jumna, and Gogra—there are the following secondary streams, each with numerous minor tributaries:—the East and West Káli and the Hindan flow through the Doáb; the Chambal intersects the trans-Jumna tract; in Bundelkhand the principal streams are the Betwá and the Ken; the Rámgangá, rising in Garhwál, pursues a very tortuous course through Rohilkhand; the Gumti enters the Provinces from Oudh, and flows past Jaunpur to join the Ganges; the trans-Gogra region is divided into two nearly equal parts by the Rápti. All the drainage of the country falls directly or indirectly into the Ganges.

Climate, &c.—The climate of the North-Western Provinces as a whole may be classed as hot and dry. The Himálayan districts are, of course, cool, and have a much greater rainfall than the plains. They are succeeded by a broad submontane belt, the Tarái, which is rendered moist by the mountain torrents, and is covered by forest from end to end. This region bears a singularly bad reputation as the most unhealthy in all India, and in many parts only the acclimatized aborigines can withstand its deadly malaria. The plain country is generally warm and dry, the heat becoming more oppressive as the general level of the country sinks towards Allahábád and Benares, or among the hills of Bundelkhand. The monthly temperature of twelve stations in 1881-82 was as follows:—maximum, 112° Fahr.; minimum, 40°·1 Fahr.; general mean, 77°·8 Fahr. The maximum was 82° at Chakráta in Dehra Dún, 109° in Meerut, 114° in Allahábád, and 116° in Jhánsi; the minimum was 28° at Chakráta, 35° at Meerut, 41° at Allahábád, and 44° at Jhánsi. The general mean was 57°·7 at Chakráta, 76°·8 at Meerut, 78°·4 at Allahábád, 78°·8 at Benares, and 79°·1 at Jhánsi. The total rainfall during the same year amounted to 54·03 inches at Chakráta, 97·49 at Dehra, 29·63 at Meerut, 35·43 at Bareli, 34·01 at Allahábád, 33·77 at Benares, and 52·62 at Jhánsi. The chief disease is fever, to which a large proportion of deaths are due.

Population.—The North-Western Provinces contain a denser population than any country of Europe, excepting Belgium and England. The census of 1881 returned the population of the British districts at 32,720,128 (males 17,060,901, females 15,659,227), distributed among 81,274 villages and towns. Including the two attached native states of Garhwál and Rámpur, the area amounted to 86,983 square miles, and the population to 33,461,878. The following table exhibits the area (in square miles) and population of each district and state separately (exclusive of Oudh).

Division.	District.	Area.	Population.	Division.	District.	Area.	Population.
Meerut	Dehra Dun	1193	144,070	Jhánsi ..	Jaláun ..	1469	418,142

				Rámpur (native state)		945	541,914

Mohammedans muster strongest in the northern divisions of Meerut and Rohilkhand, where they number 2,327,620. In Benares, Allahábád, Agra, and Kumáun divisions they form a percentage respectively of 10·7, 9·5, 8·7, and 8·4 of the population. Many of the descendants of converts forced to embrace Islám at the sword's point retain several Hindu customs and adhere to purely Hindu observances and ceremonies.

Most of the people are gathered into small villages. There are, however, no fewer than 238 towns with a population exceeding 5000, and containing an aggregate of 3,513,107 inhabitants. No other part of India contains so large a proportion of celebrated cities, though recent changes have made over Delhi, the most famous of all, to the adjacent province of the Punjab. Thirteen towns contained in 1872 a population exceeding 50,000—namely, (1) Benares, 199,700; (2) Agra, 160,203; (3) Cawnpur. 155,444; (4) Allahábád, 148,547; (5) Bareli (Bareilly), 113,417; (6) Meerut, 99,565; (7) Sháhjahánpur, 74,830; (8) Murádábád, 67,387; (9) Farrukhábád, 62,437; (10) Koil (Alígarh), 61,730; (11) Sahāranpur, 59,194; (12) Gorakhpur, 57,922; and (13) Mírzápur, 56,378. Eighteen towns contain a population of between 20,000 and 50,000. The other places of interest in the provinces are—the hill sanataria

of Nâini Tál, Masúri (Mussooree), and Landaur, the sacred town of Hardwár, the ruined sites of Kananj and Hastinapur, the deserted Mughal capital of Fatehpur Sikri, and the ancient temples and fortresses of Mahobá and Kálinjar. Most of the great towns lie along the banks of the Ganges and the Jumna.

Agriculture.—Of a total area of 81,858 square miles, 35,169 were returned as under cultivation in 1881-82. Eleven great canal irrigation works have been undertaken by Government:—(1) Ganges Canal, (2) Eastern Jumna Canal, (3) Ágra Canal, (4) Dún Canals, (5) Rohilkhand Canals, (6) Bijnaur Canals, (7) Bundelkhand Lakes, (8) Lower Ganges Canal, (9) Bundelkhand survey, (10) Sardah Canal survey, and (11) Betwá Canal. The total area irrigated in 1881-82 by Government works amounted to 1,395,217 acres. There are two principal harvests, in autumn and spring. The great agricultural staple is wheat. The chief commercial crops include indigo, cotton, sugar, oil-seeds, and opium. The cultivation of tea is confined to the submontane districts of Kumáun, Garhwál, and Dehra Dún. The produce is chiefly manufactured into green tea, which finds a ready sale across the frontier in Central Asia, and is also exported to England. Rice and sugar-cane grow chiefly in the river valleys or in irrigated fields; wheat is raised on the uplands by the aid of canals and wells; millets and cotton grow on the drier soils, while tobacco, vegetables, and other richer crops occupy manured plots in the neighbourhood of villages. The three principal recognized tenures are—(1) *zamíndári*, in which the whole land is held and managed in common, the rents and profits of the entire estate being thrown into a common stock and divided among the shareholders: (2) *pattidári*, in which the lands are held severally by the different proprietors, all of whom are jointly responsible for the Government revenue; (3) *bhaydchára*, in which portions of the soil are held severally, while other portions may be held in common, with joint responsibility for the Government demand. In the hill tracts the peasantry are well off and independent; in the more favoured plain districts they are in fairly comfortable circumstances; but in Bundelkhand they still suffer from the effects of former misrule and from the effects of recent famines.

Commerce and Trade; Communication, &c.—The exports of the North-Western Provinces are principally confined to its raw agricultural produce—wheat, oil-seeds, cotton, indigo, sugar, molasses, timber and forest produce, dye-stuffs, *ghi*, opium, and tobacco. The imports consist mainly of Manchester piece-goods, metal-work, manufactured wares, salt, and European goods. The principal manufactures are sugar, indigo, and coarse cotton cloth. Ornamental metal-work is made at Benares. The only factories on the English model are the Elgin and Muir cotton mills at Cawnpur, the Sháhjahánpur rum distillery, and breweries at Masúri and Nâini Tál. The largest and most valuable portion of the trade of the Provinces is now conducted by rail direct with Calcutta, but the great waterways of the Ganges and Jumna still carry a large part of the heavy traffic. The Gogra forms the main channel for the grain and cotton of Gorakhpur, Basti, and Azamgarh, and for the forest produce of Nepál. The lines of railway are the East Indian, which enters the North-Western Provinces from Bengal, and has its terminus at Delhi: the Sind, Punjab, and Delhi line; the Oudh and Rohilkhand Railway; and the Rájputána State Railway, connecting Agra with Bhartpur. The great trunk road traverses the heart of the Provinces.

Administration.—The North-Western Provinces are under the administrative charge of a lieutenant-governor, who resides at Allahábád. The total revenue (including that of Oudh) in 1881-82 amounted to £9,075,727, and the expenditure to £4,362,274. The chief item of receipt is the land-tax, which produced during the same year £5,751,104. Education is making steady progress throughout the central Gangetic plain, though still very backward in the Himálayan districts, in Bundelkhand, and in the remoter parts of Rohilkhand and the trans-Gogra tract. The total number of colleges and schools in the North-Western Provinces in 1881-82 was 5063, with a roll of 170,966 pupils, of whom 142,190 were Hindus and 24,437 Mohammedans. The principal institutions for higher English education are the Muir Central College at Allahábád, and the Government and Church Missionary Society's Colleges at Agra. The Benares College gives high Sanskrit education, while Delhi College, just beyond the borders, gives instruction in Arabic and Persian. Primary education is afforded by a complete system of village schools, the Provinces being divided into three circles of inspection, and elementary instruction is now brought within easy reach of all who choose to avail themselves of it.

History.—The traditions of the *Mahábhárata* cluster round the city of Hastinapur in Meerut district, which, with Indraprastha, whose shapeless ruins are still to be seen near Delhi, formed the respective capitals of the Pandavas and Kauravas. The earliest empire in this part of India, however, of which any certain monuments remain was that of the Buddhist dynasty of Magadha, which attained its greatest development under Asoka (see vol. xii. p. 784 *sq.*).

Continuous history begins with the Mohammedan invasion of Mahmúd of Ghazni, who sacked the sacred cities of Kanauj and Muttra in 1017 A.D. Mohammed Ghori, however, was the real founder of the Moslem power in Hindustán. In 1193 the seat of the Moslem empire was fixed at Delhi, where it remained, with few intermissions, till the British conquest.

The British first came into connexion with the North-Western Provinces as they advanced along the valley of the Ganges from Bengal. In 1763 the nawáb wazír of Oudh, with the phantom emperor Sháh Alam, invaded Bengal. They received a crushing defeat at Baxar, and the emperor, with Balwant Sinh, rájá of Benares, joined the British camp. In 1775 the nawáb of Oudh, Asaf-ud-daulá, ceded Benares, Jaunpur, and Gházipur to the British, retaining Allahábád and Korah, which had been taken from the emperor in the previous year, when the British sold them to Oudh.

The nawáb wazír, having agreed to pay a subsidy for the English troops maintained for his aid, and being always in arrear, signed in 1801 the treaty of Lucknow, by which he made over to the British the whole of his Oudh dominions in the Doáb, together with Rohilkhand. For Lord Lake's campaign in 1803 against Sindhia, which brought the whole remaining portion of the North-Western Provinces under British rule, see vol. xii. p. 804. The Himálayan districts of Kumáun and Garhwál were not acquired until after the Gúrkha war of 1814-15, while the Delhi territory remained the personal appanage of the Mughal royal family until 1832, when it passed to the direct government of the East India Company.

The first half-century of the British occupation was a period of peaceful progress. The Doáb especially rose into a great agricultural and commercial tract, filled with new and growing cities, such as Cawnpur, Meerut, Alígarh, Rúrki (Roorkee), and Saháranpur. This peaceful period was interrupted by the mutiny of 1857, which first broke out in the North-Western Provinces, and produced more disastrous effects in this tract than in any other part of India. Since the repression of the rebellion the principal event of importance in the Provinces has been the rapid development of the railway system, which is revolutionizing the commercial condition of the country and throwing open fresh outlets for its agricultural wealth. The outlying chief-commissionership of Oudh was placed under the administration of the lieutenant-governor of the North-Western Provinces from January 1877. (W. W. H.)

NORTH-WEST TERRITORY was at first the vague general designation of all that portion of British North America which lay to the north-west of the provinces of the St Lawrence basin. In the British North America Act of 1867 provision was made for the eventual admission into the Dominion of Canada of Rupert's Land and the North-Western Territory. When, in 1869-70, the territories of the Hudson's Bay Company (Rupert's Land, &c.) were incorporated with Canada, the province of Manitoba was formed out of the district lying between 49° and 50° 30′ N. lat. and between 96° and 99° W. long., and "any portion of Rupert's Land and the North-West Territory outside" of those limits was to be governed by the lieutenant-governor of Manitoba under the name of the North-West Territories. In 1876 the district of Keewatin (or Kewatin) was constituted; in 1881 the limits of Manitoba were shifted north to 52° 30′ and west to 101° 20′; and in 1882 the four new districts of Assiniboia, Saskatchewan, Alberta, and Athabasca were organized. (1) Keewatin (395,000 square miles) lies due north of Manitoba, and extends as far as Boothia on the Arctic Ocean. (2) Assiniboia (about 95,000 square miles) lies west of Manitoba between 101° 20′ W. long. and the line dividing the 10th and 11th ranges of townships of the Lands System Survey, and is bounded northward by the 9th correction line (near 52° N. lat.). It contains Fort Pelly, Fort Ellice, Qu'Appelle, and Regina (on the Canadian Pacific Railroad), the last of which has been chosen as the future capital of the province. (3) Saskatchewan (about 114,000 square miles) lies north of Assiniboia, and extends north to the 18th correction line (about 54° N. lat.) and east to the Nelson river and Lake Winnipeg. It contains Battleford, Carleton, Prince Albert. (4) Alberta (100,000 square miles) is all the country due west of Assiniboia and Saskatchewan as far as the boundary of British Columbia. (5) Athabasca (122,000 square miles) is the country due north of Alberta as far as the 32d correction line (about 60° N. lat.). The term North-West Territories is now used to indicate, not only the unorganized region to the north-west, but all the unorganized region of British North America, inclusive even of Labrador.

NORTHWICH, a market town of Cheshire, England, is situated at the confluence of the rivers Weaver and Dane, near the Trent and Mersey Canal, and near the main line of the London and North-Western Railway in the Chester branch of the Cheshire lines, 18 miles north-east of Chester and 22 south-west from Manchester. The streets are narrow and irregular, and many of the houses are screwed and bolted together to keep them secure from subsidences arising from the dissolving of the salt strata (180 feet in thickness), caused by the pumping of brine for the purpose of evaporation. Among the public buildings are the market-house, the drill-hall, and the Victoria club. Salt springs in Northwich were known to the Romans. By the Britons it was called the Black Salt Town. The substratum of rock-salt upon which the town rests was first discovered in 1670. It consists of two beds, a lower and an upper, which lie horizontally, the lower about 330 feet from the surface. In the lower stratum there exist several mines in the neighbourhood of the town. From two of these, each 40 acres in extent, the rock-salt is produced. The average quantity of salt exported from the town annually amounts to over 500,000 tons. Many of the inhabitants are engaged in building flat boats to convey the salt to Liverpool; and shipbuilding, rope and sail making, brick making, iron and brass founding, and tanning are also carried on. One mile from the town the river Weaver trustees have constructed an hydraulic lift to connect their navigation with the Trent and Mersey Canal on the higher level. By the river vessels of 500 tons burden can approach the town. The population of the urban sanitary district (area 1920 acres) in 1881 was 12,246.

At the time of the Norman survey Northwich constituted part of the demesne of the earls of Chester. In the reign of Richard III. it passed to the crown, and afterwards was granted to the Derby family, who sold it a century ago; in recent years the manor was acquired by the local board by purchase. The town in 1643 was fortified by the Parliament, was taken by the Royalists, but was retaken by the Parliamentarians.

NORTON, HON. MRS CAROLINE ELIZABETH (1808-1877), afterwards Lady Stirling-Maxwell, ranks high among the women of letters of the 19th century. She was born in 1808. One of the three beautiful granddaughters of Sheridan, daughters of his son Thomas, "three Graces" of London society in the reign of George IV., she showed literary ambition and faculty before she was out of her teens. Her first publication, made at the age of seventeen, was a merry satire, *The Dandies' Rout*, illustrated by herself, full of girlish high spirits and wit. The preference shown for mournful and tender themes in her subsequent writings is in strange contrast with this opening *jeu d'esprit*. Her first essay in serious verse was made in 1829 with *The Sorrows of Rosalie*, the next in 1831 with *The Undying One*, a version of the legend of the Wandering Jew. Fluent melody of versification, richness and felicity of language, great tenderness of sentiment, and rhetorical luxuriance of illustration showed that she had inherited no small portion of her grandfather's genius, and brought her at once into fame. Her portrait appeared in *Fraser's Magazine* in 1831 as that of "the leader of the female band." Curiously enough, the author of the accompanying notice describes her as "happy in all the appliances of wealth and fame," and asks, "Of a life like hers what can be told?" at the very time when, according to her own subsequent account, she was "learning the law respecting women, piecemeal, by suffering from every one of its defects of protection." She had made an unfortunate marriage in 1827 with the Hon. George Norton, brother of Lord Grantley; then, after three years of protests on her part and good promises on his, she had taken the decisive step of leaving his house for her sister's, had "condoned" on further good promises, and had returned, to find matters worse. The husband's unmanly persecutions culminated in 1836 in an action brought against Lord Melbourne for seduction of his wife, which the jury decided against Mr Norton's claims without leaving the box. Mrs Norton made her own unhappy experience a plea for addressing to the queen in 1855 an eloquent letter on the law concerning divorce, and her writings had considerable influence in ripening opinion for recent changes in the legal status of married women. During the reign of William IV., Mrs Norton was at the height of her literary reputation, contributing many criticisms, sketches, tales, and songs to various periodicals and annuals, and using pencil as well as pen. She was not a mere writer of elegant trifles; she was one of the priestesses of the "reforming" spirit; she appeared at her best in such works as *A Voice from the Factories* (1836), a most eloquent and rousing condemnation of child labour. In a similar vein of warm sympathy with the unfortunate, she addressed a poem in 1845 to the prince of Wales, exhorting this *Child of the Islands* to use his power for social reforms. *Aunt Carry's Ballads*, dedicated to her nephews and nieces, are written with playful tenderness and grace of the most charming kind. Later in life she produced three novels, *Stuart of Dunleath* (1851), *Lost and Saved* (1863), and *Old Sir Douglas* (1868). All three are written with great power and freshness of style, enthusiastic facility in the exposure of social impostures and in the exhibition of ideals of generous conduct. Her heroines are too painfully tried by calamitous misunderstandings and injuries, especially Eleanor Raymond, the heroine of the first, whose long series of misfortunes finds hardly any relief from childhood till death. This may have been due to the writer's moral purpose, originating in her own bitter experience, of championing the wrongs of her sex; but it is a singular fact, pointing to temperament as the cause, that Johnson made the same complaint about the novel of her great-grandmother, Frances Sheridan. Mrs Norton's last poem was the *Lady of La Garaye* (1861), her last publication the half humorous, half heroic story of *The Rose of Jericho* in 1870. She died on the 14th of June 1877. Mr Norton died in 1875; and Mrs. Norton in the last year of her life was married to Sir W. Stirling-Maxwell.

NORWALK, a township of the United States, in Fairfield county, Connecticut, on Long Island Sound, 43 miles north-east of New York, at the terminus of the Danbury and Norwalk Railroad. It contains the borough of Norwalk, dating from 1836, and the city of South Norwalk, incorporated in 1870, the population of township, borough, and city in 1880 being respectively 13,956, 5308, and 3726. Vessels drawing 6 feet of water ascend the Norwalk river at low tide, and there is regular steamboat communication with New York. The shallow waters of the bay at the mouth of the river form a good locality for oyster-culture, and about three hundred families in South Norwalk are engaged in this industry. Locks, knobs (of New Jersey clay), and iron bolts and screws are manufactured in the township on a very extensive scale; and there are also iron-foundries, shipyards, flour-mills, planing-mills, felt factories, hat factories, carriage-works, shoe factories, &c. Norwalk was settled about 1640 and incorporated as a town in 1653. The settlement was burned by Governor Tryon's Hessians in 1779.

NORWALK, a post-village of the United States, capital of Huron county, Ohio, 58 miles east of Toledo by the Lake Shore and Michigan Southern Railway and also on the Wheeling and Lake Erie Railroad, is a flourishing little place of 5704 inhabitants (1880), containing planing-mills, grist-mills, manufactories of sewing-machines, organs, carpet-sweepers, and shoes, and breweries.

NORWAY & SWEDEN

NORWAY

Part I.—Geography.

Plate IX. NORWAY comprises the western and northern divisions of the Scandinavian peninsula. It is bounded N. by the Arctic Ocean, W. by the Norwegian Sea and the North Sea, S. by the Skagerrak, and E. by Sweden, Finland, and Russia. It lies between 57° 59′ (Lindesnæs, or The Naze) and 71° 11′ (Knivskjærodden, close to the North Cape) N. lat. and 4° 30′·5 (Utvær, off Sogne Fjord) and 31° 12′·5 (Renö, adjacent to Vardö) E. long. The length of the coast-line, exclusive of fjords, bays, and islands, is 3018 miles, and the area 122,780 square miles. The country, which has its greatest breadth, 280 miles, at the 61st parallel of latitude, is comparatively narrow, measuring only 70 miles across between the 64th and the 68th parallels.

Configuration. The Scandinavian peninsula constitutes for the most part a rocky region, of which the loftiest tracts lie on the Norwegian side. The interior of Finmark, the most northerly district of Norway, has no considerable heights; but the frontier between Sweden and Norway, from Tromsö stift (69° N. lat.) to the southern part of Throndhjem stift (63° N. lat.), is marked by a continuous mountain range, called Kjölen (the keel), which, geologically, extends in lower levels still farther south as the frontier between the two countries. In this range are specially conspicuous the alpine regions occupying the interior of Tromsö stift, with peaks reaching a maximum altitude of 5475 feet,—the ice-clad tract of Sulitjelma east of Salten Fjord (6178 feet), the heights east of Throndhjem Fjord (4560 feet), and those east of Röros (4680 feet). From this region the loftiest line of the rocky mass takes a direction bearing west-south-west, under the name of the Dovre Fjeld, commencing with a plateau only 2000 feet high, but rising farther west into mountainous tracts like those of Snæhætten, whose summit (7566 feet) was long regarded as the highest in Norway, Rundane (6930 feet), the Jotun Fjelde, where the loftiest peak of Norway, or indeed of northern Europe, occurs (Galdhöpiggen, 8400 feet), and terminating at its western extremity, north of Sogne Fjord, in the snow-field known as Justedalsbræ, where Lodalskaupen reaches the height of 6790 feet. From the Jotun Fjelde the ridge extends southwards, under the name of the Lang Fjelde, comprising the Fille Fjeld (Suletind, 5807 feet; Jökuleggen, 6247 feet), the Hemsedal Fjeld, Hallingskarvet (6430 feet), Hallingjökelen (6539 feet), Hardangervidden (Haarteigen, 6063 feet), and is gradually lost in more moderate elevations towards the extreme south of the country. Thus a glance at the map will show that the ridge of highest points which traverses the Scandinavian peninsula runs almost parallel to the west coast of Norway, and that the lines retain on the whole this relative position in their various deviations. The narrower part of the mountain mass occurs on the side of the ridge facing the Norwegian Sea, the broader part on that facing the Baltic and its arms. In the latter direction, *i.e.*, eastward, the surface of the country presents a comparatively uniform slope, alike in Sweden and in the part of Norway lying south of the Dovre Fjeld and east of the Lang Fjelde. West of the ridge, on the other hand, the rocky mass maintains on the whole a higher elevation, sinking comparatively slowly and here and there in ledges towards the sea, so that in various localities its final descent to the ocean is exceedingly abrupt, or it terminates in lofty precipitous islands.

In Norway the mountainous region constitutes chiefly a vast plateau extending well-nigh over the whole country, the general outline of which has been noted above. From this tableland rise the summits of the mountains, and the rocky mass itself is intersected by wide fissures, forming valleys, lakes, and fjords. The roads across the mountain ridge traverse the valleys, and hence can afford no standard by which to measure its height. Its elevation is estimated at from 2000 to 4000 feet in different localities. From the position of this mountain ridge it naturally follows that the longest valleys and the longest rivers are found in the "east country," *i.e.*, the part of Norway lying to the east of the Lang Fjelde and south of the Dovre Fjeld, whereas on the west coast the valleys are invariably short, and many of the fissures are occupied by deep fjords penetrating far into the interior. Such parts of the country as may justly be entitled plains (as, for instance, Romerike in east Norway, and Lister and Jæderen on the south-west coast) are exceedingly limited as to both number and extent. Hence the rivers are navigable only for short distances, and even then only exceptionally by large vessels. Rivers. It is only in those comparatively frequent cases where the rivers expand into lakes that they can, strictly speaking, be navigated by ships. On the other hand, the waterfalls in Norway are exceedingly numerous, and many of them remarkable for their height, body of water, and great beauty. The most important rivers are enumerated below.

(1) The Klar Elv flows from Fæmundsö into Sweden. (2) The Tista (7 miles) flows through Femsö and thence into the sea at Frederikshald. (3) The Glommen, the largest river in the Scandinavian peninsula (350 miles), rises in Söndre (South) Throndhjem amt, north of Röros, flows through Österdal, and disembogues by two arms into the Skagerrak at Frederikstad. It is navigable for large ships 7 miles from its mouth up to Sarpsborg, where it forms the celebrated Sarpfos (69 feet). The Glommen has numerous tributaries, of which the most considerable is the Vormen, flowing out of Lake Mjösen. (4) The Gudbrand Laagen (50 miles), rising in Lesjeskogen Vand (a lake with two outlets) on the Dovre Fjeld and flowing through Gudbrandsdal, forms Lake Losna and falls into Lake Mjösen at Lillehammer. (5) The Drams Elv (163 miles, reckoned from the source of the Bægna), the outlet of Lake Tyrifjord, falls at Drammen into Drammen Fjord, an arm of Christiania Fjord. The chief tributaries of the Drams Elv are the Rands Elv, which flows through Rands Fjord; the Bægna (87 miles), which rises in the Fille Fjeld and passes through Valders; and the Hallingdal Elv (113 miles), which has its source in Hallingskarvet and flows through Hallingdal and Lake Kröderen. The two first of these tributary streams unite at Hönefos, at the northern extremity of Lake Tyrifjord. (6) The Nummedal Laagen (143 miles) rises in the mountain lake Normands Laagen on Hardangervidden (Waste of Hardanger), flows through Nummedal, passes the mining town of Kongsberg, and falls into the Skagerrak at Laurvik. (7) The Skien Elv (126 miles) receives the drainage of eastern Thelemark and falls at Skien into Skien Fjord. (8) The Nisser Elv (112 miles), from Nisser Vand, falls into the sea at Arendal. (9) The Topdal Elv (84 miles) rises in western Thelemark and disembogues at Christiansand. (10) The Otteren (140 miles) flows through Sætersdal, where it expands into several lakes, and falls at Christiansand into the Skagerrak. (11) The Mandal Elv (85 miles) reaches the Skagerrak at Mandal. (12) The Sire-aa (84 miles) traverses Siredal, forms Siredal Vand, and disembogues into the North Sea. (13) The Bjoreia (22 miles) rises on Hardangervidden, forms the celebrated Vöringfos (474 feet high), and discharges itself into Hardanger Fjord. (14) The Rauma (36 miles), from Lesjeskogen Vand, flows through Romsdal and has its outlet at Veblungsnæs into Romsdal Fjord. (15) The Driva (70 miles), from Snæhætten on the north side of the Dovre Fjeld, flows through Drivdal and disembogues into Sundal Fjord. (16) The Orkla (98 miles), flowing from Opdal through Orkedal, discharges itself into Throndhjem Fjord. (17) The Gula (78 miles) rises in close proximity to the springs of the Glommen and flows through Guldal to Throndhjem Fjord near the embouchure of the Orkla. (18) The Nea (70 miles), from Selbusjö, the river on which Throndhjem is situated, forms the Lerfos. (19) The Namsen Elv (85 miles) flows through Namdal and enters Namsen Fjord at Namsos. (20) The Rös Elv (16 miles), the outlet of Rös Vand, falls into Ranen Fjord. (21) The Ranen Elv (42 miles), from the frontier range, disem-

bogues into Ranen Fjord. (22) The Salten Elv (43 miles) falls into Salten Fjord. (23) The Maals Elv (74 miles) flows into Malangen Fjord. (24) The Skibotten Elv (43 miles) falls into Lyngen Fjord. (25) The Reisen Elv (70 miles), from the Swedish-Norwegian frontier, disembogues into Reisen Fjord. (26) The Alten Elv (98 miles), from the Finmark plateau, flows past Kautokeino and falls into Alten Fjord; it is navigable with boats for a considerable distance. (27) The Tana Elv (175 miles), which constitutes throughout a great part of its course the frontier between Norway and Finland, disembogues into Tana Fjord; it also is navigable with boats for a considerable distance. (28) The Neiden Elv (50 miles) is in south Varanger. (29) The Pasvik Elv (77 miles), which for part of its course constitutes the Russian frontier, drains the great Enare Lake and flows into Kloster Fjord, an arm of Varanger Fjord. (30) The Jakobs Elv (15 miles), the last frontier river bordering on Russia, disembogues close to King Oscar II.'s Chapel.

Lakes. The fresh-water lakes of Norway must, as already stated, be generally regarded as mere river expansions. Hence they are, as a rule, long and narrow, and, to judge from the soundings hitherto made, exceedingly deep.

The most important are:—Fæmundsö in Österdal, 35 miles long, 2300 feet above the sea; Öieren (Glommen); Mjösen, the largest inland lake of Norway, 57 miles long, with a surface-area of 200 square miles, 400 feet above the sea, and 1483 feet in depth, the bottom being 1083 feet beneath the level of the North Sea; Randsfjord, 43 miles long; Tyrifjord, comparatively quadrangular in form; Kröderen (the Hallingdal Elv), Nordsjö, Hiterdal Vand, Tinsjö, Siljord Vand, Bandak Vand, Nisser Vand, in Thelemark; Bygdin, Gjende, 3314 feet above the sea; Vinster Vandene (Jotun Fjelde), Hornindal Vand (in Nordfjord), Selbusjö (Throndhjem), Ros Vand, possibly the largest inland lake of Norway next to Mjösen, and by comparison of a somewhat more quadrangular form, in Helgeland; and Alte Vand (Tromsö stift). A map of Norway on a large scale shows a prodigious number of smaller sheets of water, more particularly in Christiansand stift. The total surface-area of all the fresh-water lakes of Norway is estimated at 2930 square miles, or 2·38 per cent. of the area of the land.

Southern coast. The numerous and in many cases very extensive fjords, as well as the height and contour of the country, give to the different parts of the coast of Norway a remarkably varied character. For long distances the mainland does not come into direct contact with the sea, girdled as it is by a belt of islands, holms, and skerries, more or less thickly set, which forms the so-called "skjærgaard" (fence of skerries) or outer coast. Between this wall of islets and the mainland, accordingly, extends a connected series of sounds—"leder" (roads), as they are called—of the greatest importance for coastal navigation, since they admit of the employment of smaller and weaker vessels. The whole of the coast from Svinesund, the terminal point of the southern frontier towards Sweden, as far as Lister, is comparatively low. Of its most noteworthy fjords the first in order is that of Christiania, 90 miles long from south to north, or from the Færder lighthouse to Christiania. Here, at its head, it forms Bunde Fjord, extending north to south; and some distance down Drammen Fjord. Farther west comes Langesund Fjord, which enters Skien Fjord in a northerly direction. The remaining fjords on this tract of the coast are of minor importance. Of islands must be mentioned those in close proximity to Christiania:—Jelöen, in the vicinity of Moss; the Hvalöer, off the eastern shore of Christiania Fjord; Nöterö and Tjomö, off the western shore; Jomfruland, in the vicinity of Kragerö; and Tromöen, near Arendal. The navigable roads or sounds on this part of the coast are not strictly connected, though comparatively considerable in extent. Open tracts, unprotected by a belt of islets and skerries, occur at the mouth of Langesund Fjord, and along the coast westwards from Lindesnæs. At Lister the coast begins to rise, and continues to do so as far as the flats of Jæderen, where the land has a gentle slope towards the interior of the country. This tract, with the sole exception of Egeröen, has no girdle of skerries, nor is it anywhere intersected by any considerable fjords.

Western coast. From Bukken Fjord, however, which lies fully exposed to the sea, the "skjærgaard," in a stricter sense, commences, to continue almost uninterruptedly along the whole west coast. Bukken Fjord sends off several arms, the principal of which are Stavanger Fjord and Lyse Fjord, the latter noted for its great narrowness and its lofty precipitous walls. The roads or navigable sounds between Bukken Fjord and Bergen are open to the sea at the mouths of the larger fjords only. Of such the most noteworthy is Hardanger Fjord, which, beginning at Bömmelen and piercing the country for 80 miles in a north-easterly direction, sends off several arms. That nearest the head is the picturesque Sör Fjord, lying north and south. From Bergen northwards to Cape Stad there is, if the mouths of the fjords be excepted, a well-protected "led" or road. At the 61st parallel of latitude we have the longest fjord of Norway, Sogne Fjord, which penetrates 100 miles into the country, everywhere shut in by high and precipitous rocky walls. Northwards, its chief arms are Fjærland Fjord, Sogndal Fjord, and Lyster Fjord; eastwards, Aardal Fjord and Leirdal Fjord; southwards, Aurland Fjord, together with Nerö Fjord, the grandest of them all. Off the north shore of Sogne Fjord we have the most westerly islands of Norway, viz., Utvær, and farther north the lofty islands of Alden, Kinn, Batalden, and Skorpen. Here Dals Fjord and Förde Fjord, and farther north Nord Fjord, of very considerable extent, penetrate into the country. Off Nord Fjord lies the island of Bremangerland, with a mountain summit, the Hornelen, rising to the height of 2940 feet. The land at Stad projects into the sea without any belt of islets; the protecting fence, however, soon recommences farther towards the north-east. On this part of the coast, that of Romsdal, several large fjords penetrate deep into the country, such as Stor Fjord in Söndmöre, with numerous arms, the most important being Hjörund Fjord and Sunelv Fjord, Romsdal Fjord, Sundal Fjord, and Surendal Fjord. To an exposed tract of coast, Hustadviken, south of Christiansund, succeeds Throndhjem Led (Throndhjem Road), shut off from the sea by the large low islands of Smölen and Hiteren, the latter of which is the largest island in southern Norway. From Throndhjem Led the broad and extensive Throndhjem Fjord stretches in several directions, first south-eastwards, then eastwards, and finally north-eastwards, for about 80 miles into the country, as far as Stenkjær on Beitstad Fjord.

North of Throndhjem Fjord an outer coast with a navigable "road" extends almost unbroken to the North Cape. Among other fjords in Nordre Throndhjem amt Folden Fjord and Namsen Fjord must be mentioned; off the latter, the low-lying group of islands bearing the name of Vigten project far into the sea, surrounded, as in the case of Smölen and Hiteren, by an extremely shoaly "skjærgaard," which stretches right up to Vest Fjord, and renders an approach to land very difficult and dangerous. The coast of Nordland is distinguished by a chain of lofty picturesque islands, as Torghatten, with its natural tunnel, 400 feet above the sea, which runs from south-west to north-east for a length of 520 feet, Vægö, Dönnesö, Lovunden, Trænan, Hestmandö, Lurö, Fuglö, and Landegode. The mainland, too, exhibits magnificent mountain summits, viz., the Seven Sisters on Alstenöen, Strandtinderne, and the snow-field Svartisen. The fjords, though not so long as in southern Norway, are still of very considerable size, as, for example, Bindal Fjord, Vel Fjord, Vefsen Fjord, Ranen Fjord, Salten Fjord, Folden Fjord, Tys Fjord, and Ofoten Fjord. Off Salten are the well-known Lofoten Islands, skirting westerly the broad arm of the sea called Vest Fjord, which terminates in Ofoten Fjord. The Lofotens consist of a chain of islands separated from each other by broader and narrower channels. The mountains on the outermost group are not particularly high—indeed the principal island, Röst, is

remarkably low; but otherwise the islands exhibit a chain of granite peaks to be counted in hundreds, strangely characteristic with their jagged, fantastic outlines, and towering to a height of from 2000 to 3500 feet above the level of the sea. This truly alpine scenery is rendered the more imposing in character by the fact of its rising directly from the sea. The Lofotens are connected on the north with the group of islands called Vesteraalen, which, in their southern parts, fully equal the Lofotens in grandeur. Within these groups of islands lies the largest island in Norway, Hindöen (area, 865 square miles), with the lofty peak, Mösadlen. From the innermost creek of Ofoten Fjord the distance to the Swedish frontier is only 6 miles. North of Hindöen, in Tromsö amt, there is also a chain of large islands, as Senjen, Kvalö, Ringvasö, and others. Of large fjords may be mentioned Malangen Fjord, Bals Fjord, Ulfs Fjord, Lyngen Fjord, as also Kvænang Fjord, with the grand scenery of the Kvænang peaks. In Finmark, the large coast islands Sörö, Stjernö, Seiland, Kvalö, Ingö, Magerö extend to the North Cape; but here the "skjærgaard," or outer coast, comes abruptly to an end. The coast of east Finmark presents a totally different character: flat mountain wastes descend precipitously to the ocean without any islands beyond, save Vardö, with two low islets at the farthest eastern extremity of Norway. The fjords of Finmark are broad and long, as Alten Fjord, Porsanger Fjord, Laxe Fjord, Tana Fjord, all extending southwards, and Varanger Fjord, which takes a westerly direction. The farther east one proceeds the lower does the country become; the sharp peaks disappear and give way to a low-lying, monotonous landscape on the north side of Varanger Fjord; the south side, however, exhibits a more varied aspect, especially where, between the tributary fjords, several islands occur. The total area of the islands of Norway amounts to 8460 square miles.

Northern fjords and islands.

Sea-bed

The form of the sea-bed off the shores of Norway has been investigated, partly by the Coast Survey and partly by the Norwegian North Atlantic Expedition, 1876-78. (See NORTH SEA and NORWEGIAN SEA.) The hundred-fathom line of the North Sea extends west of the British Islands, and north of Shetland towards Norway, off Cape Stad. But the bank bounded by this line does not fully reach the Norwegian coast. From off Stad (62° N. lat.) a depression in the sea-bed, called the Norwegian Channel, stretches along the west and south coasts of Norway, southward and eastward, almost to Christiania Fjord and the Cattegat. The deepest part of this channel, upwards of 400 fathoms, extends through the Skagerrak between Arendal in Norway and the Scaw. Off Lister the depth is 200 fathoms, and off Bömmelen, the shallowest part, 120 fathoms. Thence it increases in a northerly direction, reaching 200 fathoms off Sogne Fjord, after which the channel finds an outlet into the deep basin of the Norwegian Sea. The breadth of the Norwegian Channel, computing by the hundred-fathom line, is from 50 to 70 miles; it is narrowest in the southernmost part, off Lindesnæs. Its walls shelve gradually down on either side, and the bottom is comparatively wide and flat. The bank extending between the coast and the inner slope of the channel is exceedingly narrow, being only from 7 to 10 miles broad. The Norwegian Channel thus constitutes a definite boundary between the plateau of the North Sea, with the countries rising from it, and the land of Norway. North of Stad occurs an expansion of the Norwegian coastal bank. Its outer slope rapidly descends towards the deep basin of the Norwegian Sea. While the hundred-fathom line keeps comparatively close to the Norwegian coast as far as the Russian frontier—off the Lofotens only does it extend a little more than 40 miles from land—the two-hundred-fathom line, which, off Romsdal, at Storeggen, runs at a distance of 40 miles from the shore, takes a northward direction, the coast, on the other hand, deflecting towards the north-east and north-north-east. Accordingly the distance between them continues to increase till, off the coast of Helgeland, it reaches 130 miles. Off the Lofotens and Vesteraalen it again approaches the land, at its nearest point—off Andenæs in Vesteraalen—being scarcely 10 miles distant. North of Vesteraalen, the two-hundred-fathom line, or the edge of the coastal bank, makes another bend towards the north, and draws off from the coast of Norway. The Barents Sea, which bounds Norway on the north, is a comparatively shallow ocean tract, the greater part of its bed ranging between 100 and 200 fathoms below the surface. Norway is thus encompassed by a series of rampart-like coastal banks, in the strictest sense continuous, being nowhere broken by channels through which ice-cold water from the depth of the Polar Sea would otherwise find a passage to the "sejlled" or navigable roads along the coast, and to the deep fjords that penetrate so far into the country. The Norwegian fjords have as a rule the remarkable characteristic that the bottom for great distances lies deeper, and in some cases very considerably deeper, than the surface of the coastal banks; thus, for example, the Norwegian Channel is upwards of 400 fathoms deep in the Skagerrak, Stavanger Fjord has a depth of 380 fathoms, Hardanger Fjord 355, Sogne Fjord 670, Nord Fjord 340, Throndhjem Fjord 300, Ranen Fjord 235, Vest Fjord 340, Alten Fjord 225, and Varanger Fjord 230. These maximum depths occur in many cases at a great distance from the sea.

Geology

For our knowledge of the geology of Norway we are chiefly indebted to the results brought to light by the Royal Norwegian Geological Survey, under the direction of Professor Kjerulf. To the geologist Norway presents a region of the highest interest, alike from the structure of the country itself and from the fact of the rock-surface almost everywhere lying bare and being intersected by natural profiles of valleys and ravines. Extensive tracts consist of the Archæan formation, with its strata of gneiss, hornblende schist, and quartz,—the first of these forming the lower, the last the upper section, both of great depth. The beds are generally folded, and in part vertical. This formation occurs particularly in Romsdal, in the vicinity of Arendal, east of Christiania Fjord (gneiss), in Thelemark, Hallingdal, Nordfjord (quartz), along the shores of Sogne Fjord, throughout the inner tracts of east Finmark. Above this formation is the Sparagmite, chiefly consisting of fragmentary rocks in thick strata, with felspar embedded. The lowest beds are grey and red Sparagmite, partly accompanied by deep masses of conglomerate. To this formation belongs the blue quartz, widely distributed throughout central Norway, as also subordinate green and black clay schist and black limestones. In the latter, which constitute the upper part of the formation, the Primordial Zone, we meet with the first traces of animal life—the oldest trilobites. The Sparagmite formation extends throughout a great part of central Norway, Österdal, Gudbrandsdal, Land. In other parts the Primordial Zone is met with immediately above the Archæan rocks. Then succeeds the Silurian system, also of wide extent, occurring in a series of beds distinctly marked off by their fossils. Characteristic strata in this system are the orthoceratite limestone with graptolithic schist (Lower Silurian), next lime sandstone, pentamerous limestone, coral limestone, along with other strata, such as red clay schist, limestones, and marl slate (Upper Silurian). The Silurian beds are almost everywhere greatly bent, compressed, and dislocated; the strike is in the great majority of cases from south-west to north-east. At and around Christiania, in the tracts bordering on Lake Mjösen and Skien Fjord, the Silurian beds occur without being metamorphosed, except locally at their contact with eruptive rocks. In the environs of Bergen, the outer part of Hardanger Fjord, the Hardanger Waste, in Söndre Throndhjem amt we meet with regionally metamorphic schists and limestones containing Silurian fossils. In the medial of the three sections of the Throndhjem schists occur Upper Silurian fossils. The Silurian system in Norway extends in the direction of south-west to north-east, straight across the southern part of the country, from Hardanger Fjord to some distance east of Throndhjem Fjord, as also from Skien Fjord to Lake Mjösen. Above the Silurian system is found, in various localities, more particularly west of Christiania Fjord, a sandstone formation, to some extent along with conglomerates, of which the geological age remains uncertain, no fossils having as yet been found in it. With this formation the series of stratified rocks in southern Norway may be said to terminate, since the next fossil-bearing strata are diluvian, containing Pleistocene animal remains.

Archæan formation.

Silurian system.

cal ma- ns. In various parts of the country we meet with extensive and highly-remarkable beds, geologically established with special local designations, and which, on the discovery of fossils indicating the sections, will, no doubt, at some later period be classed under the names given to the great and generally accepted formations with more precision than is possible at present. Such are, farthest north, the Gaisa series and the Raipas series in Finmark; in the Throndhjem region, the older of the Throndhjem schists, conglomerate and the sandstone series, and the Gula schists; in central Norway, environing the Jotun Fjelde, the alpine quartz. Of Mesozoic beds (Oxford clay) a few only still remain on the island of Andö in Vesteraalen; they consist of sandstone, coal, and oil-shale, with embedded Jurassic fossils.

uptive :ks,— nite. The eruptive rocks—granite, syenite, porphyry, gabbro, norite, serpentine, greenstone, &c.—have broken through the beds of the various formations in a variety of ways, at one time as vast masses in continuous streams, at another time as isolated dome-like summits or simply cutting upwards as dykes. Old granite occurs in Christiansand stift, Thelemark, the Hardanger Waste, where it extends over extensive tracts and at its boundaries is seen to break through the Archæan formation, sending off multitudinous coarse-grained dykes, as also on the east side of the mouth of Christiania Fjord, in Aadal and in Hedal, south of Valders, and in Österdal. Very extensive tracts of granite are met with along the coast of Romsdal and in Nordre Throndhjem amt, where the coast, called Fosen, exhibits its characteristic rounded forms. Up through Nordland we pass numerous granite tracts of considerable extent. The whole of the Lofotens and Vesteraalen, together with all the outermost islets, holms, and skerries along the coast of Nordland, consist exclusively of granite. The interior of Finmark also has very large granite tracts. Extensive masses of post-Silurian granite and syenite, as also of porphyry in sheets, occur to the west and north of Christiania Fjord; it is at the borders of these masses that the Silurian system here becomes prominent. The largest tract of gabbro is that of the Jotun Fjelde; this rock is also met with extensively in Throndhjem stift and in Tromsö stift. Norite occurs chiefly near Sógne Fjord and at Egersund. Serpentine, in tracts of very considerable extent, is met with principally throughout Throndhjem stift. Dykes of post-Silurian porphyry, but more especially of greenstone, pierce in large numbers the Silurian system of eastern Norway; similar dykes, however, are also seen here and there throughout the country traversing both schist and granite.

inerals. Notwithstanding its great abundance of rocks, Norway cannot be said to be rich in valuable ores or minerals. Thus, for example, true coal does not occur; Jurassic has been found on Andöen, but only in seams extremely limited in extent. Gold is met with very sparingly in veins of quartz at Eidsvold, in the rivers of Finmark, and along with silver in the Kongsberg mines. The latter metal is found as native silver in veins of calcareous spar at Kongsberg, where the state owns a silver mine of considerable value. Copper occurs in numerous localities, as Thelemark, Röros in the Throndhjem district, many parts of the west coast, more especially at Vigsnæs on Karmöen, and in northern Norway at Kaafjord in Alten. Nickel is produced in some parts from sulphuretted iron ore, particularly on the island of Senjen in Tromsö amt. Iron ores are met with in southern Norway, particularly along the coast near Arendal. According to the geological survey, the presence of ore is intimately connected with the eruptive rocks, at the limits of which they are accordingly to be looked for, both in the Archæan and in the later formations; thus on the confines of the oldest granite we find alike iron and copper ore; on those of gabbro, sulphuretted iron ore containing nickel and apatite.

Volcanoes, in a strict sense, and their subsequent results, such as hot springs, have not been met with in Norway.

Geological changes. The portion of the earth's crust now visible in Norway has obviously in the lapse of time undergone very great changes with respect to the position of its parts, their level, and their surface. Both the oldest formation and the later systems are almost everywhere greatly bent, compressed, and distorted,—and also denuded, and their parts forcibly dislocated, alike as regards situation and relative height. Formations that in the interior lie at a height of several thousand feet are on the coast found level with the surface of the sea. Strata resting on the summits bordering a lake or the shores of a fjord are again seen on islands in such lakes or fjords, and level with the surface of the latter. One side of a valley exhibits a profile which, in regard to the height of the various strata, differs materially from the profile of the opposite side. The whole rocky sheet is cut up in various directions, and the several laminæ are now sunk beneath, now raised above, those adjoining them. These dislocations have been occasioned by fissures, which in many places can be pointed out, and the number of such provable faults of dislocation increases almost every year. The direction of the fissures is manifestly of the greatest assistance in indicating the form exhibited by the surface of the country. The subsidence between two fissures produces a valley, a fjord, its rise on the other hand a height, a promontory. Professor Kjerulf has succeeded in showing that the entire system embracing the valleys and fjords of southern Norway may be easily referred to four principal directions, corresponding very nearly to the four quarters of the globe, round which the principal directions of the valleys and fjords are found grouped with predominant frequency. The same applies to northern Norway, and can also be shown to distinguish the fjords of Spitzbergen, Iceland, and Greenland; the same directions are again met with in the lines of the Icelandic volcanoes, springs, lava-dykes, and volcanic eruptions.

Influence of the ice age. Vestiges left by the ice age are very conspicuous and varied throughout Norway. The rock-surface exhibits almost everywhere, and more especially when sheltered by loose superincumbent layers, a ground, polished, and striated aspect; up to a height of 4000 to 5000 feet the striation runs in the direction of the valleys, or from the lofty inland tracts, towards the sea. Boulders of foreign origin are found scattered over the mountains, in the fields, and in the loose layers covering the surface; their origin can often be determined with certainty. Old moraines, consisting of gravel-walls lying transversely to the direction of the striæ, indicate by their position the fronts of the ancient glaciers, and by their numerous serial lines an equal number of breaks in the retreat of the ice into the country. Layers of clay and banks of mussel-shells, in which are embedded the remains of arctic marine animals, indicate the sedimentary deposit of the material carried down by the rivers of the ancient glaciers to the sea.

Snow-masses. At the present day perpetual snow is found in Norway only in elevated localities. The most celebrated masses are the following—(1) the Justedalsbræ, between Sogne Fjord and Nord Fjord. It occupies an area of 580 square miles, reaches an altitude of 5000 feet, descends with its snow-cap to between 4000 and 4500 feet, and sends off numerous glaciers on either side; several of these extend very nearly down to the sea, as the Boiumbræ in Fjærland, in Sogn, 426 feet above the sea; the largest of the Justedal glaciers is the Nigardsbræ. (2) The Folgefon, between Hardanger Fjord (Sor Fjord) and Aakre Fjord, with an area of 108 square miles and an altitude of 5270 feet. It sends off only three glaciers. (3) Hallingskarvet. (4) The snow-fields of the Jotun Fjelde, east of Sogne Fjord. (5) The snow-fields of Snæhætten. (6) The Store Borge Fjeld in Helgeland. (7) Svartisen, the largest snow-field but one in Norway, between Ranen Fjord and Salten Fjord in Nordland. It sends off a number of glaciers, some of which reach almost to the sea-level at the heads of the fjords. (8) The Sulitjelma snow-field, east of Salten Fjord, on the Swedish frontier. (9) The Jokul Fjeld, between Kvænang Fjord and Ox Fjord, on the boundary of Finmark. It sends off magnificent glaciers towards the sea. One of these, in Jokel Fjord, a branch of Kvænang Fjord, extends down to the water's edge, so that fragments of its ice fall into the fjord and float as small icebergs on the surface, the sole instance of the kind in Norway. (10) Seiland snow-field, on the island of Seiland, near Hammerfest, the most northerly névé in Europe. The limit of perpetual snow in Norway is estimated at 3080 feet on the island of Seiland, 5150 feet on the Dovre Fjeld, from 4100 to 4900 feet on the Jotun Fjelde, from 3100 to 4100 feet on the Justedal snow-fields, and from 3100 to 4100 feet on the Folgefon.

Marine terraces, beach-lines. Traces of relative changes of level between land and sea are observed in numerous localities. The highest marine terraces (in which the remains of marine animals have been found) are met with in the east part of the country and near Throndhjem at 600 feet above the sea-level; at the heads of the fjords on the west coast

they lie lower. This obviously proves these districts, at the termination of the ice age, while the glaciers were still in process of melting, to have been relatively lower than at present. And we have further indication of the fact that the interior lay higher during the ice age in the "giant kettles" occurring near the level of the sea, since these are believed to have been formed at the foot of cataracts in the glaciers, the substratum of which must, of course, have been above the level of the sea. Along the whole coast, in numerous localities, from Sondhordland (between Stavanger Fjord and Hardanger Fjord) nearly to the North Cape, and along the fjords, are found ancient beach-lines cut out in the solid rock. Their real significance as sea-level marks is shown by their perfectly horizontal direction, by their extending in several localities on the same level as the most elevated of the marine terraces (*e.g.*, that of Throndhjem), by the circumstance that in other places they run in a line continuous with the surface of adjoining terraces, and finally by the sea-wrought caverns found on the same level. It is in northern Norway especially that beach-lines largely occur. In several localities there are two parallel lines, the one above the other. Throughout extensive tracts these lines can be referred to particular levels, thus indicating a pause in the rise of the land that afforded sufficient time for the action of the sea, or pointing to the presence of certain climatic influences favourable to this production periodically alternating with unfavourable intervals. No change of level in the Norwegian coast within recent years can be scientifically shown. Earthquakes are of rare occurrence in Norway.

Temperature. The following is a summary of the results arrived at by the Norwegian Meteorological Institute (1867-83). The number of stations is from forty to fifty. The coldest parts of Norway, where the mean annual temperature is below 32° Fahr., are the highest regions of the country and the interior of Finmark (Karasjok, 26°·4); on the sea-shore it is only at Varanger Fjord that it falls below 32°. The highest mean annual temperature (44°·6) is that of Skudesnæs; and the outer coastal margin from the mouth of Sogne Fjord to Lindesnæs has a mean annual temperature of 44°. The interior of southern Norway and that of Finmark have the longest winter (200 days with a mean annual temperature of under 32°) and the lowest winter temperature, the mean temperature of the coldest day being under 14°. From the interior districts towards the coast the climate becomes everywhere milder in winter. From Lindesnæs an exceedingly narrow strip of land stretches along the west coast northwards right to the mouth of Throndhjem Fjord where the lowest mean temperature of any day exceeds 32°. Röst, the outermost of the Lofoten Islands, belongs to this strip of coast (32°·9 in January). The January isotherm for 32° reaches beyond Tromsö up to the 70th parallel of latitude; on the one side it extends down to the southern coast of Iceland, on the other to the alpine districts of Norway. In January the interior of Finmark has a temperature of 2°·5, central Norway, at an altitude of 1600 feet, 11°·3. The winter isotherms follow the contours of the coast and lie very close together. The summer is hottest in south-eastern Norway (Christiania, July, 61°·9); next come Hardanger (July, 58°·3) and Sogn (Sogndal, July, 60°·3). Karasjok has in July a mean temperature of 57°·2. On the coast the summer is colder than some distance inland; it is coldest on the Finmark coast (Vardö, July, 47°·7) and in the lofty inland tracts (Röros, 52°, 2000 feet above the sea). The interior of Finmark has a higher temperature (upwards of 57°) than any part of the outermost coastal margin as far south as Jæderen (59° N. lat.). The temperature in July (50°·2) at the North Cape (71° N. lat.) is the same as in the southern part of Iceland (63° to 64° N. lat.). The isotherm for 52° passes through the Lofotens (68° N. lat.) and the Shetland Isles (62° N. lat.); that for 56° extends from Jæderen straight across the North Sea to the northern part of Scotland. On reducing the temperature to the sea-level we get for the south-eastern part of Norway a maximum of heat exceeding 60°. The interior having a warm summer and a cold winter, and the coast a cool summer and a mild winter, the annual range of temperature is greatest throughout the inland regions (55° in Finmark, 45° in central Norway) and least on the coast—from Lindesnæs to Vardö. In Österdal and the interior of Finmark the mercury sometimes freezes (−40°). Along the outermost line of coast, from Romsdal to Jæderen, the mercury never sinks below 12°. At Karasjok a temperature of −58° has been observed. The highest known readings are those observed at Christiania (90°) and in Finmark (96° in the vicinity of Varanger Fjord). Throughout a tract extending straight across the country near the 65th parallel of latitude the maximum temperature does not reach that observed in the south-east and in Finmark. Along the coast the highest temperature is from 77° to 79°, and on the outermost skerries it hardly reaches 75°. The diurnal range of the temperature of the air is greatest in the south-east (Christiania, 15° in July, 3° in January), least on the coast (only 5° in July). In Finmark it is inappreciable during the dark season, when the sun is below the horizon throughout the twenty-four hours. At Vardö it is 5° in July. In spring the heat everywhere makes its way from the coast towards the interior of the country (in Finmark from north to south); in autumn the cold passes from the interior towards the sea (in Finmark from south to north). The thermic anomaly is in Norway during the winter months always positive; along the west coast it reaches as much as 36° in January, and off the Lofotens amounts to even 43°, the highest value it anywhere attains on the globe; even in central Norway it is +11° in January. In July it is greatest in Lapland, viz., +9°. Along a narrow strip of the south-western coast of Norway it is negative in the month of July, though hardly −2°; hence this strip of coast is comprised in the negative thermic anomaly of the North Atlantic during summer.

The tension of vapour is at all seasons of the year greatest on the coast and least in the interior of the country. The relative humidity is greatest on the coast of Finmark (82 per cent. per annum). Leirdal in Sogn, which lies under the lee of the Justedalsbræ, has an annual relative humidity of only 65 per cent. In winter it is greatest in the cold tracts of the interior (85 per cent.) and least on the west coast (70 per cent.); in summer it is greatest on the coast (upwards of 80 per cent.) and least in the interior (Christiania, 60 per cent.). On the driest days it can sink as low as 20 or even 12 per cent. [illegible] humidity.

Just as the isotherms exhibit a tendency to follow the contours of the coast, so likewise do the isobars. In the mean for the year there is a maximum of pressure (reduced to the level of the sea and to the gravity at 45° lat.) in south-eastern Norway comprised within the isobar for 29·88 inches. The isobar for 29·84 inches extends from the north of Scotland over Bergen, Dovre, Throndhjem, and parallel with the coast of Nordland to Lapland. The isobar for 29·80 inches passes across Shetland and the coasts of Romsdal, Nordland, and Finmark to the south side of Varanger Fjord. The isobar for 29·76 inches passes a little to the north of the Faroe Islands, across the Lofotens, and along the Finmark coast to Vardö. Out in the Norwegian Sea there is a minimum pressure of air (29·72 inches), with its longitudinal axis stretching from south-west to north-east, between Iceland and Norway; it extends into the Barents Sea, between Beeren Eiland, Novaya Zemlya, and Finmark. In January the normal isobars take approximately the same course. Central Norway has a maximum of 29·97 inches. The isobar for 29·80 inches extends from the north coast of Ireland across Scotland to Stad and Lapland; that for 29·60 inches passes from the Faroe Islands towards the north-east, off the coast of Norway. The least pressure of air in January is at the North Cape (29·64 inches). A minimum occurs east of Iceland (29·45 inches, a still lower Isobars.

(29·37 inches) west of Iceland, and another not quite so low in the Barents Sea to the north-east of the North Cape (29·56 inches). In July there is a minimum of pressure (29·80 inches) over central Norway (61° N. lat.). Along the part of the country adjoining the coastal region we have a maximum zone with a pressure of 29·85. In the sea between Iceland and Norway a trifling minimum (29·76 inches) occurs. It is obvious that the distribution of pressure must be regulated by that of temperature,—a maximum pressure of air over the colder, a minimum over the warmer localities.

ds. As a consequence of this normal distribution of the pressure of the air the prevailing winds in winter blow from the land to the sea, with a deviation to the right. These are accordingly north-easterly along the Skagerrak, southerly along the west coast, south-westerly in northern Norway. They are for the most part cold winds, and cool down the surface of the sea throughout the nearest tracts. In summer sea-winds prevail; they blow along the land with the land to the left, more especially in southern Norway, where the coast of the Skagerrak has south-westerly, Lindesnæs westerly, and the west coast northerly winds. In northern Norway the prevailing summer winds are northerly. The winds blowing along the coast, in one direction or another, up or down, are twice as numerous as those blowing across it, from the land or the sea. In accordance with the greater value of the normal gradient in winter than in summer, the force of the wind on the coast is *greatest in* winter; during that season it rarely ceases to blow on the coast; but the number of calm days is very considerable in the interior of the country in and around the locality of the *maximum barometric pressure. In summer calm* weather is comparatively frequent on the coast (maximum zone of pressure), but not to the same extent in the interior. Upon the whole, the force of the wind on the coast is at all seasons of the year much greater than in the inland tracts. Storms are frequent on the coast (30 stormy days a year), rare in the interior (4 *stormy* days a year). Their most frequent direction is the same as that of the prevailing winds, viz., for the whole country on an average from the south-west, then from the west and the north-west. They are most frequent in winter, particularly during December and January (4 a month), rarest in summer (hardly 1 a month).

uds. The amount of cloud in Norway is on the whole considerable. The coast of Finmark has the largest proportion (upwards of 3 cloudy days to 1 clear day). In the interior of the country the amount of cloud approximates 50 per cent. The summer months are somewhat clearer than those of winter.

g. Fog is most frequent on the west coast and the coast of Finmark in summer, rarest in winter. In the south-east part of the country the reverse is the case. In winter a frosty fog hangs over the inner extremities of the fjords when the cold is severe and the wind blows out from the land over the open water of the fjord.

in. The number of days with rain or snow is upon the whole greatest on the coast, from Jæderen to Vardö, least in the south-east part of the country. At the North Cape, in the Lofotens, along the west coast between Stad and Sogne Fjord, precipitation occurs on as many as 200 days of the year. On the Dovre Fjeld and on the coast bordering the Skagerrak the number of rainy days amounts to about 100 a year. The number of days with snow is least at Lister, increasing from 20 a year in that locality to 50 on the coast of Nordland in the vicinity of Throndhjem Fjord, on the Dovre Fjeld, and in Christiania, to 90 at Andenæs and Vardö, and to 100 at the North Cape. From Vardö to Andenæs, on the Dovre chain, and in the high mountain tracts snow occurs more frequently than rain. Snow can fall on the coast in all months of the year from the North Cape to the Lofotens. The amount of precipitation is greatest on the coast, between Sogne Fjord and Stad, where it amounts to 77 inches. West of a line from the coast of Romsdal to Christiansand it is above 40 inches. In the Lofotens it reaches 45 inches. Throughout the south-east and in Finmark it falls as low as 12 inches. In the former region, however, exceptions occur; thus, for example, a short distance north of Christiania the annual rainfall is 40 inches, whereas in the city itself it amounts to only 26 inches. In the south-east the amount of precipitation is greatest during the months of July and August, on the west coast late in autumn or in the beginning of winter. The amount of precipitation is least in spring.

Thunder-storms. Thunderstorms are not very frequent in Norway. They occur chiefly in summer, either during rainy weather and with southerly to south-westerly winds or (especially throughout the interior) on very hot days. In winter the heavy gales from the west and south-west on the west coast are often accompanied with thunder and lightning of an exceedingly dangerous character, the clouds hanging very low. Not less than a hundred churches in Norway have been struck and destroyed by lightning during the last 150 years, and of these not less than forty on the coast, in the winter thunderstorms, as far north as the Lofotens. At the North Cape, too, thunderstorms occur in winter.

Temperature of water in fjords. *The mild climate Norway enjoys must be chiefly ascribed to the* high temperature of the water that laves her shores. (See NORWEGIAN SEA.) The fjords are filled with the heated water of the Atlantic, which in their deepest parts exhibits a constant temperature as high as, in the north even higher than, the mean annual temperature of the air, representing an amount of heat which during the coldest of winters can be reduced only to a slight extent. Thus in the depths of the Skagerrak channel the temperature is 42°, that of Sogne Fjord is 43°·7, of Throndhjem Fjord 42°·8, of Ranen Fjord 40°·6, of Salten Fjord 38°·1, of Vest Fjord 42°·8, of Alten Fjord 39°·2, and of Varanger Fjord 37°·6. Where the temperature at a depth of 100 to 200 fathoms is above 32° the water *does not freeze*; hence the open coasts and fjords of Norway. *It* is only in the innermost and more continentally situated arms of fjords into which rivers disembogue, as also along shallow stretches of coast—the coast of Lister, for example—that the sea is found to freeze in winters of exceptional severity. The cold prevailing land-winds in winter cool the surface of the sea on the coasts; therefore the surface-temperature increases outwards towards a thermal axis extending off the coast of Norway, and the isotherms of the sea-surface assume the same linguiform shape as those of the air. In winter the surface of the sea on the coast has a higher temperature than the air. The surplus heat is in January 4° at the Skagerrak, 10° at the North Cape. In summer the surface of the sea is in part very slightly colder than the air. Thus upon the whole the sea exerts a direct influence in raising the temperature of the air; and the prevailing direction of the wind from the south-west tends to diffuse this heated air over the nearest inland tracts, in particular those of the west coast. In summer Norway is indebted, as regards climate, to the long days which, by reason of her high northern latitude, she enjoys. The heated water on the banks and in the fjords having during winter rendered impossible the formation of ice on the coast, and thus provided against any waste during summer of solar energy in a melting process, the sun can freely exert his beneficent influence, working, so to speak, well-nigh—in Finmark actually—without intermission throughout the short period of *vegetation.*

The current sets as a rule along the Norwegian coast from the mouth of Christiania Fjord, passing round Lindesnæs and thence on to the North Cape and the Russian frontier. In the Skagerrak the water is *much less* salt than on the west coast, being mixed with fresh water from the great rivers in the south-east part of the country, and those emptying into the Baltic. The tidal water is scarcely appreciable east of Lindesnæs; its height increases, however, rapidly northwards (Lindesnæs 1 foot, Stavanger 3 feet, Bergen 4 feet, Throndhjem 8 feet, Hammerfest and Vardö 9 feet). In *narrow* sounds the tidal current is often exceedingly strong; the following are examples—the Moskenström or Malström in the Lofotens, the Saltström at Bodo, the Ryström at Tromso.

Flora. The forest growth of Norway consists chiefly of pine and fir, which clothe the slopes of the mountain valleys, especially in *southern* Norway (as those of the Glommen and its tributaries, those of the Drammen. Laurvik, Skien, Arendal, and Christiansand

districts, and those drained by the rivers disemboguing at Frederikshald). Extensive forests of Coniferous trees are also found in Throndhjem stift and the amt of Nordland. The Coniferous woods of Bergen and Tromsø stifts consist—with a solitary exception—of fir alone. The extreme limit of the fir belt in southern Norway is from 2200 to 3000 feet above the sea; throughout the Throndhjem region, from 1600 to 2000 feet; at Talvik in Alten (70° N. lat.) it does not exceed 700 feet. With the sole exception of the birch, none of the foliferous trees indigenous to the country form woods of great extent. The birch, reaching higher up the mountain sides than do any of the Conifers, forms a belt above them, which is, however, exceedingly narrow in southern Norway. Next come the dwarf birch (*Betula nana*) and various species of willows, and, last of all, between this and the snow-limit, the lichen belt. But the line of demarcation between this region and the willow belt is not distinctly traceable, the dwarf birch and some few of the willows—more especially the creeping rotundifolious varieties (*Salix herbacea* or *polaris*)—extending occasionally to the very edge of the snow-fields. Other plants also, such as the snow ranunculus, the Alpine heather, and numerous mountain plants, many of them distinguished by their beautiful flowers, grow abundantly here. The region of the Dovre is especially noteworthy, as the tract in which the alpine flora of Northern Europe is found in greatest variety, and within comparatively narrow limits. In the fertile and less elevated districts of Norway the forest growth, apart from Conifers, includes the ash, elm, lime, oak, beech, and black alder. The aspen, white alder, mountain ash, and bird cherry thrive at a considerable elevation, and are occasionally found even in the birch zone. The oak still grows abundantly on the south-eastern coast, from Jarlsberg-Laurvik amt to Christiansand, but is nowhere found in extensive forests. The only locality in which the beech can be said to thrive is Jarlsberg-Laurvik amt.

Fauna. The vast fir and pine forests are still the haunts of the largest of European carnivora—the bear, the lynx, and the wolf. The numbers of the last-mentioned, however, have, in southern Norway, been steadily and one may almost say unaccountably decreasing during the last twenty years; and the wolf may be now regarded as the most rare of all Norwegian beasts of prey. In Finmark it still abounds, constituting the worst enemy to the herds of reindeer. The bear also is less frequently met with, a fact to be accounted for by the immense quantities of timber felled of late throughout the country. The animal is most numerous now in Throndhjem, Nordland, and Romsdal amts; it occurs with comparative frequency in the amts of Bratsberg, Nedenæs, Buskerud, Hedemark, and Christian, and is not absolutely rare in Nordre Bergenhus amt. About 150 are annually killed throughout Norway; in 1849 the number was twice as great. The lynx does not appear to have suffered any diminution within the last twenty years; as many as 120 are annually killed. Nordre Throndhjem amt would appear to be its northern limit. This animal is most destructive to hares and all kinds of feathered game. In the great forests—especially where the soil is marshy, and there is a mingled growth of ash, mountain ash, and willow (*Salix caprea*)—the elk occurs, and indeed appears to be increasing in numbers in some places, notwithstanding the vast quantities of timber felled, a fact chiefly attributable doubtless to the rapid decrease of its worst enemies, the wolf and the bear. It is most numerous in Hedemark and Buskerud, and in some parts of Akershus and Smaalenene, though considerable numbers have been met with of late throughout Nordre Throndhjem amt; in a westerly direction it has penetrated as far as Nedenæs amt. The elk is not found in the west of Norway, but its place is partially taken by the red deer, which selects as its haunts the largest of the wooded islands on the coast and the numerous semi-insular projections of the mainland. It is most abundant on the island of Hiteren, at the mouth of Throndhjem Fjord. The wild desolate wastes of the fjelds are the home of the glutton and the reindeer, the lemming and the polar fox. Large herds of reindeer still roam throughout the alpine region of the fjelds between eastern and western Norway, and on the Dovre mountains, the Rundane, and the highlands between Gudbrandsdal and Österdal, and Gudbrandsdal and Valders; but this noble animal has become scarcer of late years, owing chiefly to the numbers killed by peasant hunters, who fire their rifles into the midst of the herd, sometimes maiming at a shot half-a-dozen animals, which they cannot hope to secure, and which afterwards become the prey of the glutton. In some years, and in certain localities, the lemming makes its appearance in countless multitudes, to be attacked by its numerous enemies, particularly birds of prey, among which are the snowy and the short-eared owl; the common kestrel too, and the rough-legged buzzard, are seen in large numbers at such times, sweeping over the wastes of the fjelds. The lemming has an enemy among ruminants even, the reindeer crushing it with a stroke of his cloven hoof for the sake of the vegetable matter it contains. Hares are found all over the country up to the snow-limit. In Finmark occur several species of small mammals of Russian origin.

The sea that washes the shores of Norway abounds in fish; and hence the coast, with its numberless islands, holms, and skerries, is a favourite haunt for such birds and mammals as prey upon fishes and other marine animals. When the herring approaches the coast to spawn, it is hotly pursued by the whale; and in Finmark when shoals of capelan make for the coast in spring, accompanied by cod, which gorge themselves with this their favourite food, the fin-whale (*Balænoptera musculus*) and the blue-whale (*Balænoptera sibbaldi*) are also exceedingly numerous, and their presence has given rise to a most important branch of the fishing industry. The waters of the fjords, and the holms and islets of the coast, abound in the spotted seal (*Phoca vitulina*), and the *Phoca barbata* is not uncommon in some localities on the outermost skerries.

Avifauna. Feathered game—capercally, black-cock, hazel grouse—is still abundant in the forests, though less plentiful now than formerly, owing to the reckless manner in which they have been destroyed by amateur sportsmen. The woodcock is distributed pretty equally over the whole country; besides the lynx, it has enemies in the marten, fox, and weasel, the birds of prey most destructive to it being the sparrow-hawk and the great eagle owl. The finest ptarmigan are found in the birch region of the fjelds; but in southern Norway they often prefer the more elevated tracts of the willow zone during summer, though even then they are most abundant in the birch zone. The "rype" must be regarded as the most important of Norwegian game birds, on account of its numbers no less than of its flavour. It is extensively snared in winter, and of late years dogs have been used to hunt it. On the numerous islands lying off the northern coast, where the vegetation is strikingly similar to that of the birch belt and willow region of the fjelds, ptarmigan are plentiful. The treeless island of Smolen, in the bailiwick of Nordmore, where they occur in great numbers, is the most southerly of the insular localities they frequent. The marshy tracts of the fjelds are the breeding-grounds of numerous varieties of fen-fowl, the lapwing (*Charadrius apricarius*) and the dotterel plover (*Charadrius morinellus*) occurring in great numbers. The double snipe and the teal, which also breed in the willow belt, are frequently shot by sportsmen when in pursuit of ptarmigan. In the numerous mountain tarns various species of divers are met with, for instance the *Fuligula marila* and the *Fuligula clangula*. The partridge, which has strayed across from Sweden, is now pretty evenly distributed throughout the amts of Akershus, Buskerud, Hedemark, and Christian; but in severe winters, when the fall of snow is exceptionally heavy, nearly every bird perishes, and several years elapse before the stock is recruited by immigration from the neighbouring kingdom. Almost every species of sea-fowl occurring in northern Europe that prey upon fish is found along the coasts, some of them breeding together in countless thousands in certain localities. The coast north of Stad is their chief haunt. The so-called "fugleberge" (bird cliffs) are chiefly frequented by the *Mormon fratercula*, the flesh, eggs, and feathers of which provide the owners of these preserves with some of the chief necessaries of life. The great black-banded loom occurs in tarns and mountain-lakes all over the country.

Fish. Of the various species of freshwater fish the *Salmonidæ* are beyond comparison the most important to the inhabitants. In the more extensive of the lakes, which are generally of great depth, trout attain almost the size of salmon, weighing up to 30 lb. In some lakes the red charr attains a weight of 12 lb, as does also the Finmark variety of this fish, which, in common with the sea-trout, remains during most of the year in deep sea-water, ascending the rivers in the spawning season only. Mountain-trout are found to thrive best in certain lakes and tarns within the birch and willow belts; but, owing to the abundance of food they can obtain, do not readily take the fly, hence they must be fished for with live bait or netted. As a rule, however, the great mountain-lakes yield excellent sport to the angler. The Mjosen abounds in grayling and charr; there is good grayling fishing too in the Tyrifjord and Randsfjord. Next to these species the perch, pike, bream, and eel are found in greatest numbers; but the eel is met with almost exclusively in a few rivers of southern Norway. Norway, notwithstanding the great number of its rivers which empty their waters into the sea, will not, owing to their inaccessible character, bear comparison with Great Britain or Ireland as a salmon-producing country. The most destructive enemies of freshwater fish in Norway are the otter, the loom, the duck, and the osprey.

The sea being very deep, both in the fjords and off the coast, such fishes and marine animals as affect great depths are there abundant. Some species are of great economic importance. On the banks off the coast of Finmark, at a depth of 150 to 200 fathoms, large numbers of the Greenland shark (*Scymnis glacialis*) are annually captured, their livers yielding a large quantity of oil. During the first half of the present century the sun fish, or basking shark (*Selache maxima*), abounded on the coast, its capture forming an important branch of the fishing industry. It is now but rarely met with; and the fishery has been discontinued. No species of fish can compare in point of importance with the herring and the cod, which, taken in immense quantities on the western coast, constitute one of the chief sources of national wealth.

Part II.—Statistics.

ula- n. The population of Norway on the 31st of December 1882 was 1,913,000, of whom 1,509,000 were living in the country districts, and 404,000 in the towns. Subjoined are the figures for each of the eighteen counties (amter) into which the kingdom is divided:—

Smaalenene	114,000	Stavanger	118,000
Akershus	100,000	Söndre Bergenhus	121,000
Buskerud	104,000	Nordre Bergenhus	88,000
Jarlsberg and Laurvik	92,000	Romsdal	125,000
Bratsberg	87,000	Söndre Throndhjem	123,000
Hedemark	123,000	Nordre Throndhjem	84,000
Christian	113,000	Nordland	116,000
Nedenæs	79,000	Tromso	60,000
Lister and Mandal	77,000	Finmark	27,000

Of the towns the following seven had the largest population (Christiania and Bergen being each a separate amt):—Christiania, 119,407; Bergen, 43,026; Throndhjem (1875), 22,152; Stavanger (1879), 23,500; Drammen, 19,582; Christiansand, 12,282; and Christiansund, 9025.

Norway is the most sparsely-populated country in Europe, having an average of about eighteen persons to the square mile. The distribution is very unequal: the greatest density is in Christiania stift, which contains about seven-twentieths of the whole population in seven-hundredths of the total area of the country. The density is relatively great along the coast. The districts which lie more than 600 to 700 feet above the sea are comparatively sparsely peopled. Notwithstanding the great emigration to America and Australia which has taken place in recent years, the population of the country has steadily advanced. About 1660 it numbered only 300,000, while at the beginning of the present century it was 800,000.

ricul- e. According to the returns completed in 1875, the owners of real property in the rural districts numbered 173,183, the total value of their properties being stated at £42,390,000. 24,713 English square miles of the southern stifts are estimated to be under wood, while the whole arable land of the country in 1875 amounted to 739 square miles, with a production valued at £2,794,000. At the same date the live stock included 151,903 horses, 1,016,617 cattle, 1,686,306 sheep, 322,861 goats, 101,020 pigs, and 96,567 reindeer.

sheries. The fisheries form one of the most important sources of the national wealth. In 1881 they employed upwards of 120,000 men, and the aggregate profits were estimated at about £1,111,000. The principal are the cod fisheries, along the inner coasts of the Lofoten Islands, where, in 1881, 26,850 men on 6153 boats caught 28,400,000 fish, valued at £312,400. In the same year the cod fishery in Finmark yielded about 13,000,000 fish, at a value of £131,000; those on the coast of Sondmore produced only one-fourth of this amount. Next come the herring fisheries, which in 1881 yielded 2,112,630 bushels, valued at about £277,800. 6,165,000 mackerel (£42,700) were also taken. The summer fisheries of coal-fish, ling, salmon, trout, lobsters, and oysters at the same time gave a total of £222,200.

anufac- res. Manufacturing establishments in 1878 numbered 2628, employing an aggregate of 41,391 hands. The leading place here is taken by the saw-mills, of which there were 112 driven by steam (3402 hands) and 630 by water (4274 hands). Next come 551 cotton-mills (2037 workmen), 199 brick-works (3540 workmen), 123 cod-liver-oil works (598 workmen), 112 shipbuilding yards (2388 workmen), and 27 wool-fibre factories (805 workmen).

ines. Mines are a considerable source of wealth to the country, their production in 1879 being estimated at £202,200. To this sum must be added £11,310 for apatite, £6150 for felspar, and £24,360 as the value of hewn stone exported in that year. The most important mines are:—the silver mines at Kongsberg, which in 1879 produced 9415 lb of silver, and a surplus of £3750; the copper works at Roros, producing 6880 tons, valued at £17,800; the copper pyrite mines at Vigsnæs, with a production of 39,898 tons, and a value of £69,410; the nickel-works at Senjen in Nordland, which yielded 3528 tons, valued at £5000; the iron-works of Næs and Egeland, which produced 2400 tons, at a value of £1050; and the iron works of Holden, with 5660 tons, worth £2500. It must, however, be mentioned that the production of the mines since 1879 has been diminishing.

The foreign trade of Norway is steadily increasing. Its aggregate value in 1882 was estimated at £15,724,500 (imports, £8,916,700; exports, £6,807,800). The principal imports were:—corn, 1,100,000 quarters, £1,575,650; beef and pork, £202,660; butter, £310,570; colonial wares, £594,950; and manufactured goods, £1,305,560. Among the exports the leading place is taken by timber (£2,519,450), of which the greater part was sent to England. The fishery products sent abroad were valued at £1,444,450, and the metals at £117,[illegible]. The port of Christiania has the largest trade, the imports in 1882 having been worth £4,082,500, and the exports £1,1[illegible],200; next to Christiania come Bergen and Throndhjem. The mercantile marine of Norway some years ago passed through a period of stagnation, but revived somewhat in 1880 and 1881. At the end of the latter year it consisted of 7977 vessels (7618 sailing vessels and 359 steamers), with an aggregate tonnage of 1,520,407. The gross freight earned was £5,021,200, of which not less than £3,969,500 were derived from the carrying trade. The largest shipping ports are those of Stavanger (669 vessels, 120,017 tons), Arendal (412 vessels, 171,858 tons), Bergen (348 vessels, 84,870 tons), Christiania (318 vessels, 105,193 tons), and Drammen (281 vessels, 85,028 tons).

The Norwegian railways have a total length of 973 English miles. Railways. (1) From Christiania along the eastern coast of Christiania Fjord to the Swedish frontier (Smaalensbanen), including the inner or eastern line between the station of Ski and the town of Sarpsborg, 156 miles. (2) The Trunk Railway (Hovedbanen), between Christiania and Eidsvold by Lake Mjösen, 42 miles. (3) From Lillestrom on the Trunk Railway to the Swedish frontier (Kongsvingerbanen), 71 miles. (4) From Eidsvold to Hamar (Hedemarksbanen), 36 miles. (5) From Hamar to Throndhjem (Rorosbanen), consisting of four administratively separate sections—Hamar to Grundset, 24 miles; Grundset to Rena, 16 miles; Rena to Storen, 199 miles; and Storen to Throndhjem, 31 miles. (6) From Throndhjem to the Swedish frontier (Merakerbanen), 63 miles. (7) From Christiania to Drammen, 33 miles. (8) From Drammen along the western coast of Christiania Fjord to Skien (Grevskabsbanen), with a branch line from Skopum, 98 miles. (9) From Drammen to Randsfjord Lake (including branch lines from Hougsund to Kongsberg and from Vikersund to Lake Kroderen), 89 miles. (10) From Stavanger to Egersund (Jæderbanen), 47 miles. (11) From Bergen to Vosserangen, 67 miles. The first three are commonly called the eastern railways (Östbanerne), (5) and (6) the northern (Nordbanerne), and the last three the western (Vestbanerne).

With improved means of communication the Norwegian post-office has made corresponding advances. Post-Office. In 1882 there were forwarded a total of 13,990,100 letters, of which 11,749,600 were inland, and 2,240,400 were sent abroad; 2,728,800 letters were in the same period received from foreign countries. The Government telegraphs had at the close of 1882 a line length of 47,065 miles, with a wire length of 85,485 miles. The telegrams transmitted in that year reached a total of 880,876.

As regards primary education Norway takes a leading place among the states of Europe. Education. In the country districts 207,922 children were instructed in 6408 schools by 3374 teachers and 108 preceptresses in 1878; in the same year 40,826 children in the towns were instructed by 372 teachers and 367 preceptresses in 144 schools. There are, besides, 147 citizen-schools, middle-schools, and higher-schools, with a staff in 1878 of 824 teachers and 466 preceptresses; the scholars numbered 16,800 (9150 boys and 7650 girls). The university, that of Christiania, has 50 professors and 1000 students.

Service in the army or navy, without the right of providing a substitute, is obligatory on all males who have completed their twenty-third year; the only exemptions are in favour of ecclesiastical functionaries, pilots, and the inhabitants of Finmark. Army navy. To the navy are drafted all conscripts who have made a voyage to foreign parts of at least twelve months, all conscripts from Nordland and Tromso, and a certain number of those from southern Norway who are accustomed to the sea. The army is made up of the troops of the line, the landværn, and the landstorm; the term of service is seven years in the line, and three in the landværn. The landstorm consists of every man capable of bearing arms, under fifty years of age, who does not belong to the line or the landværn. The troops of the line in continuous service number 1850 non-commissioned officers and men, and consist partly of volunteers; the other troops of the line in time of peace are called out for drill only in summer. For infantry recruits the minimum period of drill is forty-two days, for cavalry and artillery ninety days; for those who have passed out of that category it is only twenty-four days. The military schools are at Christiania. The average annual conscription is 6300 men. The total establishment of the army on 30th June 1878 was 68,809 men, viz., infantry 60,672 (48,275 combatants), cavalry 2735 (1343 combatants), artillery 5150 (2867 combatants). The commissioned officers numbered 703. The numbers on a peace footing were:—for the line 15,878 (war complement 3203), for the reserve 17,089, for the landværn 12,846. There were also 532 musicians.

The navy is manned in part by volunteers. The term of service is from the age of twenty-two to that of thirty-five. The schools for naval instruction are at Horten, where also is the chief royal dockyard. There is also a torpedo service.

The revenue of the kingdom for 1881-82 was £2,573,000 and the expenditure £2,556,000. Finance. The debt, contracted mainly for the construction of railways, amounted to about £6,000,000.

The constitution of Norway primarily rests on the "fundamental law," or grundlov, which was promulgated at Eidsvold on the 17th of May 1814, and afterwards, on the union with Sweden, agreed to, with slight modifications, in Christiania on the 4th of November in the same year. Constitution. To this must be added the Swedish succession ordinance of the 26th of September 1810, accepted by Norway in November 1814, and the rigsact, or charter of union, of 1815. By the first-mentioned Norway is a free, independent, indivisible kingdom, united with Sweden under the same king. The form of

government is a limited monarchy, and the throne is hereditary in the male line. Evangelical Lutheranism is the established religion. In their foreign relations the two kingdoms are regarded as one. The one cannot make war without the other, and there is a common diplomatic corps, which is controlled by the ministry of foreign affairs in Stockholm. In all other respects each kingdom is regarded as sovereign and independent.

Executive. The executive is vested in the king, who comes of age when he is eighteen. His person is inviolable, and all responsibility for his official acts rests with the council of state. This body consists of two ministers, and at least seven (at present nine) councillors, chosen by the king from among the citizens, of at least thirty years of age. One minister and two councillors must always be with the king when he is not in Norway. The others form, under the presidency of the remaining minister, or of the viceroy if there be one, the Government in Christiania; its authority is decisive, except in cases reserved for the king, when it only advises. As viceroy in Norway the king can nominate only the crown prince. Formerly the Government in Christiania was presided over by a governor, but this office was never filled after 1855, and in 1873 it was abolished (on the accession of Oscar II.). Each of the seven councillors has charge of one of the seven state departments (finance, justice, home affairs, church, war, navy and post-office, and audit). The king can declare war and conclude peace, make alliances and treaties, and has the supreme command of army and navy; but for offensive war the consent of parliament is necessary. The king appoints to all public offices, and can dismiss at pleasure his council of state and other Government functionaries, the highest officials of church and state, the heads of the army, and the commandants of fortresses. He can also issue provisional ordinances relating to trade, taxation, industry, and legal procedure, provided they are not contrary to the fundamental law of the country and the laws agreed upon by parliament; these ordinances are in force till next meeting of parliament.

Legislature. While the king has thus the executive power, the right of legislation and taxation is exercised by the people through their representatives in the parliament or *storthing*, which statedly meets in Christiania in the beginning of February every year. The king can, however, when circumstances require it, summon an extraordinary storthing. The elections are for a period of three years. The number of members is, by a law passed in 1878, fixed at 114,—38 from the towns and 76 from the country. The members are not chosen directly, but by electors nominated by the voters Several little towns are grouped into one electoral district. In the country there is an elector for every hundred voters in the parish (*herred*). The electors afterwards meet in each county, and choose the number of members fixed by law. Only citizens who have the right to vote are eligible, and they must, moreover, be at least thirty years of age and have been ten years settled in the country. Every Norwegian citizen, not being a criminal or in foreign service, is entitled to vote, if he has passed his twenty-fifth year, has been settled in the country five years, and has certain property qualifications—a public appointment, ownership or tenancy of land, or, in towns, ownership of property worth at least 600 crowns (about £33).

Immediately after the opening of parliament one-fourth of its members are elected to constitute the "upper house" or *lagthing*; the remaining three-fourths form the lower house or *odelsthing*. In practice this means a division between the legislative and the controlling powers of parliament. Every bill or proposed enactment must be introduced either by a member or by Government through a councillor in the odelsthing. If it passes it is sent to the upper house, and if carried there also the royal assent gives it the force of law. If rejected by the upper house it goes back, with or without remark, to the lower house, where it is again discussed. If again carried it is sent once more to the upper house, and if it fails to obtain the requisite majority of votes the whole parliament now meets, and two-thirds decide the motion. To give legal sanction to a resolution of parliament thus carried the royal assent is still required.

The royal veto in ordinary questions is not absolute; a resolution passed unchanged by three successive regular parliaments becomes law *ipso facto*; but it is otherwise where alterations in the fundamental law are involved. Parliament also fixes taxation, its enactments with regard to which continue in force only until the 1st of July of the year in which the next ordinary parliament meets. Parliament alone has control of the members of the council, of the supreme court of justice, and of its own members; for crimes in their public capacity these can be put on their trial at the instance of the lower house before the supreme court of the kingdom (*rigsretten*), which is composed of the supreme court of justice and the upper house of parliament. The proceedings of parliament and of its divisions are carried on, when not otherwise determined by special vote, with open doors, and published. The members of the council are not allowed to take part in the proceedings. By the fundamental law Norwegians only, with a few exceptions, are eligible for public appointments.

Administratively Norway is divided into six dioceses (*stifter*), with a bishop at the head of each, and into eighteen counties (*amter*) under the civil administration of an *amtmand* or governor.[1] The towns of Christiania and Bergen form counties by themselves. The dioceses are Christiania, Hamar, Christiansand, Bergen, Throndhjem, and Tromsö. Christiania stift embraces the counties of Smaalenene, Akershus, Buskerud, part of Bratsberg, Jarlsberg and Laurvik; Hamar those of Hedemark and Christian; Christiansand those of Bratsberg (part of), Nedenæs, Lister and Mandal, Stavanger; Bergen, besides Söndre and Nordre Bergenhus, takes in part of Romsdal; Throndhjem the rest of Romsdal, with Söndre and Nordre Throndhjem; Tromsö the three northern counties. Administrative officers. Each diocese is divided into deaneries (*provstier*), each under a dean, who is elected by the clergy of the district concerned; each amt is divided into bailiwicks (*fogderier*), each presided over by a sheriff or *foged*, appointed by the king to watch over the maintenance of the law, carry out judgments, and collect taxes and customs. In each town similar functions are assigned to the *byfoged* or town sheriff, who, however, has a more extended authority. The sheriff in the country has generally in each parish a substitute or *lensmand*. In the larger towns there are additional officers charged with municipal and police affairs. As regards courts of justice, only the supreme court and the rigsret, already spoken of, are fixed by the constitution. Courts of first instance are held in the towns by the sheriff and in the country by district judges, who travel on circuit twice or thrice a year. From the inferior courts cases are in second instance carried on appeal to the superior diocesan courts, of which there are four—one at Christiania (in two divisions), one at Christiansand, one at Bergen, and one at Throndhjem. From these courts cases relating to values of more than 400 crowns (about £22) and criminal cases proceed to the supreme court of the kingdom, which, according to the fundamental law, is composed of a president (*justitiarius*) and at least six assessors. The municipal court of Christiania consists of a president and seven assessors; from this court there is direct appeal to the supreme court of the kingdom.

National flag. The kingdom of Norway has its own national flag, red, divided by a dark-blue, white-bordered cross into four parts. In the upper square, next to the staff, the union mark is placed. The Norwegian escutcheon is a crowned golden lion on a red field, armed with the battle-axe of the tutelary saint, St Olaf.

(H. MO.—H. RA.—O. A. Ö.)

PART III.—HISTORY.

The early history of Norway is exceedingly obscure. The scanty allusions to Scandinavia and its inhabitants which we find in the classical writers refer to the inhabitants of Denmark and of the south of Sweden. The first mention of names which can be identified with any certainty as those of known Norwegian tribes is found in Jordanes, a writer of the 6th century. The traditions of the earlier times which are preserved in Norse literature can scarcely be said to afford any sure ground for history, for whatever truth may be in them seems to be almost hopelessly concealed beneath an overgrowth of mythological and genealogical legend. It is, however, certain that the first settlers after the nomad tribes of Lapps or Finns, whose traces are still found far south of their present limits, were the ancestors of the present inhabitants,—Germanic tribes closely akin to the Danes, Swedes, and Goths. Early immigration. The time of their immigration is unknown, but is conjectured with probability to have been at the latest not long after the commencement of the present era. The way by which they came has been the subject of a lengthened controversy. Munch and his school held that the first proper Norwegian settlements took place in the north, and spread thence down the western coast and the centre of the country. Later historians incline to the more probable theory that the country was settled by immigration from the south. To some extent the theory of a northern immigration derived its vitality from a view of early Norwegian history which is now generally rejected. Until recently the collection of old Norse poetry which passed under the name of the *Eddas* was regarded not merely as the peculiar inheritance of the Norse branch of the Scandinavian family but as the oldest and most primitive relic of Germanic mythology and legend. It fell in

[1] This territorial division is the only one which has been known in Norway since that into "fylkis," which had become antiquated even in the days of Harold Haarfager. These fylkis were more numerous than the present amter.

naturally with this view to regard the Norse people as leaving their primitive home at a later time, and as travelling by a different route from the rest of their kin. And plausible arguments could also be drawn from archæology. There is a well-marked distinction between the older and younger iron ages in Scandinavia. The older age, which is more fully developed in Denmark and the southern part of the Scandinavian peninsula, is marked by greater refinement of workmanship, and is more under the influence of southern art. The younger age, which is best marked in Norway and in Sweden proper, is rougher, and has more the appearance of an independent growth. It seemed natural, therefore, to regard the comparatively sudden transition to the more recent archæological period as evidence that the land had been occupied by a new people, closely akin indeed to the earlier inhabitants of the south, but which had come fresh from the common home and had not been subjected to the same influences. For various reasons, however, this more recent period cannot well be put farther back than the end of the 7th century, a date which brings the supposed northern immigration so near historic times that if it had taken place it must have been distinctly commemorated in tradition; and, at the same time, it is now generally admitted that even the oldest of the Eddic poems must be referred to a period close to or within the limits of authentic history. In all probability, therefore, we may regard the change of custom and the rise of the earliest poetry as marking a period of development and expansion which affected all the Scandinavian peoples, but which, we may well suppose, presented peculiarly individual characteristics in the isolated districts of Norway.

rly ing edi- ns.

Towards the end of the 8th century we first hear of that phase of history which made the Scandinavian peoples well known during the next two hundred years to the nations of north-western Europe. In 787, if we may trust a record of later date, the ships of the Northern sea rovers first appeared on the English coast, and in 793 and 794 they plundered Lindisfarne and Monkwearmouth. Thenceforward we find them in continually increasing numbers on the coasts of Scotland and Ireland, in England and France, and on the southern coasts of the North Sea, isolated expeditions going as far as Spain and the Mediterranean. It is not easy to determine the share taken by the Danes and Norwegians respectively in these earlier expeditions, for the contemporary chroniclers confounded them under common names. But the geographical relations of the two peoples naturally led them into different tracks. The coasts which lay nearest to the Danes were those of the southern shores of the North Sea and the English Channel; but the nearest way for the Norsemen of western Norway lay straight across to the Shetlands and Orkneys and thence south along the Scottish coasts. It seems probable, therefore, that the first expeditions which ravaged the coast of Northumberland, and which swept down by the Hebrides to Ireland, and thence in some instances to the more southern coasts of France, before Flanders and the northern coasts of France began to suffer, started from the western coasts of Norway. Some years later, when the Danish expeditions become numerous and powerful, they fall with heaviest force on Flanders, England, and France. Of course, when the rovers increased in number and their excursions became wider, we find these kindred peoples in the same countries and joining in common expeditions. At an early period they come into collision in Ireland. Northumberland seems for a while to have been almost common ground, and Rollo, the chief who completed the permanent settlement in Normandy, is generally admitted to have been a Norseman, although the point is contested by Danish writers. But on the whole it was in the north and west that the Norse vikings had their chief haunts and formed their settlements. At first even the largest viking expedition had no further aim than plunder: they simply devastated the coasts on which they landed and returned with their booty to their native country, or sold it in foreign parts; but after a time we find them making permanent settlements, either attracted by the richer countries or driven from their own by the pressure of population or by political reverses. In the middle of the 9th century the Norse kingdom of Dublin was founded. In the latter half of the century the Danes, with a possible admixture of Norsemen, had obtained a permanent footing in England. Towards the end of the century the Scottish islands, which had hitherto formed a temporary refuge and starting-point for vikings, were occupied by permanent Norse settlers, and the colonization of Iceland was commenced.

Primitive territorial divisions.

Before the end of the 9th century we know comparatively little of the internal condition of Norway. The land is divided into *fylkis*, which in point of relative size answer roughly to the English shire. The word is connected etymologically with "folk," and seems to indicate that the fylki was originally a district peopled by a subdivision of the race. In the case of many of the fylkis this is borne out by the formation of the individual name, while in others the name seems to have applied directly to the district itself. There seems to have been an early union between some of these fylkis, having laws and customs of their own. The *Egil's Saga* tells us that Gula-thing was originally constituted from Horda-fylki, Sygna-fylki, and Firda-fylki; and this seems confirmed by the three twelves which form so conspicuous an element in the Icelandic law courts. In this case Horda-fylki may give us the name of the race by which that part of the country was originally settled, while the others are simply names of districts subsequently occupied by the same tribe. At a later time the whole country was divided into great districts, each with a common thing and a body of law of its own. These law districts, which corresponded to natural divisions of Norway of considerable importance in its history, were the district of the Frosta-thing, which comprehended the northern fylkis as far south as Sogne Fjord; that of the Gula-thing, which comprehended the south-western fylkis; and that of the Uplands and Vik, which included all the country south and east of the central mountain chain, and which had in old times its only common meeting-place in the Eidsifia-thing, but from which at a later time the Vik district with its Borgar-thing was separated. Within the fylki we find a minor subdivision called the *herad*, at the head of which stood the *hersir*, who held his office by hereditary right, and who, like the Icelandic godi, presided over the civil and religious affairs of the district. At the head of each fylki stood as a rule the king, though occasionally we find more than one king in a fylki, or more than one fylki under the rule of a king. In at least one district of the country, also, the chief power is in the hands of a race of jarls, a title which in later times was conferred by the kings, but which at this early period, although inferior to that of king, does not appear to be necessarily subordinate. It is difficult to define precisely the position of these petty kings. They seem to have represented the fylki in external affairs and to have been its leaders in war, but their power depended greatly on their personal qualities and the extent of their private possessions. That they had no very deep hold is clear from the readiness with which they disappear after the union of the kingdom. But both in fylki and herad every matter of importance was determined at the thing, the meeting of the free people. In some respects the condition of the people in Norway differed materially from that of other Germanic peoples at a similar

stage of development. Owing probably to the nature of the country, we find no trace of the village community which has played so important a part in kindred races. As far back as we can go the ground was owned by individual proprietors, who partly held it in their own use and partly let it out to men who were practically their dependents. These proprietors, with the hersir families at their head, formed something closely resembling a landed aristocracy. The most powerful members of the class, distinguished by their descent, possessions, and personal qualities, scarcely acknowledged a superior. They were surrounded by a band of dependents trained to arms, and were accustomed to foreign expeditions, which increased their wealth, power, and warlike habits. Nor did the law of equal succession which at all times prevailed in Norway at all break up the power of these great families. The more common practice seems to have been, not to divide the lands, but to give the younger and more restless members their share of the inheritance in movable goods and let them seek a settlement for themselves. After the lands were settled such a practice must eminently have tended to increase the readiness to undertake foreign expeditions, while at the same time the wealth and power acquired in these expeditions fostered the increase of powerful families at home.

About the end of the 9th century Norway first became a united kingdom, and from that time we have a comparatively full and authentic record of its history. On the west side of the Vik, the present Christiania Fjord, lay a small district called Vestfjold, ruled over by a race of kings descended, according to a not very trustworthy legend, from the Swedish Upsala kings. The whole country round the Vik stood, as might be expected from its situation, in closer relation to Denmark and Sweden than the rest of Norway did. According to one version of history the Vestfjold kings occupied for a short time the Danish throne, while according to another they were tributaries of Denmark. There was a well-known trading-place within their territory; and probably at an early time they shared extensively in the traffic of the neighbouring seas and in the expeditions of the Danes. The first clearly discernible figure amongst these Vestfjold kings is Halfdan the Black, who, partly by family connexions and partly by conquest, included within his kingdom the country around the head of the Vik, and thence inland to Lake Mjösen. Halfdan died at a comparatively early age, leaving a son, Harold, who afterwards bore the famous name of Harold Fairhair, and who, according to the commonly received story, succeeded his father in 860, being then ten years of age. Mr Vigfusson contends, however, with considerable probability, that Harold's reign, as well as the colonization of Iceland, has been antedated by nearly thirty years, and it seems, to say the least, improbable that the events during the first ten years of his accession could have taken place in his early youth. But, setting aside the question of chronology, the story of Harold's reign, as given in Norse history, appears to be substantially trustworthy. After obtaining a firm hold on his father's dominions, he went north through Gudbrandsdal and descended upon the country of Throndhjem, which he speedily brought to subjection; and in the three or four subsequent years he had subdued the whole country as far south as Sogne Fjord. He appears to have received material assistance from two great chiefs, Earl Hakon, whose descendants are conspicuous in subsequent history as the Hlada jarls, and Earl Rognwald of Mœri, the ancestor of the dukes of Normandy and the Orkney earls. The country south of Sogne Fjord was still unsubdued, nor was its conquest apparently attempted for some years later. It was the most warlike part of Norway, and from it probably issued the greater part of the Norwegian viking expeditions, which were now in their fullest vigour. The western chiefs appear at length to have taken the initiative, and to have gathered together a great force, summoning aid apparently even from their kinsmen beyond the western sea. Harold sailed south to meet them, and a fierce battle took place at Hafrs Fjord, near Stavanger, in which he gained a complete victory; the hostile force was entirely broken, and from this time his rule over all Norway appears to have been undisputed. Every man was forced to own him as master; new taxes and obligations were imposed; the fylkis were put under the rule of earls, and the hersirs became or were replaced by the king's *lendermenn*,—a title which becomes familiar in subsequent history. These lendermenn, however, must not be mistaken for an official nobility deriving their main strength from the king. They became the king's men, bound to support him and to follow him in war, and they received lands from him in return, from which they derived their name; but they were still for a long time merely the old hersirs under another name, powerful local chiefs who were ready at any moment, if the occasion seemed to require it, to lead against the king their dependents and the free proprietors by whom they were surrounded. But many of the leading men refused to live in Norway upon these terms. They sailed with their families and dependents, some of them to Iceland, but many more to the Scottish islands, which had long been a favourite resort of the western Norwegians; and thence for years they kept up a series of raids upon Norway. Harold for a while endeavoured to encounter them on the Norway coast, but finding this interminable he at last crossed the sea with a great force and fell upon the vikings from the northern islands as far south as Man. Orkney, and probably the Hebrides, were placed under Norwegian earls, and from this time we hear comparatively little of marauding expeditions from these islands to Norway. Many of those driven out in this western expedition settled ultimately in Iceland, the colonization of which was completed during Harold's reign (see ICELAND). Harold in his later years divided his kingdom among his sons, giving a predominance among them to his favourite Erik Blood-axe. He died at an advanced age *c.* 933 A.D.

Vestfjold kings.

Harold Fairhair.

On Harold's death Erik attempted to make himself sole king of Norway, and defeated and slew two of his brothers to whom vassal kingdoms had been assigned by their father; but his tyrannical and unpopular character fostered the reaction which naturally set in against the strong rule of Harold. Hakon, a younger son of Harold, who was brought up at the English court, and was afterwards known as Athelstan's foster-son, was sent for from England. He was presented by Earl Sigurd, the son of Earl Hakon (Harold's early supporter), at a great thing at Throndhjem, and there, after promising that he would restore the old rights which his father had taken away, he was accepted as king. In the words of the saga, the tidings flew through the land like fire in dry grass that the Throndhjem people had taken to themselves a king like in all things to Harold Fairhair, except that Harold had enslaved and oppressed all the people in the land, while this Hakon wished good to every one and offered back the odal rights which Harold had taken away. The people flocked to him from all sides, and Erik soon found himself compelled to leave the country, and sailed west to the Orkneys. Hakon's reign was true to the promise of its commencement. In the Uplands and in Vik he left his kinsmen in possession of the vassal kingdoms; Earl Sigurd ruled under him in the north, and the rest of the kingdom he took into his own hand. The landowners were freed from the burdens and vassalage of Harold's days, although some of the least oppressive taxes appear to have been continued, and the Gula-thing and

Hakon, son of Harold Fairhair.

naturally with this view to regard the Norse people as leaving their primitive home at a later time, and as travelling by a different route from the rest of their kin. And plausible arguments could also be drawn from archæology. There is a well-marked distinction between the older and younger iron ages in Scandinavia. The older age, which is more fully developed in Denmark and the southern part of the Scandinavian peninsula, is marked by greater refinement of workmanship, and is more under the influence of southern art. In the latter half of the century the Danes, with a possible admixture of Norsemen, had obtained a permanent footing in England. Towards the end of the century the Scottish islands, which had hitherto formed a temporary refuge and starting-point for vikings, were occupied by permanent Norse settlers, and the colonization of Iceland was commenced.

Primitive territorial divisions.

Before the end of the 9th century we know comparatively little of the internal condition of Norway. The land is divided into *fylkis*, which in point of relative size answer roughly to the English shire. The word is connected etymologically with "folk," and seems to indicate that the fylki was originally a district peopled by a subdivision of the race. In the case of many of the fylkis this is borne out by the formation of the individual name, while in others the name seems to have applied directly to the district itself. There seems to have been an early union between some of these fylkis, having laws and customs of their own. The *Egil's Saga* tells us that Gula-thing was originally constituted from Horda-fylki, Sygna-fylki, and Firda-fylki; and this seems confirmed by the three twelves which form so conspicuous an element in the Icelandic law courts. In this case Horda-fylki may give us the name of the race by which that part of the country was originally settled, while the others are simply names of districts subsequently occupied by the same tribe. At a later time the whole country was divided into great districts, each with a common thing and a body of law of its own. These law districts, which corresponded to natural divisions of Norway of considerable importance in its history, were the district of the Frosta-thing, which comprehended the northern fylkis as far south as Sogne Fjord; that of the Gula-thing, which comprehended the south-western fylkis; and that of the Uplands and Vik, which included all the country south and east of the central mountain chain, and which had in old times its only common meeting-place in the Eidsifia-thing, but from which at a later time the Vik district with its Borgar-thing was separated. Within the fylki we find a minor subdivision called the *herad*, at the head of which stood the *hersir*, who held his office by hereditary right, and who, like the Icelandic godi, presided over the civil and religious affairs of the district. At the head of each fylki stood as a rule the king, though occasionally we find more than one king in a fylki, or more than one fylki under the rule of a king. In at least one district of the country, also, the chief power is in the hands of a race of jarls, a title which in later times was conferred by the kings, but which at this early period, although inferior to that of king, does not appear to be necessarily subordinate. It is difficult to define precisely the position of these petty kings. They seem to have represented the fylki in external affairs and to have been its leaders in war, but their power depended greatly on their personal qualities and the extent of their private possessions. That they had no very deep hold is clear from the readiness with which they disappear after the union of the kingdom. But both in fylki and herad every matter of importance was determined at the thing, the meeting of the free people. In some respects the condition of the people in Norway differed materially from that of other Germanic peoples at a similar

stages of development. Owing probably to the nature of the country, we find no traces of the village community which has played so important a part in kindred races. As far back as we can go the ground was owned by individual proprietors, who partly held it in their own use and partly let it out to men who were practically their dependants. These proprietors, with the hersir families at their head, formed something closely resembling a landed aristocracy. The most powerful members of the class, distinguished by their descent, possessions, and personal qualities, scarcely acknowledged a superior. They were surrounded by a band of dependants trained to arms, and were accustomed to foreign expeditions, which increased their wealth, power, and warlike habits. Nor did the law of equal succession which at all times prevailed in Norway at all break up the power of these great families. The more common practice seems to have been, not to divide the lands, but to give the younger and more restless members their share of the inheritance in movable goods and let them seek a settlement for themselves. After the lands were settled such a practice must naturally have tended to increase the readiness to undertake foreign expeditions, while at the same time the wealth and power acquired in these expeditions fostered the increase of powerful families at home.

About the end of the 9th century Norway first became a united kingdom, and from that time we have a comparatively full and authentic record of its history. On the west side of the Vik, the present Christiania Fjord, lay a small district called Vestfold, ruled over by a race of kings descended, according to a not very trustworthy legend, from the Swedish Upsala kings. The whole country round the Vik stood, as might be expected from its situation, in closer relation to Denmark and Sweden than the rest of Norway did. According to one version of history the Vestfold kings occupied for a short time the Danish throne, while according to another they were tributaries of Denmark. There was a well known trading place within their territory; and probably at an early time they shared extensively in the traffic of the neighbouring seas and in the expeditions of the Danes. The first clearly discernible figure amongst these Vestfold kings is Halfdan the Black, who, partly by family connexions and partly by conquest, included within his kingdom the country round the head of the Vik, and thence inland to Lake Mjösen. Halfdan died at a comparatively early age, leaving a son, Harold, who afterwards bore the famous name of Harold Fairhair, and who, according to the commonly received story, succeeded his father in 860, being then ten years of age. Mr Vigfusson contends, however, with considerable probability, that Harold's reign, as well as the colonization of Iceland, has been antedated by nearly thirty years, and it seems, to say the least, improbable that the events during the first ten years of his accession could have taken place in his early youth. But, setting aside the question of chronology, the story of Harold's reign, as given in Norse history, appears to be substantially trustworthy. After obtaining a firm hold on his father's dominions, he went north through Gudbrandsdal and descended upon the country of Throndhjem, which he speedily brought to subjection; and in the three or four subsequent years he had subdued the whole country as far south as Sogne Fjord. He appears to have received material assistance from two great chiefs, Earl Hakon, whose descendants are conspicuous in subsequent history as the Hlade jarls, and Earl Rognvald of Möri, the ancestor of the dukes of Normandy and the Orkney earls. The country south of Sogne Fjord was still unsubdued, nor was its conquest apparently attempted for some years later. It was the most warlike part of Norway, and from it probably issued the greater part of the Norwegian viking expeditions, which were now in their fullest vigour. The western chiefs appear at length to have taken the initiative, and to have gathered together a great force, summoning aid apparently even from their kinsmen beyond the western sea. Harold sailed south to meet them, and a fierce battle took place at Hafrs Fjord, near Stavanger, in which he gained a complete victory; the hostile force was entirely broken, and from this time his rule over all Norway appears to have been undisputed. Every man was forced to own him as master; new taxes and obligations were imposed; the fylkis were put under the rule of earls, and the hersir became or were replaced by the king's *lendermenn*, a title which became familiar in subsequent history. These lendermenn, however, must not be mistaken for an official nobility deriving their main strength from the king. They became the king's men, bound to support him and to follow him to war, and they received lands from him in return, from which they derived their name; but they were still for a long time merely the old hersir under another name, powerful local chiefs who were ready at any moment, if the occasion seemed to require it, to lead against the king their dependants and the free proprietors by whom they were surrounded. In the Uplands and in Vik he left his kinsmen in possession of the vassal kingdoms; Earl Sigurd ruled under him in the north, and the rest of the kingdom he took into his own hand. The landowners were freed from the burdens and exactions of Harold's days, although some of the least oppressive taxes appear to have been continued, and the Gula thing and

Hakon, son of Harold Fairhair.

Frosta-thing were reorganized, with probably several amendments on their respective laws, and were extended to their later boundaries. In one respect Hakon was not in accord with his subjects. He had been brought up as a Christian at Athelstan's court, and attempted to introduce Christianity into the land; but in this attempt he signally failed, and at one time seems nearly to have broken with his people in consequence. On the whole, however, Norway enjoyed under Hakon internal peace. The troubles which beset his reign, more especially towards its close, arose from Denmark and the sons of Erik Blood-axe.

k od- It is not easy to trace Erik's career after he fled to the Orkneys. According to the Norse sources, he received Northumberland from Athelstan as a vassal kingdom not long after leaving Norway. In the English sources we find him represented as holding Northumberland not under but in opposition to the English king. It is probable enough that he may have held it in both relations; but, however that may be, he certainly ruled for a time at York, and fell in England *c.* 952. At the time of his death his wife Gunhild went to the Orkneys with her children and thence to Denmark. She was a famous character in the history of the time, and to her the Norse tradition attributes much of the evil that appears in the career of her husband and children. According to one account she was the sister of Harold Bluetooth, but it is scarcely credible that the relationship between two such well-known figures in the 10th century should be unknown to the principal Norse writers. The favourable reception which she and her children met with in Denmark is sufficiently accounted for by Erik's own Danish descent, and the relations which then existed between Denmark and Norway. Shortly after their arrival in Denmark Erik's sons commenced a series of expeditions against Norway which lasted during the rest of Hakon's reign; at last, after gaining many victories over the invaders, Hakon was taken by surprise and slain *c.* 961.

On Hakon's death the sons of Erik, with Harold, afterwards called Greyfell, at their head, got possession of the western part of Norway, but Vik and the Uplands remained under their former kings, and Earl Sigurd still kept firm hold of the Throndhjem country. Earl Sigurd was treacher-

rl ıkon e eat. ously slain, and was succeeded by his son, Earl Hakon the Great; and for many years afterwards the history of the country is a series of struggles between the sons of Erik and Hakon, mixed up with occasional interferences from Denmark. At length Harold Greyfell was slain in Denmark, and Hakon succeeded with the help of the Danes in driving the sons of Erik out of the country. For a time he remained in nominal dependence on Denmark, but this was soon shaken off, and in the latter part of his life Hakon, though he never assumed the title of king, ruled in entire independence over the whole north and west of Norway. Latterly he excited animosity by some reckless outrages on the feelings of the people; a rising took place against him in the Throndhjem country, in which he was slain *c.* 995, and at the very time of the rising Olaf Tryggvason landed in Norway.

laf ryggva- on. Olaf was a great-grandson of Harold Fairhair. His father, Tryggve, had been treacherously slain by the sons of Erik, and his mother had with difficulty escaped with him. After some strange adventures the boy was received and brought up at the court at Novgorod, and then in his early youth took to a viking life. He soon became a famous leader, and plundered far and wide. In 991 we hear of him in England as one of the chiefs who fought the battle of Maldon, and he appears there again in 994. He sailed on his Norwegian expedition from Ireland, and found the whole country well disposed to receive him as king. Olaf's short reign of five years was chiefly occupied with his efforts to Christianize the country. He had been baptized some time during his English expedition, and had taken up Christianity in a more serious manner than was generally the case with the Northern converts of his class, who as a rule submitted to baptism as a convenient or necessary transaction. Olaf's Christianity does not appear to have been of a very deep or enlightened type, but he was thoroughly in earnest about it, and set himself to enforce its supremacy with the whole energy of his character. And in an incredibly short time, if he had not exactly succeeded in making his subjects Christian, he had at least made it very unsafe for them to be anything else. By force, or gifts, or persuasion, or even by torture if necessary—for his anger was sometimes cruel enough—he had soon scarcely left a man of note unbaptized in Norway. Even Iceland was persuaded to accept the faith by his energetic handling of the Icelanders at his court. Of course this wholesale conversion was of a very nominal character, and even Olaf himself always appears to be little more than a loyal and devoted heathen vassal of the new faith. Perhaps the strangest thing is not merely that he attained his end so rapidly, but that he did so without rousing and alienating the people. His splendid personal appearance, his wonderful strength and skill in arms, his inexhaustible courage and energy, and the frank chivalrous nature—bright and joyous when in quiet, but capable of terrible passion when enraged—seem to have overawed and attracted every one at the time, and have made him since the favourite hero of Norse history. In the fifth year of his reign (*c.* 1001) Olaf undertook an expedition to the Baltic, and a league was formed against him by the kings of Denmark and Sweden, and by Earl Erik, the son of Hakon, who had fled into Sweden after his father's death. Olaf went with a powerful fleet, he himself commanding his great ship the "Long Serpent," the largest and best manned that had ever sailed from Norway. His foes lay in wait for him on his return under Swöld, an island off the German coast which cannot now be identified, and there took place the most famous and picturesque battle in Norse history. Olaf's ships were induced by treachery to pass by the island behind which the forces of his enemies lay, while the hostile chiefs watched them as they sailed by. At last when all were gone on their way to Norway but the few ships which with Olaf himself brought up the rear, the enemy rowed out and fell upon them. Olaf bound his ships together with the "Long Serpent" in the centre, and his foes surrounded him on all sides. One after another the ships were taken and cleared of men, and at last the crew of the "Long Serpent" were left alone, under a shower of spears and arrows, with the whole enemy around them and with fresh men continually attempting their decks. The saga tells us that Olaf's men grew so mad with rage that they leaped at the ships that surrounded them, not seeing that they were often so far off, so that they fell into the sea and perished. At length almost none were left, and Olaf leaped overboard in his armour. His people at home could scarce believe that he could have perished, and for many years stories were circulated that he had been seen in foreign countries; but, however that may be, says the chronicler, Olaf Tryggvason came back no more to his kingdom in Norway.

The two kings and Earl Erik divided Norway among them, but in reality the greater part of the country was held by Earl Erik and his brother Earl Svend, under a little more than nominal vassalage. In the south some of the districts were more directly dependent on Denmark and Sweden. Fourteen years afterwards another descendant of Harold Fairhair appeared in the country. Olaf, son of Saint
Harold Gränske, had, like most of his race, spent his early Olaf.
youth in foreign expeditions. When about nineteen he

came back to Norway with a small band of well-tried men, and went first to his kinsmen in the Uplands, where some of the small kings of Harold's race still remained in a not very close dependence on Denmark. Erik was by this time dead; Olaf succeeded in driving Svend out of the land, and became in a short time more thoroughly king of all Norway than any one had been since Harold Fairhair. He rebuilt Nidaros (the modern Throndhjem), which had been founded by Olaf Tryggvason, and which may be called henceforward the capital of Norway. Like Olaf Tryggvason, he was a zealous adherent of Christianity, and, as soon as he was firmly settled, proceeded to enforce it on his subjects. The previous conversion of the land had been superficial, so that, except in the parts of the country which came most into relations with foreign countries, the old religion had still a strong hold, and in some districts was predominant. Under Olaf heathen worship was suppressed with the utmost severity, and Christianity may be said to have become the professed religion of the land. Olaf's rule was firm and powerful. Equal justice was dealt out, as far as practicable, to every one, often in a summary fashion. The great families had flourished under the earls, and seem to have been almost wholly independent within their own districts, but, as they one after the other came into collision with the king, they had to yield. Olaf was in many ways a greater man than Olaf Tryggvason: his aims were higher, and he understood them more thoroughly; but he lacked some of the gifts of his brilliant predecessor. Olaf Tryggvason was the very incarnation of the old popular ideal, and, had the times been favourable, might well enough have passed into tradition, Christianity and all, as one of the Æsir who had come back again to earth. But the other Olaf was in some ways a new force in Norway. He was aiming at a united Christian kingdom under a strong central power, and these ideas, in so far as they were intelligible, were repugnant to the Norse chiefs. And, besides, his character was somewhat still and reserved, not always destitute even of traits of cunning, so that altogether, though every one was forced to respect his courage and ability, and his own followers were devotedly attached to him, most of the Norwegian chiefs never wholly understood or trusted him. In one way or another he incurred the enmity of many of the most powerful men in the west and north, and he had a dangerous foreign enemy. Canute was at the height of his power, had claims, he thought, upon Norway, and was, moreover, deeply irritated by an expedition which Olaf had made upon Denmark along with the king of Sweden. He had connexions with many of the chiefs, which he fostered as much as possible, and in 1028 he came with a great force to Norway; Olaf could make no head against him, and was compelled to fly to Russia. But after a while Olaf heard that there was for a time no ruler in Norway, and resolved to attempt to win back his kingdom. He obtained assistance in Sweden, gathered his friends from Norway, and then went over the mountains into the Throndhjem country. The chiefs who were most bitterly opposed to him drew together a great force and met him at Stikklestad, and there, when only thirty-five years old, he was defeated and slain in August 1030. There is a singular change to be observed in the narrative of this latter part of Olaf's life. He seems to have become more devoted to Christianity, and in every way more thoughtful and gentle. The stories about him look as if his adversities had forced him to take a retrospect of his life and prepare for a new career; and if he had been the victor at Stikklestad it is hard to say what influence he might not have exercised upon subsequent history.

A short experience of Danish rule under Svend, the son of Canute, made Norway bitterly regret the loss of Olaf. The resentments which had been awakened by his stern, just rule passed out of sight, and men only remembered his great qualities, and that in his time the land was free from foreign interference. His devoted adherence to Christianity, especially in his later days, gave a definite direction to these reminiscences; he was regarded as a martyr and saint, and miracles were reported to have been wrought by him even under the very nose of his Danish successor. Olaf was rightly regarded as the patron saint of the new Christian monarchy. It was he who not only had Christianized the land, but had for the first time thoroughly united the kingdom. His reign had given rise to a feeling of unitedness and independent existence which the country never had before and never afterwards wholly lost. For nearly a century afterwards Norway was ruled in internal peace by the kings of his race. The church was organized and became powerful. The private viking expeditions gradually ceased, for it began to be considered a scandal to plunder in Christian lands; and possibly also the practice grew more dangerous. Swein Asleifson, in the middle of the 12th century, is the last recorded viking of the old type, and he dwelt in the Orkneys. At the same time several of the kings made greater foreign expeditions, which probably afforded a sufficient vent for their more restless subjects. The central authority of the king grew stronger and more stable. His court and personal following were better organized. The lendermenn, although still remaining chiefs of the landed aristocracy, ceased to exercise the same semi-independent power in their own districts, and came into closer relations with the king and court.

Magnus, son of Saint Olaf.

In 1035 Magnus, Olaf's son, who had remained in Russia, was sent for by some of the leading men, and was readily accepted as king. Magnus, or rather the chiefs in his name, for he was still very young at the time, had settled the quarrel with Denmark by coming to an agreement with Hardicanute, that when one died the other should succeed to his crown. In 1042 Hardicanute died, and Magnus peacefully took possession of his kingdom. But troubles soon arose from Svend Estridsen, nephew of Canute the Great, who attempted to seize Denmark, and who had entered into terms with a formidable Norse ally. Harold, Sigurd's son, known sometimes as Hardrada (hard counsel), the half-brother of Olaf, was one of the last and most famous of the great viking chiefs. His father was a small Upland king of Harold Fairhair's race; he had fought when a boy at Stikklestad, had gone to the East and taken service with the Greek emperor, and was now come back to the North with great wealth and fame. For a short time he entered into league with Svend, but an arrangement was soon brought about by which he and Magnus were made friends, and Harold became joint king of Norway. Magnus died in the following year (1047), leaving Denmark to Svend and Norway to Harold; Harold was not, however, inclined to relinquish Denmark, and wasted it year after year by terrible incursions; at last he undertook a more formidable task, and fell in England in 1066 with the very flower of Norway at the battle of Stamford Bridge.

Harold Hardrada.

Olaf Kyrre.

Harold's son, Olaf Kyrre (the quiet), ruled Norway in peace for twenty-seven years, a peace which may in some respects have been due to the way in which the country had been drained of its hottest blood by Harold's expeditions. During this reign the country attained considerable prosperity, trade increased, and, among other merchant towns, Bergen, which soon attained the first place, was founded. But Olaf's son Magnus (known sometimes as Magnus Barefoot), who succeeded his father in 1093, reigned in a manner more like his grandfather. He was continu-

Magnus Barefoot.

ally occupied in foreign expeditions, and at last fell in Ireland in 1103.

ystein nd igurd orsalafari.

The three sons of Magnus succeeded to the kingdom at his death. One of them died in youth, but Sigurd and Eystein reigned long together, Eystein being a king like Olaf Kyrre, while Sigurd inherited to the full the warlike qualities of his family. The great external event of the reign is Sigurd's expedition to the East, from which he gained the name of Jorsalafari (the traveller to Jerusalem). The account given by the saga of the origin of that expedition is characteristic and probably enough true. Many men had already been to Jerusalem and to Constantinople, and there they had got renown, and had all kinds of news to tell when they came home, and those who had taken service at Constantinople had the best luck in the way of gain; so the people bade one of the kings undertake the expedition. Sigurd went with a great force, fought many battles by the way, gained much plunder in heathen lands, and visited Jerusalem and Constantinople. Sigurd survived Eystein, and died in 1130. In his last year he showed traces of insanity. He was the last true representative of Harold Fairhair's great race, and with him the classical period of Norwegian history may almost be said to come to an end.

Period of narchy.

With the death of Sigurd commences a long period of internal strife. His son Magnus was forced to share the sovereignty with a colleague, Harold Gilchrist, who professed to be a natural son of Magnus Barefoot, and who in a short time succeeded in deposing his colleague. Harold was slain in 1136 by another pretender. Parties had formed themselves amongst the lendermenn aristocracy, who took as their nominal heads the sons and grandsons of Harold Gilchrist, often mere children; the church hierarchy, now growing powerful, interfered in the struggle, and the whole land was divided by bitter feuds. The disorganization of the country was shown by the appearance of bands of armed disorderly men, generally at first on the Swedish frontier. Unity at last seemed likely to be secured by an innovation in the succession. A powerful chief named Erling Skakke managed to get his son Magnus, who by his mother's side was a grandson of Sigurd Jorsalafari, accepted as king, first by the leading party and then practically by the whole country. He came to terms with the hierarchy; an agreement was entered into in 1164, by which various privileges were secured to the church, and a definite rule of succession was adopted. The kingdom was to be held as a fief of St Olaf, and the church dignitaries were to have a powerful voice in the succession. In return for these concessions Magnus was solemnly crowned by the archbishop of Throndhjem, and his defective claim was thus strengthened by a new form of legitimation.

Magnus, son of Erling Skakke.

There seemed every reason to suppose that the kingdom would now rest firmly on the united support of the aristocracy and the church, but in reality the basis proved to be an insecure one. The aristocracy stood no longer as formerly in close connexion with the mass of the free people, and they had not yet become welded together in a separate organized order. One of the troops of adventurers which had appeared in the previous state of confusion, and had been the followers of one of the various claimants to the throne, was known as the Birkebeinar. They were on the verge of extinction when they secured a leader of no common type. Sverri was a Faroe Islander. He seems to have been well enough aware himself that he had no claims to royal birth, but he gave himself out as the son of Sigurd, the son of Harold Gilchrist, and as such was accepted by the Birkebeinar. In a little while it became clear that his talents for command were of the first order, and the little troop of disorderly men became in his hands a disciplined military force. A fierce struggle ensued with Magnus, who in the end was defeated and slain in 1184 at Fimreite on Nord Fjord. Sverri became king, and represented himself as maintaining the old law of succession and the old order of things as against the arrangement of 1164. But in reality his reign was the commencement of a new phase. The older kings were within very narrow limits absolute, and claimed the kingdom as an odal right; but they were confronted and controlled by the mass of free landowners under their local aristocratic chiefs. A change had gradually taken place, and it seemed as if a separate aristocracy were to detach themselves from the people, and, with the help of the church, take the administration into their own hands. Sverri struck the hardest blows at both. He effectually prevented the formation of a powerful nobility, and he wholly repudiated the domination of the church. He had hammered out for himself a theory of church and state not unlike that of Henry VIII., and held that the king derived his title from God, and was entitled to an equal supremacy over both. The church retaliated by excommunication, for which, however, Sverri and his followers cared nothing, and by which their position does not seem to have been in the least affected. New officials appear in the administration of local affairs who were appointed and directly controlled by the king, and if his plans had been fully carried out it seems likely that the whole power would have been centralized under his hands. He had to fight, however, for his kingdom to the very end, and at his death in 1202 it seemed doubtful what turn affairs would take.

The Birkebeinar.

Sverri.

The party strife continued with scarcely an intermission until long after Sverri's death. The party of the Birkebeinar, however, kept well together and were on the whole the stronger. Their rivals had their chief seat in the south, and were closely connected with Denmark. At last Hakon, a grandson of Sverri, was placed on the throne in 1217, and in 1240 the last of the rival claimants to the throne fell, and the whole country was once more at peace under one king. The stormy times of Norway's history appear suddenly to pass away, and the stillness that ensues is likened by one of its historians to "the stillness on a battlefield after the battle." Hakon died in 1263. There are only two external events of note in his long reign. The one is the acquisition of Iceland, which, like the parent country, had been thoroughly worn out by the struggles of its chiefs. The other is Hakon's Scotch expedition in 1261, which was put an end to by a storm and by the not very important battle of Largs, and which showed conclusively how much the seamanship and fighting power of Norway had declined. Hakon's son Magnus surrendered the Hebrides to Scotland by the treaty of Perth in 1268. There is some dispute whether or not this was done under condition of a tribute, but there seems to be no doubt that the tribute, if due, was at all events never paid. Magnus was known by the surname of Lagabætr (law reformer), a designation which indicates the chief work of his reign. The great changes that had taken place during the long period of the civil wars must have rendered some alteration of the old law imperatively necessary; and, while something had been done in Hakon's reign, the work was completed under Magnus. In place of the old provincial laws a new law book was prepared for the whole kingdom, compiled from the older laws with the changes that seemed necessary. Many of these changes relate to customs and rights which had their origin in heathen times. Others show the altered relation of classes. A conspicuous feature is the new importance of the king's officials and the increased power and position of the king himself. Magnus died in 1280 and was succeeded by his son Erik, whose only child, the Maid of Norway,

Hakon, grandson of Sverri.

Magnus Lagabætr.

Erik, son of Magnus.

perished at sea when on her way to Scotland. In 1299 Erik died and was succeeded by his brother Hakon, who died in 1319, and whose only daughter carried the Norwegian crown into the Swedish line. During the reign of Hakon the lendermenn, who had so long been conspicuous in Norse history, finally disappeared. Hakon abolished them by a decree, without apparently even consulting his council, and without encountering the slightest resistance. They do not even reappear in the minority which followed, and which must have afforded them a very favourable opportunity of recovering their power. They occupied, in truth, an anomalous and untenable position. They had long ceased, as we have seen, to be the chiefs and representatives of the free landowners, and they had failed to assert themselves as a separate power by the side of the king. Under Magnus Lagabœtr they had acquired the title of barons, but even under long minorities they never got any real hold of power. The king was too strong for them after they had lost their old position, and he preferred ruling through officers of his own who were wholly dependent on him. Neither was there any room for the growth of a nobility of another type. On the one hand the position of the king was too absolute, and on the other hand the people were too firmly rooted in their old traditional independence. The mass of the small landowners, among whom the greater families, by the partition of their domains, gradually sank back, were ready to obey the king and his officers; but they were not the material on which an intermediate power could be rested. They admitted that the king had an odal right to his kingdom and a definite claim for services and payments, but in the same way they themselves had an immemorial odal right to their lands. The situation of Norway during the Middle Ages might be shortly described as an absolute monarchy resting almost directly on one of the most democratic states of society in Europe. Titles appear, but they represent little or nothing. The ruling officials or deputies of the king are occasionally oppressive, but there is no permanent subjection to them.

Hakon son of Magnus, abolishes the Lendermenn.

Union with Swedish crown.

From the time of the union with the Swedish crown the history of Norway is bound up with that of the other Scandinavian countries. With Sweden she entered the Calmar union in 1397, but when that union was broken in the beginning of the 16th century she remained with Denmark, and during the whole time of union can scarcely be said to have had a history of her own. The Danish kings were accepted in Norway with only an occasional show of dissent and resistance. One of her oldest and most famous colonies, the Orkney and Shetland Islands, was in 1468 given in pledge, never to be redeemed, to the Scottish king by Christian I. The commercial towns fell under the iron rule of the Hanseatic League and all the old enterprise seemed to have perished. Intellectual life appeared to fall as low as commercial prosperity. The vigorous Norse-Icelandic literature was supplanted after the time of Hakon Magnusson by versions of foreign legends and history, but even that disappeared, and, as the manuscript copies grew scarcer, it appears as if for a while the Norwegians had ceased to read as well as to write. The Reformation spread more slowly into Norway than into the other Scandinavian countries, and had to be encouraged by the Danish kings by methods not altogether dissimilar to those by which Christianity had at first been introduced. But better times began to dawn during last century. Restrictions were removed from lands and the administration was improved. The material prosperity of the country rapidly increased and a new life began to appear.

Union with Denmark.

Reverts to Sweden.

By the terms of the peace of Kiel (14th January 1814) Norway was to be transferred from Denmark to Sweden. The Norwegians were at first inclined to resist this, but their means of resistance were small and the Swedes offered liberal terms. In the same year the constitution was solemnly ratified, and Charles XIII. was taken as king. Since then the country has been peaceful and prosperous. The only serious political troubles have been those arising from the question whether the king has an absolute veto upon alteration of the fundamental law of the kingdom.

Keyser, *Norges Stats- og Retsforfatning* (Christiania, 1867). Different views of the part taken by Norway and Denmark in the viking expeditions are represented in Gustav Storm's *Kritiske Bidrag til Vikingetiden's Historie* (Christiania, 1878); and J. C. H. R. Steenstrup's *Indledning i Normannertiden* (Copenhagen, 1876). See also Konrad Maurer's *Die Bekehrung des Norwegischen Stammes zum Christenthume* (Munich, 1855). The original sources are only accessible to English readers in Laing's *Chronicle of the Kings of Norway* (London, 1844), a translation from *Heimskringla*, which does not, however, represent the best versions of some of the sagas. Valuable historical notes are to be found in Messrs. Vigfusson and Powell's *Corpus Poeticum Boreale* (Oxford, 1883). (A. GI.)

PART IV.—LITERATURE.

The literature of Norway bears something of the same relation to that of Denmark that American literature bears to English. In each case the development and separation of a dependency have produced a desire on the part of persons speaking the mother-tongue for a literature that shall express the local emotions and conditions of the new nation. Two notable events led to the foundation of Norwegian literature: the one was the creation of the university of Christiania in 1811, and the other was the separation of Norway from Denmark in 1814. These events were the signals for intellectual and political independence. Before this time Norwegian writers had been content, as a rule, to publish their works at Copenhagen, which was the metropolis of the realm; they had now a capital of their own in Christiania. The great distinction, however, between Norway and America was that the former was sufficiently ancient and sufficiently neighbouring to contribute to the glory of Denmark a great many young men who quitted the colonial and narrow circle into which they were born, and became to all intents and purposes Danish writers. The first name on the annals of Danish literature, Peder Claussön, is that of a Norwegian; and if all Norse writers were removed from that roll, the list would be poorer by some of its most illustrious names, by Holberg, Tullin, Wessel, Treschow, Steffens, and Hauch.

We must first examine what was done in Norway itself during the colonial period. The first book printed in the country was an almanac, brought out in Christiania in 1643 by a wandering printer named Tyge Nielsen, who brought his types from Copenhagen. But the first press set up definitely in Norway was that of Valentin Kuhn, brought over from Germany in 1650 by the theologian Christian Stephensen Bang (1580-1678) to help in the circulation of his numerous tracts. Bang's *Christianiæ Stads Beskrifvelse*, 1651, is the first book published in Norway. The name which next detains us is that of Christen Jensen (d. 1653), a priest who collected a small glossary or *glosebog* of the local dialects, and which was published in 1656. Gerhard Milzow (1629-1688), the author of a *Presbyterologia Norvegica*, 1679, was also a Norse priest. The earliest Norwegian writer of any original merit was Dorthe Engelbrechtsdatter (1634-1716), afterwards the wife of the pastor Ambrosius Hardenbech (see vol. viii. p. 214). She is the author of several volumes of religious poetry, of a very lacrymose and lamentable order, which have enjoyed great popularity down to the present day. The hymn-writer Johan Brunsmann (1637-1707), though a Norseman by birth, belongs by education and temper entirely to Denmark. Not so Peder Dass (1647-1708) (see vol. vi. p. 831), the

most original writer whom Norway produced and retained at home during the colonial period. Another priest, Jonas Ramus (1649-1718), wrote two important posthumous works in prose, *Norriges Kongers Historie* (History of the Norse Kings) in 1719, and *Norriges Beskrivelse*, 1735. The celebrated missionary to Greenland, Hans Egede (1686-1758), wrote several works on his experiences in that country. Peder Hersleb (1689-1757) was the compiler of some popular treatises of Lutheran theology. Frederik Nannestad, bishop of Throndhjem (1693-1774), deserves mention as the founder of the periodical press in Norway, having started a weekly gazette in 1760. The missionary Knud Leem (1697-1774) published a number of philological and topographical works regarding the Lapps of Finmark, one at least of which, his *Beskrivelse over Finmarkens Lapper*, 1767, still possesses considerable interest. The famous Erik Pontoppidan (1698-1764) cannot be regarded as a Norwegian, for he did not leave Denmark until he was made bishop of Bergen, at the age of forty-nine. On the other hand the far more famous Baron Ludvig Holberg (1684-1754), the chief of Danish writers, belongs to Denmark by everything but birth, having left Norway in childhood.

A few Norsemen of the beginning of the 18th century distinguished themselves, chiefly in science. Of these Johan Ernst Gunnerus (1718-1773), bishop of Throndhjem, was the most eminent; he was the first man who gave close attention to the Norwegian flora. He founded the Norwegian Royal Society of Sciences in 1760, in unison with his friends Gerhard Schöning (1722-1780) the historian and Hans Ström (1726-1797) the zoologist. Of these three friends Schöning deserves the greatest prominence in this place, because he wrote more in Danish and less in Latin than the other two. In belles-lettres Norway began to show vitality only when the century had reached its half-way point. Peder Christofer Stenersen (1723-1776), a writer of occasional verses, merely led the way for Christian Braumann Tullin (1728-1765), a lyrical poet of exquisite genius, whose talent is claimed by Denmark as one of the jewels in the crown of her literature, but who must be mentioned here, because his poetry was not only mainly composed in Christiania, but breathes a local spirit. He has been called the Father of Danish lyrical verse. From Tullin's day for about thirty years Denmark was principally supplied with poets from Norway. That portion of the chronicle of Danish literature which extends between the great names of Evald and Baggesen presents us with hardly a single figure which is not that of a Norseman. The director of the Danish national theatre in 1771 was a Norwegian, Niels Krog Bredal (1733-1778), who was the first to write lyrical dramas in Danish, and who exercised wide influence. A Norwegian, Johan Nordahl Brun (1745-1816), was the principal tragedian of the time, in the French taste. It was a Norwegian, J. H. Wessel (1742-1785), who laughed this taste out of fashion. In 1772 the Norwegian poets were so strong in Copenhagen that they formed a *Norske Selskab* (Norwegian Society), which exercised a tyranny over contemporary letters which was only shaken when Baggesen appeared. Among the leading writers of this period we can but just mention, besides those above named, Claus Frimann (1746-1829), Peter Harboe Frimann (1752-1839), Claus Fasting (1746-1791), Johan Wibe (1748-1782), Edvard Storm (1749-1794), C. H. Pram (1756-1821), Jonas Rein (1760-1821), Jens Zetlitz (1761-1821), and Lyder Christian Sagen (1771-1850), all of whom, though Norwegians by birth, find their place in the annals of Danish literature. To these poets must be added the philosophers Niels Treschow (1751-1833) and Henrik Steffens (1773-1845), and in later times the poet Johannes Carsten Hauch (1790-1872). There is no example of a writer of importance, born in Norway since 1800, who is counted among Danish authors.

The first form which Norwegian literature took as an independent thing was what was called "Syttendemai-Poesi," or poetry of the seventeenth of May, that being the day on which Norway obtained her independence and proclaimed her king. Three poets, called the Trefoil, came forward as the inaugurators of Norwegian thought in 1814. Of these Conrad Nicolai Schwach (1793-1860) was the least remarkable. Henrik Anker Bjerregaard (1792-1842), born in the same hamlet of Ringsaker as Schwach, had a much brighter and more varied talent. His poems, collected at Christiania in 1829, contain some charming studies from nature. He brought out a tragedy of *Magnus Barfods Sönner* (Magnus Barefoot's Sons) and a lyrical drama, *Fjeldeventyret* (The Adventure in the Mountains), 1828. The third member of the Trefoil, Mauritz Christopher Hansen (1794-1842), was a laborious and fecund worker in many fields. His novels, of which *Ottar de Bretagne*, 1819, was the earliest, were much esteemed in their day, and after Hansen's death were collected and edited, with a memoir by Schwach. Hansen's *Poems*, printed at Christiania in 1816, were among the earliest publications of a liberated Norway, but were preceded by a volume of *Smaadigte* (Short Poems) by all three poets, edited by Schwach in 1815, as a semi-political manifesto. These writers, of no great genius in themselves, did much by their industry and patriotism to form a basis for Norwegian literature to be built upon. They wrote, however, on national themes without much knowledge, and in complete bondage to the conventional forms in vogue in Copenhagen in their youth.

The creator of Norwegian literature, however, was the poet Henrik Arnold Wergeland (1808-1845), a man of great genius and enthusiasm, who contrived within the limits of a life as short as Byron's to concentrate the labours of a dozen ordinary men of letters. He held views in most respects similar to those pronounced by Rousseau and Shelley; he never ceased to preach the dignity of man, the worth of liberty to the individual and of independence to the nation, and the relation of republican politics to a sound form of literature. His own ideal of literature, however, was at first anything but sound. He was the eldest son of Professor Nikolai Wergeland (1780-1848), who had been one of the constitutional assembly who proclaimed the independence of Norway in 1814 at Eidsvold. Nikolai was himself pastor of Eidsvold, and the poet was thus brought up in the very holy of holies of Norwegian patriotism. His earliest efforts in literature were wild and formless. He was full of imagination, but without taste or knowledge. He published poetical farces under the pseudonym of "Siful Sifadda," trifles unworthy of attention. These were followed, in 1828, by *Sinclair's Death*, an unsuccessful tragedy; and in 1829 by a volume of lyrical and patriotic poems, which attracted the liveliest attention to his name. At the age of twenty-one he became a power in literature,—nay more, an influence in the state. But these writings were coldly received by connoisseurs, and a monster epic, *Skabelsen, Mennesket, og Mesias* (Creation, Man, and Messiah), which followed in 1830, showed no improvement in style. From 1831 to 1835 Wergeland was submitted to severe satirical attacks from Welhaven and others, and his style became improved in every respect. His popularity waned as his poetry improved, and in 1840 he found himself a really great poet, but an exile from political influence. His *Jan van Huysums Blomsterstykke* (J. van Huysum's Flower-piece), 1840, *Svalen* (The Swallow), 1841, *Jöden* (The Jew), 1842, *Jödinden* (The Jewess), 1844, and *Den Engelske Lods*

(The English Pilot), 1844, form a series of narrative poems in short lyrical metres which remain the most interesting and important of their kind in Norwegian literature. He was less successful in other branches of letters; in the drama, neither his *Campbellerne* (The Campbells), 1837, *Venetianerne* (The Venetians), 1843, nor *Sökadetterne* (The Cadets), 1848, has achieved any lasting success, while his elaborate contribution to political history, *Norges Konstitutions Historie*, 1841-43, is forgotten. The poems of his last five years, however, enjoy as true a popularity as ever, and are not likely to lose it. The only influence which Wergeland, in spite of his genius, has had on Norwegian literature is the removal of traditions and the release of style in various directions. His obscurity and extravagance have stood in the way of his teaching, and his only disciples in poetry have been Sylvester Sivertson (1809-1847), a journalist of talent whose verses were collected in 1848, and Christian Monsen (1815-1852).

A far more wholesome and constructive influence was that of Johann Sebastian Cammermeyer Welhaven (1807-1873), who was first brought to the surface by the conservative reaction in 1830 against the extravagance of the radical party. His first publications were polemical, and were mainly directed against Wergeland. A savage attack on *Henrik Wergeland's Poetry*, published in 1832, caused a great sensation, and produced an angry pamphlet in reply from the father, Nikolai Wergeland. The controversy became the main topic of the day, and in 1834 Welhaven pushed it into a wider arena by the publication of his beautiful cycle of satirical sonnets called *Norges Dæmring* (The Dawn of Norway), in which he preached a full conservative gospel. Norway has not followed Welhaven in politics, but it certainly has in literature. The salutary character of his advice was instantly felt by the younger men of letters. As a poet and as a critic he continued to do admirable work. He published volumes of lyrical and romantic poems in 1839, 1845, 1848, 1851, and 1860; and he enriched the language by two excellent critical studies, one on *Holberg*, 1854, and the other on *Ewald and the Norwegian Club*, 1863. His collected works appeared in eight volumes in 1867-68. He was assisted in his controversy with Wergeland by Henrik Hermann Foss (1790-1853), author of *Tidenornerne* (The Norns of the Age), 1835, and other verses.

Andreas Munch (b. 1811), the oldest now-living Norwegian author of any repute, has been one of the most rapid and industrious of poetical writers. He took no part in the feud between Wergeland and Welhaven, but addicted himself to the study of Danish models independently of either. He published a series of poems and dramas, one of which latter, *Kong Sverres Ungdom*, 1837, attracted some notice, without securing much position. His popularity commenced with the appearance of his *Poems Old and New* in 1848, and has only lately begun to decline. Andreas Munch makes little or no appeal to the highest poetical susceptibilities; his work is melodious, facile, and graceful, but without depth of feeling or artistic beauty. His highest level as a poet was reached by his epic called *Kongedatterens Brudefart* (The Bridal Journey of the King's Daughter), 1861. Two of his historical dramas have enjoyed a popularity greatly in excess of their merit; these are *Salomon de Caus*, 1854, and *Lord William Russell*, 1857. Munch published a fragment of an autobiography in 1874, with the title of *Barndoms- og Ungdoms-minder* (Memoirs of Childhood and Youth).

A group of minor poetical writers may now be considered. Magnus Brostrup Landstad (1802-1881) was born on Maasö, an island in the vicinity of the North Cape, and therefore in higher latitudes than any other man of letters. He was a hymn-writer of merit, and he was the first to collect, in 1853, the *Norske Folkeviser*, or Norwegian folk-songs. Landstad was ordered by the Government to prepare an official national hymn-book, which was brought out in 1861. Peter Andreas Jensen (1812-1867) published volumes of lyrical poetry, mostly to edification, in 1835, 1849, 1855, and 1861, and two dramas. He was also the author of a novel, *En Erindring* (A Souvenir), in 1857. Aasmund Olafsen Vinje (1818-1870) was a peasant of remarkable talent, who was the principal leader of the movement known as the "maalstræv," an effort to distinguish Norwegian from Danish literature by the adoption of a peasant dialect, or rather a new language arbitrarily formed on a collation of the various dialects. Vinje wrote a volume of lyrics, which he published in 1864, and a narrative poem, *Storegut* (Big Lad), 1866, entirely in this fictitious language, and he even went so far as to issue in it a newspaper, *Dölen* (The Dalesman), which appeared from 1858 to Vinje's death in 1870. In these efforts he was supported by Ivar Aasen, to whom we shall return, and by Kristoffer Jansen (b. 1841), now the only remaining "maalstræver," who resides in the United States, and who is the author of various important works,—an historical tragedy, *Jon Arason*, 1867; several novels,—*Fraa Bygdom*, 1865; *Torgrim*, 1872; *Fra Dansketidi*, 1875; *Han og Ho*, 1878; and *Austanfyre Sol og Vestanfyre Maane* (East of the Sun and West of the Moon), 1879; besides a powerful but morbid drama in the ordinary language of Norway, *En Kvindeskjæbne* (A Woman's Fate), 1879. Superior to all the preceding in the quality of his lyrical writing was the late bishop of Christiansand, Jörgen Moe (1813-1882), author of three little volumes of exquisite verses, published in 1850, 1851, and 1853. He is, however, better known by his labours in comparative mythology, in conjunction with P. C. Asbjörnsen.

The mixture of such opposite elements as the wild genius of Wergeland and the cold critical judgment of Welhaven would seem to have formed a singularly happy basis for the writers of the next generation to build a literature upon. The now-living poets of Norway may hold their own without fear of too severe a rivalry, not merely with those of Denmark and Sweden, whom they easily excel, but with those of the great powers. There can be no reasonable question that Ibsen and Björnson are the two most original figures of their generation in the Teutonic world of imagination. But their energy, and that of their companions, has been almost entirely confined to two fields,—the drama and the novel. The narrative and epical forms of poetry, and even the lyric in its more ambitious directions, have not flourished in the modern Norwegian school. The most conspicuous name in Norwegian literature is that of Henrik Ibsen (b. 1828). His early efforts were not remarkable, and to this day he has not succeeded in any field but the drama, where he is a master. His first tragedy, *Catilina*, 1850, was a work of little importance. It was not until 1856 that he came forward with a romantic drama, *Gildet paa Solhaug* (The Feast at Solhaug), in which an individual style was noticeable. Two successive tragedies, *Fru Inger til Östraad*, 1857, and *Hærmændene paa Helgeland* (The Warriors on Helgeland), 1858, displayed a sudden development of power. In 1863, at last, he wrote an historical tragedy, *Kongsemnerne* (The Pretenders), which is a work of maturer genius. He had by this time, however, been drawn into a new channel. In 1862 he began his series of lyrico-satirical dramas on modern Norwegian life with his *Kjærlighedens Komedie* (Love's Comedy), a brilliant study, which was succeeded by two masterpieces of a similar kind, *Brand* in 1866, and *Peer Gynt* in 1867. These were long dramas, written entirely in octosyllabic rhyming verse. In *De Unges Forbund* (The Young Men's League), 1869, which was a political satire of much force, he abandoned verse, and has since written all his dramas in prose. In 1871 he collected his lyrical poems, and in 1873 he published *Kejser og Galilæer* (Emperor and Galilean), a double drama of portentous size, on the career of Julian the Apostate. Since that time he has published, about once in every two years, satirical comedies of great pungency and wit, laying bare some sore of modern social life among his countrymen,—*Samfundets Stötter* (The Pillars of Society), in 1877; *Et Dukkehjem* (A Doll's House, or Nora), in 1879; *Gengangere* (Ghosts), in 1881; and *En Folkefiende* (An Enemy to the People), in 1883. The last of these is a humorous apology for the poet's severity as a satirist, which in his latest works has seemed excessive even to his greatest admirers. He has lived in voluntary exile from Norway since 1864.

It has been a misfortune to Björnstjerne Björnson (b. 1832) that he was born four years later than Ibsen, with whose powers his might else be more exactly matched. It is possible that in some respects his mind is more richly endowed than Ibsen's, and it would seem to be more versatile; the elder poet, however, is the superior artist, and has his qualities under more severe control. Björnson has made several false starts; Ibsen scarcely one. The first successes of Björnson were made in the field of the novel, where he adapted from the German school of "dorfgeschichten," a species of realistic and yet romantic tale of life among the peasants in the mountains, which was singularly charming and attractive. Of these the two first, *Synnöve Solbakken*, 1857, and *Arne*, 1858, were among the best, and made his name famous. His ambition, however, was to excel in dramatic writing, and after three comparative failures—*Halte Hulda* (Halting Hulda), 1858; *Mellem Slagene* (Between the Battles), 1859; and *Kong Sverre* (King Sverre), 1861—he made a great success with his heroic trilogy of *Sigurd Slembe* in 1862. In the meantime small sketches of peasant life, and the exquisite little story called *En Glad Gut* (A Merry Lad), had supported his reputation. In 1863 he brought out a tragedy of *Maria Stuart i Skotland*, and in 1865 a little comedy *De Nygifte* (The Newly-married

Couple), which enjoyed an overwhelming success. Another story, *Fiskerjenten* (The Fisher-Girl), in 1868, was found less fresh and unaffected than his early stories, and he returned to his charming pristine manner in *Brudeslaaten*, 1873. Since that year he has published but one novel, *Magnhild*, 1877, and a slight study of Italian life, *Kaptejn Mansana*, 1879, neither quite worthy of his genius. All his other productions have been dramatic. Fired with emulation for Ibsen, he has written *Sigurd Jorsalfar*, in 1873, an historical saga-drama, and a series of satirical comedies,—*En Fallit* (A Bankruptcy), 1875, an admirable piece; *Redaktören* (The Editor), 1875; *Kongen* (The King), 1877, a political manifesto in four acts; *Leonarda*, 1879; *Det ny System* (The New System), 1879; *En Handske* (A Glove), 1883; and *Over Ævne* (Beyond his Reach), 1883,—the last a very singular study of epileptic hysteria as a factor in religious enthusiasm. Björnson is a republican of the most advanced order, and his views are pushed forward too crudely for artistic effect in several of his later works.

Two writers of novels who owe much to the example of Ibsen and Björnson are Jonas Lie (b. 1833) and Alexander Kielland (b. 1849). Lie was late in developing his talent, and has lost much time in wavering between the sentimental and the realistic schools of treatment. He has finally thrown in his cause with the latter in his last novel *Livs-Slaven*, 1883. His best books have been stories of seafaring life—*Den Fremsynte* (The Man with the Second Sight), 1870; *Tremasteren Fremtiden* (The Threemaster "Future"), 1872; *Lodsen og hans Hustru* (The Pilot and his Wife), 1874; and *Rutland*, 1880. His tales of town-life—*Thomas Ross*, 1878, and *Adam Schrader*, 1879—have less of the novelist's illusion. Kielland may prove to possess a stronger talent than Lie; his progress has been more rapid and steady, and he has a clearer idea of what he wishes to do. He began by being strongly influenced by Zola in his *Garman og Worse*, 1879, and his *Arbeidsfolk* (Working People), 1880. His latest works have shown steady improvement in style and a growing independence of French models. From this, the youngest of distinguished Norwegian writers, we may turn back to a few older names which close the list of novelists. Nicolai Ramm Östgaard (1812-1873) to some extent preceded Björnson in his graceful romance *En Fjeldbygd* (A Mountain Parish), in 1852. Frithjof Foss, who wrote under the pseudonym of Israel Dehn (b. 1830), attracted notice by a series of no less than seven separate stories published between 1862 and 1864, but has been silent since. The two most important women-novelists have been Jacobine Camilla Collett (b. 1813), a cousin of the poet Wergeland, author of *Amtmandens Döttre* (The Governor's Daughters), 1855, an excellent novel, and many other volumes; and Anna Magdalene Thoresen (b. 1819), a Dane by birth, author of a series of novels.

The labours of Peter Christen Asbjörnsen (b. 1812), in conjunction with Bishop Moe, in the collection of the old Norse folk-tales, demand prominent recognition in any sketch of Norwegian literature. Before they were twenty years of age these friends began to write down the stories of the peasants. In 1838 Asbjörnsen first made public some of the results of his investigations in a little publication for children called *Nor*. Not until 1842 did the first authorized edition of the *Norske Folkeeventyr* see the light. It was followed in 1845 by *Huldreeventyr*, or stories about the fairies or sirens which haunt the mountain dairies, by Asbjornsen alone. Of these a second series appeared in 1848, and in 1871 a new series was published again by Asbjörnsen alone of the *Folkeeventyr*. It was from minstrels, boatmen, vagabonds, and paupers that the best stories were collected, and it is a significant fact that most of these professional reciters are now dead. Had Asbjörnsen and Moe neglected the duty of preserving the ancient legends, they would now, in all probability, be entirely lost. What has been done by Asbjörnsen for the peasant-stories has been done for the dialects in which they were composed by Ivar Aasen (b. 1813). Since 1850 he has received a pension from the state to enable him to study the peasant-patois, and his great dictionary, *Norsk Ordbog*, first printed in 1858, and his other linguistic publications have been the result. He is the creator of the artificial language, the "maal," which Vinje, K. Jansen, and others have written in; and he has published in it a valuable collection of proverbs, 1851.

The principal historian of Norway has been Peter Andreas Munch (1810-1863), whose multifarious writings include a grammar of Old Norse, 1847; a collection of Norwegian laws until the year 1387, 1846-49; a study of Runic inscriptions, 1848; a history and description of Norway during the Middle Ages, 1849; and a history of the Norwegian people, in 8 vols., 1852-63; Jakob Aall (1773-1844) was associated with Munch in this work. Jakob Rudolf Keyser (1803-1864) performed services scarcely less important in printing and annotating the most important documents dealing with the mediæval history of Norway. Carl Richard Unger (b. 1817) has taken part in the same work and edited *Morkinskinna* in 1867. Sophus Bugge (b. 1833) is a leading philologist of a younger school, and Oluf Rygh (b. 1833) has contributed to the archæological part of history. The modern language of Norway found an admirable grammarian in Jakob Olaus Lökke (1829-1881). A careful historian and ethnographer was Ludvig Kristensen Daa (1809-1877). Ludvig Daae (b. 1834) has written the history of Christiania, and has traced the chronicles of Norway during the Danish possession. Bernt Moe (1814-1850) was a careful biographer of the heroes of Eidsvold. Eilert Lund Sundt (1817-1875) published some very curious and valuable works on the condition of the poorer classes in Norway. Professor J. A. Friis (b. 1821) has published the folk-lore of the Lapps in a series of very curious and valuable volumes.

In jurisprudence the principal Norwegian authorities are Anton Martin Schweigaard (1808-1870) and Frederik Stang (b. 1808). Peter Carl Lasson (1798-1873) and Ulrik Anton Motzfelt (d. 1865) were the lights of an earlier generation. In medical science, the great writer of the beginning of the century was Michael Skjelderup (1769-1852), who was succeeded by Frederik Holst (b. 1791). Daniel Cornelius Danielsen (b. 1815) is a prominent dermatologist; but probably the most eminent of recent physiologists in Norway is Carl Wilhelm Boeck (b. 1808). The elder brother of the last-mentioned, Christian Peter Bianco Boeck (1798-1877), also demands recognition as a medical writer. Christopher Hansteen (1784-1873) was prominent in several branches of mathematical and chemical literature, and was professor of mathematics at the university for nearly sixty years. Michael Sars (b. 1805) has obtained a European reputation through his investigations in invertebrate zoology. He has been assisted by his son Georg Ossian Sars (b. 1837). Baltazar Michael Keilhau (1797-1858) and Theodor Kjerulf (b. 1825) have been the leading Norwegian geologists. Mathias Numsen Blytt (1789-1862) represents the section of botany. His *Norges Flora*, part of which was published in 1861, was left incomplete at his death. Niels Henrik Abel (1802-1829) was a mathematician of extraordinary promise; Ole Jakob Broch (b. 1818) must be mentioned in the same connexion. Marcus Jakob Monrad (b. 1816), an Hegelian, is the most prominent philosophical writer of modern Norway. Among theological writers may be mentioned Hans Nielsen Hauge (1771-1824), author of the sect which bears his name; Svend Borchman Hersleb (1784-1836); Stener Johannes Stenersen (1789-1835); Wilhelm Andreas Wexels (1797-1866), a writer of extraordinary popularity; and Carl Paul Caspari (b. 1814), the learned professor of theology in the university of Christiania.

No very recent compendium of Norwegian literature exists. *La Norvége Littéraire*, by Paul Botten-Hansen (1824-1869), is an admirable piece of bibliography so far as it reaches, but comes down no farther than 1866. Professor L. Dietrichson published in 1866 the first and only part of an *Omrids af den Norske Poesis Historie* (Outline of the History of Norwegian Poetry). J. B. Halvorsen is now publishing a *Norsk Forfatter-Lexikon*, 1814-1880 (Norwegian Dictionary of Authors); but this has not as yet proceeded beyond the letter B. In English see Gosse's *Northern Studies* (2d ed., 1882). (E. W. G.)

For the language, see SCANDINAVIAN LANGUAGES.

NORWEGIAN SEA. The sub-polar regions of the Atlantic lying between the Scandinavian peninsula and Greenland have been in recent years carefully investigated by Norwegian expeditions under Professors Mohn and Sars; and, as the sea immediately to the west of Norway has not hitherto been known by any distinctive name, Mohn has proposed the name of "Norwegian Sea,"—a suggestion which has been now generally adopted. The Norwegian Sea, therefore, includes the whole of the region between Greenland and Norway, a portion of which, to the north-west of the island of Jan Mayen, is sometimes known as the Greenland Sea. The Norwegian Sea is a well-marked basin cut off from the Atlantic by submarine ridges connecting the north of Scotland, the Faroe Islands, Iceland, and Greenland. On the summit of these ridges there is an average depth of about 250 fathoms. Between Spitzbergen and Lapland there is a wide opening into the Barents Sea, where the depth is from 100 to 200 fathoms. Between Spitzbergen and Greenland a wide and deep opening extends into the frozen Arctic Ocean, with a depth of 2500 fathoms. The surrounding land is almost everywhere high, rugged, deeply indented with fjords, and skirted with outlying islands, which are mostly composed of stratified rocks and ancient geological formations. Jan Mayen, situated near the centre of the basin, Iceland, and the Faroe Islands are of volcanic origin.

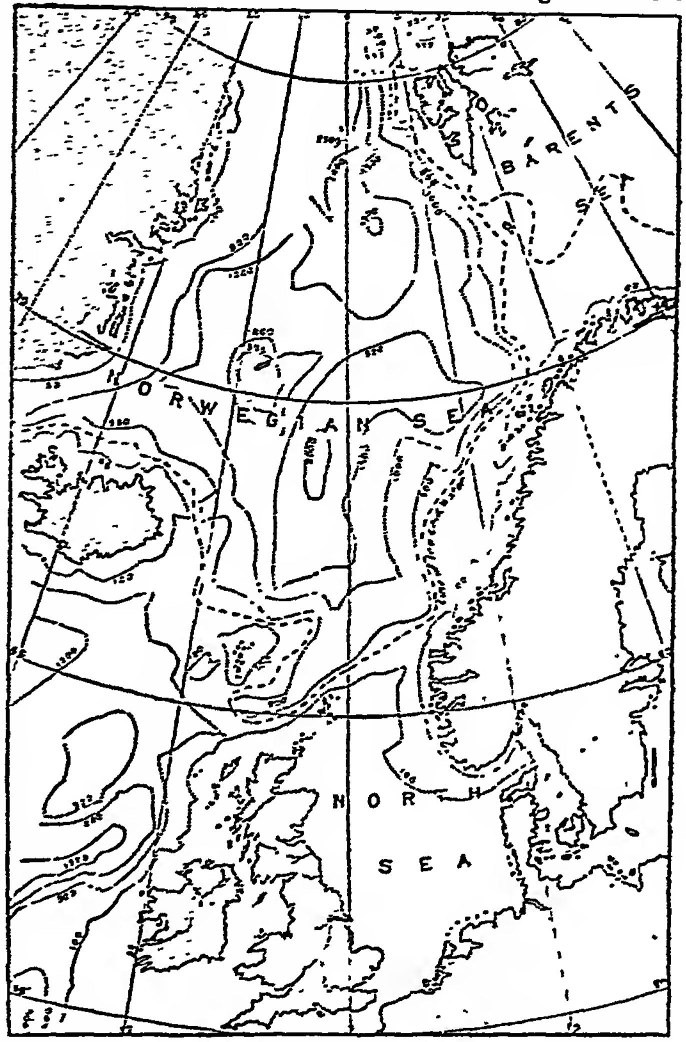
The marked peculiarity of the Norwegian Sea is the striking contrast in the climate of its eastern and western portions. If we draw a line from the east side of Iceland to the south end of Spitzbergen we have, generally speaking,

on the west of this line a sea covered with ice during the whole of the year, throughout nearly its entire extent. It is only rarely that the east coast of Greenland can be approached through the lanes and openings formed in the ice. An arctic current passes southward along the coast of Greenland, carrying with it vast fields of hummocky ice, and enters the North Atlantic through the straits which separate Iceland from the coast of Greenland. To the eastward of this line we have a sea free from ice throughout the year. A warm current—the so-called extension of the Gulf Stream—passes between the coasts of Scotland and Iceland, and carries a large amount of heat to the shores of Norway and Lapland, rendering them relatively mild and habitable. The prevailing wind over the western part of the Norwegian Sea is from the north-east, while that over the eastern is from the south-west, in each case corresponding with the direction of the ocean currents. With respect to the relations of the barometric minimum to the prevailing winds and currents see METEOROLOGY, vol. xvi. p. 139.

In March and April a very extensive seal fishery is carried on to the north and east of Jan Mayen along the edge of the ice-fields,—as many as 300,000 young seals having been captured in one season. Large numbers of polar bears are at this time noticed in the neighbourhood of the seal rookeries, and are captured on the ice at great distances from land. Later in the season there is a right whale fishery to the north and west of the island of Jan Mayen. A large number of small vessels from Hammerfest and Lapland ports visit the coasts of Spitzbergen each season to collect eider-down, and to engage in the walrus and shark fisheries. Narwhals (*Monodon*) are also captured along the edge of the ice-floes. Guillemots, little auks, gulls, and other sea-birds are found in vast numbers near the coast of Spitzbergen and along the edge of the pack-ice. Along the coast of Norway there are valuable cod, mackerel, herring, and lobster fisheries. The Norwegian Sea has a depth almost rivalling that of the great Atlantic and Pacific Oceans, that of the whole of the central parts exceeding 1000 fathoms, while to the south-east of Jan Mayen there is a depth of 2000 fathoms, and off Spitzbergen of 2500 fathoms.

The bottom in the western portion is composed of a mixture of mud and stones formed from the detrital matter carried from the land by floating ice, and containing not more than 5 or 6 per cent. of carbonate of lime. In the deeper parts of the eastern portion we have a fine mud or clay containing sometimes 50 per cent. of carbonate of lime, and a total absence of the ice-borne stones and gravel so abundant in the western portion. The carbonate of lime consists chiefly of the shells of *Globigerina* which have fallen from the surface, and some other species of Foraminifera (the most frequent of which is *Biloculina*) which live on the bottom. In some places this deposit approaches in character the *Globigerina* ooze or mud of the Atlantic, but is very poor in pelagic shells when compared with the deposits in lower latitudes. The pelagic Foraminifera and Pteropod shells so abundant in tropical parts of the Gulf Stream are killed off and fall to the bottom as they are carried into the colder areas of the North Atlantic. The upper layer of this deposit is of a brownish colour, and is less compact and contains more lime than the deeper layers, which have a blue or greyish colour. In this respect it agrees with the deposits found at similar depths around all continental shores. The deposits along the Norwegian coast, in depths less than 1000 fathoms, consist chiefly of detrital matter from the shores, the mineral particles consisting of quartz, felspars, mica, hornblende, magnetite, and fragments of rocks. Around Jan Mayen and Iceland the deposits consist largely of volcanic sand. In all the deposits there are many Diatom frustules.

The isotherms of the atmosphere receive a very remarkable deflexion to the north along the coast of Norway, as may be seen by reference to the article METEOROLOGY, figs. 8-11 (vol. xvi. pp. 133, 135, 136). A similar remarkable deflexion takes place with the isotherms of the ocean, showing the temperature of the sea surface. In January the warmest water is found at a distance of over 100 miles from the coast, and ranges from 46° Fahr. in the south to 36° Fahr. in the north. In July and August the warmest water is found close along the shore, the range being from 60° Fahr. in the south to 47° Fahr. in the north. This is due to the cooling effect of the



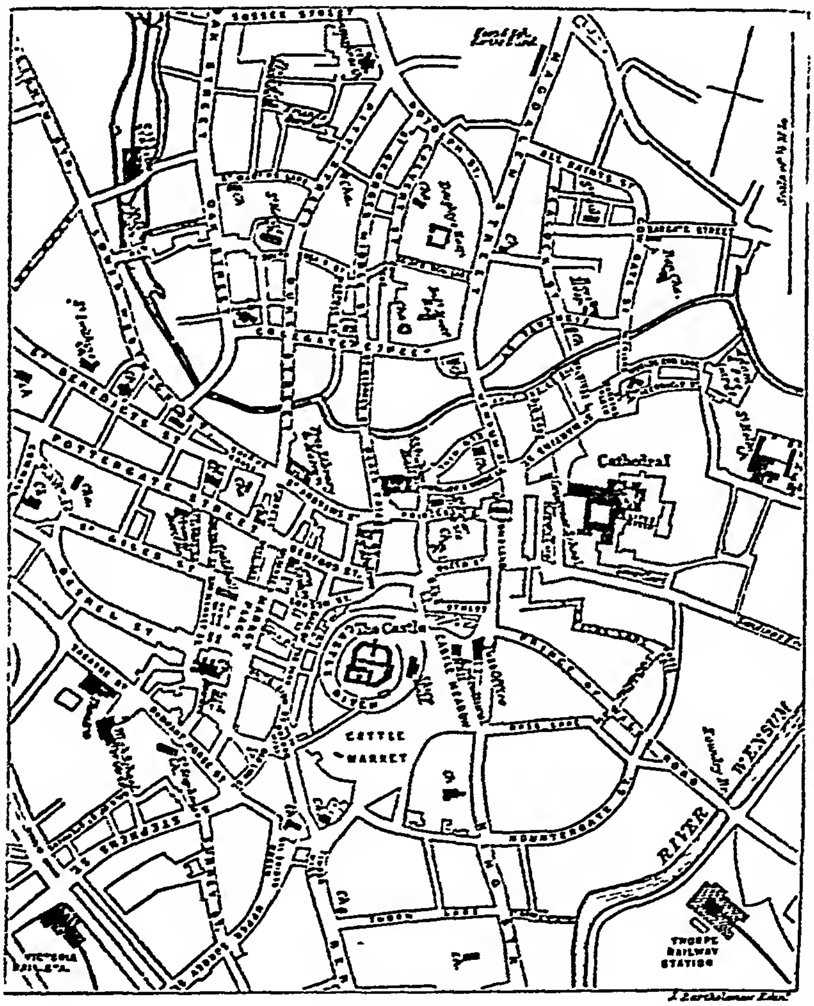
Map of Norwegian Sea.

land in winter and its warming effect in summer. In the western part of the Norwegian Sea ice-cold water is found at the surface throughout the year. The deeper parts are wholly filled with ice-cold water, this temperature being met with off the coast of Norway at a depth of 400 or 600 fathoms. The remarkably mild and genial temperature of Norway, considering its latitude, is to be accounted for (1) by the warm current from the south which flows northwards over the banks and fills up the deep fjords beyond with water of a relatively high temperature; (2) by the banks which extend along its shores with a depth of between 100 and 200 fathoms,—sometimes stretching out several hundred miles from the land and thus keeping the ice-cold water of the basin out of the deep bays and fjords. The water at the bottom of the deep fjords usually ranges from 40° Fahr. to 43° Fahr. throughout the year. In summer the surface is warmer than the bottom water in these fjords, but in winter it is several degrees colder (see NORWAY, p. 580). The bottom water in the fjords is not affected by the cold of winter or heat of summer, owing to the great depth in connexion with the slow rate at which changes of temperature are communicated through the water. The specific gravity ranges from 1·0265 along the coast of Norway to 1·0250 among the ice-floes off the coast of Greenland.

The narrow and deep channel running between the Faroe Islands and Scotland (see fig. 1, p. 564) must be specially referred to on account of the deep-sea investigations which have been there carried on. Indeed the widespread interest taken at the present time in the deep sea arose in a great degree from the interesting discoveries made in this channel by Dr Carpenter and Wyville Thomson in 1868 and 1869, in H.M.S. "Porcupine" and "Lightning." Two areas were found, one having at the bottom a temperature of 30° Fahr. and the other a temperature of 45° Fahr. The faunas in the two

edifice of *c.* 1316, originally a chapel, with a "carnary" or crypt below. Among its scholars have been Coke, Lord Nelson, Rajah Brooke, and George Borrow. St Andrew's Hall (124 by 64 feet) is the seven-bayed nave of the Black Friars' church, rebuilt with the aid of the Erpinghams between 1440 and 1470. A splendid specimen of Perpendicular work, with its twenty-eight clerestory windows and chestnut hammer-beam roof, it has served since the Reformation as a public hall, in which from 1824 have been held the triennial musical festivals, second only in date and in fame equal to those of Birmingham. It was restored in 1863. The guildhall, on the site of an earlier tolbooth, is a fine flint Perpendicular structure of 1408-13; one of its rooms, the mayor's council-chamber, fitted up with furniture of the time of Henry VIII., is an interesting specimen of a court of justice of that period.

Of forty-three churches—Perpendicular flint-work, mostly of the 15th century—St Peter Mancroft, restored in 1880-83, is by many esteemed the finest parish church in England. Measuring 212 by 70 feet, it has a richly-ornamented tower and fleche, 148 feet high, with a matchless peal of twelve sweet bells, a long light clerestory of thirty-four windows, a beautiful carved-oak roof, a remarkable font cover, and the tomb of Sir Thomas Browne. St Andrew, St Stephen, St Michael Coslany, St John Maddermarket, St Lawrence, and St Giles—the last with a tower 126 feet high—are also noticeable. A new Roman Catholic church, about to be built at the cost of the duke of Norfolk, will be much the largest and finest of a number of Nonconformist places of worship.



Plan of Norwich.

The museum (1839) has collections of fossils and birds (especially *Raptores*). It houses the literary institution (1822; 26,000 vols.), as also archæological, medical, art, and meteorological societies. Adjoining it is the free library (1857; 8000 vols.). These two buildings mark the site of the 17th-century palace of the dukes of Norfolk, said to have been the largest town-house in the kingdom out of London. The public library (1784; 50,000 vols.) in 1835 was transferred to its present quarters, a handsome building with Doric portico. The Norfolk and Norwich Hospital, first built in 1772, and rebuilt in 1879-83, is in the Queen Anne style, and on the pavilion system, with 220 beds. Other buildings are the lunatic asylum (1877-80; accommodation, 300), the workhouse (1858-60; accommodation, 1057), Jenny Lind Infirmary for sick children (1853), St Giles's or the old men's hospital (1249), Doughty's Hospital (1687), an asylum and school for the indigent blind (1805), the cavalry barracks (1791), the drill hall (1866), the agricultural hall (1882; 175 by 103 feet), the corn exchange (1861; 125 by 81 feet), the post-office (1865), and the theatre (1826). The cemetery (1856; 43 acres) has four mortuary chapels and a striking soldiers' monument (1878).

The textile manufactures of Norwich, once so important, have declined; and now its great industrial establishments are a mustard and starch works employing upwards of 2000 hands, three or four large breweries, and ironworks. Boots, clothing, vinegar, and agricultural implements are also made in large quantities. There is one daily paper, and eight others are published weekly. The corporation consists of a mayor, deputy mayor, and sheriff (elected annually), sixteen aldermen, and forty-eight councillors; and the city has sent two members to parliament since the reign of Edward I. The population has been successively (1801) 36,832, (1831) 61,110, (1871) 80,386, (1881) 87,842—males 40,288, females 47,554—in 20,764 houses (1881).

Norwich seems to have been the *Caer-Gwent* of the Britons, the *Venta Icenorum* of the Romans; and its name of *Nord-wic*, or "north-town," which first appears in the Saxon Chronicle under date 1004, is thought to refer to the large and perfect Roman camp of Caister, 3 miles to the south, which by earlier antiquaries was itself identified with *Venta Icenorum*, and by tradition is said to have been "a city when Norwich was none, for Norwich was built of Caister stone." A Saxon "burh" appears to have stood at Norwich in 767, but the present castle was probably built or rebuilt in the reign of Rufus. Only its keep remains, which, crowning the summit of a steep mound, has been adapted to prison purposes.

Frequently sacked by the Norsemen, Norwich was Guthrum's headquarters in 878, in 1004 was burned by Sweyn, and in 1017 was Canute's residence. In Domesday the city is described as having 1320 burgesses with their families, 25 parish churches, and between 800 and 900 acres of land. Ralph de Gnaer in 1075, rebelling against the Conqueror, defended the castle unsuccessfully; in 1122 Henry I. gave Norwich a charter containing the same franchise as that of London, and the government of the city was then separated from that of the castle, the chief magistrate being styled *Præpositus* or provost. In the same reign a colony of Flemish weavers introduced the woollen manufacture at Worstead, about 13 miles from Norwich; and a second colony settled at Norwich itself under Edward III., when the city was made a *staple* town for the counties of Norfolk and Suffolk. The dauphin plundered and burned the city in 1216; and in 1272 the priory was burnt in a riot between the monks and the citizens. The "black death" of 1348-49 cut off two-thirds of the inhabitants, and in 1381 the Norfolk Levellers, under John le Littester, did much damage; but by 1403 the city had sufficiently recovered to be honoured with a charter, under which it might elect a mayor and two sheriffs. In 1422 the doctrines of the Reformation made their appearance in Norwich; and several persons were executed as Wickliffites or Lollards. Among the list of martyrs is the name of Thomas Bilney, who was burned in 1531. In 1549 the city was the scene of an insurrection which grew out of the enclosure of commons, and was headed by Robert Kett *alias* Knight, a tanner. Norwich, in common with all Norfolk and Suffolk, warmly espoused the cause of the Reformation; and under Elizabeth the burnings of Roman Catholics rivalled the flames which Protestants had fed in former reigns, whilst martyrdoms for heresy of doctrine even among Protestants themselves were far from uncommon. In 1582 the city contained 5000 Dutch and Walloons, Protestant refugees from the Low Countries, who did much to foster manufactures. During the Commonwealth the city was put in defence against the royal cause and the castle was fortified for the service of Cromwell. But at the Restoration Norwich was amongst the earliest to do homage to Charles. In June 1660 the fee-farm of the city was resigned to him, with a present of £1000 in gold; and in 1663 the charter of the city was renewed and enlarged. In 1701 the art of printing, which had been introduced in 1570 but discontinued for many years, was revived, and news-

papers began to be printed. The famous "Norwich school" of landscape painting flourished during the first half of the present century, the principal artists being Crome, Cotman, Stark, and Vincent. Distinguished natives were John Kaye or Caius, Archbishop Parker, Robert Greene, Thomas Legge, Bishop Cosin, Bishop Pearson, "Old Crome," William Taylor, Amelia Opie, Harriet Martineau, and Dr Crotch, whilst among residents the best known have been Sir Thomas Erpingham, Bishop Hall, and Sir Thomas Browne.

See A. D. Bayne, *Norwich, its Political, Religious, and Municipal History* (1869); Dean Goulburn, *Sculptures in the Roof of Norwich Cathedral, with a History of the See* (1876); Jarrold, *Handbook to the City of Norwich* (1883); and other works cited under Norfolk. (F. H. G.)

NORWICH, a city of the United States, one of the county seats of New London county, Connecticut, lies 16 miles from Long Island Sound at the junction of the Yantic and the Shetucket to form the Thames, and 13 miles north of New London by the New London Northern Railroad. The greater part of the city is built on rising ground between the valleys of the confluent streams, and with its white and handsome houses has a highly picturesque effect. Besides the court-house (1873), used for county, township, and city affairs, the more conspicuous edifices are the free academy (1856), the Park Church (Congregational), and Christ Church (Episcopalian). Among the numerous industrial establishments settled at Norwich, on account of the abundant water-power in the district, are cotton, wool, paper and rolling mills (all on a very large scale), as well as factories for firearms, printing-presses, water-wheels, locks, stoves, belts, bolts, wood-type, carriages, &c. Steamers ply daily between the city and New York, and there is a thriving trade in coal, lumber, and general goods. The population of the town was 14,048 in 1860, 16,653 in 1870, and that of the city 15,112 (of the town 21,143) in 1880.

In 1659 the Indian chief Uncas, whose grave may still be seen in the old Indian burying-ground, sold the site of Norwich to Major John Mason and a body of thirty-four settlers. The incorporation of the city dates from 1784.

NORWOOD, a large suburban district of London, county of Surrey, is situated in a hilly and finely-wooded district about 1 mile south-west of Dulwich and 4 south of Lambeth. It is divided into Upper, Lower, and South Norwood, all consisting principally of villa residences and detached houses inhabited by the better classes. Almshouses for the poor of St Saviour's, Southwark, were opened at South Norwood in 1863, a Jewish convalescent home in 1869, and the royal normal college and academy of music for the blind at Upper Norwood in 1872. There is also a Catholic convent and orphanage of the Faithful Virgin. Red pottery ware is manufactured in the neighbourhood. Norwood received its name from an old forest of oak trees. Near it is Gipsy Hill, where at one time dwelt the celebrated Margaret Finch, who died in 1740 at the age of 109, and to whom a monument has been erected in Beckenham churchyard. The population of Norwood (area 1009 acres) in 1871 was 12,536, and in 1881 it was 19,017.

NORWOOD, a municipal suburb of Adelaide, South Australia, is situated about 2 miles north-east of the centre of the city, with which it is connected by a tramway. It possesses a post and telegraph office, a mechanics' institute, and a branch of the bank of Adelaide. Norwood along with Kensington forms a municipality, with an area of 1½ square miles and a population in 1881 of 10,037.

NOSE. See Smell.

NOSSI-BÉ, an island off Passandava Bay, on the north-west coast of Madagascar, in 13° 23′ S. lat. and 45° 59′ E. long., is situated 149 miles from Mayotte, and governed, along with the smaller island of Nossi-komba, by a French commandant subordinate to the governor of Mayotte. Nossi-bé is of volcanic formation, the north and south parts of older, the central part of more modern date. Besides a number of true volcanic craters of no great height (the culminating point of the island is only 1486 feet above the sea), M. Velain found a great many crater-lakes or circular troughs level with the ground—the result, probably, of subterranean explosions which did not last long enough to allow the lava to reach the surface (see *Nature*, March 1877, p. 417). Nossi-bé has an area of 481,845 acres (nearly 750 square miles), of which not more than 1800 or 2000 acres are planted with sugar-cane, coffee, &c. Trade is mainly carried on with Madagascar, though a few vessels come directly from Zanzibar or Bombay. In 1878 the value of the imports was 1,470,449 francs, that of the exports 2,092,385. The population, consisting mainly of Sakalavas, varies considerably in number. Hellville, the European chief town (so called after De Hell, governor of Réunion at the time of the French annexation), had in 1878 from 1200 to 1500 inhabitants and the rest of the island about 6000.

In 1837 Tsiomeika, queen of the Sakalavas, was expelled by the Hovas and fled to Nossi-bé and Nossi-komba. Failing to obtain assistance from the imam of Muscat, she accepted French protection. In 1849 a vigorous attempt was made to expel the French. See Von Jedina in *Revue geogr. internat.*, 1877.

NOSTRADAMUS (1503-1566), the assumed name of Michel de Notredame, a French astrologer, who was descended from a family of Jewish origin, and was born at St Remi in Provence 13th December 1503. After completing a course of study in humanity and philosophy at Avignon, he entered the school of medicine at Montpellier, where he eventually took the degree of doctor of medicine in 1529. Shortly afterwards he settled at Agen, and in 1544 he established himself at Salon near Aix in Provence. Both at Aix and at Lyons he acquired great distinction by his devoted and skilful labours during terrible outbreaks of the plague, and he was already well known before he appeared in the character of a seer. In 1555 he published at Lyons a book of rhymed prophecies under the title of *Centuries*, which secured him the notice of the superstitious Catherine de' Medici of France; and in 1558 he published a second and enlarged edition with a dedication to the king. The seeming fulfilment of some of his predictions greatly increased his influence, and Charles IX. named him his physician in ordinary. He died 2d July 1566.

The *Centuries* of Nostradamus have been frequently reprinted, and have been made the subject of many commentaries. In 1781 they were condemned by the papal court, being supposed to contain a prediction of the fall of the papacy. Nostradamus was the author of a number of smaller treatises. See especially Bareste, *Nostradamus* (Paris, 1840).

NOTARY or Notary Public. In Roman law the *notarius* was originally a slave or freedman who took notes (*notæ*) of judicial proceedings in shorthand or cipher. The notary of modern law corresponds rather to the *tabellio* or *tabularius* of Roman law than to the *notarius*. In the canon law the notary was a person of great importance, and it was a maxim of that law that his evidence was worth that of two unskilled witnesses.

In most European countries he still holds something of his old position under the canon law. In France, for instance, a document attested by a notary is said to be "legalized," a term much too strong to express the effect of such attestation in England, where the notary public, in spite of his name, is not recognized as a public officer to such a degree as the notary in other countries. The office of notary in England is a very ancient one. It is mentioned in statute law as early as the Statute of Provisors, 25 Edward III. stat. 4. The English notary is a skilled person, nominated since 25 Henry VIII. c. 21 by the archbishop of Canterbury through the master of the faculties (now the judge of the provincial courts of Canterbury and York), in order to secure evidence as to the attesta-

tion of important documents. All registrars of ecclesiastical courts must be notaries.

The office is still nominally an ecclesiastical one, though its duties are mainly of a secular character. "The general functions of a notary consist in receiving all acts and contracts which must or are wished to be clothed with an authentic form; in conferring on such documents the required authenticity; in establishing their date; in preserving originals or minutes of them which, when prepared in the style and with the seal of the notary, obtain the name of original acts; and in giving authentic copies of such acts" (Brooke, *On the Office of a Notary*, chap. iii.). The act of a notary in authenticating or certifying a document is technically called a "notarial act." In most countries the notarial act is received in evidence as a semi-judicial matter, and the certificate of a notary is probative of the facts certified. But English law does not recognize the notarial act to this extent. An English court will, in certain cases, take judicial notice of the seal of a notary, but not that the facts that he has certified are true, except in the case of a bill of exchange protested abroad.

The most important part of an English notary's duty at the present day is the noting and protest of foreign bills of exchange in case of non-acceptance or non-payment. This must be done by a notary in order that the holder may recover. He also prepares ship protests and protests of other kinds relating to mercantile matters. The office of notary is now usually, though not necessarily, held by a solicitor. In London he must be free of the Scriveners' Company. The principal statutes relating to English notaries are 25 Henry VIII. c. 21; 41 George III. c. 79; 3 and 4 William IV. c. 70; 6 and 7 Vict. c. 90.

In Scotland, before the reign of James III., papal and imperial notaries practised until the third parliament of that king, held at Edinburgh on the 29th November 1469, when an Act was passed declaring that notaries should be made by the king. It would appear, however, that for some time afterwards there were in Scotland two kinds of notaries, clerical and legal,—the instruments taken by the latter bearing faith in civil matters. In 1551 an Act was passed directing sheriffs to bring or send both kinds of notaries to the lords of session to be examined; and in a subsequent statute, passed in 1555, it was ordained that no notary, "by whatsoever power he be created," should use the office "except he first present himself to the said lords, showing his creation, and be admitted by them thereto." It does not appear that this statute vested the right of making notaries in the court of session; but in 1563 it was by law declared that no person should take on him the office, under the pain of death, unless created by the sovereign's special letters, and thereafter examined and admitted by the lords of session. Since then the court of session has in Scotland exercised full and exclusive authority on the admission of notaries in all legal matters, spiritual and temporal. The position of notaries in Scotland is somewhat higher than it is in England. Certain facts connected with the title to land must be authenticated by notarial instrument, 21 and 22 Vict. c. 76. A notary may execute a deed for a person unable to write, 37 and 38 Vict. c. 94, s. 41. The parish clergyman has notarial powers to the extent of executing a will,—a relic of the old ecclesiastical position of notaries.

In America the duties of a notary vary in different States. "They are generally as follows:—to protest bills of exchange and draw up acts of honour; to authenticate and certify copies of documents; to receive the affidavits of mariners and draw up protests relating to the same; to attest deeds and other instruments; and to administer oaths" (Bouvier, *Law Dictionary*).

NOTICE. The primary meaning of notice is knowledge (*notitia*), as in "judicial notice;" thence it comes to signify the means of bringing to knowledge, as in "notice to quit;" at last it may be used even for the actual writing by which notice is given. The most important legal uses of the word are judicial notice and the equitable doctrine of notice. Judicial notice is the recognition by courts of justice of certain facts or events without proof. Thus in England the courts take judicial notice of the existence of states and sovereigns recognized by the sovereign of England, of the dates of the calendar, the date and place of the sittings of the legislature, &c. The equitable doctrine of notice, so called because it was a doctrine formerly peculiar to the courts of equity, is that a person who purchases an estate, although for valuable consideration, after notice of a prior equitable right, will not be enabled by getting in the legal estate to defeat that right. On the other hand, a purchaser for valuable consideration without notice of an adverse title is as a rule protected in his enjoyment of the property. Other common uses of the word are notice to quit, notice of dishonour, notice of action (generally necessary in case of a breach of duty created by statute), notice of trial, notice in lieu of service of a writ (where the defendant is a foreigner out of the jurisdiction), notice to produce, &c. Notice may be either express or constructive. The latter is where knowledge of a fact is presumed from the circumstances of the case, *e.g.*, notice to a solicitor is usually constructive notice to the client. Notice may be either oral or written. It is usually advisable to give written notice even where oral evidence is sufficient in law, as in the case of notice to quit. The American use of notice is practically the same as in England.

NOTKER, a name of somewhat frequent occurrence in the ecclesiastical history of the Middle Ages. Among those by whom it was borne two are specially distinguished. NOTKER BALBULUS (*c.* 840-912) was a native of northern Switzerland, and, having become a monk of the monastery of St Gall, held the position of "magister" in its school for many years. He was canonized in 1513. Balbulus compiled a martyrology and was the author of other works, but is mentioned principally in connexion with his services to church music and with the "sequences" of which he was the composer. See HYMNS, vol. xii. p. 583. NOTKER LABEO, also a monk of St Gall, died on 29th June 1022. His translations of the Old Testament Psalms, the *De Consolatione* of Boetius, the *Categories* of Aristotle, and some other works into Old High German are of considerable philological interest. See vol. x. p. 517.

NOTO, a city of Italy, in the province of Syracuse (Sicily), 24 miles south-west of Syracuse by road on the way to Modica. Built on a new site after the earthquake of 1693, it is laid out in modern style, and contains a number of handsome mansions belonging to the provincial aristocracy. The population of the city was 15,925 in 1881; that of the commune, 16,590 in 1871, reached 18,239 in 1881.

Netum or Neetum (Νέητον) was one of the cities left to Hiero of Syracuse by the treaty of 263 B.C. Like Messina and Tauromenium (Taormina) it was a *fœderata civitas* in the time of Cicero, and at a later date it still enjoyed the rare privileges of a Latin town. Under the Saracens it was a place of importance and gave its name to one of the divisions of the island, Val di Noto. It was one of the last of the towns of Sicily to surrender to Roger the Norman. In 1837 it was made capital of the province instead of Syracuse, but this dignity was restored to the larger city by the new Italian parliament.

NOTTINGHAM or NOTTS, an inland county of England, Plate XXI.
is bounded N. by Yorkshire and Lincolnshire, W. by Derbyshire, S. by Leicestershire, and E. by Lincolnshire. It is of an irregular oval shape, its length from north to south being about 50 miles, and its greatest breadth from east to west about 25 miles. The area is 527,752 acres, or nearly 825 square miles.

The surface, though for the most part low, generally presents a pleasant diversity of hill and dale. The northern part is included in the great plain of York, and in the extreme north there is some extent of marshes. The valley of the lower Trent and that of the Idle are also very flat. In the south-west, between Nottingham and Warsop, the undulations swell into considerable elevations, reaching near Mansfield a height of about 600 feet. This district includes Sherwood Forest, of which, in 1609, there were 44,839 acres enclosed, 9486 woods, and 35,080 waste.

Some portions of it are still retained in their original condition, and there are several very old oaks. The county generally is finely wooded, although to the east of the valley of the Soar there is a considerable stretch of wolds. The principal rivers are the Trent, the Erewash, the Soar, and the Idle. The Trent, which enters the county near Thrumpton, where it receives the Erewash from the north and the Soar from the south, flows north-east past Nottingham and Newark, where it takes a more northerly direction, forming the northern part of the eastern boundary of the county till it reaches the Isle of Axholm (Lincolnshire). The Soar forms for a short distance the boundary with Leicester, and the Erewash the boundary with Derby. The Idle, which is formed of several streams near Sherwood Forest, flows northwards to Bawtry, and then turns eastward to the Trent. The Idle has been made navigable from Bawtry to the Trent. There are also several canals.

Geology and Minerals.—The oldest rocks of the county are the Coal-measures, which, forming part of the Yorkshire, Nottingham, and Derby coalfield, stretch in from Derby, occupying principally the district west of a line drawn from Nottingham to Kirkby, although coal is obtainable below the other rocks as far east as Lincolnshire, at a depth of probably less than 4000 feet. The principal workable seams are the Top Hard, the Deep Soft, the Deep Hard, and the Kilbourne coal. In 1881 there were thirty-nine collieries, producing together 4,758,060 tons. Ironstone is found, but not in sufficient quantities to make its working profitable. The Coal-measures are bounded by a narrow strip of Permian rocks, consisting chiefly of magnesian limestone, which is overlaid by the Middle Permian marls and sandstones. Red and white sandstone, freestone, and magnesian limestone are quarried in the neighbourhood of Mansfield. The lower beds of the limestone are made use of for paving-stones. The remainder of the county is occupied chiefly by the New Red Sandstone. The higher ridge between the Idle and the Trent is occupied by the Upper Keuper marls and sandstones. Lias occurs south-east from Cropwell to the neighbourhood of Newark. Along the valleys and on the tops of the hills there is generally a coating of drift. The banks of the Trent are occupied by river gravels, and along the Idle there is a large deposit of mud as well as of gypsum, the latter being dug for manure and for plastering and floors. Valuable beds of gypsum also occur in various parts of south Nottinghamshire.

Agriculture.—As the higher regions of Derby and Yorkshire attract the rain-clouds, the climate of Nottingham is much above the average in dryness, and on that account crops ripen nearly as early as in the southern counties. The soil of about one-half the county is gravel and sand, including Sherwood Forest, where it inclines to sterility, and the valley of the Trent, where there is a rich vegetable mould on a stratum of sand or gravel. The land along the banks of the Trent is equally suitable for crops and pasture. The farms generally are of moderate size, the great majority being under 300 acres. Most of the immediate occupants are tenants-at-will. Considerable improvements have taken place in the farm buildings and cottages, most of them being now built of brick and tile. According to the agricultural returns for 1883, there were 454,217 acres, or nearly nine-tenths, of the total area under crops. Corn crops occupied 142,305 acres, of which 51,250 were under wheat, 47,479 under barley or bere, and 27,090 under oats. Green crops occupied 50,151 acres, 34,925 of these being occupied by turnips and swedes, 6613 by potatoes, and 4685 by vetches. As many as 185,060 acres were in permanent pasture, while 54,684 were under clover, and 21,956 fallow. A common custom is to fallow the arable land once in three years. There were 1806 acres under orchards, 685 under market gardens, 146 of nursery grounds, and 26,387 of woods. The soil in many places is supposed to be specially suited for apples and pears, but, although they are grown in considerable quantities, there are not many orchards of large size. Hops were at one time extensively grown in the clay districts, which produce stronger plants, though less mild in flavour, than are grown in Kent and Sussex, but in 1883 they occupied only 33 acres. The total number of horses in 1883 was 20,511, of which 15,191 were used solely for agricultural purposes. Cattle numbered 76,229, of which 24,822 were cows and heifers in milk or in calf. Shorthorns are the favourite breed. Dairy farming is pretty common. Sheep numbered 211,893 and pigs 30,371. The old forest breed of sheep is almost extinct, Leicesters and various crosses being common.

According to the latest return there were 14,519 proprietors, possessing 507,337 acres with a gross annual rental of £1,560,853, or an average of about £3, 2s. per acre. The estimated extent of commons and waste lands is 1450 acres. Of the owners, 9891, or about sixty-eight per cent., possessed less than one acre, twenty-six possessed between 2000 and 5000 acres, nine between 5000 and 10,000 acres, and the following six above 10,000 acres each, viz., duke of Portland, 35,209; duke of Newcastle, 34,468; Earl Manvers, 26,460; Henry Savile, 17,821; Lord Middleton, 14,135; Earl Howe, 11,601.

Manufactures.—Nottinghamshire has for more than a century been the centre of the hosiery trade of England, and it is now equally famous for its lace manufactures. Besides the numerous silk-mills and worsted-mills, there are also cotton-mills, bleach works, sailcloth works, paper works, iron- and brass-foundries, engineering-shops, chemical works, malt works, tanneries, and breweries.

Railways.—The county is traversed in various directions by branches of the Midland, the Great Northern, the Manchester, Sheffield, and Lincoln, and the London and North-Western Railways.

Administration and Population.—Nottinghamshire comprises six wapentakes—Bassetlaw, Broxtow, Bingham, Newark, Rushcliffe, and Thurgarton; and the municipal boroughs of East Retford (population 9748), Newark (14,018), and Nottingham (186,575). In addition to these three boroughs there are eleven urban sanitary districts, viz., Arnold (5745), Beeston (4479), Heanor (6822), Hucknall Torkard (10,023), Hucknall-under-Huthwaite (2028), Ilkeston (14,122), Mansfield (13,653), Mansfield Woodhouse (2618), Sutton in Ashfield (8523), Warsop (1329), and Worksop (11,625). The county has one court of quarter-sessions, and is divided into seven petty and special sessional divisions. The boroughs of Newark and Nottingham have commissions of the peace and separate courts of quarter-sessions, and the borough of East Retford has a commission of the peace. Before the Reform Bill of 1832 the county sent eight members to parliament, and it now returns ten. For parliamentary purposes it is divided into North Nottinghamshire and South Nottinghamshire, each returning two members, as does also each of the boroughs of Nottingham, Newark, and East Retford. The parliamentary borough of East Retford has an area of 207,906 acres, including, in addition to the municipal borough, the wapentake of Bassetlaw; on the other hand, the parliamentary borough of Nottingham is now less extensive than the municipal borough. Nottinghamshire is in the province of York, and was almost entirely in the diocese of Lincoln, but an Act of 1878 has provided for the formation of the new diocese of Southwell, which comprises Derbyshire and Nottinghamshire. The county forms an archdeaconry with ten deaneries, comprising 273 civil parishes, townships, or places, and parts of five others. The population, which in 1801 was 140,350, had increased in 1821 to 186,873, in 1851 to 270,427, in 1871 to 319,758, and in 1881 to 391,815, of whom 190,778 were males and 201,037 females. The number of inhabited houses was 82,435, and the average number of persons to an acre 0·74.

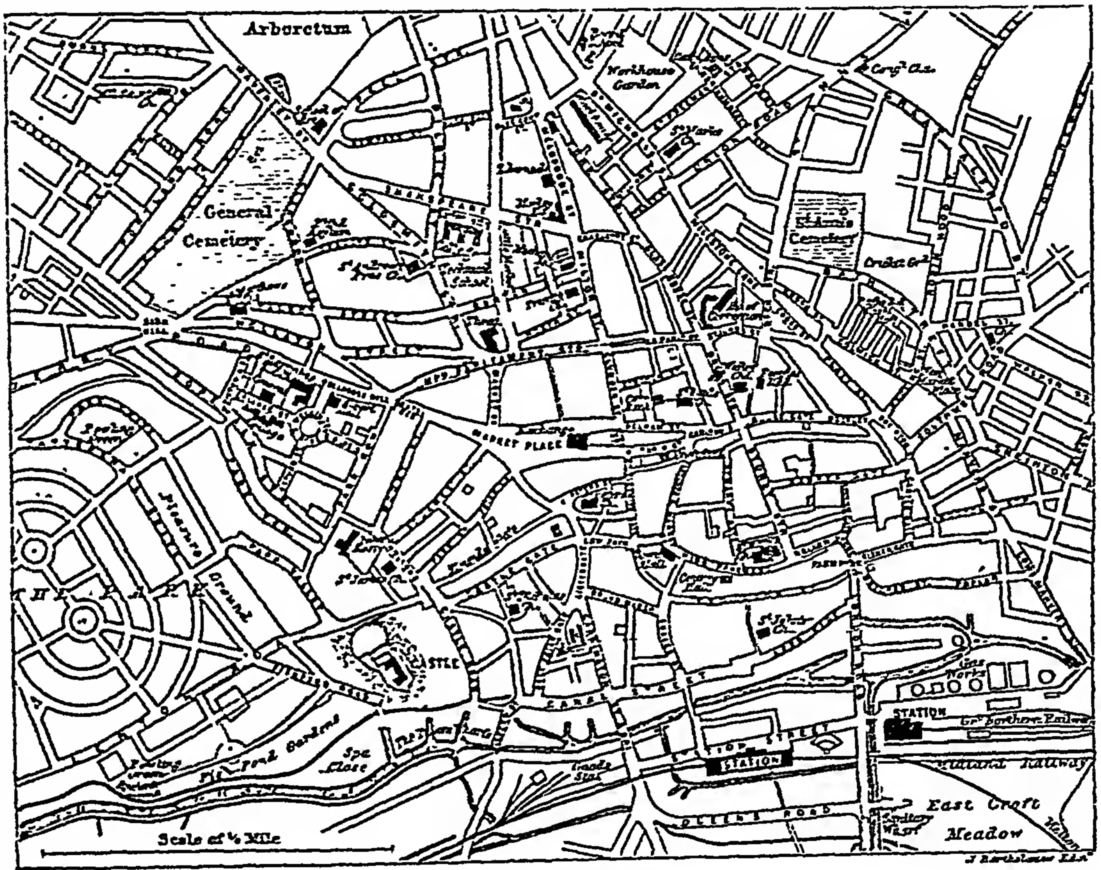
History and Antiquities.—There is some probability that the numerous caves in Nottinghamshire were occupied by the early inhabitants, but there are no architectural remains which can be proved of earlier date than the Roman invasion. The ancient Fosse Way entered the county from Leicester near Willoughby-on-the-Wolds, where Roman coins and other remains have been found, and proceeded by East Bridgford—supposed by some to be the Roman Margidunum—and Newark, entering Lincoln near South Scarle. Several Roman roads crossed it in various directions. A camp on Holly Hill near Arnold is supposed to have been a central Roman station, and Nottingham may possibly occupy the site of Causennis. Broughton and Attenborough were also Roman stations; near Mansfield have been discovered the remains of a Roman villa, and a variety of relics have been found near Newstead and in other places. The remains of an ancient fortress at Brent's Hill near Barton are supposed to be those of a British camp, although it also

in all probability was occupied by the Romans. At Oxton there is a tumulus where coins with ashes have been discovered. Few or no events of historical importance took place within Nottinghamshire during the early centuries of the present era with the exception of the defeat of Alfred the Great at Nottingham Castle in 868. During the 10th century it was frequently invaded by the Danes, whose predominance in it is sufficiently attested by the retention of such suffixes in the proper names as "beck," "holme," "thwaite," "thorpe," and "by." At the Conquest 174 manors in Nottingham were given to Roger de Buseli, and 55 to William de Peverel, who received the title of earl of Nottingham, and had an honour court, which still exists, for the recovery of debts and damages. The county was the frequent scene of contests during the reigns of the early Norman sovereigns, and it occupied a conspicuous position during the parliamentary wars, the castles of Newark and Nottingham being more than once besieged and taken by each of the parties. Legend speaks of the county as the chief scene of the adventures of the famous outlaw Robin Hood, and at the verge of Sherwood Forest there exists a curious amphitheatre called Robin Hood's Hill.

At the dissolution of the monasteries there were no fewer than forty religious houses in Nottinghamshire, eight of them in the neighbourhood of the town of Nottingham, including a cell, three hospitals, a house dedicated to St Sepulchre, and monasteries of Grey Friars and White Friars. There were hospitals at Bawtry, Blyth, Bradebusk near Gonalstone, Newark, Southwell, and Stoke; colleges at Bingham, Clifton, Ruddington, Sibthorpe, Southwell, and Tuxford; a Benedictine priory at Blyth, and a nunnery of the same order at Wallingwells; Premonstratensian abbeys at Broadholme and Welbeck; a Carthusian priory at Beauvale; Austin abbeys at Newstead and Radford, and Austin priories at Felley, Newark, Shelford, and Thurgarton; a Cluniac monastery at Lenton, a Gilbertine priory at Mattersey, and a Cistercian abbey at Rufford. The only important monastic remains are those at Newstead, but the building has been partly transformed into a mansion-house, which was formerly the residence of Lord Byron. There are also traces of monastic ruins at Beauvale, Mattersey, Radford, and Thurgarton. The finest parish church in the county is that of Newark. The churches of St Mary, Nottingham, and of Southwell were collegiate churches; the latter contains examples of Norman and the former of Early English. Balderton, Bawtry, Hoveringham, Mansfield, and Worksop are also partly Norman, and Coddington, Hawton, and Upton St Peter near Southwell Early English. Of the old castles, Nottingham and Newark are the only ones of which there are remains, but there are several interesting old mansions, such as Kingshaugh, Serooby, Shelford, and Southwell.

For the town and county of Nottingham see Domesday Book relating to Nottingham; Thoroton, *Antiquities of Nottinghamshire* (1677); Deering, *Nottingharnia vetus et nova* (1751); Throsby, *History of Nottingham* (1795); Bailey, *Annals of Nottinghamshire* (1856); Wylie, *Old and New Nottingham* (1853, 1865); Felkin, *History of Machine-wrought Hosiery* (1867); J. H. Brown, *Historical Sketch of Nottingham Castle* (1876); Thomas Chambers Hine, *Nottingham, its Castle* (1876; supp., 1879); Briscoe, *Old Nottinghamshire* (1881).

NOTTINGHAM, a municipal and parliamentary borough of England, a county in itself and the chief town of Nottinghamshire, is finely situated on an acclivity of a rock rising above the Trent and on several railway lines, 128 miles north-north-west of London and 15½ east of Derby. It is connected both with the Midland and Great Northern railway systems, while by means of the Trent, the Grantham Canal, and the Nottingham, Cromford, and Erewash Canal it has convenient water-communication with the counties of Lincoln, Leicester, Stafford, and Derby. Towards the north the town is sheltered by a chain of hills, but fine and varied views are commanded towards the south. In the neighbourhood there are many picturesque walks, and the corporation has laid out and ornamented a picturesque arboretum. Though the older streets are narrow and irregular, the rapid increase of the town has almost completely altered its character in this respect, most of the new streets being spacious, and some of them containing fine ranges of buildings. A new bridge across the Trent was opened in 1871. Nottingham possesses one of the largest market-places in England, its total area being about 5½ acres. Shortly after the Conquest a wall was built across the market, dividing it into two parts—the Norman and the Saxon. There are three old parish churches—St Mary's Church, a fine cruciform structure, lately restored, now entirely in the Perpendicular style, and possessing a fine tower rising from the centre in two stages, crowned with battlements and pinnacles; St Peter's, which was nearly all rebuilt in the Perpendicular style in the 15th century, and has been enlarged at different times; St Nicholas, a plain building in red brick with stone facings, erected in 1676. There are numerous fine modern churches, but special mention may be made of the Roman Catholic cathedral of St Barnabas, in the Early English style, by Pugin, erected in 1842-44. Among the secular buildings are the exchange hall which is now used as the town-council chamber; the town or guild hall (rebuilt 1741), a plain stuccoed building; the municipal offices (formerly the post-office, 1848), in the classic style, with a Doric portico; the corn exchange; the county hall; the new post-office, erected in 1868 in the Italian style; the people's hall (1854); the Albert Hall, for concerts (1876), a Gothic building with a tower; and the masonic hall (1880). For the Midland Counties Art Museum a lease has been obtained by the corporation of the castle buildings for 500 years, and the exhibition was opened by the prince of Wales in 1878. The town also possesses a free



Plan of Nottingham.

museum of natural history, a mechanics' institute, and a free public library with nearly 40,000 volumes. Among the educational establishments the principal are University College, for which a splendid range of buildings was opened in 1881; the free grammar school, founded in 1513, for some time in disuse, but revived in 1807, and now, since its removal in 1868 to new buildings, known as the High School; the Nottingham High School for girls; the blue-coat school, founded in 1723; the people's college, founded in 1846 for children of the working classes, and now under the direction of the Board as a middle-class school; the Congregational institute for the education of students, chiefly for evangelistic and mission work; and the Nottingham school of art, for which a fine building was erected in 1865 in the Italian style, and which is attended by over 500 students. There are a large number of benevolent institutions, including the general hospital, founded in 1781, and possessing an endowment of over £26,000, the garden hospital, the children's hospital, the nursing institution, the Nottingham and Midland eye infirmary, the dispensary, the lunatic hospital, the lunatic asylum for Nottinghamshire, the Nottingham borough asylum, the Midland institution for the blind, the homes for aged poor, incurable orphans, and deserted infants, and the hospital for women. There are also a large number of almshouses and other charities.

Nottingham has been a manufacturing town for more than 600 years, and towards the close of the last century became an important seat of the stocking trade. It was here that Richard Arkwright in 1769 erected his first spinning frame, and here also Hargreaves had the year previously removed with his spinning jenny after his machine had been destroyed by a mob at Blackburn. While Leicester became the centre of woollen hosiery, Nottingham has devoted itself chiefly to cotton, silk, and merino hosiery. Up to 1815 point lace was also an important manufacture. In 1808 and 1809 John Heathcoat of Nottingham obtained patents for machines for making bobbin net, which inaugurated a new era in the lace manufacture. Besides hosiery and bobbin net lace manufacture, the industries include bleaching, the dyeing, spinning, and twisting of silk, the spinning of cotton and woollen yarn, tanning, engineering, and brewing. There is also an extensive trade in malt.

The population increased from 31,638 in 1801 to 79,604 in 1851, to 86,621 in 1871, and to 111,648 in 1881, of whom 51,892 were males and 59,756 females. Up to 1877 the municipal and parliamentary limits were coextensive, but in that year the municipal limits were increased from 1996 to 9960 acres, with a population in 1881 of 186,575, of whom 87,633 were males and 98,942 females. The number of inhabited houses in the parliamentary area in 1881 was 23,128, while 915 were uninhabited and 318 building. In the municipal area there were 38,548 inhabited houses, 1429 uninhabited, and 767 building.

Nottingham, or Snotingaham, is supposed to have been a Celtic settlement. It first became important in the 9th century. For some time after Alfred's defeat in 868 the town was in the hands of the Danes, and constituted one of their five boroughs, but it was restored and repeopled by Edward the Elder, who erected a portion of the town wall, rebuilt the castle, and threw a bridge over the Trent (920-4). The growing importance of Nottingham is evidenced by the fact that Athelstan, the successor of Edward the Elder, established there a royal mint. In 1013 the town submitted to Sweyn. After the Conquest Nottingham Castle was rebuilt to overawe the people north of the Trent, its governorship being bestowed on William de Peverel, reputed natural son of the Conqueror. And it was whilst residing in it that Roger Mortimer, earl of March, and Isabella, widow of Edward II., were seized in the dead of night by Edward III. in 1330. Parliaments were held at Nottingham in 1334, 1337, and 1357, and it was the scene of the conference of the judges with Richard II. in August 1387. Several important persons have been imprisoned in the castle, among others David II. of Scotland. Edward IV. assembled his troops at Nottingham in 1461; and it was the headquarters of Richard III. before the battle of Bosworth in 1485. In 1642 Charles I. finally broke with the Parliament by setting up his standard at Nottingham, and during the ensuing civil war the castle was held by each of the two parties more than once. In 1644 it was dismantled by Cromwell's orders; but in 1674-79 it was re-erected in the Palladian style by the duke of Newcastle. During the Reform riot in 1831 it was partly destroyed by fire. The town received a charter from Henry II. confirming privileges granted to it by Henry I. In the reign of Henry VI. it was constituted a county under the title of "the town and county of the town of Nottingham." A surreptitious surrender of its charter was obtained by Charles II., but he was persuaded subsequently to grant it a new one. This charter was withdrawn by James II., but restored by William III. Since the reign of Edward I. Nottingham has returned two members to parliament. In 1870 it was made the seat of a suffragan bishop in the diocese of Lincoln.

NOTTINGHAM, EARLS OF. I. HENEAGE FINCH (1621-1682), first earl, lord chancellor of England, was descended from an old family, many of whose members had attained to high legal eminence, and was the eldest son of Sir Heneage Finch, recorder of London, by his first wife Frances, daughter of Sir Edmund Bell of Beaupré Hall, Norfolk. In the register of Oxford university he is entered as born in Kent, 23d December 1621, and probably his native place was Eastwell in that county. He was educated at Westminster and at Christ Church, Oxford, where he remained till he became a member of the Inner Temple in 1638. He was called to the bar in 1645, and soon obtained a lucrative practice, acquiring from his persuasive powers the titles of "the silver-tongued lawyer" and "the English Cicero," and from his graceful action that of the "English Roscius." He was chosen a member of the convention parliament of April 1660, and shortly afterwards was appointed solicitor-general, being created a baronet the day after he was knighted. In May of the following year he was chosen to represent the university of Oxford, and in 1665 the university created him a D.C.L. In 1670 he became attorney-general, and in 1675 lord chancellor. He died in Great Queen Street, Lincoln's Inn Fields, 18th December 1682, and was buried in the church of Ravenstone in Bucks.

The contemporaries of Lord Chancellor Nottingham of both sides of politics agree in their high estimate of his integrity, moderation, and eloquence, while his abilities as a lawyer are sufficiently attested by the fact that he is still spoken of as "the father of equity." His most important contribution to the statute book is "The Statute of Frauds." While attorney-general he superintended the edition of Sir Henry Hobart's *Reports*, 1671. He also published *Several Speeches and Discourses in the Tryal of the Judges of King Charles I.*, 1660; *Speeches to both Houses of Parliament*, 1679; *Speech at the Sentence of Viscount Stafford*, 1680. He left Chancery Reports in MS., and notes on Coke's *Institutes*.

See Burnet, *History of His Own Time* (1724-34); Wood, *Athenæ Oxonienses* (1691); Horace Walpole, *Royal and Noble Authors* (1758); Lord Campbell, *Lives of the Lord Chancellors* (1849); Foss, *Judges of England* (1848-64); and Blackstone, *Commentaries*.

II. DANIEL FINCH (1647-1730), second earl, son of the preceding, entered parliament for Lichfield in 1679. He was one of the privy councillors who in 1685 signed the order for the proclamation of the duke of York, but during the whole of the reign of James II. he kept away from the court. At the last moment he hesitated to join in the invitation to William of Orange, and after the abdication of James II. he was the leader of the party who were in favour of a regency. He declined the office of lord chancellor under William and Mary, but accepted that of secretary of state, retaining it till December 1693. Under Anne he in 1702 again accepted the same office in the ministry of Godolphin, but finally retired in 1704. On the accession of George I. he was made president of the council, but in 1716 he finally withdrew from office. He succeeded to the earldom of Winchelsea 9th September 1729, and died 1st January 1730.

NOVALIS. See HARDENBERG, vol. xi. p. 472.

NOVARA, a city of Italy, the chief town of a province, stands between the Agogna and the Terdoppio on a hill 545 feet above sea-level in the plain between the Sessia and the Po. It is an important railway junction, 30 miles west of Milan, on the main line from Turin to Venice, which there connects with the continuation of the St Gotthard line and the Simplon route, as well as with a line to Alessandria and Genoa. Previous to 1830 Novara was still surrounded by its old Spanish ramparts, which were entered by only four gates, and gave the place a

heavy appearance from the outside; it is now an open modern-looking town. Part of the old citadel is used as a prison. Of the churches it is enough to mention the cathedral, originally dating from 400, but (with the exception of the octagonal dome-roofed baptistery, separated from the west end by an atrium) rebuilt in the Romanesque style between 1860 and 1870 after designs by Antonelli; the church of S. Gaudenzio (so called after Bishop Gaudentius (*ob.* 417), who is buried under the high altar), rebuilt by Pellegrino Pellegrini Tibaldi, with its strange tower, more than 269 feet high; and San Pietro del Rosario, in which the papal anathema was pronounced against the followers of Fra Dolcino. The city also contains handsome market-buildings erected in 1817-42, a large hospital originally dating from the 9th century, a court-house constructed in 1346, a municipal library of 30,000 volumes (located in the market-buildings), a theatre, a statue of Cavour by Dini (1863), and another of Charles Albert. Besides being the largest grain market in the north-west of Italy, Novara trades in silk, linen, &c., and manufactures cotton, waxcloth, pottery, and starch. The communal population was 29,516 in 1871, and 33,077 in 1881; that of the city was 15,232 (or, with its suburbs, S. Martino, S. Andrea, S. Agabio, Bicocca, and Torrion, 26,206) in 1881.

Novara, the ancient Novaria, according to Pliny of Gaulish, according to Cato of Ligurian origin, was a municipal city of some importance during the Roman empire. Dismantled in 386 by Maximus for siding with his rival Valentinian, it was restored by Theodosius; but it was afterwards ravaged by Radagaisus (405) and Attila (452). A dukedom of Novara was constituted by the Lombards, a countship by Charlemagne. In 1110 the city was taken and burned by the emperor Henry V. Before the close of the 12th century it accepted the protection of Milan, and thus passed into the hands first of the Visconti and secondly of the Sforzas. In 1706 the city, which had long before been ceded by Maria Visconti to Amadeus VIII. of Savoy, was occupied by the Savoy troops. At the peace of Utrecht it passed to the house of Austria along with the duchy of Milan; but, having been occupied by Charles Emmanuel in 1734, it was granted to him in the following year. Under the French it was the chief town of the department of Agogna. Restored to Savoy in 1814, it was in 1821 the scene of the defeat of the Piedmontese by the Austrians, and in 1849 of the more disastrous battle which led to the abdication of Charles Albert and an Austrian occupancy of the city. Natives of Novara are C. Albucius Silus (ancient rhetorician), and Gaudenzio Ferrari (many of whose works are preserved in the city); and Peter Lombard was born at Lumello in the neighbourhood. The chapel-mastership has been held by some of the greatest Italian musicians, Paganini, Mercadante, La Coccia, &c.

Plate IV. NOVA SCOTIA, originally Acadia, a province of the Dominion of Canada, lies between 43° 25′ and 47° N. lat. and 59° 40′ and 66° 25′ W. long., and is composed of the peninsula proper and the adjoining island of CAPE BRETON (*q.v.*), which is separated from the mainland by the Gut of Canso. It is bounded on the N. by Northumberland Strait (which divides it from Prince Edward Island) and the Gulf of St Lawrence, N.E., S.E., and S. by the Atlantic Ocean, and W. by the Bay of Fundy and New Brunswick, being connected with the latter province by a narrow isthmus 13½ miles wide. The extreme length from south-west to north-east is 350 miles, the breadth 120 miles, and the area 20,907 square miles (13,382,003 acres).

Physical Features.—The province is intersected by chains of lofty hills, in most instances running parallel with the coast-line. The Cobequid Mountains, stretching in a long line from east to west and terminating in Cape Chignecto, form the chief ridge. Several of the elevations are as high as 1100 feet, and are cultivable almost to their summits. Lying on each side of this range are two extensive tracts of arable land which yield profitable crops. A sharply-outlined ridge of precipices runs for 130 miles along the Bay of Fundy from Briar Island at the farthest extremity of Digby Neck to Capes Split and Blomidon. Here and there masses of trap rocks, averaging from 200 to 600 feet in height and crowded with stunted firs, overhang the coasts. Beyond them lies the garden of Nova Scotia, the valley of the Annapolis, full of varied scenery, and unrivalled for its fruit, flowers, and cereals. The general slope of the country is south-easterly, in which direction there are several chains of lakes, the source of many rivers and streams of moderate length. The south-eastern coast is remarkable for its harbours, twelve of which are capable of affording shelter to ships of the line, while between Canso and Halifax, a distance of 110 miles, there are fourteen ports which possess ample accommodation for merchantmen of average size. The principal inlets are Bay Verte, Tatamagouche, and St George's Bay in Northumberland Strait; Chedabucto Bay at the head of the Gut of Canso; Halifax Harbour, Margaret's and Mahone Bays on the south-east coast; St Mary's Bay on the south-west; Annapolis Basin, Minas Basin and Channel, and Cobequid Bay on the west. Of these the most remarkable is Minas Basin, the eastern arm of the Bay of Fundy; it penetrates some 60 miles inland, and terminates in Cobequid Bay, where the tides rush in with savage impetuosity, rising sometimes as high as 60 feet, while on the opposite coast, in Halifax Harbour, the spring tides scarcely exceed 7 or 8 feet. The principal inlets in Cape Breton are Aspy Bay, St Anne's Bay, Sydney Harbour, Miré Bay, and St Peter's Bay. All along the coast of Nova Scotia there are many small islands, the south-east shore being literally studded with them. The chief are Caribou and Pictou in Northumberland Strait; St Paul, Scatari, and Isle Madame off the coast of Cape Breton. Sable, a dangerous and sandy island, almost barren, lies 150 miles east of Halifax, and has long been noted as the scene of fearful shipwrecks. Its length is 25 miles by about 1½ miles in breadth, the eastern end being in 43° 59′ N. lat. and 59° 45′ W. long. An effective humane establishment is maintained on this island by the provincial Government. Other islands are Cape Sable, Seal, and Mud in the south, and Long Island at the entrance of St Mary's Bay. The principal capes (apart from those of Cape Breton) are Malagash, John, and St George on the northern coast; Porcupine, Canso, Sambro Head, Pennant Point, Crown Point, and La Have on the south-east; Sable on the south; St Mary, Split, Chignecto, and Blomidon on the west. The interior of the country is traversed and watered by many rivers and lakes, which cover an estimated area of 3000 square miles. The rivers are, with few exceptions, navigable for coasting vessels for distances averaging from 2 to 20 miles. The principal are the Annapolis, Avon, Shubenacadie, East, Middle, and West, St Mary's, Musquodoboit, La Have, Mersey. The Annapolis river, which is navigable for a long distance, takes its rise in King's county, flows between the North and South Mountains through a fertile tract of territory and discharges into Annapolis Bay. The Shubenacadie flows from the Grand Lake in Halifax county, receives the waters of ten other streams, and, after winding through Hants county, empties itself into Minas Basin. It is navigable for craft of large size, and its banks are rich in forest trees. The East, West, and Middle rivers, also navigable for similar vessels, discharge into Pictou Harbour. The La Have empties into the Atlantic, the Avon into the Bay of Fundy, and the Mersey into Liverpool Harbour. The Medway, Shelburne, Clyde, Tusket, St Mary's, and several others have their sources in the numerous lakes which lie in the interior. The largest of the latter is Lake Rossignol, situated in Queen's county, and more than 20 miles long. Ship Harbour Lake, 15 miles in length, and Grand Lake are in Halifax county, College Lake is in the eastern part of

the peninsula. The Bras d'Or Lake (Cape Breton) may be best described as an imprisoned sea. It is 50 miles long and of great depth, bordered by the counties of Victoria, Inverness, Richmond, and Cape Breton; it is full of fish, and expands into several streams and bays, each of which affords excellent sport to the angler.

Geology.—The Lower Cambrian runs along the whole extent of the Atlantic seaboard in one uninterrupted line. To the north of this stretches an extensive district composed of rocks of Upper Silurian and probably others of Lower Silurian age. Along the section on the south coast of the Bay of Fundy, and at Minas Basin and Channel, is to be found the New Red Sandstone formation. Grey granite, gneiss, and mica-slate prevail along the shore. Trap rocks, often embedded in clay-slate, abound in several sections of the province, and the newer Red Sandstone prevails in the western division. There are vast Carboniferous beds, occupying a large area, and forming a source of great wealth to the inhabitants. Millstone grit, the gypsiferous series, limestones, slates, the metamorphic series, the Huronian, &c., are also to be noted. The Carboniferous plain of New Brunswick is connected with that of Nova Scotia at its eastern extremity. The coal-fields of the latter are especially valuable and productive. They are situated in Cape Breton, Cumberland, Pictou, Inverness, and Richmond counties. In 1882 there were twenty-one collieries in operation, which produced 1,365,811 tons of coal, consumed principally in Quebec, New Brunswick, Newfoundland, Prince Edward Island, and the United States. About 4235 persons are employed in this industry. The coal is bituminous and very rich in quality. In the Carboniferous areas there are immense deposits of pyroschist or bituminous shale, "capable," says Dawson, "of yielding as much as 63 gallons of oil, or 7500 feet of illuminating gas per ton. Owing to the great cheapness of petroleum little attention has been paid to these shales for some years, but it is likely that they will before long again be in demand."

Gold is found in workable quantities, the production in 1882 being 14,107 ounces. The gold district includes Caribou, Gay's River, Montagu, Oldham, Renfrew, Sherbrooke, Stormont, Tangier, Uniacke, Waverley, Wine Harbour, and unproclaimed,—thirty mines in all. Iron ore abounds also in profitable quantities, and of excellent quality; the production in 1882 was 42,135 tons. Other minerals, such as manganese ore, gypsum, barytes, &c., abound. A fair business is annually done in coke, fire-clay, building-stone, and grindstones. Some veins of copper, silver, lead, and galena, especially rich in quality, exist. There are many curious and beautiful fossils, besides amethysts, agates, chalcedonies, jaspers, cairngorms, &c.

Climate and Vegetation.—The climate of Nova Scotia somewhat resembles that of New Brunswick. There are extremes of heat and cold, and sudden changes of temperature, varying sometimes in one day as much as 50°. Considering its northern latitude, it is remarkably temperate on the whole. The extreme of cold is about 20° below zero in the depth of winter, and the greatest heat is 98°. The climate varies in the different counties, those in the west averaging from 6° to 8° Fahr. warmer than those in the east. The coldest period is from the end of December to the first week in March, during which the weather is tolerably uniform. The spring is usually brief and chilly, but the autumn, which is the most favoured season of the year, is delightfully pleasant. Vegetation develops rapidly. At certain times dense fogs line the banks along the Atlantic coast, but they are not considered unhealthy.

Nova Scotia is a valuable agricultural country; wheat, oats, rye, barley, buckwheat, Indian corn, potatoes, turnips, beets, tomatoes, &c., grow in abundance, while apples, pears, plums, cherries, strawberries, raspberries, cranberries, gooseberries, currants, and other fruits ripen to perfection. Even grapes and peaches grow in the open air in some districts. The Nova Scotia apple is an article of commerce, and quantities have been exported to England. The orchards of Annapolis and King's counties extend along the roadsides for upwards of 50 miles. The soil is of various degrees of fertility. The intervale lands, which form an extensive part of the country, are rich, and yield largely. The uplands, lying between the hilly sections and the rivers, are of moderate capacity. The high lands are as productive as the intervales. The produce in 1881 was 529,251 bushels of wheat, 228,748 of barley, 47,567 of rye, 1,873,113 of oats, 339,718 of buckwheat, 37,220 of pease and beans, 8128 of grass and clover seeds, 7,378,387 of potatoes, 1,006,711 of turnips, 326,143 of other roots, and 597,731 tons of hay. Of live stock there were 57,167 horses, 33,275 working oxen, 137,639 milch cows, 154,689 other horned cattle, 377,801 sheep, and 47,256 swine.

The forests of Nova Scotia are extensive and valuable, the principal trees found in New Brunswick also growing in the sister province. They are chiefly pine, oak, tamarack, birch, maple, hemlock, spruce, butternut, ash, &c. The yield of timber is very great, the shipments in 1881 amounting in value to $1,587,941.

Industries, Commerce, &c.—Nova Scotia is not strong as a manufacturing country, but every year some new industries are added to the list. At present there are two sugar-refineries and a cotton-factory in Halifax. Coarse "homespuns," coarse flannels, bed-linen, blankets, carpets, and tweeds are made in considerable quantities. Tanning is extensively carried on, and there are several factories where household and other furniture, agricultural implements, boots and shoes, saddlery, harness, tobacco, printing and wrapping paper, machinery, nails, pails and wooden ware, fuse gunpowder, carriages, and sleighs, &c., are made. In 1881 the province contained 1190 saw-mills, 263 grist-mills, 151 tanneries, 68 carding and weaving establishments, 8 breweries, and various other manufactories; 217,481 lb of maple sugar were produced. The value of the boots and shoes manufactured was $754,128, of iron smelted $720,000, and of sugar refined $1,702,000. The exports of mining produce amounted to $676,078, of agricultural products to $830,804, of manufactures to $487,503, and of animals and their produce to $836,052. The total exports were $9,217,295 and the total imports $8,701,589. Shipbuilding is extensively carried on. In 1882 there were 122 vessels built, tonnage 31,361; and 174 vessels of all classes were registered. In the same year 6615 craft, representing a tonnage of 709,167, were engaged in the coasting trade. The total number on the registry books of the province was 3026, tonnage 546,778.

Next to Newfoundland, Nova Scotia possesses the largest and most valuable fisheries in British North America. Along the entire coast, extending over 1000 miles, food fish of almost every description (salmon, trout, cod, holibut, haddock, bass, mackerel, herring, shad, lobsters, &c.) may be taken. Immense quantities of these are shipped to the West Indies, the United States, various ports in Canada; and of late years several varieties have been welcomed in British markets. In 1882 fish to the value of $4,437,364 were exported. About 19,000 men are employed in this industry.

Most of the principal birds of North America are to be found in Nova Scotia, and the game of the country includes moose, caribou, duck, teal, geese, woodcock, partridge, snipe, plover, &c. The game laws are very strict, and are rigidly enforced. The wild animals remaining in the province are bears, wolves, foxes, wild-cats, and a few others.

Communication.—Nova Scotia is well furnished with railways, there being nearly 600 miles in operation at the present time. The Intercolonial runs from Halifax to Amherst, 138 miles, and thence to St John, N.B., and Quebec. There are two canals in the province, one from Halifax to Cobequid Bay, and the other, the St Peter's, connecting St Peter's Bay on the southern side of Cape Breton with the Bras d'Or Lake. The roads of Nova Scotia are exceedingly good and well maintained. Telegraphic lines are established nearly all over the province, and connect with the United States system.

Government, Finance, &c.—The executive authority is in the hands of a lieutenant-governor and a council of eight members, four with portfolios and four without. Thirty-eight representatives are elected every four years to the house of assembly, and twenty legislative councillors are appointed for life by the local govern-

ment. The lieutenant-governor is appointed by the governor-general of Canada in council. The system of administration is known as responsible government. The province returns twenty-one members to the Dominion House of Commons, and ten senators are appointed by the crown to the senate of Canada. They hold their positions for life. The province has the right to make its own civil laws, but in all criminal cases the form which obtains in all the courts is the criminal law of the Dominion. The judiciary consists of a chief justice, an equity judge, and five puisne judges, a supreme court having law and equity jurisdiction throughout the province, a vice-admiralty court, and a court of marriage and divorce. In each county there is a court of probate. There are also seven county court judges.

Nova Scotia forms the ninth military district in the militia of Canada. The established strength of the active force by arms is composed of 1 troop of cavalry, 1 field battery of artillery, 17 batteries of garrison artillery, 9 battalions of infantry and rifles; total, 318 officers, and 3638 non-commissioned officers and men. The period of service in time of peace is three years. British regiments of the line are also stationed at Halifax.

The public revenue of the province is a little more than half a million dollars annually, and the expenditure is about the same. The chief source of revenue is the yearly subsidy granted to the province by the Dominion, under the terms of the British North America Act of 1867. In 1882 it amounted to $380,000. The remainder of the revenue is derived from the sales of wild lands, royalties from mines, miscellaneous fees, marriage and other licences.

Religion, Education, &c.—There are two Roman Catholic dioceses in Nova Scotia—the archdiocese of Halifax and the diocese of Arichat; the clergy of the two combined number 76. A Church of England see was established at Halifax in 1787; the bishop, who has jurisdiction in Prince Edward Island also, has under him an archdeacon and 85 clergymen. The synod of the maritime provinces in connexion with the Presbyterian Church in Canada includes 101 ministers in Nova Scotia. The Methodist Church has 100 clergymen and supernumeraries, and the Baptist denomination has 104. The following table shows the number of the adherents of the various bodies:—

Church of England	60,255	Lutherans	5,632
Church of Rome	117,487	Adventists	1,555
Presbyterians	112,488	Other denominations	2,281
Baptists	83,761	Jews	19
Methodists	50,811	No creed stated	1,518
Of no religion	121		
Congregationalists	3,506	Total	440,572

The free-school system is in operation, the whole community paying for its maintenance. The total Government expenditure for this service in 1882 was $173,877; the local expenditure, county fund, was $106,948; the total expenditure for public schools amounted to $571,389. In this year there were 1910 schools in operation, taught by 1975 teachers, and attended by 81,196 pupils. Besides the public schools and academies, there are a model and a normal school, several convents, and six colleges, viz., Dalhousie College and University, St Mary's (R.C.) College, the Presbyterian College, Acadia College (Baptist) at Wolfville, St Francis (R.C.) College at Antigonish, and King's College and University (Episcopal) at Windsor, which was founded in 1787.

The public charitable institutions receiving aid from the province are the insane asylum, poor's asylum and provincial city hospital, blind asylum, transient poor and visiting dispensary, and the deaf and dumb asylum, which is also helped by the New Brunswick Government. Several other institutions are maintained by societies and the benevolence of private individuals.

Population.—The province is divided into eighteen counties (including Cape Breton), as follows (1881):—

Counties.	Pop.	Capitals.	Counties.	Pop.	Capitals.
Halifax	67,917	Halifax.	Cumberland	27,368	Amherst.
Lunenburg	28,583	Lunenburg.	Colchester	26,720	Truro.
Queen's	10,577	Liverpool.	Pictou	35,535	Pictou.
Shelburne	14,913	Shelburne.	Antigonish	18,060	Antigonish.
Yarmouth	21,284	Yarmouth.	Guysborough	17,808	Guysborough.
Digby	19,881	Digby.	Inverness	25,651	Port Hood.
Annapolis	20,598	Annapolis.	Richmond	15,121	Arichat.
King's	23,469	Kentville.	Cape Breton	31,258	Sydney.
Hants	23,359	Windsor.	Victoria	12,470	Baddeck.

The total population was 440,572, including 220,538 males and 220,034 females. In 1871 the population was 387,800. There are 2125 Indians in Nova Scotia, principally Malicites and Micmacs. The inhabitants consist chiefly of Scotch, English, Irish, American, German, Acadian French, Dutch, freed negroes, of whom there are 7062, and various other nationalities.

Besides Halifax, the capital, of which the population in 1881 was 36,100, the chief towns are Pictou (3403), New Glasgow (2595), Sidney (Sydney), C.B. (3667), North Sydney (5484), Yarmouth (6280), Liverpool (3000), and Lunenburg (4097). Windsor (3019), possessing one of the principal colleges in the province, is also the centre of a large trade in gypsum. Annapolis, formerly Port Royal, Truro, Amherst, Antigonish, and Pugwash are also rising and thriving towns.

History.—Nova Scotia was first visited by the Cabots in 1497, but it was 1604 before any attempt at colonization by Europeans was made. This was the expedition headed by De Monts, a Frenchman, which tried to form settlements at Port Royal, St Croix, and elsewhere, and endured severe hardships until 1614, when the English colonists of Virginia made a descent upon them, claimed the territory in right of the discovery by the Cabots, and expelled them from the soil. In 1621 Sir William Alexander obtained a grant of the whole peninsula, and it was named in the patent Nova Scotia instead of Acadia, the old name given the colony by the French. Alexander intended to colonize the country on an extensive scale, but the attempt was frustrated (1623) by the French. During the reign of Charles I. the Nova Scotia baronets were created, and their patents ratified in parliament. Their number was not to exceed 150, and in exchange for their titles and grants of land they agreed to contribute aid to the settlement. Cromwell despatched a strong force to the possession in 1654. In 1667 it was ceded by the treaty of Breda to the crown of France. But the restless English colonists, unmindful of treaty obligations, attacked the French from time to time at various points, until in 1713 the latter relinquished all claim to the country. England neglected it until 1749, when, the designs of the French again becoming marked, the Government made strenuous exertions to induce British settlers to go there. More than 4000 emigrants with their families sailed for the colony; and Halifax was founded. But the French settlers, who enjoyed privileges as neutrals, still embraced a considerable portion of the population, and, with their allies the Indians, proved exceedingly troublesome to the English. They were finally expelled; and in 1758 a constitution was granted to Nova Scotia. By the treaty of Paris in 1763 France resigned all pretension to the country. In 1784 New Brunswick and Cape Breton were separated from Nova Scotia; but in 1819 the two latter divisions were reunited, and in 1867 they became part of the Dominion of Canada.

See Campbell, *Nova Scotia in its Historical, Mercantile, and Industrial Relations* (Montreal, 1873); Dawson, *Acadian Geology* (Montreal, 1878); Fletcher in *Report of the Geological Survey of Canada* (1879-80); *Pub. Doc.* "Nova Scotia and Dominion of Canada (1882-83)." (G. ST.)

NOVATIANUS, Roman presbyter, and one of the earliest antipopes, founder of the sect of the Novatiani or Novatians, was born about the beginning of the 3d century. On the authority of Philostorgius (*H. E.*, viii. 15), he has often been called a native of Phrygia, but perhaps the historian intended by this nothing more than to indicate the Montanistic complexion of Novatian's creed. Of the facts of his life very little is known, and that only from his opponents. His conversion is said to have taken place after an intense mental struggle; he was baptized by sprinkling, and without episcopal confirmation, when on a sick-bed in hourly expectation of death; and on his recovery his Christianity retained all the stern and gloomy character of its earliest stages. He was ordained to the priesthood at Rome by Fabian, or perhaps by an earlier bishop; and during the Decian persecution he maintained very strenuously the severer view of the church's disciplinary function, which would have excluded for ever from ecclesiastical communion all those (lapsi) who after baptism had ever sacrificed to idols,—a view which had frequently found expression within the church previously, and which had indeed been the occasion of the schism of Hippolytus. Bishop Fabian suffered martyrdom in January 250, and, when Cornelius was elected his successor in March or April 251, Novatian objected to the new bishop on account of his known laxity on the above-mentioned point of discipline, and allowed himself to be consecrated bishop by the minority who shared his views. He and his followers were excommunicated by the synod held at Rome in October of the same year. He is said by Socrates (*H. E.*, iv. 28) to have suffered martyrdom under the emperor Valerian. After his death the Novatians, in spite of much opposition, increased, and spread rapidly to almost every province of the empire; they called themselves καθαροί, or Puritans, and insisted on rebaptizing their converts from the Catholic view. The eighth canon of the council of Nice provides in a spirit of considerable liberality for the readmission of the clergy of the καθαροί to the Catholic

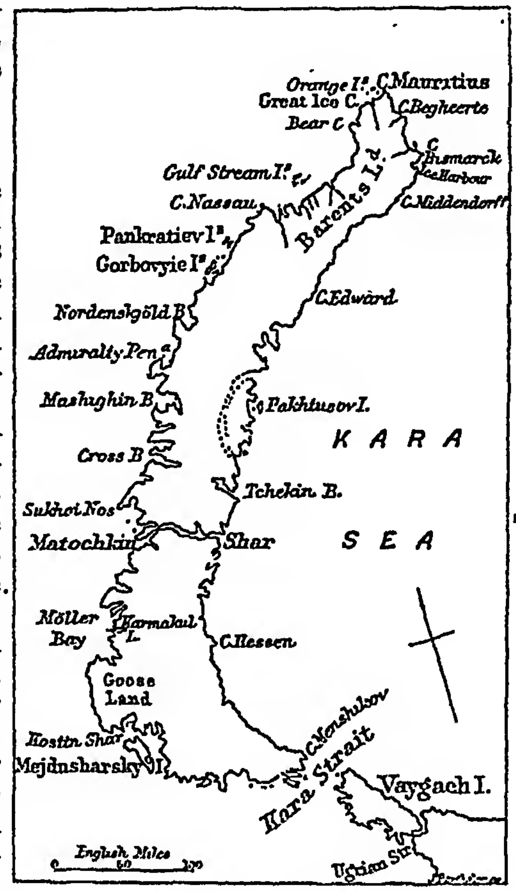
Church, and the sect finally disappeared some two centuries after its origin. Novatian has sometimes been confounded with his contemporary Novatus, a Carthaginian presbyter, who held similar views.

Novatian was the first Roman Christian who wroto to any considerable extent in Latin. Of his numerous writings three are extant: (1) a letter written in the name of the Roman clergy to Cyprian in 250; (2) a treatise in thirty-one chapters, *De Trinitate*; (3) a letter written at the request of the Roman laity, *De Cibis Judaicis*. They are well-arranged compositions, written in an elegant and vigorous style. The best editions are by Welchman (Oxford, 1724) and by Jackson (London, 1728); they are translated in vol. ii. of Cyprian's works in the *Ante-Nicene Theol. Libr.* (Edinburgh, 1869). The Novatian controversy can be advantageously studied in the *Epistles* of Cyprian.

NOVATION is a term derived from the Roman law, in which *novatio* was of three kinds—substitution of a new debtor (*expromissio* or *delegatio*), of a new creditor (*cessio nominum vel actionum*), or of a new contract. In English law the term (though it occurs as early as Bracton) is scarcely yet naturalized, the substitution of a new debtor or creditor being generally called an assignment, and of a new contract a merger. It is doubtful, however, whether merger applies except where the substituted contract is one of a higher nature, as where a contract under seal supersedes a simple contract. Where one contract is replaced by another, it is of course necessary that the new contract should be a valid contract, founded upon sufficient consideration (see Contract). The extinction of the previous contract is sufficient consideration. The question whether there is a novation most frequently arises in the course of dealing between a customer and a new partnership, and on the assignment of the business of a life assurance company with reference to the assent of the policyholders to the transfer of their policies. The points on which novation turns are whether the new firm or company has assumed the liability of the old, and whether the creditor has consented to accept the liability of the new debtors and discharge the old. The question is one of fact in each case. See especially 35 and 36 Vict. c. 41, s. 7, where the word "novations" occurs in the marginal note to the section, and so has quasi-statutory sanction. Scotch law seems to be more stringent than English law in the application of the doctrine of novation, and to need stronger evidence of the creditor's consent to the transfer of liability. In American law, as in English, the term is something of a novelty, except in Louisiana, the only State where the civil law prevails.

NOVA ZEMBLA, or, more correctly, Novaya Zemlya (*i.e.*, "New Land"), is a large island, surrounded by many small ones, situated in the Arctic Ocean (see vol. ii., plate xxvi.), and belonging to the Russian empire. It lies between 70° 30′ and 77° N. lat. and between 52° and 69° E. long., in the shape of an elongated crescent 600 miles in length, with an average width of 60 miles, and an estimated area of 40,000 square miles, separating the Kara Sea on the east from that part of the Arctic Ocean which is often called Barents's Sea. The north-eastern extremity of Novaya Zemlya lies a little to the west of the meridian of the peninsula of Yalmal, from the extremity of which it is only 160 miles distant. Its southern part, bending towards the south-east, appears as a continuation of the Vaigatch (Vaygach) Island, from which it is separated by the Kara Strait, 30 miles in width,—the island itself being separated from the continent by the narrow Ugrian Strait, only 7 miles broad. Novaya Zemlya is cut through about the middle by a narrow winding channel, the Matotchkin (Matochkin) Shar, which also connects the Arctic Ocean with the Kara Sea.

While the eastern coast runs as a regular curve, with deeper indentations only in its middle, the western is deeply indented by numerous and in some cases fjord-like bays, studded, like the rest of the coast, with many islands. Amongst the principal on the western coast are several parallel fjords at the southern extremity and the wide bay of Sakhanikha. Then farther north is the Kostin Shar, bounded on the north by Cape Podrezoff, which forms the southern extremity of Gusinaya Zemlya or Goose Land, in 72° N. lat.; Möller Bay, 40 miles wide, between Goose Land and Britvin Promontory, has several fjord-like bays, with good anchorages. A broad indentation between Britvin and Sukhoi Nos Promontories, which has received the general name of Marquis de. Traversé Bay, includes several bays with good anchorages for larger vessels. Several other large and deep bays follow until Admiralty Peninsula (75° N. lat.) is reached; of these the chief are Krestovaya and Mashigin. Farther on, Nordenskjöld's Bay is worthy of notice.



Map of Nova Zembla.

Orography and Geology.—The interior of Novaya Zemlya is almost unknown; still, the broad features of its structure can be inferred from data obtained at various points on the coast. Two orographical regions must be distinguished. The first of these, south of lat. 72°, appearing as a continuation of the Pay-Kho mountains, is a plateau of moderate height, with several low parallel ridges (2000 feet) running north-west, and separated by level valleys dotted with numerous lakes. It consists of gneisses and clay-slates, with layers of augitic porphyry (north of Kostin Shar), and thick beds of Silurian and perhaps Devonian limestones, continued on Vaigatch Island, where they are partially covered with Carboniferous deposits. On the north-west it terminates in the low plateau (300 to 400 feet) of Goose Land. The middle and northern parts of Novaya Zemlya, on the other hand, form an alpine region with isolated peaks and a complicated system of spurs and deep valleys, extending even under the sea. Instead of being, as it has been frequently described, a single chain running in the main direction of the island closer to its western coast, it appears to be rather a system of shorter chains running due north-east, and disposed in échelons displaced eastwards as they advance towards the north. They terminate seawards in several promontories having the same direction; but the difference of the geological structure on the two sides of the Matotchkin Shar would suggest that it is rather a combination of two longitudinal valleys connected by a transverse cleft than one transverse valley. The highest parts of the alpine region (the Mitusheff Kameñ, 3200 feet; Wilczek, 3900 feet; and other peaks to the west rising perhaps to 4000 and 4650 feet) are in the neighbourhood of this channel; south of the eastern en-

trance is a peak about 5000 feet in height. Farther north the region sinks much lower, while that part of northern Novaya Zemlya which bends eastward seems to consist of a more massive swelling of land, covered with an immense ice-sheet descending north and south to the sea-coast. The whole of the alpine region is covered with fields of snow descending in broad strips along the slopes of the isolated peaks, and feeding glaciers in the deeper valleys.

The geological structure of the central region is of the most varied description. The primary rocks which appear at Mitusheff Kameñ are overlaid with thick beds of quartzites and clay-slates containing sulphite of iron, with subordinate layers of talc or mica slate, and thinner beds of fossiliferous limestone, Silurian or Devonian. More recent clay-slates and marls belonging to the middle Jurassic occur in the western coast-region about Matotchkin Shar. About 74° N. lat. the crags of the eastern coast are composed of grey sandstone, while in 76° Barents's Islands, and possibly a much greater part of the northern coast, show Carboniferous strata. Traces of Eocene deposits, produced under a warmer climate, which are so widely developed in other parts of the polar basin, have not yet been discovered on Novaya Zemlya. During the Glacial period its glaciers were much larger than at present, whilst during a later portion of the Quaternary period (to judge by the marine fossils found as high as 300 feet above the sea) Novaya Zemlya, like the whole of the arctic coast of Russia, was submerged for several hundred feet. At present it appears to partake of the movement of upheaval common to the whole of northern Russia.

Climate.—Though milder than that of north-eastern Siberia, the climate of Novaya Zemlya is colder even than that of Spitzbergen. The average temperature about the Matotchkin Shar has been found from three years' observations to be 17° Fahr., and it decreases towards the south, being only 14°·9 at Kamenka (70° 35′ N.). At Shallow Bay, in 73° 55′, it has been found to be 19°·6. In the middle parts of the western coast the average temperature of the winter is – 4°; that of the summer at Matotchkin Shar is 36°·5,—that is, lower than at Boothia Felix, or Melville Island. On the western coast also warm west winds bring considerable moisture, which is condensed by the mountains, and thus a cloudy sky intercepts the already scanty sunlight. On the eastern coast the summer temperature is less still, the average for the year being probably 2° Fahr. lower than that of corresponding latitudes of the western coast. The coasts of Novaya Zemlya are less icebound than might be supposed owing to the influence of a warm current which flows along the coast on the north-west, and which may be considered as a continuation of the Gulf Stream. There are years in which the island can be circumnavigated without difficulty. The southern shores, besides experiencing the cold influence of the Kara Sea, are washed by a cold current which issues from Kara Strait and flows northwards along the south-western coast.

Flora.—Grass does not grow to any extent except in Goose Land, where the soil is covered with finer débris. Elsewhere even the leaved lichens are precarious, though the leather lichens flourish, especially the *Vermicaria geographia*. Of Phanerogams, only the *Dryas octopetala* covers small areas of the débris, and is interspersed with isolated *Cochlearia*, *Stereocaulon paschale*, and *Papaver nudicaule*. *Silene acaulis*, *Saxifraga oppositifolia*, *Arenaria rubella*, five or six species of *Draba*, as well as the *Dryas octopetala* and *Myosotis*, are found where the débris permits. Where a layer of thinner clay has been deposited in sheltered places, the surface is covered with *Platypetalum purpurascens*, *Saxifragæ*, and *Draba alpina*; and a carpet of mosses allows the *Salix polaris* to develop its two dwarf leaflets and its catkins. Where a thin sheet of humus, fertilized by lemmings, has accumulated in the course of ages, the *Rhodiola rosea*, the *Erigon uniflorum*, a *Ranunculus nivalis*, or an *Oxyria reniformis* make their appearance, with here and there a *Vaccinium* (which, however, never flowers). Even where a carpet of plants has developed under specially favourable circumstances, they do not dare raise their stems more than a few inches, and their brilliant flowers spring direct from the soil, concealing the developed leaflets, whilst their horizontally-spread roots grow out of proportion; only the *Salix lanata* rises to 7 or 8 inches, sending out roots 1 inch thick and 10 to 12 feet long. One hardly understands how these plants propagate; vegetation seems to be maintained, at least partially, by seeds brought by birds or by currents. All this, of course, applies only to the better-known neighbourhoods of Matotchkin and Kostin Straits; north of 74° N. but very few species have been found at all (*Saxifraga oppositifolia*, *Papaver nudicaule*, *Draba alpina*, and *Oxyria digyna*). In all, the phanerogamic flora of Novaya Zemlya and Vaigatch now numbers 185 species, of which 30 have not yet been found on the main island, but may yet be discovered in its southern part. Of the total, 131 are Dicotyledons. As to the much-discussed genetic connexions of the Novaya Zemlya flora, it appears, according to M. Kjellmann's researches, that it belongs to the Asiatic arctic region rather than to the European. Eleven species are what Hooker and Grisebach regard as old glacial, 56 are purely alpine, and 6 have been found in other alpine regions of Europe; 36 non-alpine species belong to the flora of middle Europe, 41 to the Scandinavian flora, and only 16 to that of arctic Russia, whilst 29 have not been found in Europe at all. Altogether, 156 species are European (132 from arctic Europe), and 177 Asiatic (164 from arctic Asia), whilst 11 are wanting in both arctic Europe and Asia.

Fauna.—The desolate interior of Novaya Zemlya shows hardly a trace of animal life, save perchance a solitary vagrant bird, a few lemmings, an ice-fox, a brown or white bear, and at times immigrant reindeer. Even insects are few; the very mosquitoes of the tundras are wanting, and only a solitary bee flies among the scanty flowers. The sea-coast, however, is occupied by countless numbers of birds, which come from the south for the breeding season, and at certain parts of the sea-coast the rocks are covered with millions of *Uria troile*, and the air is resonant with their cries, while numberless flocks of ducks, geese, and swans swarm every summer on the valleys and lakes of the southern part of the island. Whales, walruses, seals, and dolphins are still abundant. Only two species of fish are of any importance,—the *goltzy* (*Salmo alpinus*) in the western rivers, and the *omul* (*Salmo omul*) in the eastern.

The following is a list of the land mammals (some of them not satisfactorily determined):—*Ursus arctos* and *maritimus*, *Rangifer tarandus* (Pallas), *Vulpes vulgaris* and *lagopus*, *Canis lupus*, *Cuniculus torquatus* (Pallas), perhaps *Mus grœnlandica*, or *Myodes obensis*. The birds are:—*Strix nictea*, *Falco buteo*, *Tringa maritima*, *Plectrophanes nivalis*, *Otocorys alpestris*, and *Strepsilas collaris*, all endemic; many species of ducks, *Harelda glacialis* being the most common, *Somateria spectabilis* and *mollissima* in company with the *Cephus Mandtii*; several species of geese and swans (*Cygnus musicus* included); as also *Larus glaucus*, *Uria troile*, *U. bruennichii*, and *Alca pictorhina*. The marine mammals are:—the walrus, *Odobænus rosmarus*; seals, *Phoca vitulina*, *P. leporina*, *P. grœnlandica* (O. Müller) in the Kara Sea, *P. barbata* (?); and dolphins, *Delphinus Orca* and *D. delphis* (?).

The numbers of sea mammals in the sea around Novaya Zemlya and the vast quantities of birds attracted Russian hunters as soon as they became acquainted with the northern Ural, and even in the 16th century they had extended their huts (*starorishtcha*) to the extreme north of the island. Many of them wintered for several consecutive years on Novaya Zemlya without suffering great losses from scurvy; but no inhabitants have ever tried to establish themselves permanently on the island. The hunters were very often extremely successful; but the industry has always been subject to great vicissitudes. During the last twenty-five years the Archangel and Kola hunters have but rarely visited Novaya Zemlya; on the other hand, both it and the Kara Sea are now more and more visited by Norwegians. A few Samoyede families, recently settled by the Russian Government at Karmakuly, have remained there for several consecutive years, living chiefly by hunting the reindeer which abound on the eastern coast, and of which two varieties are distinguished, one like that of Spitzbergen.

History.—Novaya Zemlya seems to have been known to Novgorod hunters in the 11th century; but its geographical discovery was four centuries later, at the time of the great movement for the discovery of the north-eastern passage. In 1553 Sir Hugh Willoughby sighted what was probably Goose Land; Chancellor penetrated into the White Sea. In 1556 Burrough reached the southern extremity of the island (the first western European to do so). William Barents touched the island (1594) at Sukhoi Nos (73° 46′), and followed the coast northward to the Orange Islands and southward to the Kostin Shar. Rumours of silver ore having been found induced the Russian Government to send out expeditions to the island during the second half of the 18th century. Yushkoff visited it in 1757; and in 1760 Savva Loshkin cruised along all the eastern coast, spent two winters there, and in the next year, after having reached Cape Begehrte (Begheerte), returned along the western coast, thus accomplishing the first circumnavigation; but the valuable records of his voyage in Russian archives have been lost. In 1768 Rozmysloff reached Goose Land and penetrated into the Kara Sea by the Matotchkin Shar, where he spent the winter; in the following year he pursued the exploration of the Kara Sea, but was compelled to return and abandon his ship. Pospeloff investigated the alleged discovery of silver at Silver Bay in 1806. The first real scientific information about the island is due to the expeditions of Count Lütke in 1821, 1822, 1823, and 1824. Nearly the whole of the western coast as far as Cape Nassau, as well

as the Matotchkin channel, was visited and mapped during these expeditions, and abundance of most valuable scientific information obtained. In 1832 Pakhtusoff mapped the eastern coast as far as Matotchkin Shar; and in 1835 Pakhtusoff and Tsivolka mapped the coast as far as 74° 24′. The next expedition was that of Karl Baer in 1838, whose matchless descriptions still are the most valuable of all our sources of information about this region.

A new era of scientific exploration of Novaya Zemlya and of the neighbouring seas begins in 1868. The measurements of temperature made in that year by Bessels and by Dufferin between Bear Island and Novaya Zemlya, and partly those made by Yarjinsky in his dredgings off the Murman coast, established the existence of a warm current crossing Barents's Sea, and led to the publication of Petermann's remarkable treatise on the Gulf Stream. The existence of the warm current was further confirmed by the measurements of Yarjinsky in 1869, by Maydell and Middendorff in 1871, and by the more recent and closer investigations of Andreeff in 1880-82. On the other side, since 1868 the Norwegian sea-hunters, availing themselves of the suggestions of Mohn, Nordenskjöld, and Petermann, have brought in most valuable geographical information. In 1870 Johannesen penetrated as far east as 79° E. long., in 76° 13′ N. lat., and afterwards accomplished the second circumnavigation of Novaya Zemlya. The measurements of Johannesen, Ulve, Mack, Torkildsen, Qvale, and Nedrevaag enabled the first map of the Kara Sea worthy of the name, as also of northern Novaya Zemlya, to be drawn up. These and subsequent explorations led the way for Nordenskjöld's famous voyages (see Polar Regions). Two recent undertakings must be mentioned, however,—the establishment of a permanent station on Novaya Zemlya, the wintering at Karmakuly of Lieutenant Tyaghin, and the crossing of the island in 1878 by M. Grinevetskiy from Karmakuly to the eastern coast; and the last Dutch expedition of the "Dijmphna," which, along with the steamer "Varna," wintered in the Kara Sea. (P. A. K.)

NOVEL. See Romance.

NOVELLO, Vincent (1781-1861), an artist whose efforts to diffuse an increased taste for classical music in England fifty years ago have been crowned with permanent success, was born in London 6th September 1781. He was organist at different times of the Sardinian, Spanish, and Portuguese chapels, and of St Mary's chapel, Moorfields. He was an original member of the Philharmonic Society, of the Classical Harmonists, and of the Choral Harmonists. He composed an immense quantity of sacred music, much of which is still deservedly popular; but his great work lay in the introduction to England of unknown compositions by the great masters. The Masses of Haydn and Mozart were absolutely unknown in England until he edited them, as were also the works of Palestrina, the treasures of the Fitzwilliam Museum, and innumerable great compositions now well known to every one. To his zeal is due the store of sacred music published, first by his son, and then by Novello, Ewer, and Co.; and it is not too much to say that benefit is still derived from the impulse given to English taste by these publications. Novello died at Nice on 9th August 1861.

NOVEMBER (or *Novembris*, sc. *mensis*, from *novem*), the ninth month of the old Roman year, which began with March. By the Julian arrangement, according to which the year began with 1st January, November, while retaining its old name, became the eleventh month and had thirty days assigned to it. The 11th of November was held to mark the beginning of winter (hiemis initium); the sacred banquet called "epulum Jovis" took place on the 13th. The principal November festivals in the calendar of the Roman Church are:—All Saints' Day on the 1st, All Souls' on the 2d, St Martin's on the 11th, the Presentation of the Virgin on the 21st, St Cecilia's on the 22d, St Catherine's on the 25th, and St Andrew's on the 30th. St Hubert is commemorated on the 3d. In the English calendar All Saints' and St Andrew's are the only feasts retained; the particular service commemorative of the "Papists' Conspiracy" on the 5th was abolished in 1859. The eve of St Andrew's is a fast. The Anglo-Saxon name of November was Blotmonath (blood month), the latter name probably alluding to the custom of slaughtering cattle about Martinmas for winter consumption. In the calendar of the first French republic November reappeared partly as Brumaire and partly as Frimaire.

NOVERRE, Jean Georges (1727-1810), an artist to whom the action and music of the modern ballet may almost be said to owe their existence, was born in Paris 29th April 1727. He first performed at Fontainebleau in 1743, and in 1747 composed his first ballet for the Opéra Comique. In 1755 he was invited by Garrick to London, where he remained two years. Between 1758 and 1760 he produced several ballets at Lyons, and published his *Lettres sur la Danse et les Ballets*. He was next engaged by the duke of Würtemberg, and afterwards by the empress Maria Theresa, for whom he wrote many celebrated works at Vienna. In 1775 he was appointed *Maître des Ballets* at the Académie; this post he retained until the Revolution reduced him to poverty, which he endured with dignity until his death, at St Germain, in 1810.

Noverre's life-work consisted in the reduction of the ballet to an artistic and consistent form by aid of intelligible pantomime, appropriate action, correct costume, and, above all, music well adapted to the sentiment and situations of the drama; and it is to his efforts in these several directions that the modern ballet owes the high esteem in which it has so long been held in Paris and elsewhere.

NOVGOROD, a government of north-western Russia, bounded on the W. and N. by St Petersburg and Olonetz, on the S.E. by Vologda, Yaroslavl, and Tver, and on the S.W. by Pskov, has an extreme length from south-west to north-east of 400 miles, and an area of 47,240 square miles. Its southern part is occupied by the Valdai or Alaun plateau, which has the highest elevations of middle Russia (800 to 1000 feet), and contains the sources of all the great rivers of the country. It is deeply furrowed by valleys with abrupt slopes, which give it the aspect of a highland region, and descends rapidly towards the valley of Lake Ilmen in the west, which is only 107 feet above the sea-level. The north-eastern part of the government belongs to the lake district of north-western Russia. This tract, gently sloping towards Lakes Ladoga and Onega in the north, is covered with innumerable sheets of water, of which Byelo-ozero (White Lake) and Vozhe are the largest, while more than 3000 smaller ones are figured on the maps. Immense marshes, relics of former lakes, covered with thin forests of birch and elm, occupy the flat depressions and cover more than one-sixth of the government; several of them have an area of from 300 to 450 square miles. In summer they are quite impassable; they admit of being crossed only when frozen. Six centuries ago they were even less accessible, and were perhaps the best protection Novgorod possessed against its enemies; but the slow upheaval of north-western Russia, going on at a rate of three or more feet per century, powerfully contributed towards the drainage of the country, as the rivers more deeply excavated their gently-sloping beds. Of recent years artificial drainage has been carried out on a large scale. The forests still occupy more than two-thirds of the government.

Geologically, Novgorod exhibits in the west vast beds of Devonian limestones and sandstones; these are elsewhere overlaid with Carboniferous limestone, dolomite, sandstones, and marls. The Devonian gives rise to salt-springs, especially at Staraya Russa, and contains iron-ores, while the later formation has coal strata of inferior quality. The whole is covered with a thick sheet of boulder-clay, very often arranged in ridges or *åsar*, the bottom moraine of the north European ice-sheet of the Glacial period. Numerous remains of the neolithic stone age are found, especially around the deposits of extinct lakes. The numerous rivers of Novgorod are distributed between the Arctic Ocean, Baltic Sea, and Caspian Sea basins; the last

two basins are further connected by the Mariinsk, Tikhvin, and Vyshnii-Volochok canals, while the Alexander-von-Würtemberg canal connects the tributaries of the White Sea with those of the Baltic. The chief river is the Volkhoff, which flows from Lake Ilmen into Lake Ladoga. Other navigable rivers are the Syas, also flowing into Lake Ladoga, and the Sheksna and the Mologa, tributaries of the Volga. A brisk traffic is steadily carried by the Novgorod rivers, as all boats from the Volga to St Petersburg pass through this government, while the goods embarked within the province itself amount to more than 7,000,000 cwts., worth from 6,000,000 to 7,000,000 roubles.

The climate is very harsh, the yearly average temperature at Novgorod being only 38°·8 Fahr. (14°·5 in January, 62°·5 in July). The severe climate, the marshy or stony soil, and the want of grazing grounds render agriculture unprofitable; though it is carried on everywhere, only rye, oats, barley, and some tobacco are raised, and this to so small an amount that nearly 1,000,000 quarters of grain have to be imported every year. Neither gardening nor the raising of cattle is very flourishing; in 1877 there were only 212,000 horses, 364,000 cattle, and 253,000 sheep. A number of petty trades are successfully carried on in the villages, all kinds of wooden wares being made and exported; the preparation of timber, pitch, tar, and charcoal is general, and shipbuilding is widely diffused in several districts. The fisheries on the great lakes are valued at 170,000 roubles annually, and, owing to the proximity of the capital, hunting is still profitable. But the greater number of the inhabitants are dependent on the river-boat traffic; and nearly one-fourth of the able-bodied male population are driven in search of work to other parts of Russia. The Novgorod carpenters and masons still maintain their old-established renown. The industrial establishments are few; in 1879 they numbered 245 (steam flour-mills, distilleries, paper mills, glass works, and saw mills), employing about 4500 hands, and turned out an aggregate production worth 6,313,000 roubles. Trade, which is animated in several towns and at several points of the river-system, is chiefly in grain and timber, and in manufactures and grocery wares from St Petersburg. The fairs are numerous, and several of them (Kirilovsk monastery, Staraya Russa, and Tcherepovets) show considerable returns. The inhabitants are almost exclusively Great Russians, but they are distinguished by some historians from the Great Russians of the basin of the Oka, as showing some remote affinities with the Little Russians. They belong mostly to the Greek Church, but there are many Nonconformists. Lutherans and Catholics number respectively 1000 and 2000. Novgorod, apart from the usual schools and gymnasiums, is better provided with educational institutions than many other governments of Russia, and, through the successful efforts of its zemstvo, primary education is more widely diffused in the villages. The government is but thinly inhabited, the population (1,011,500 in 1870) being only 1,090,000 in 1884. The chief towns of the eleven districts are:—Novgorod, Borovichi (10,000 inhabitants), Byelozersk (6000), Tcherepovets (3600), Demiansk (1500), Kiriloff (3200), Krestzy (3200), Staraya Russa (6000), Ustyuzhna (7000), and Valdai (3500).

NOVGOROD, capital of the above government, is situated 119 miles to the south of St Petersburg, on the low flat banks of the Volkhoff, some two miles below the point where it leaves Lake Ilmen. The present town is but a poor survival of the wealthy city of medieval times. It consists of a kremlin (old fortress) and of the city, which stands on both banks of the river, here connected by a handsome bridge. The kremlin was much enlarged in 1044, and again in 1116. Its stone walls, originally palisades, were begun in 1302, and much extended and embellished in 1490. It is very spacious, and formerly a great number of churches and shops with wide squares stood within the enclosure. Its valuable historical monuments include the cathedral of St Sophia, begun in 1045 by an architect from Constantinople to take the place of the original wooden structure (989), destroyed by fire in that year. Some changes were made in the walls in 1688 and 1692, and the windows were enlarged, but otherwise (notwithstanding several fires) the building remains unaltered. It contains many highly-prized relics. Another ancient building in the kremlin is Yaroslaff's Tower, in the square where the Novgorod *vyetche* (common council) met, and which still bears the name of "the court of Yaroslaff"; the tower was the *gridnitsa* or chancellery of the secretaries of the *vyetche*. Several other remarkable monuments of Russian architecture still exist at Novgorod, such as the church of St Nicholas, erected in 1135, and churches of the 14th and 15th centuries. Within the town itself there are four monasteries and convents; and the large number in the immediate neighbourhood shows the great extension the city formerly had. A monument to commemorate the thousandth anniversary of the foundation of the Russian state (the calling in of the Varangians by Novgorod in 862) was erected in 1864. It consists of a large globe on a massive pedestal, surrounded by numerous statues commemorating the leading events of Russian history. Another monument commemorates the campaign of 1812. On the whole, apart from its old churches and some portions of its walls, Novgorod has nothing to recall the leading part it has played in the history of Russia. Since the diversion from it of the great commercial highways of north-western Russia its commercial influence has been very limited. Its merchants still send timber, grain, and hay to St Petersburg; but the total production of its manufacturing establishments—paper-mills, flour-mills, saw-mills, glass-works, brick-works, match-works, and distilleries—does not reach 1,000,000 roubles. A trunk railway, 45 miles long, connects the city with Tchudovo on the Moscow and St Petersburg Railway. The population is 17,500.

The date at which the Slavonians on their northward advance first erected forts on the Volkhoff (where it leaves Lake Ilmen and where it flows into Lake Ladoga) is unknown. That situated on a low terrace close by Lake Ilmen was soon abandoned, and Novgorod or "New-town" arose on another which extended a mile lower on both banks of the river. The older fort (Gorodische) still existed in the 13th century. It is certain that, even in the 9th century, the new city on the Volkhoff, whilst maintaining close relations with Kieff, already exercised a kind of supremacy over the other towns of the lake region, when its inhabitants in 862 invited the Varangians to the defence of the Russian towns of the north. Down to the end of the 10th century Novgorod was in some sort dependent on Kieff; yet it must have maintained its internal autonomy, for in 997 its inhabitants obtained from their own Prince Yaroslaff a charter which granted them self-government, a jurisdiction of their own, and the rule of their proper *vyetche*. For five centuries this charter continued to be regarded as the chief written testimony of the independence of Novgorod, and was ever resorted to in the struggles with the princes. From the end of the 10th century the princes of Novgorod, chosen either from the sons of the great princes of Kieff (until 1136) or from some other branch of the family of Rurik, were always elected by the *vyetche*, and swore to maintain the free institutions of the town; but they were only its military defenders. Their delegates were merely assessors in the courts which levied the fixed taxes meant to defray the maintenance of the military force raised by the prince. The *vyetche* expelled the princes as soon as they provoked discontent. Their election was often a subject of dispute between the wealthier merchants and landowners and the poorer classes; and Novgorod, which was dependent for its corn supply upon the land of Suzdal, was sometimes compelled to accept a prince from the Suzdal branch instead of from that of Kieff, which was more popular among the poorer classes. After 1270 the city often refused to have princes at all, and the elected mayor (*posadnik*) was the representative of the executive in its limited attributes. Novgorod in its transactions with other cities took the name of "Sovereign Great Novgorod" (*Gospodin Velikii Novgorod*). The supreme power and the supreme jurisdiction were in the hands of the *vyetche*, whose resolutions were carefully inscribed by its secretaries (*diaki*). The city, which had a population of more than 80,000, was divided into sections (*kontsy*), radiating from its centre, and corresponding to some extent to the prevailing occupations of the inhabitants; each constituted a distinct commune which enjoyed a large share of independence. The *kontsy* were subdivided into streets (*ulitsy*), which also corresponded to the prevailing occupations of their inhabitants (artisans or merchants), and each of which was quite independent with regard to its own affairs, such as the election of priests, the maintenance of order, jurisdiction in inferior matters, trade, food supply, &c.

Trade was carried on by corporations which embodied, not only the merchants proper or *gosti*, but also the poorer classes; in fact, it was the chief source of income, and, owing to the existence of numerous trading corporations, everybody was enabled to participate in it more or less. Novgorod, owing to its very advantageous position, made great advances in trade. By the Volkhoff and the Neva it had direct communication with the Hanseatic and Scandinavian cities. The Dnieper brought it into connexion with the Bosphorus,

and it was intermediary in the trade of Constantinople with northern Europe. The rich gifts offered by the corporations to the churches of Novgorod are a present testimony of the ancient wealth of the city.

The Novgorod *ukshuyniki* (who often associated robbery with trade) at an early date penetrated to the shores of the White Sea, hunted on Novaya Zemlya in the 11th century, colonized the basins of the northern Dwina, descended the Volga, and, as early as the 14th century, extended their dominions over the "Ugra," beyond the Ural, into Siberia. The Zavolotchie, or the basin of the northern Dwina, was early colonized, and forts were erected to maintain the dominions, while two great colonies, Vyatka and Vologda, organized on the same republican principles as the metropolis, favoured the further colonization of north-eastern Russia.

At the same time a number of flourishing minor towns (*prigorody*), such as Novyi Torg (Torzhok), Novaya Ladoga, Pskov, and many others, arose in the lake region. Pskov soon became quite independent of the metropolis, and had a history of its own; the others enjoyed a large measure of independence, still figuring, however, as subordinate towns in all those circumstances which implied a common action of the whole region. Several contemporary testimonies state the population of Novgorod in the 14th century to have reached 400,000, and add that the pestilences of 1467, 1508, and 1533 carried off no fewer than 134,000 persons. These figures, however, seem to relate rather to the Ilmen region; but it may be safely admitted that, before the visitations referred to, the city, with the suburbs, had a population of nearly 100,000.

Throughout its history Novgorod has had to sustain many contests. Its struggle against the Suzdal region began as early as the 12th century. In the following century it had to contend with the Swedes and the Germans, who were animated not only by the desire of territorial extension throughout the lake region but also by the spirit of religious proselytism. The advances of both were checked by the battles at Ladoga and Pskov in 1240 and 1242. Protected as it was by its marshes, Novgorod escaped the Mongol invasion, and was able to repel the attacks of the princes of Moscow by whom the Mongols were supported; but it was compelled to pay a tribute, which soon became a tribute to Moscow (end of the 14th century). It also successfully resisted the attacks of Tver, and aided Moscow in its struggle against this powerful neighbour, but it soon itself experienced the power of the growing Moscow state. The first serious invasion of its independence, in 1332, was turned back only with the aid of the Lithuanians. But a severe blow was inflicted in 1456 by the Great Prince of Moscow, Vasilii Temnyi, who, taking advantage of the internal troubles of the city, and finding supporters among the Novgorod *boyars*, succeeded in imposing a heavy tribute. Ivan III. took possession of the Zavolotchie colonies and the Perm region, and began two bloody wars, during which Novgorod fought for its liberty under the leadership of Martha Posadnitsa. In 1475 Ivan III. entered Novgorod, abolished its charters, and carried away 1000 of the wealthier families, substituting for them families from Moscow; the old free city now recognized his sovereignty. A century later Ivan IV. (the Terrible) abolished the last vestige of the independence of the city. Having learned of the existence of a party favourable to Lithuania, he took the field in 1570, and entered Novgorod (much weakened by the recent pestilences) without opposition. His followers seized nearly all the heads of monasteries and beat them to death with sticks. At a given signal a general pillage began: the shops were destroyed, the merchandize thrown out, the wealthier of the merchants and clergy killed and thrown into the Volkhoff, whilst other plundering parties burned and pillaged all stores in the villages. No less than 15,000 men, women, and children were killed at Novgorod alone (60,000 according to some authorities). A famine ensued, and the district of Novgorod fell into utter destitution. Thousands of families were transported to Moscow, Nijni-Novgorod, and other towns of the principality of Moscow. In the beginning of the 17th century Novgorod was taken and held for seven years by the Swedes; and in the 18th century the foundation of St Petersburg ultimately destroyed its trade. Its position, however, on the water highway from the Volga to St Petersburg, and on the trunk road from Moscow to the capital, still gave it some commercial importance; but even this was brought to an end by the opening of the Vishera canal and the Nicholas Railway, which passes 45 miles to the east of Novgorod. (P. A. K.)

NOVI, or (to distinguish it from Novi di Modena, &c.) Novi Ligure, a city of Italy, in the province of Alessandria (Piedmont), at the foot of the Apennines and on the edge of a fertile plain, about 20 miles south of the river Po. It is of importance mainly as the meeting-place of the railways from Alessandria, Genoa, and Piacenza, and is one of the leading seats of the silk industry in Italy. The ruins of its ancient castle, its collegiate church, the Piazza del Duomo with its central marble fountain, and some of the picturesque old palaces of the Genoese nobility are the chief objects of interest, though the city also possesses its theatres, public library, antiquarian museum, literary academy, &c. The population of the city was 9917 in 1881; that of the commune 11,445 in 1861, and 13,783 in 1881.

Novi begins to appear as Corte Nova in the 10th century, and in the Middle Ages it was a frequent object of dispute between Tortona, Milan, Pavia, and Genoa. In 1480 Nicolao Ghirardengo, a native of the town, set up his printing-press within its walls. In August 1799 was fought the great battle of Novi, in which the French under Joubert were defeated by the Russians under Suwaroff, and in November of the same year there was a lesser conflict, in which the French proved victorious over the Austrians.

NOVIBAZAR, Novipazar, or Yenipazar (*i.e.*, New Market), on the Rashka, a tributary of the Ibar and subtributary of the Danube, is the chief town of a sanjak in the Turkish vilayet of Bosnia (formerly of Kossovo), which was occupied by Austria-Hungary in 1879 in accordance with the terms of the treaty of Berlin. Owing to the configuration of the country it is a point of great strategical importance, commanding the lines of communication between Bosnia and Rumelia, and between Servia and Montenegro. The site was formerly occupied by the old Servian town of Rassia mentioned by Byzantine writers in the 9th century. In the neighbourhood is the old church of St Peter and St Paul, the metropolitan church of the bishopric of Rassia, in which Stephen Nemanya passed from the Roman to the Greek Church in 1143. According to Dr Blau, the sanjak had a male population of 83,983 in 1871, that of the town is estimated at from 9000 to 12,000.

NOVO-BAYAZET, or Novuii Bayazet, a town of trans-Caucasian Russia, at the head of a district (area 2390 square miles, population 67,800) in the Erivan government, 60 miles east-north-east of Erivan, and about 4 east of Goktchi Lake, lies 5870 feet above the sea on the rocky ravine of the Kavar-tchai. An Armenian village which had stood here from an early date was destroyed by Nadir Shah of Persia in 1736, and it was not till the Turkish war of 1828-29 that the site was again occupied by Armenian refugees from the Turkish town of Bayazet or Bayazid. The name Novuii Bayazet was adopted at the organization of the Erivan government in 1850. From 4518 in 1865 the population had increased by 1873 to 5363, still mainly Armenians. There are seventeen villages in the district, each with more than 1000 inhabitants.

NOVOGEORGIEVSK, a town, and a fortress of Russia. (1) The former, usually known under the name of Kriloff, in the government of Kherson, district of Alexandriya, stands at the junction of the Tyasmin with the Dnieper, 9 miles to the north-west of the Krementchug railway station. Its fort was erected by the Poles in 1615 to protect the passage across the Dnieper, and to guard the steppe on the left bank of the river. The 10,500 inhabitants of Kriloff now carry on a lively trade in timber, grain, and cattle, and have a few flour-mills and candle-works. (2) Novogeorgievsk or Modlin is a first-class fortress of Russia in Poland, at the junction of the Nareff with the Vistula, 19 miles to the north-west of Warsaw. It constitutes the right flank of the line of defence of the Vistula against attack from the west, the centre of this line being at Warsaw, and the left flank at Ivangorod; 12,000 men are needed for its defence, and the fortifications can shelter from 48,000 to 50,000 men. The small town of Novoye Myesto, opposite the fortress, has 5500 inhabitants.

NOVOMOSKOVSK, a district town of Russia, in the government of Ekaterinoslaff, 19 miles to the north-east of the capital of the province. Including several villages which have been incorporated with it, it extends for nearly 7 miles along the right bank of the Samara, a tributary

of the Dnieper. In the 17th century the site was occupied by several villages of the Zaporog Cossacks, which were known under the name of Samartchik, and derived their wealth from valuable fisheries. In 1687 Prince Golitzyn founded here the Ust-Samara fort, which was destroyed after the treaty of the Pruth; it was rebuilt again in 1736, and the settlement of Novoselitsy established, which received a municipal constitution about the end of the last century. The very fertile surrounding country was rapidly colonized, and now has several villages each of more than 5000 and one above 10,000 inhabitants. The population of Novomoskovsk, which numbers 11,000, is chiefly engaged in agricultural pursuits. Some are employed in tanneries, and there is also some trade in horses, cattle, tallow, skins, tar, and pitch. As many as 150,000 head of cattle change hands at the yearly fair. In the immediate neighbourhood is the Samarsko-Nikolaevskii monastery, which is visited by many pilgrims.

NOVOTCHERKASSK, capital of the province of the Don Cossacks, is situated 737 miles south-south-east from Moscow, and 40 miles from the sea of Azoff. It was founded in 1805, when the inhabitants of the Tcherkassk *stanitsa* (now Old Tcherkassk) were compelled to leave their abodes on the banks of the Don on account of the frequent inundations. They were settled on a hill, 300 feet above the low plain, at the junction of the Don with the Aksai, and it was the intention of the authorities to create there, around the chief town of the Don Cossacks, a large agricultural colony; but the want of drinking water proved a great obstacle, and it was decided to transfer Novotcherkassk to another site, when Nicholas I., after a visit in 1837, ordered that it should remain where it was. In 1863 a water-supply was obtained by the construction of an aqueduct 18 miles long, with a steam-engine pumping 325,000 gallons per day. In the following year the town was brought into railway communication with Voronesh and Rostoff, from which last it is 32 miles distant. It is finely situated, and an extensive view over the low prairies of the Don is obtained from the top of the hill. The town has a public garden, a theatre, a clubhouse, and is adorned by the palace and gardens of the ataman of the Cossacks, and by a monument to Platoff. The educational institutions include a gymnasium for boys, and another for girls, besides several lower schools. Since the introduction of a water-supply and the construction of a branch railway line to the Grushevskiya coal-mines, Novotcherkassk has been developing rapidly; wide suburbs extend to the south-west, and the right bank of the Aksai is dotted with the villas of the Cossack officials. Manufactures, however, make but slow progress; there are only a few candle-works, brick-works, distilleries, tobacco-works, and manufactories of champagne, with an aggregate production in 1879 of 240,000 roubles (out of a total for all the province of 1,909,000 roubles). An active trade is carried on in corn, wine, and timber (exports), and manufactures and grocery wares (imports). There are two fairs of some local importance. The population of the town is 34,000.

NOWGONG or NÁOGÁON, a district in the chief-commissionership of Assam, India, lying between 25° 45′ and 26° 40′ N. lat. and 92° and 93° 50′ E. long., is bounded on the N. by the Brahmaputra, separating it from Darrang, E. and S. by Síbságar and the Nágá and Khási Hills. The district, which has an area of 3417 square miles, consists of a wide plain much overgrown with jungle and cane-brakes, intersected by numerous offshoots and tributaries of the Brahmaputra, and dotted with shallow marshes. It is estimated that about a hundred minor streams become navigable in the rainy season. The Míkír Hills cover an area of about 65 miles by 35 in the south of the district; the highest peak is about 3500 feet. The slopes are very steep, and are covered with dense forest. The Kámákhyá Hills are a small range near the bank of the Brahmaputra, about 1500 feet high. On the summit of the highest peak is a celebrated temple of Kámákhyá, the local goddess of love, where three annual festivals are held, attended by crowds of pilgrims from all parts of the country. Only about one-ninth of the area of the district has been as yet brought under cultivation. Wild beasts of all kinds abound.

The population in 1881 was 310,579, of whom about 12,000 were Mohammedans and the rest mainly aborigines or semi-Hinduized aborigines and Hindus in about equal proportions. The great bulk of the aborigines consists of the cognate tribes of Míkírs, Lalangs, and Cácháris. The population of the town of Nowgong was only 4200 in 1881.

The staple crop is rice. Tea cultivation and manufacture are carried on by means of European capital and under European supervision. The principal means of communication are afforded by the rivers. The chief road, that from Nowgong town to Gauháti in Kámrúp, runs for 44 miles through the district, but is unbridged. The climate of Nowgong is extremely unhealthy.

NOY, WILLIAM (1577-1634), attorney-general, was born, it is believed, on the family estate of Pendrea in Buryan, Cornwall, in 1577, his father belonging to a family whose pedigree is included in the visitation of Cornwall in 1620. He matriculated at Exeter College, Oxford, 27th April 1593, and looked back upon his academical life with such affection that, twenty years later, when the privileges of that institution were invaded by Lord Petre, he pleaded its cause gratuitously and successfully. His legal career began at Lincoln's Inn, and throughont life he was a diligent student of the grounds and precedents on which English law is based. From 1603 until his death he was elected, with one exception, to each parliament, sitting invariably for a constituency of his native county. For several year his sympathies were in antagonism to the wishes of the court, so that his historical knowledge was freely laid at the service of the opposition. Every commission that was appointed numbered Noy among its members, and even those who were opposed to him in politics acknowledged his learning. A few years before his death he was drawn over to the side of the court, and in October 1631 he was created attorney-general, but was never knighted. It was through his advice that the impost of ship-money was levied, and popular feeling vented its rage against him for its disastrous revival. Noy had long been a martyr to disease of the stone, and his death occurred, under circumstances of great agony, 9th August 1634; two days later he was buried at New Brentford church. Though he was of a reserved, almost morose disposition, and after his change of principles had little regard for the feelings of his old friends, many acts of kindness which he showed can be gleaned from the literature of his time. His principal works, *On the grounds and maxims of the laws of this kingdom* (1641) and *The compleat lawyer* (1661), went through many editions. Further particulars concerning him and his children may be found collected in Davies Gilbert's *Cornwall*, iii. 143-60, and in the *Bibliotheca Cornubiensis*, vols. i. and iii.

NOYON, a city of France, department of Oise, 67 miles north-north-east of Paris by the railway to Brussels, is built at the foot and on the slopes of a hill, and traversed by a small stream, the Verse, which joins the Oise a mile farther down. The old cathedral of Notre Dame, constructed during the latter half of the 12th century, is a fine example of the mixture of Romanesque and Gothic architecture. In plan it is a Latin cross, with a total length from east to west of 343 feet, and from north to south of 66. The west front has a porch, added in the 14th century, and two unfinished towers, their npper portions dating from the 13th century; its decorations have been greatly mutilated. The nave (167 feet long and 66

broad) consists of eleven bays, including those of the west front, which, in the interior, forms a kind of transept. In the windows of the aisles, the arches of the triforium, and the windows of the clerestory the round type is maintained; but double Pointed arches appear in the lower gallery; and the vaults of the roof, originally six-ribbed, were rebuilt after the fire of 1293 in the prevailing Pointed style. Side chapels were added in the north aisle in the 14th century and in the south aisle in the 15th and the 16th, one of the latter (15th) is especially rich in decorations. The flying buttresses of the building are at present (1884) being restored in the style of the 12th century. From the north-west corner of the nave runs the western gallery of a fine cloister, erected in 1230; and next to the cloister is the chapter-house of the same date, with its entrance adorned with statues of the bishops and other sculpture. The bishops' tombs within the cathedral were destroyed during the Revolution. The chapel of the bishops' palace is an example of the Early Pointed style; the second bishops' palace is a brick and stone structure in the Renaissance style; the canons' library was built of wood in the 15th century; and the town-house (Gothic and Renaissance) dates from 1485-1523. Among the town manuscripts is the Red Book or communal charter of Noyon. Remains of the Roman walls may be traced in the foundations of various houses. Noyon has a good trade, and contains large sugar-refineries, chemical-works, tanneries, and cotton-spinning mills. The population of the commune and that of the city were respectively 6268 and 5236 in 1872, and 6252 and 5780 in 1881.

Noyon, the ancient Noviomagus Veromanduorum, was Christianized by St Quentin at the close of the 3d century; and in 531 St Medard, bishop of the district of Vermandois, transferred his see thither from St Quentin. The episcopate of St Eligius (640-648), the burial of Chilperic II., the coronation of Pippin the Short in 752, and on the same occasion the coronation of his infant son Carloman with the title of king of Noyon, the coronation of Charlemagne in 771, the plunder of the town by the Normans in 859 and 880, the expulsion of the castellan by the inhabitants, and in 997 the recognition of the overlordship of the count of Flanders are the chief points in the history of Noyon down to the 10th century. In the 11th the city, passing under the French crown, became one of the ecclesiastical peerages of the kingdom; and at the beginning of the 12th century it easily obtained a communal charter through the favour of its bishops. The extent of the bishopric was considerably curtailed in 1135 by the breaking off of the diocese of Tournay. Noyon was ravaged by the English and the Burgundians during the Hundred Years' War. In 1516 a truce was signed at Noyon by Francis I. and Charles V. The city was captured by the Spaniards in 1552, and afterwards by the Leaguers, who were expelled in 1594 by Henry IV. It lost its bishopric in 1791, and is at present only the chief town of a canton in the arrondissement of Compiègne. Calvin was born at Noyon in 1509.

See Le Vasseur, *Annales de l'Église Cathédrale de Noyon*, 1633; Lafons de Mélicocq, *Rech. hist. sur Noyon*, 1839; Barthélemy, *Monogr. de l'Église Notre Dame de Noyon*; Vitet, *Monogr. de l'Église de N. D. de Noyon*, 1845; and Moët de la Forte Maison, *Antiquités de Noyon* (1845).

See Plate XV. (and Plate II., vol. I.) NUBIA, a country of north-east Africa, bounded on the N. by Egypt, on the S. by Abyssinia, Senaar, and Kordofan, and on the E. and W. by the Red Sea and the Libyan Desert respectively. It thus comprises the whole of the Nile valley, from Assuan (Oswán, Syene) near the first cataract southwards to Khartúm (Khartoum) at the confluence of the White and the Blue Niles, stretching in this direction for about 560 miles between 16° and 24° N. lat., and for nearly the same distance east and west between 31° and 39° E. long. But Nubia has at no time formed a strictly political, ethnical, or even administrative expression. Unless it can be identified with the Nob or Nub—that is, "*Gold*"—region of the hieroglyphic records, the term was unknown to the ancients, by whom everything south of Egypt was vaguely called Ethiopia, the land of the dark races. It is first associated historically, not with any definite geographical region, but with the Nobatæ, a negro people removed by Diocletian from the western oasis to the Nile valley above Egypt (Dodecaschœnus), whence the turbulent Blemmyes had recently been driven eastwards. From Núba, the Arabic form of the name of this people, comes the modern Nubia, a term about the precise meaning of which no two writers are of accord. Locally it is restricted to a comparatively small district, the Wády al-Núba, reaching from Sebú' along the Nile southwards to the north frontier of Dongola. Officially it finds no recognition as an administrative division of the khedive's possessions, the region commonly understood by Nubia, as above roughly defined, being completely absorbed for administrative purposes, partly in the government of Upper Egypt, but mainly in that of Egyptian or Eastern Súdan (Soudan).[1] Within these two governments it comprises the whole of the four mudírìehs (provinces) of Berber, Táká, Dongola (Donkola), and Suákin (more correctly Sawákin), besides parts of Massowah, Khartúm, and Esneh (Upper Egypt), with a total area of about 345,000 square miles, and a population vaguely estimated (1878, 1882) at from 1,000,000 to 1,500,000.

But, apart from political and ethnical considerations, Nubia is physically a sufficiently intelligible expression. Merging westwards in the sands of the Libyan desert, and limited eastwards by the Red Sea, it comprises the whole of the rugged and mainly arid steppes and plateaus through which the united White and Blue Niles, after their junction at Khartúm, force their way down to Upper Egypt. In this section, which may be regarded as the upper course of the Nile proper, there occurs a continuous series of slight falls and rapids, including all the historical "six cataracts," beginning a few miles below Khartúm (the sixth at J. Garri), and terminating at Philæ, close to the Egyptian frontier. Between these extreme points the total fall in a distance of 1150 miles is about 760 feet (from 1160 feet above sea-level at Khartúm to 400 at *Philæ*). Here the river describes two great bends, the first, from Khartúm to Merawi (Napata) below the fourth cataract, comprising the Bahiúda desert on the west, the second, thence to Egypt, comprising the Nubian desert on the east,—the two roughly corresponding to the conventional divisions of Upper and Lower Nubia respectively.

Throughout the whole of this section the Nile receives no affluents on its left bank, and on its right one only, the Atbara, which joins it from Abyssinia just above Al-Meshérif (Berber). Hence all Nubia west of the Nile, and most of the region east of the Nile—that is, from the Atbara confluence to Egypt—are mainly arid wastes, rocky in the east, sandy in the west, relieved on both sides by some grassy steppe lands, and by a few small oases. Of the Nubian, which is sometimes called the Ḳorosko, desert, and the northern section of which is named from its nomad Bíshárí inhabitants, the prevailing features are bare or scrubby sandstone plains broken by moderately high rugged granite hills and ranges, such as the J. Jerfa, J. Elbe', J. Kawewad, and J. Shiḳr, and intersected in many places by numerous small "khórs" or wadies running in various directions across the plateau. The wells and oases occurring along these depressions afford the only means of communication across this region, as well as in the more sandy Bahiúda wilderness on the opposite side of the Nile. Thus are formed all the great caravan routes, of which the most important are—(1) from Derr and Ḳorosko across the Ababdeh country by the Hurat wells southwards to Abu Ḥámid, 230 miles, shorter by about one-third than the long and difficult water journey between these two points; (2) from Ambukól to Khartúm, which describes an arc of 200 miles to the southern curve enclosing the Bahiúda desert; (3) from Berber eastwards to the Red Sea at Suákin, 280 miles, difficult, with little fodder and rare

[1] See Behm in *Bevölkerung der Erde* for July 1882.

wells, but of vital strategic and commercial importance as affording the most direct access from the coast to the interior, and the shortest highway from the Nile to Suákin, the only outport of Nubia; (4) a better but much longer route from Tokar below Suákin by the Khór Barka southwards to Kassala on the Mareb, a tributary of the Atbara, and thence through the Shukurieh country westwards to Khartúm. This route, which has been recently explored by G. Casati,[1] traverses the province of Táká, the most fertile and productive region in the whole of Nubia. Táká, being well watered by the Atbara, Mareb, and other streams from Abyssinia, is a true African tropical land, covered in some places with dense forest, in others with extensive pastures and arable tracts. Hence this route has lately been proposed in preference to that from Suákin to Berber for the projected line of railway from the coast to the interior.

Besides Táká the only other fertile and permanently inhabitable region is the valley of the Nile itself. But this valley, expanding above Khartúm into open alluvial plains, is in Nubia proper confined mainly to very narrow limits, with a mean breadth of scarcely more than half a mile (Burckhardt). The river is here almost everywhere hemmed in between granite and sandstone hills, which approach at some points to the very banks, at others run transversely to it, thus giving rise to the continuous windings and rapids which characterize its course throughout Nubia. Nor does the Nile now flood its banks to the same extent as formerly in this region, as appears from the "nilometer" discovered by Lepsius. But it is a mistake to suppose, as is often stated, that no rising takes place.

In Táká much humus and alluvial soil overlie the older crystalline beds and later sedimentary rocks. Elsewhere throughout Nubia these rocks are now mostly denuded, and consist mainly of new sandstones, with large masses of granite, porphyry, and trachyte cropping out in many places. The extensive syenite range on the Egyptian frontier is pierced for 80 miles by the Nile, and runs thence interspersed with sandstones eastwards to the Red Sea, where it forms the bold headland of Ras Benás, projecting round the Gulf of Berenice. Westwards the same system develops the J. Kukur, beyond which it extends to about 25° E. long. in the direction of the Libyan desert. Higher up, at the second or "Great" cataract of Wády Halfá, the sandstone is broken through by huge masses of granite and diorite rising 500 feet above the river-bed. Still farther south sandstones also prevail throughout Dongola, where the Nile presents the aspect of a mountain stream rushing for 250 miles over rapids. At Batn-al-Hajar the granite hills attain an altitude of 2000 feet above the river, and in this district the sandstone mostly disappears under the eruptive basalts, trachytes, diorites, phonoliths, and large beds of shale.

None of the porphyries appear to be metalliferous, and the only gold mines hitherto discovered are those in the east about Mount Elbe', which were worked by the ancient Egyptians, and even during mediæval times, but which are now abandoned, although apparently not yet quite exhausted (Linant de Bellefonds). This auriferous district of Nob or Nub, which according to some authorities has given its name to the whole country, lies close to the Red Sea in 22° N., nearly opposite Jidda. The only other minerals of economic importance are salt and alum, occurring at various points on the plateaus. The granites and syenites afford magnificent building materials, largely utilized by the ancient Egyptians.

The greater part of the land lies almost within the rainless zone, for the tropical rains are now arrested about the latitude of Khartúm (Petherick), beyond which point very little moisture is precipitated in any part of the Nile basin. Hence the Nubian climate, while intensely hot (108° to 114° Fahr. in the shade in May on the eastern plateau) is excessively dry and not unhealthy. The plague, formerly endemic in Egypt, never originates in Nubia; nor does the cholera penetrate up the Nile valley beyond Wády Halfá. North of this point, however, the riverain parts are often rendered dangerous, especially to strangers, by the exhalations from the stagnant pools left after the subsidence of the Nile waters. It is noteworthy that here the right bank being periodically flooded is much more fertile than the left, although all the finest ruins lie on the left side. The contrast is probably due to the Libyan sands continually moving eastward and encroaching on the narrow arable zone along the great artery.

Except in Táká, the natural flora is very poor, all the arable districts being required for the cultivation of useful plants. Amongst these the most important are the dóm palm, durra (*Sorghum vulgare*), of which several varieties have the stalk from 7 to 10 feet high, maize, dokhn (panicum), barley, lentils, tobacco, beans, and melons Cotton and the vine flourish in several places, and the dates of Ibrym and Sokkot are much prized. The banks of the Nile are often fringed with the mimosa; senna abounds in moist, the tamarind in sandy places; several varieties of gum trees occur in the south, and symka is common, its seed yielding oil, its leaves good camel fodder.

Wild animals are rare except in the Táká forests, where the elephant, lion, panther, rhinoceros, giraffe, hyæna, and wild boar are met with. The crocodile and hippopotamus infest all the streams, many species of large and small snakes occur, but few are poisonous, the stork, wild goose, partridge, ibis, are amongst the chief representatives of the local avifauna. There is a good breed of horses, the camel and ass are used as mounts, the ox and buffalo (not numerous) as pack animals and in irrigation, of which there are two methods (as in Egypt),—the sákiya, worked by oxen and liable to a tax of £3, and the shádúf, a hand lever and bucket, rated at 30s. (Petherick).

The population being almost exclusively agricultural and pastoral, the industries are unimportant, and limited mainly to coarse cottons and woollens, pottery, and household utensils made of the date tree. The exports also are confined to senna, some grain, leeches, musk, and honey. But although the local traffic is small there is a very large transit trade, carried on chiefly by caravans between Central Africa and Egypt. In this way considerable quantities of ivory, gold dust, ostrich feathers, and slaves have from the remotest times been brought down from the interior through Nubia to the seaports on the Mediterranean and the Red Sea. Of late years the slave trade had been almost entirely suppressed.

Few ethnological questions are beset with greater difficulties than those connected with the origin and affinities of the Nubian race, and, although much light has recently been thrown on the subject by Lepsius in the learned introduction to his *Nubische Grammatik*, there are several points which still remain matter of conjecture. As an ethnical expression the term Núba or Nubian itself has become equivocal. Rejected by the presumable descendants of Diocletian's Nobatæ, who now call themselves Berber, Barábira, it has become synonymous in the Nile valley with "slave," or "Negro slave." This is due to the large number of slaves drawn by the Arab dealers in recent times from the Núba tribes of Kordofan, who appear to constitute the original stock of the race. On the other hand, the expression has never at any time been applied to all the inhabitants of the region we now call Nubia. At present this region is occupied by peoples of three distinct stocks—the comparatively recent Semitic Arab intruders, mainly in Upper Nubia; the Hamitic Ababdeh and Beja (Bisharín), everywhere between the Nile and the Red Sea; and the Negro or Negroid Núbas (Barábira), in Lower Nubia, where they are now almost exclusively confined to the banks of the Nile, from Assuan southwards to Dongola.

That these Nilotic Núbas are closely allied to those of Kordofan may now be regarded as placed beyond reasonable doubt. And, as the latter are admittedly of Negro stock and speech, it follows that the former also, hitherto affiliated by some to the Fulahs of west Sudan, by others to the Hamitic Beja, must henceforth be regarded as essentially a Negro people. But, whereas the Kordofan Núbas have preserved their racial purity, those of the Nile, while preserving their Negro speech intact, have in their new homes become physically modified, mainly by the admixture first of Hamitic (Beja), then of Semitic (Arab), and even of European blood. Ethnologically the modern Nubians are therefore to be considered as a very mixed people, forming the transition between the three great Hamitic. Semitic, and Negro branches of the human family who converge in the Nile basin. Their ultimate affiliation to the last-named rather

[1] *Esploratore* for August 1883, and *Boll. Ital. Geogr. Soc.*, July 1883, p. 538.

than to either of the two others is determined partly by their physical appearance, which is still fundamentally of a Negro type, and partly by their language, which differs dialectically only from the Negro speech of the Kordofan Núbas.

This conclusion, based on physical and linguistic grounds, is fully confirmed by what is known of the earliest migrations and history of the Nilotic peoples. The first inhabitants of the region beyond Egypt appear to have been the Uaua, whose name occurs in an inscription on a tomb at Memphis of the VIth Dynasty (about 2500 B.C.), and again constantly in subsequent inscriptions down to the time of the Ptolemies, as the leading Negro race to the south of Syene. It thus appears that throughout the historic period down to the arrival of the Romans the Nile above Egypt was occupied by a Negro people. Egyptian monuments are found as far south as Mount Barkal (Napata), but no Egyptian settlements beyond Syene. Hence these Uaua Negroes probably remained unaffected, or very slightly affected, by foreign elements until about the 3d century of our era, when their domain began to be encroached upon from the east by the Hamitic Blemmyes, who have been clearly identified with the present Beja or Bishárin of the Nubian desert. It was owing to the incessant raids of these troublesome marauders that Diocletian withdrew the Roman garrisons above the cataracts, and called in the warlike Nobatæ to protect the Egyptian frontier from their attacks These Negro Nobatæ, originally from Kordofan, as is now evident, had advanced to the Great Oasis of Khargeh in Upper Egypt, whence they passed into the Nile valley between the cataracts. Here they absorbed the older Uaua of kindred stock, and ultimately came to terms with the Blemmyes. The two races even became intermingled, and, making common cause against the Romans, were defeated by Maximinus in 451 (Priscus). Thus were the Nilotic Núbas in the first instance affected by Hamitic elements.

Then came the conversion (545) of this new Negroid race to Christianity, and the growth of the Nubian political power in the upper Nile basin. Silko, founder of the famous Christian kingdom of Dongola, so named from its capital, called himself king of the Nobads and of all Ethiopians, that is, of the Nilotic Núbas and Hamitic Blemmyes. But the latter remaining pagan were soon after driven from the Nile valley eastwards to the kindred Megabares, Memnons, and other Hamitic nomads, who, with the Troglodytes, had from time immemorial held the whole steppe region between the Nile and the Red Sea from Axum to Egypt. Here their most collective name was Bugaitæ (Βουγαειται), as appears from the Axumite inscription, whence the forms Buja, Beja, which occur in the oldest Arab records, and by which they are still known.

Soon after overrunning Egypt (639) the Arabs themselves penetrated into Lower Nubia, where the two Jawábareh and Al-Gharbiya tribes became powerful, and amalgamated with the Núbas of that district. But their further progress was long arrested by the Dongolawi kings, who even reduced them for a short time. At length, however, after flourishing for 700 years, this native Christian state was in the 14th century overthrown by the Arabs, aided by a detachment of Bosnians sent from Turkey by Sultan Selim (Burckhardt). These Bosnians (Kalaji, as they called themselves) also settled in the country and intermarried with the Arabs and Nubians, their descendants still holding sundry tracts between Assuan and Derr. Hence it is that the Nubians of this district, fairest of all the race, still claim Arab and Osmanli (Bosnian) descent. And thus were the Nilotic Núbas affected in the second instance by Semitic and European elements.

Nevertheless the type remains essentially Negro, being characterized by a very dark complexion, varying from a mahogany brown and deep bronze to an almost black shade, with tumid lips, large black animated eyes, dolichocephalous head (index Nos 73, 72), hair often woolly or strongly frizzled, and scant beard worn under the chin like the figures of the fugitives (Uaua?) in the battle-pieces sculptured on the walls of the Egyptian temples. At the same time, the nose is much larger and the zygomatic arches less prominent than in the full-blood Negro. The features are at times almost quite regular, with a decidedly Egyptian cast (Lepsius); and the Nilotic Nubians are on the whole a strong muscular people, essentially agricultural, more warlike and energetic than the Egyptians, whom they also greatly excel in moral qualities. Many find employment as artisans, small dealers, porters, and soldiers in Egypt, where they are usually noted for their honesty, and frank and cheerful temperament. Since the overthrow of the native Christian state all have become Mohammedans, but not of a fanatical type. Although a native of Dongola, the present (1884) Mahdi has found his chief support, not amongst his countrymen, but amongst the more recently converted Kordofan Negroes and the nomad Arabs and Beja Nor do they appear at any time to have displayed a love of letters, and it remains uncertain whether to the Nubians or to their Hamitic neighbours are to be attributed the numerous still undeciphered rock inscriptions occurring along the Nile valley from Philæ to Khartúm. On the other hand, the colossal ruins reaching as far south as Meroe date almost exclusively from the Egyptian period.

The Núba language itself does not appear to have ever been cultivated, or even committed to writing until recently, although Eutychius of Alexandria (930) includes the "Nubi" among the six kinds of writing which he mentions in a somewhat doubtful passage as current amongst the Hamitic peoples. There is no present native literature, and most of the men speak Arabic as well as their mother tongue, which is very sonorous and expressive. Its distinctly Negro character is betrayed in the complete absence of grammatical gender, in its primitive vowel-system and highly-developed process of consonantal assimilation, softening all harsh combinations, lastly, in the peculiar infix *j* inserted between the verbal root and the plural pronominal object, as in *ai tokki-j-ir* = I shake them. As in Bantu, the verb presents a multiplicity of forms, including one present, three past and future tenses, with personal endings complete, passive, interrogative, conditional, elective, negative, and other forms, each with its proper participial inflexions. In Lepsius's grammar the verbal paradigm fills altogether 110 pages.

Of the Nilotic as distinguished from the Kordofan branch of the Núba language there are three distinct dialects current from Assuan along the Nile southwards to Meroe, as under:—

I. NORTHERN: Dialect of *Bant Kenz* or *Mattokki*, from the first cataract to Sebú' and Wády al-'Arab, probably dating from the Diocletian period.

II. CENTRAL: The *Mahas* or *Marisi*, from Korosko to Wády Halfá (second cataract). Here the natives are called Saidokki, in contradistinction to the northern Mattokki.

III. SOUTHERN: *Dongolawi*, throughout the province of Dongola from the second cataract to J. Déja near Meroe, on the northern frontier of the Arab district of Dár-Sháikíya (Sheghya). By the Mahasi people it is called Biderin Bannid, "language of the poor," or, collectively with the Kenz, Oshkirin Bannid, "language of slaves."

The northern and southern varieties are closely related to each other, differing considerably from the central, which shows more marked affinities with the Kordofan Núba, possibly because the Saidokki people are later arrivals from Kordofan.

NUGEENAH. See NAGINA.

NUGENT, ROBERT (d. 1788), who ultimately became Earl Nugent, was a native of Westmeath in Ireland, and a Roman Catholic, tersely described by Richard Glover as "a jovial and voluptuous Irishman who had left Popery for the Protestant religion, money, and widows." His change of religion took place at a very early period in life; the widow whom he married in 1736 was a daughter of Craggs, the postmaster-general, and a lady who had already been twice given in marriage. Her property comprised the borough of St Mawes in Cornwall, and Nugent naturally sat for that constituency from 1741 to 1754, after which date he represented Bristol until 1774, when he returned to his old love. At first he was numbered among the adherents of the little court of "only Fred," but with his usual skill he made his peace with the ministry of George II. at the right moment. A speaker of great liveliness joined to good sense—Horace Walpole said that he seemed now and then on the precipice of absurdity, but that he kept clear of it—his support of the ministry was so useful that he became in 1767 Viscount Clare, and in 1776 Earl Nugent, both Irish peerages. He died 13th October 1788.

Lord Nugent was the author of some poetical productions, several of which are preserved in the second volume of Dodsley's *Collections* One of these pieces, an ode to William Pulteney, in which he combined a description of his own change of religion with compliments on Pulteney's attempts "to prop a nation's frame," was much admired at the time, and fragments of it are still quoted. A haunch of venison which Lord Clare sent to his fellow-countryman and fellow-poet Goldsmith gave rise to one of the most spirited poetic epistles in the language.

NUISANCE, in English law, is either public or private. A public or common nuisance is defined by Mr Justice Stephen as "an act not warranted by law, or an omission to discharge a legal duty, which act or omission obstructs or causes inconvenience or damage to the public in the

exercise of rights common to all Her Majesty's subjects" (*Digest of the Criminal Law*, p. 120). A common nuisance is punishable as a misdemeanour at common law, where no special provision is made by statute. In modern times many of the old common law nuisances have been the subject of legislation. For instance, under the Public Health Act, 1875, many nuisances are punishable by imposition of a penalty after summary conviction, and local authorities are empowered to take measures for their suppression. The same Act, 38 and 39 Vict. c. 55, in s. 16 gives a definition of nuisances for the purposes of the Act. In some cases the common law and statutory remedy appear to be concurrent. It is no defence for a master or employer that a nuisance is caused by the acts of his servants, if such acts are within the scope of their employment, even though such acts are done without his knowledge and contrary to his orders. Nor is it a defence that the nuisance has been in existence for a great length of time, for no lapse of time will legitimate a public nuisance. Examples of public nuisances are the obstruction of highways, bridges, and navigable rivers, the keeping of disorderly houses and gaming houses, and the carrying on of offensive trades.

A private nuisance is an act or omission which causes inconvenience or damage to a private person, and is left to be redressed by action. It is not easy to define what amount of infringement of the rights of property will give a right of action. There must be some sensible diminution of these rights affecting the value or convenience of the property. "The real question in all the cases is the question of fact, whether the annoyance is such as materially to interfere with the ordinary comfort of human existence" (Lord Romilly in Crump *v.* Lambert, 1867). A private nuisance, differing in this respect from a public nuisance, may be legalized by uninterrupted use for twenty years. It used to be thought that, if a man knew there was a nuisance and went and lived near it, he could not recover, because, it was said, it is he that goes to the nuisance and not the nuisance to him. But such is not the law now. In such a case the newcomer has his civil remedy if the nuisance has not existed for twenty years, and of course his remedy at criminal law irrespective of time if the nuisance be public.

The remedy for a public nuisance is by information, indictment, summary procedure, or abatement. An information lies in cases of great public importance, such as the obstruction of a navigable river by piers. In some matters the law allows the party to take the remedy into his own hands and to "abate" the nuisance. Thus, if a gate be placed across a highway, any person lawfully using the highway may remove the obstruction, provided that no breach of the peace is caused thereby. The remedy for a private nuisance is by mandamus, injunction, action for damages, or abatement. An action lies in every case for a private nuisance; it also lies where the nuisance is public, provided that the plaintiff can prove that he has sustained some special injury. In such a case the civil is in addition to the criminal remedy. In abating a private nuisance, care must be taken not to do more damage than is necessary for the removal of the nuisance.

In Scotland there is no recognized distinction between public and private nuisances. The law as to what constitutes a nuisance is substantially the same as in England. A list of statutory nuisances will be found in the Public Health (Scotland) Act, 1867, 30 and 31 Vict. c. 101, s. 16. It resembles, but is not quite coincident with, the list in the English Public Health Act. The remedy for nuisance is by interdict or action.

The American law on the subject is practically the same as the English law.

NUKHA, a town of Russia in the Caucasian government of Elizabethpol (formerly of Baku), and previous to 1819 the capital of the khanate of Sheki, lies 173 miles east-south-east of Tiflis, at the foot of the main chain of the Caucasus, the cupola of the church in the fortress being 2454 feet above the sea-level in 41° 12′ 18″ N. lat. and 47° 12′ 7″ E. long. The fortress is a four-cornered enclosure 3000 feet in circumference, erected by Hosein Khan in 1765, and contains the palace, built somewhat later in the original Persian style under the shadow of a splendid group of plane trees. The town contains four churches and thirty-one mosques. Most of its 3000 houses are built of mud and roofed with reed-thatch, which is well suited for the breeding of silkworms, but apt to catch fire. In 1861 the number of silk-winding establishments was fifty, one of them with hundreds of basins in the European style, and worked by steam; but owing to the ravages of *gattine* the silk industry has greatly declined since 1864. At that time the trade of the town amounted to from two to three million roubles. In connexion with the silkworm plantation of Tsar-Abat (more than a mile long by 1¼ furlongs broad, and enclosed by a stone wall) there was a Government school of sericulture up to 1863. The population of Nukha was 22,618 in 1861, and 20,917 in 1873 (mainly Tatars, but 3500 Armenians). Besides the town there were in the district (1442 square miles) twenty-one villages each with more than 1000 inhabitants.

Nukha was a mere village up to the middle of the 18th century, when it was chosen by Hajji Tchelyabi, the founder of the khanate of Sheki, as his residence. The Russian occupation dates from 1807, though the annexation was not completed till 1819.

NUMANTIA, a town in Hispania Tarraconensis, of great natural strength, is famous for the memorable siege by the Romans under Scipio Africanus the younger. The siege began in 134 B.C.; the city was defended with the utmost bravery and tenacity, but after enduring the last extreme of famine the Spaniards were forced to surrender at discretion in 133. The inhabitants were sold as slaves and the town levelled to the ground. The victor was honoured with the title Numantinus by his countrymen. The site of Numantia is to be sought at or near the modern village of Puente de Garray, about four miles to the north of the town of Soria (Old Castile).

NUMA POMPILIUS, the second of the legendary kings of Rome, was a Sabine, a native of Cures; his father's name was Pompo and his wife was daughter of Tatius, the Sabine colleague of Romulus. His election, which was made by the Roman people and ratified by the senate, took place at the close of a year's interregnum, during which the sovereignty had been exercised by the members of the senate in rotation. He is represented as having been a quiet unambitious man (Tacita was his favourite muse); but even the ancients perceived the difficulty of making him a disciple of Pythagoras of Samos. His peaceful reign of forty-three years was marked by the creation of many of the most characteristic institutions of Rome; it was he who set up the worship of the god Terminus, appointed the festival of Fides, built the temple of Janus, reorganized the calendar, fixed days of business and days of cessation therefrom, instituted the flamens of Mars and Quirinus, the virgins of Vesta, the salii, the fetiales, the pontifices; in a word, the city which had been founded by means of violence and arms he succeeded in "founding anew upon principles of justice, law, and morality." He derived his inspiration from Egeria or Ægeria, his spouse, whom he used to meet unattended in the grove of the Camenæ, where a perennial spring gushed from a dark recess. He was above eighty when he died of a gentle decline. His daughter Pompilia, wife of the pontifex Numa Marcius, was the mother of Ancus Marcius. Livy (xl. 29) tells a curious story of the finding at the foot of the Janiculum in 181 B.C. of two stone chests, with inscriptions in Greek and Latin, one purporting to contain the body of Numa and the other his books. The first when opened was found to be empty, but the second contained fourteen books relating to philosophy and pontifical law, which, being perceived to have "a tendency to under-

mine the established system of religion," were forthwith publicly burned.

NUMBERS, Book of. See Pentateuch.

NUMBERS, Partition of. This subject, created by Euler, though relating essentially to positive integer numbers, is scarcely regarded as a part of the Theory of Numbers. We consider in it a number as made up by the *addition* of other numbers: thus the partitions of the successive numbers 1, 2, 3, 4, 5, 6, &c., are as follows:—

1.
2, 11;
3, 21, 111;
4, 31, 22, 211, 1111;
5, 41, 32, 311, 221, 2111, 11111;
6, 51, 42, 411, 33, 321, 3111, 222, 2211, 21111, 111111.

These are formed each from the preceding ones; thus, to form the partitions of 6 we take first 6; secondly, 5 prefixed to each of the partitions of 1 (that is, 51); thirdly, 4 prefixed to each of the partitions of 2 (that is, 42, 411); fourthly, 3 prefixed to each of the partitions of 3 (that is, 33, 321, 3111); fifthly, 2 prefixed, not to each of the partitions of 4, but only to those partitions which begin with a number not exceeding 2 (that is, 222, 2211, 21111); and lastly, 1 prefixed to all the partitions of 5 which begin with a number not exceeding 1 (that is, 111111); and so in other cases.

The method gives *all* the partitions of a number, but we may consider different classes of partitions: the partitions into a given number of parts, or into not more than a given number of parts; or the partitions into given parts, either with repetitions or without repetitions, &c. It is possible, for any particular class of partitions, to obtain methods more or less easy for the formation of the partitions either of a given number or of the successive numbers 1, 2, 3, &c. And of course in any case, having obtained the partitions, we can count them and so obtain the number of partitions.

Another method is by Arbogast's rule of the last and the last but one; in fact, taking the value of a to be unity, and, understanding this letter in each term, the rule gives b; c, b^2: d, bc, b^3; e, bd, c^2, b^2c, b^4, &c., which, if b, c, d, e, &c., denote 1, 2, 3, 4, &c., respectively, are the partitions of 1, 2, 3, 4, &c., respectively.

An important notion is that of conjugate partitions. Thus a partition of 6 is 42; writing this in the form $\left\{\begin{matrix}1111,\\11\end{matrix}\right.$ and summing the columns instead of the lines, we obtain the conjugate partition 2211; evidently, starting from 2211, the conjugate partition is 42. If we form all the partitions of 6 into not more than three parts, these are 6, 51, 42, 33, 411, 321, 222, and the conjugates are $\{$ 111111, 21111, 2211, 222, 3111, 321, 33, where no part is greater than 3; and so in general we have the theorem, the number of partitions of n into not more than k parts is equal to the number of partitions of n with no part greater than k.

We have for the number of partitions an analytical theory depending on generating functions; thus for the partitions of a number n with the parts 1, 2, 3, 4, 5, &c., without repetitions, writing down the product

$$1+x.1+x^2.1+x^3.1+x^4\ldots, =1+x+x^2+2x^3\ldots+Nx^n+\ldots,$$

it is clear that, if x^α, x^β, x^γ, ... are terms of the series x, x^2, x^3, .. for which $\alpha+\beta+\gamma+\ldots=n$, then we have in the development of the product a term x^n, and hence that in the term Nx^n of the product the coefficient N is equal to the number of partitions of n with the parts 1, 2, 3, .., without repetitions; or say that the product is the generating function (G. F.) for the number of such partitions. And so in other cases we obtain a generating function.

Thus for the function

$$\frac{1}{1-x.1-x^2.1-x^3\ldots}, =1+x+2x^2+\ldots+Nx^n+\ldots,$$

observing that any factor $1/1-x^l$ is $=1+x^l+x^{2l}+\ldots$, we see that in the term Nx^n the coefficient is equal to the number of partitions of n, with the parts 1, 2, 3, .., with repetitions.

Introducing another letter z, and considering the function

$$1+xz.1+x^2z.1+x^3z\ldots, =1+z(x+x^2+\ldots)\ldots+Nx^nz^k+\ldots,$$

we see that in the term Nx^nz^k of the development the coefficient N is equal to the number of partitions of n into k parts, with the parts 1, 2, 3, 4, ..., without repetitions.

And similarly, considering the function

$$\frac{1}{1-xz.1-x^2z.1-x^3z\ldots}, =1+z(x+x^2+\ldots)\ldots+Nx^nz^k+\ldots$$

we see that in the term Nx^nz^k of the development the coefficient N is equal to the number of partitions of n into k parts, with the parts 1, 2, 3, 4, ..., with repetitions.

We have such analytical formulæ as

$$\frac{1}{1-xz.1-x^2z.1-x^3z\ldots}=1+\frac{zx}{1-x}+\frac{z^2x^2}{1-x.1-x^2}+\ldots,$$

which lead to theorems in the Partition of Numbers. A remarkable theorem is

$$1-x.1-x^2.1-x^3.1-x^4\ldots=1-x-x^2+x^5+x^7-x^{12}-x^{15}+\ldots,$$

where the only terms are those with an exponent $\frac{1}{2}(3n^2\pm n)$, and for each such pair of terms the coefficient is $(-)^n1$. The formula shows that except for numbers of the form $\frac{1}{2}(3n^2\pm n)$ the number of partitions without repetitions into an odd number of parts is equal to the number of partitions without repetitions into an even number of parts, whereas for the excepted numbers these numbers differ by unity. Thus for the number 11, which is not an excepted number, the two sets of partitions are

11, 821, 731, 641, 632, 542
10.1, 92, 83, 74, 65, 5321,

in each set 6.

We have

$$1-x.1+x.1+x^2.1+x^4.1+x^8\ldots=1;$$

or, as this may be written,

$$1+x.1+x^2.1+x^4.1+x^8\ldots=\frac{1}{1-x}, =1+x+x^2+x^3+\ldots,$$

showing that a number n can always be made up, and in one way only, with the parts 1, 2, 4, 8, ... The product on the left-hand side may be taken to k terms only, thus if $k=4$, we have

$$1+x.1+x^2.1+x^4.1+x^8, =\frac{1-x^{16}}{1-x}, =1+x+x^2\ldots+x^{15};$$

that is, any number from 1 to 15 can be made up, and in one way only, with the parts 1, 2, 4, 8; and similarly any number from 1 to 2^k-1 can be made up, and in one way only, with the parts 1, 2, 4, .. 2^{k-1}. A like formula is

$$\frac{1-x^3}{x.1-x}\cdot\frac{1-x^9}{x^3.1-x^3}\cdot\frac{1-x^{27}}{x^9.1-x^9}\cdot\frac{1-x^{81}}{x^{27}.1-x^{27}}=\frac{1-x^{81}}{x^{40}.1-x};$$

that is,

$$x^{-1}+1+x.x^{-3}+1+x^3.x^{-9}+1+x^9.x^{-27}+1+x^{27}$$
$$=x^{-40}+x^{-39}.\;+1+x\ldots+x^{39}+x^{40},$$

showing that any number from -40 to $+40$ can be made up, and that in one way only, with the parts 1, 3, 9, 27 taken positively or negatively; and so in general any number from $-\frac{1}{2}(3^k-1)$ to $+\frac{1}{2}(3^k-1)$ can be made up, and that in one way only, with the parts 1, 3, 9, .. 3^{k-1} taken positively or negatively. (A. C.)

NUMBERS, Theory of. The Theory of Numbers, or higher arithmetic, otherwise arithmology, is a subject which, originating with Euclid, has in modern times, in the hands of Legendre, Gauss, Lejeune-Dirichlet, Kummer, Kronecker, and others, been developed into a most extensive and interesting branch of mathematics. We distinguish between the ordinary (or say the simplex) theory and the various complex theories.

In the ordinary theory we have, in the first instance, positive integer numbers, the unit or unity 1, and the other numbers 2, 3, 4, 5, &c. We introduce the zero 0, which is a number *sui generis*, and the negative numbers -1, -2, -3, -4, &c., and we have thus the more general notion of integer numbers, 0, ± 1, ± 2, ± 3, &c.; $+1$ and -1 are units or unities. The sum of any two or more numbers is a number; conversely, any number is a sum of two or more parts; but even when the parts are positive a number cannot be, in a determinate manner, represented as a sum of parts. The product of two or more numbers is a number; but (disregarding the unities $+1$, -1, which may be introduced as factors at pleasure) it is not conversely true that every number is a product of numbers. A number such as 2, 3, 5, 7, 11, &c., which is not a product of numbers, is said to be a prime number; and a number which is not prime is said to be composite. A number other than zero is thus either prime or composite; and we have the theorem that every composite number is, in a determinate way, a product of prime factors.

We have complex theories in which all the foregoing notions (integer, unity, zero, prime, composite) occur; that which first presented itself was the theory with the unit i ($i^2=-1$); we have here complex numbers, $a+bi$, where a and b are in the before-mentioned (ordinary) sense positive or negative integers, not excluding zero; we have the zero $0, = 0+0i$, and the four units $1, -1, i, -i$. A number other than zero is here either prime or else composite; for instance, 3, 7, 11, are prime numbers, and $5, = (2+i)(2-i)$, $9, = 3 . 3$, $13, = (3+2i)(3-2i)$, are composite numbers (generally any positive real prime of the form $4n+3$ is prime, but any positive real prime of the form $4n+1$ is a sum of two squares, and is thus composite). And disregarding unit factors we have, as in the ordinary theory, the theorem that every composite number is, in a determinate way, a product of prime factors.

There is, in like manner, a complex theory involving the cube roots of unity—if a be an imaginary cube root of unity ($a^2+a+1=0$), then the integers of this theory are $a+ba$ (a and b real positive or negative integers, including zero)—a complex theory with the fifth roots of unity—if a be an imaginary fifth root of unity ($a^4+a^3+a^2+a+1=0$), then the integers of the theory are $a+ba+ca^2+da^3$ (a, b, c, d, real positive or negative integers, including zero); and so on for the roots of the orders 7, 11, 13, 17, 19. In all these theories, or at any rate for the orders 3, 5, 7 (see No. 37, *post*), we have the foregoing theorem: disregarding unit factors, a number other than zero is either prime or composite, and every composite number is, in a determinate way, a product of prime factors. But coming to the 23d roots of unity the theorem ceases to be true. Observe that it is a particular case of the theorem that, if N be a prime number, any integer power of N has for factors only the lower powers of N,—for instance, $N^3 = N.N^2$; there is no other decomposition $N^3 = AB$. This is obviously true in the ordinary theory, and it is true in the complex theories preceding those for the 3d, 5th, and 7th roots of unity, and probably in those for the other roots preceding the 23d roots; but it is not true in the theory for the 23d roots of unity. We have, for instance, 47, a number not decomposable into factors, but $47^3, = AB$, is a product of two numbers each of the form $a+ba+..+ka^{21}$ (a a 23d root). The theorem recovers its validity by the introduction into the theory of Kummer's notion of an ideal number.

The complex theories above referred to would be more accurately described as theories for the complex numbers involving the periods of the roots of unity: the units are the roots either of the equation $x^{p-1}+x^{p-2}...+x+1=0$ (p a prime number) or of any equation $x^{\frac{p-1}{e}}+..\pm 1=0$ belonging to a factor of the function of the order $p-1$ (in particular, this may be the quadric equation for the periods each of $\frac{1}{2}(p-1)$ roots); they are the theories which were first and have been most completely considered, and which led to the notion of an ideal number. But a yet higher generalization which has been made is to consider the complex theory, the units whereof are the roots of any given irreducible equation which has integer numbers for its coefficients.

There is another complex theory the relation of which to the foregoing is not very obvious, viz., Galois's theory of the numbers composed with the imaginary roots of an irreducible congruence, $F(x)\equiv 0$ (modulus a prime number p); the nature of this will be indicated in the sequel.

In any theory, ordinary or complex, we have a first part, which has been termed (but the name seems hardly wide enough) the theory of congruences; a second part, the theory of homogeneous forms (this includes in particular the theory of the binary quadratic forms $(a, b, c)(x, y)^2$); and a third part, comprising those miscellaneous investigations which do not come properly under either of the foregoing heads.

Ordinary Theory, First Part.

1. We are concerned with the integer numbers 0, ± 1, ± 2, ± 3, &c., or in the first place with the positive integer numbers 1, 2, 3, 4, 5, 6, &c. Some of these, 1, 2, 3, 5, 7, &c., are prime, others, $4, = 2^2$, $6, = 2 . 3$, &c., are composite; and we have the fundamental theorem that a composite number is expressible, and that in one way only, as a product of prime factors, $N = a^\alpha b^\beta c^\gamma ...$ ($a, b, c, ..$ primes other than 1; $\alpha, \beta, \gamma, ..$ positive integers).

Gauss makes the proof to depend on the following steps: (1) the product of two numbers each smaller than a given prime number is not divisible by this number; (2) if neither of two numbers is divisible by a given prime number the product is not so divisible; (3) the like as regards three or more numbers; (4) a composite number cannot be resolved into factors in more than one way.

2. Proofs will in general be only indicated or be altogether omitted, but, as a specimen of the reasoning in regard to whole numbers, the proofs of these fundamental propositions are given at length. (1) Let p be the prime number, a a number less than p, and if possible let there be a number b less than p, and such that ab is divisible by p; it is further assumed that b is the only number, or, if there is more than one, then that b is the least number having the property in question; b is greater than 1, for a being less than p is not divisible by p. Now p as a prime number is not divisible by b, but must lie between two consecutive multiples mb and $(m+1)b$ of b. Hence, ab being divisible by p, mab is also divisible by p; moreover, ap is divisible by p, and hence the difference of these numbers, $= a(p-mb)$, must also be divisible by p, or, writing $p-mb=b'$, we have ab' divisible by p, where b' is less than b; so that b is not the least number for which ab is divisible by p. (2) If a and b are neither of them divisible by p, then a divided by p leaves a remainder α which is less than p, say we have $a=mp+\alpha$; and similarly b divided by p leaves a remainder β which is less than p, say we have $b=np+\beta$; then

$$ab=(mp+\alpha)(np+\beta), =(mnp+n\alpha+m\beta)\,p+\alpha\beta,$$

and $\alpha\beta$ is not divisible by p, therefore ab is not divisible by p. (3) The like proof applies to the product of three or more factors $a, b, c, ...$ (4) Suppose that the number $N, = a^\alpha b^\beta c^\gamma ...$ ($a, b, c, ...$ prime numbers other than 1), is decomposable in some other way into prime factors; we can have no prime factor p, other than $a, b, c, ...$, for no such number can divide $a^\alpha b^\beta c^\gamma ...$; and we must have each of the numbers $a, b, c, ...$, for if any one

of them, suppose a, were wanting, the number N would not be divisible by a. Hence the new decomposition if it exists must be a decomposition $N=a^{\alpha'}b^{\beta'}c^{\gamma'}\ldots$; and here, if any two corresponding indices, say α, α', are different from each other, then one of them, suppose α', is the greater, and we have $N\div p^{\alpha}=b^{\beta}c^{\gamma}\ldots=a^{\alpha'-\alpha}\,b^{\beta'}c^{\gamma'}\ldots$ That is, we have the number $N\div p^{\alpha}$ expressed in two different ways as a product, the number a being a factor in the one case, but not a factor in the other case. Thus the two exponents cannot be unequal, that is, we must have $\alpha=\alpha'$, and similarly we have $\beta=\beta'$, $\gamma=\gamma'$, ...; that is, there is *only* the original decomposition $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$

3. The only numbers divisible by a number $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$ are the numbers $a^{\alpha'}b^{\beta'}c^{\gamma'}\ldots$, where each exponent α' is equal to or greater than the corresponding exponent α. And conversely the only numbers which divide N are those of the form $a^{\alpha'}b^{\beta'}c^{\gamma'}\ldots$, where each index α' is at most equal to the corresponding index α; and in particular each or any of the indices α' may be $=0$. Again, the least common multiple of two numbers $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$ and $N'=a^{\alpha'}b^{\beta'}c^{\gamma'}\ldots$ is $a^{\alpha''}b^{\beta''}c^{\gamma''}\ldots$, where each index α'' is equal to the largest of the corresponding indices α, α';—observe that any one or more of the indices $\alpha, \beta, \gamma, \ldots, \alpha', \beta', \gamma', \ldots$, may be $=0$, so that the theorem extends to the case where either of the numbers N, N', has prime factors which are not factors of the other number. And so the greatest common measure of two numbers $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$ and $N'=a^{\alpha'}b^{\beta'}c^{\gamma'}\ldots$ is $a^{\alpha''}b^{\beta''}c^{\gamma''}\ldots$, where each index α'' is equal to the least of the corresponding indices α and α'.

4. The divisors of $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$ are the several terms of the product $(1+a\ldots+a^{\alpha})(1+b\ldots+b^{\beta})(1+c\ldots+c^{\gamma})$, where unity and the number N itself are reckoned each of them as a divisor. Hence the number of divisors is $=(\alpha+1)(\beta+1)(\gamma+1)\ldots$, and the sum of the divisors is $=\dfrac{(a^{\alpha+1}-1)(b^{\beta+1}-1)(c^{\gamma+1}-1)\ldots}{(a-1)(b-1)(c-1)\ldots}$.

5. In $N=a^{\alpha}b^{\beta}c^{\gamma}\ldots$ the number of integers less than N and prime to it is $\phi(N),=N\left(1-\dfrac{1}{a}\right)\left(1-\dfrac{1}{b}\right)\left(1-\dfrac{1}{c}\right)\ldots$ To find the numbers in question write down the series of numbers $1, 2, 3, \ldots N$; strike out all the numbers divisible by a, then those divisible by b, then those divisible by $c\ldots$, and so on; there will remain only the numbers prime to N. For actually finding the numbers we may of course in striking out those divisible by b disregard the numbers already struck out as divisible by a, and in striking out with respect to c disregard the numbers already struck out as divisible by a or b, and so on; but in order to count the remaining numbers it is more convenient to ignore the previous strikings out. Suppose, for a moment, there are only two prime factors a and b, then the number of terms struck out as divisible by a is $=N.\dfrac{1}{a}$, and the number of terms struck out as divisible by b is $=N.\dfrac{1}{b}$; but then each term divisible by ab will have been twice struck out; the number of these is $=N.\dfrac{1}{ab}$, and thus the number of the remaining terms is $N\left(1-\dfrac{1}{a}-\dfrac{1}{b}+\dfrac{1}{ab}\right)$, which is $=N\left(1-\dfrac{1}{a}\right)\left(1-\dfrac{1}{b}\right)$. By treating in like manner the case of three or more prime factors $a, b, c, \ldots$ we arrive at the general theorem. The formula gives $\phi(1)=1$ (viz., $N=1$, there is no factor $1-\dfrac{1}{a}$), and it is necessary to consider $\phi(1)$ as being $=1$. The explanation is that $\phi(N)$ properly denotes the number of integers not greater than N and prime to it; so that in $N=1$ we have 1 an integer not greater than N and prime to it; but in every other case the two definitions agree.

6. If N, N', are numbers prime to each other then $\phi(NN')=\phi(N)\phi(N')$, and so also for any number of numbers having no common divisor; in particular $\phi(a^{\alpha}b^{\beta}c^{\gamma}\ldots)=\phi(a^{\alpha})\phi(b^{\beta})\phi(c^{\gamma})\ldots$; $\phi(a^{\alpha})=a^{\alpha}\left(1-\dfrac{1}{a}\right)$, and the theorem is at once verified. We have $N=\Sigma\phi(N')$, where the summation extends to all the divisors N' of N, unity and the number N itself being included; thus $15=\phi(15)+\phi(5)+\phi(3)+\phi(1),=8+4+2+1$.

7. The prime factor of the binomial function $x^{N}-1$ is $=\dfrac{(x^{N}-1)(x^{N/ab}-1)\ldots}{(x^{N/a}-1)(x^{N/b}-1)\ldots}$, a rational and integral function of the degree $\phi(N)$; say this is called $[x^{N}-1]$, and we have $x^{N}-1=\Pi\,[x^{N'}-1]$, where the product extends to all the divisors N' of N, unity and the number N included. For instance

$$[x^{15}-1]=\frac{(x^{15}-1)(x-1)}{(x^5-1)(x^3-1)},=x^8-x^7+x^5-x^4+x^3-x+1;$$

and we have

$$\begin{aligned}(x^{15}-1)&=[x^{15}-1][x^5-1][x^3-1][x-1],\\&=(x^8-x^7\ldots-x+1)(x^4+x^3+x^2+x+1)(x^2+x+1)(x-1).\end{aligned}$$

8. Congruence to a given modulus. A number x is congruent to 0, to the modulus N, $x\equiv 0$ (mod. N), when x is divisible by N; two numbers x, y are congruent to the modulus N, $x\equiv y$ (mod. N), when their difference $x-y$ divides by N, or, what is the same thing, if $x-y\equiv 0$ (mod. N). Observe that, if $xy\equiv 0$ (mod. N), and x be prime to N, then $y\equiv 0$ (mod. N).

9. Residues to a given modulus. For a given modulus N we can always find, and that in an infinity of ways, a set of N numbers, say N residues, such that every number whatever is, to the modulus N, congruent to one and only one of these residues. For instance, the residues may be $0, 1, 2, 3, \ldots N-1$ (the residue of a given number is here simply the positive remainder of the number when divided by N); or, N being odd, the system may be

$$0,\ \pm1,\ \pm2,\ldots\pm\tfrac{1}{2}(N-1),$$

and N even,

$$0,\ \pm1,\ \pm2,\ldots\pm\tfrac{1}{2}(N-2),\ +\tfrac{1}{2}N.$$

10. Prime residues to a given modulus. Considering only the numbers which are prime to a given modulus N, we have here a set of $\phi(N)$ numbers, say $\phi(N)$ prime residues, such that every number prime to N is, to the modulus N, congruent to one and only one of these prime residues. For instance the prime residues may be the numbers less than N and prime to it. In particular, if N is a prime number p, then the residues may be the $p-1$ numbers, $1, 2, 3, \ldots p-1$.

In all that follows the letter p, in the absence of any statement to the contrary, will be used to denote an *odd* prime other than unity. A theorem for p may hold good for the even prime 2, but it is in general easy to see whether this is so or not.

11. Fermat's theorem, $x^{p-1}-1\equiv 0$ (mod. p). The generalized theorem is $x^{\phi(N)}-1\equiv 0$ (mod. N). The proof of the generalized theorem is as easy as that of the original theorem. Consider the series of the $\phi(N)$ numbers $a, b, c, \ldots$ each less than N and prime to it; let x be any number prime to N, then each of the numbers $xa, xb, xc, \ldots$ is prime to N, and no two of them are congruent to the modulus N, that is, we cannot have $x(a-b)\equiv 0$ (mod. N); in fact, x is prime to N, and the difference $a-b$ of two positive numbers each less than N will be less than N. Hence the numbers $xa, xb, xc, \ldots$ are in a different order congruent to the numbers $a, b, c, \ldots$; and multiplying together the numbers of each set we have $x^{\phi(N)}abc.\ \equiv abc\ldots$

(mod. N), or, since $a, b, c, \ldots$ are each prime to N, and therefore also the product $abc\ldots$ is prime to N, we have $x^{\phi(N)} \equiv 1$, or say $x^{\phi(N)} - 1 \equiv 0$ (mod. N).

In particular, if N be a prime number $= p$, then $\phi(N)$ is $= p - 1$, and the theorem is $x^{p-1} - 1 \equiv 0$ (mod. p), x being now any number not divisible by p.

12. The general congruence $f(x) \equiv 0$ (mod. p). $f(x)$ is written to denote a rational and integral function with integer coefficients which may without loss of generality be taken to be each of them less than p; it is assumed that the coefficient a of the highest power of x is not $= 0$. If there is for x an integer value a such that $f(a) \equiv 0$ (mod. p, throughout), then a is said to be a root of the congruence $f(x) \equiv 0$; we may, it is clear, for a substitute any value whatever $a' = a + kp$, or say any value a' which is $\equiv a$, but such value a' is considered not as a different root but as the same root of the congruence. We have thus $f(a) \equiv 0$; and therefore $f(x) \equiv f(x) - f(a)$, $= (x-a)f_1(x)$, where $f_1(x)$ is a function of like form with $f(x)$, that is, with integer coefficients, but of the next inferior order $n-1$. Suppose there is another root b of the congruence, that is, an integer value b such that $f(b) \equiv 0$; we have then $(b-a)f_1(b) \equiv 0$, and $b-a$ is not $\equiv 0$ (for then b would be the same root as a). Hence $f_1(b) \equiv 0$, and $f(x) \equiv (x-a)\{f_1(x) - f_1(b)\}$, $= (x-a)(x-b)f_2(x)$, where $f_2(x)$ is an integral function such as $f(x)$, but of the order $n-2$; and so on, that is, if there exist n different (non-congruent) roots of the congruence $f(x) \equiv 0$, then $f(x) = A(x-a)(x-b)\ldots(x-k)$, and the congruence may be written $A(x-a)(x-b)\ldots(x-k) \equiv 0$. And this cannot be satisfied by any other value l; for if so we should have $A(l-a)(l-b)\ldots(l-k) \equiv 0$, that is, some one of the congruences $(l-a) \equiv 0$, &c., would have to be satisfied, and l would be the same as one of the roots $a, b, c, \ldots k$. That is, a congruence of the order n cannot have more than n roots, and if it have precisely n roots $a, b, c, \ldots k$, then the form is $f(x) \equiv A(x-a)(x-b)\ldots(x-k), \equiv 0$.

Observe that a congruence may have equal roots, viz., if the form be $f(x) \equiv A(x-a)^\alpha(x-b)^\beta\ldots, \equiv 0$, then the roots $a, b, \ldots$ are to be counted α times, β times, ... respectively; but clearly the whole number of roots $\alpha+\beta+\ldots$ is at most $= n$.

It is hardly necessary to remark that this theory of a congruence of the order n is precisely analogous to that of an equation of the order n, when only real roots are attended to. The theory of the imaginary roots of a congruence will be considered further on (see No. 41).

13. The linear congruence $ax \equiv c$ (mod. b). This is equivalent to the indeterminate equation $ax + by = c$; if a and b are not prime to each other, but have a greatest common measure q, this must also divide c; supposing the division performed, the equation becomes $a'x + b'y = c'$, where a' and b' are prime to each other, or, what is the same thing, we have the congruence $a'x \equiv c'$ (mod. b'). This can always be solved, for, if we consider the b' numbers $0, 1, 2, \ldots b'-1$, one and only one of these will be $\equiv c'$ (mod. b'). Multiplying these by any number a' prime to b', and taking the remainders in regard to b', we reproduce in a different order the same series of numbers $0, 1, 2, \ldots b'-1$; that is, in the series $a', 2a', \ldots (b'-1)a'$ there will be one and only one term $\equiv c'$ (mod. b'), or, calling the term in question α, we have $x = \alpha$ as the solution of the congruence $a'x \equiv c'$ (mod. b'); $a'\alpha - c'$ is then a multiple of b', say it is $= -b'\beta$, and the corresponding value of y is $y = \beta$. We may for α write $\alpha + mb'$, m being any positive or negative integer, not excluding zero (but, as already remarked, this is not considered as a distinct solution of the congruence); the corresponding value of y is clearly $= \beta - ma'$.

The value of x can be found by a process similar to that for finding the greatest common measure of the two numbers a' and c'; this is what is really done in the apparently tentative process which at once presents itself for small numbers, thus $6x \equiv 9$ (mod. 35), we have $36x \equiv 54$, or, rejecting multiples of 35, $x \equiv 19$, or, if we please, $x = 35m + 19$.

In particular, we can always find a number ξ such that $a'\xi \equiv 1$ (mod. b'); and we have then $x = c'\xi$ as the solution of the congruence $a'x \equiv c'$. The value of ξ may be written $\xi \equiv \frac{1}{a'}$ (mod. b'), where $\frac{1}{a'}$ stands for that integer value ξ which satisfies the original congruence $a'\xi \equiv 1$ (mod. b'); and the value of x may then be written $x \equiv \frac{c'}{a'}$ (mod. b'). Another solution of the linear congruence is given in No. 21.

14. Wilson's theorem, $1 . 2 . 3 \ldots \overline{p-1} + 1 \equiv 0$ (mod. p) It has been seen that for any prime number p the congruence $x^{p-1} - 1 \equiv 0$ (mod. p) of the order $p-1$ has the $p-1$ roots $1, 2, \ldots p-1$; we have therefore

$$x^{p-1} - 1 \equiv (x-1)(x-2)\ldots(x-\overline{p-1}),$$

or, comparing the terms independent of x, it appears that $1.2.3\ldots p-1 \equiv -1$, that is, $1.2.3\ldots\overline{p-1} + 1 \equiv 0$ (mod. p), —the required theorem. For instance, where $p = 5$, then $1.2.3.4 + 1 \equiv 0$ (mod. 5), and where $p = 7$, then $1.2.3.4.5.6 + 1 \equiv 0$ (mod. 7).

15. A proof on wholly different principles may be given. Suppose, to fix the ideas, $p = 7$; consider on a circle 7 points, the summits of a regular heptagon, and join these in any manner so as to form a heptagon; the whole number of heptagons is $\frac{1}{2} . 1 . 2 . 3 . 4 . 5 . 6$. Now of these we have $\frac{1}{2}(7-1), = 3$, which are regular heptagons (convex or stellated); the number of remaining heptagons must be divisible by 7, for with any one such heptagon we connect the 6 heptagons which can be obtained from it by making it rotate through successive angles of $\frac{1}{7}$ 360°. That is, $\frac{1}{2} . 1 . 2 . 3 . 4 . 5 . 6 - \frac{1}{2}(7-1) \equiv 0$ (mod. 7), whence $1.2.3.4.5.6 - 7 + 1 \equiv 0$, or finally $1.2.3.4.5.6 + 1 \equiv 0$ (mod. 7). It is clear that the proof applies without alteration to the case of any prime number p.

If p is not a prime number, then $1 . 2 . 3 \ldots \overline{p-1} \equiv 0$ (mod. p); hence the theorem shows directly whether a number p is or is not a prime number; but it is not of any practical utility for this purpose.

16. Prime roots of a prime number—application to the binomial equation $x^p - 1 = 0$. Take, for instance, $p = 7$. By what precedes we have

$$\begin{aligned} x^6 - 1 &= [x^6-1][x^3-1][x^2-1][x-1], \\ &= (x^2-x+1)(x^2+x+1)(x+1)(x-1); \end{aligned}$$

and we have

$$x^6 - 1 \equiv (x-1)(x-2)(x-3)(x-4)(x-5)(x-6) \text{ (mod. 7)};$$

whence also

$$\begin{aligned} &(x^2-x+1)(x^2+x+1)(x+1)(x-1) \\ &\equiv (x-1)(x-2)(x-3)(x-4)(x-5)(x-6). \end{aligned}$$

These two decompositions must agree together, and we in fact have

$$\begin{gathered} x^2-x+1 \equiv (x-3)(x-5),\ x^2+x+1 \equiv (x-2)(x-3), \\ x+1 \equiv x-6,\ x-1 \equiv x-1. \end{gathered}$$

In particular, we thus have 3, 5, as the roots of the congruence $x^2-x+1 \equiv 0$, that is, $[x^6-1] \equiv 0$, and these roots 3, 5, are not the roots of any other of the congruences $[x^3-1] \equiv 0$, $[x^2-1] \equiv 0$, $[x-1] \equiv 0$; that is, writing $a = 3$ or 5 in the series of numbers $a, a^2, a^3, a^4, a^5, a^6$, we have a^6 as the first term which is $\equiv 1$ (mod. 7); the series in fact are

$$\begin{aligned} &3,\ 9,\ 27,\ 81,\ 243,\ 729 \equiv 3,\ 2,\ 6,\ 4,\ 5,\ 1, \\ &5,\ 25,\ 125,\ 625,\ 3125,\ 15625 \equiv 5,\ 4,\ 6,\ 2,\ 3,\ 1. \end{aligned}$$

And so in general the congruence $x^{p-1} - 1 \equiv 0$ (mod. p) has the $p-1$ real roots $1, 2, 3, \ldots p-1$; hence the congruence $[x^{p-1} - 1] \equiv 0$, which is of the order $\phi(p-1)$, has this number $\phi(p-1)$ of real roots; and, calling any one of

these g, then in the series of powers $g, g^2, g^3, \ldots g^{p-1}$, the first term which is $\equiv 1$ (mod. p) is g^{p-1}, that is, we have $g, g^2, g^3, \ldots g^{p-1} = 1, 2, 3, \ldots p-1$ in a different order. Any such number g is said to be a prime root of p, and the number of prime roots is $\phi(p-1)$, the number of integers less than and prime to $p-1$.

The notion of a prime root was applied by Gauss to the solution of the binomial equation $x^p - 1 = 0$, or, what is the same thing, to the question of the division of the circle (Kreistheilung), see EQUATION, Nos. 30 and 31 (vol. viii., p. 507); and, as remarked in the introduction to the present article, the roots or periods of roots of this equation present themselves as the units of a complex theory in the Theory of Numbers.

17. Any number x less than p is $\equiv g^m$, and, if m is not prime to $p-1$, but has with it a greatest common measure e, suppose $m = ke$, $p-1 = ef$, then

$$x \equiv g^{ke},\ x^f \equiv g^{kef} \equiv g^{k(p-1)} \equiv 1,$$

that is, $x^f \equiv 1$; and it is easily seen that in the series of powers $x, x^2, \ldots x^f$, we have x^f as the first term which is $\equiv 1$ (mod. p). A number $\equiv g^m$, where m is not prime to $p-1$, is thus not a prime root; and it further appears that, g being any particular prime root, the $\phi(p-1)$ prime roots are $\equiv$ the numbers g^m, where m is any number less than $p-1$ and prime to it. Thus in the foregoing example $p=7$, where the prime roots were 3 and 5, the integers less than 6 and prime to it are 1, 5; and we in fact have $5 \equiv 3^5$ and $3 \equiv 5^5$ (mod. 7).

18. Integers belonging to a given exponent; index of a number. If, as before, $p-1 = ef$, that is, if f be a submultiple of $p-1$, then any integer x such that x^f is the lowest power of x which is $\equiv 1$ (mod. p) is said to belong to the exponent f. The number of residues, or terms of the series $1, 2, 3, \ldots p-1$, which belong to the exponent f is $\phi(f)$, the number of integers less than f and prime to it; these are the roots of the congruence $[x^f - 1] \equiv 0$ of the order $\phi(f)$. It is hardly necessary to remark that the prime roots belong to the exponent $p-1$.

A number $x \equiv g^m$ is said to have the index m; observe the distinction between the two terms exponent and index; and further that the index is dependent on the selected prime root g.

19. Special forms of composite modulus. If instead of a prime modulus p we have a modulus p^m which is the power of an odd prime, or a modulus $2p$ or $2p^m$ which is twice an odd prime or a power of an odd prime, then there is a theory analogous to that of prime roots, viz., the numbers less than the modulus and prime to it are congruent to successive powers of a prime root g; thus,

if $p^m = 3^2$, we have $2, 4, 8, 16, 32, 64 \equiv 2, 4, 8, 7, 5, 1$ (mod. 9),
and if $2p^m = 2 \cdot 3^2$, we have $5, 25, 125, 625, 3125, 15625 \equiv 5, 7, 11, 13, 17, 1$ (mod. 18).

As regards the even prime 2 and its powers—for the modulus 2 or 4 the theory of prime roots does not come into existence, and for the higher powers it is not applicable; thus with modulus $= 8$ the numbers less than 8 and prime to it are 1, 3, 5, 7; and we have $3^2 \equiv 5^2 \equiv 7^2 \equiv 1$ (mod. 8).

20. Composite modulus $N = a^\alpha b^\beta c^\gamma \ldots$—no prime roots—irregularity. In the general case of a composite modulus it has been seen that, if x is any number less than N and prime to it, then $x^{\phi(N)} - 1 \equiv 0$ (mod. N). But (except in the above-mentioned cases p^m, $2p^m$, 2 or 4) there is not any number a such that $a^{\phi(N)}$ is the first power of a which is $\equiv 1$; there is always some submultiple $i = \frac{1}{\theta}\phi(N)$ such that a^i is the first power which is $\equiv 1$. For instance, say $N = 24$, $\phi(N) = 8$, then the numbers less than 24 and prime to it are 1, 5, 7, 11, 13, 17, 19, 23; and we have $1^1 \equiv 1$, $5^2 \equiv 7^2 \equiv 13^2 \equiv 17^2 \equiv 19^2 \equiv 23^2 \equiv 1$ (mod. 24), that is, 1 has the exponent 1, but all the other numbers have the exponent 2. So again where $N = 48$, the 16 numbers less then 48 and prime to it have, 1 the exponent 1, and 7, 13, 17, 23, 25, 31, 35, 41, 47 each the exponent 2, and the remaining numbers 5, 11, 19, 29, 37, 43 each the exponent 4. We cannot in this case by means of any single root or of any two roots express all the numbers, but we can by means of three roots, for instance, 5, 7, 13, express all the numbers less than 48 and prime to it; the numbers are in fact $\equiv 5^\alpha 7^\beta 13^\gamma$, where $\alpha = 0, 1, 2$, or 3, and β and γ each $= 0$ or 1.

[Comparing with the theorem for a prime number p, where the several numbers $1, 2, 3, \ldots p-1$, are expressed by means of a single prime root, $\equiv g^\alpha$, where $\alpha = 0, 1, 2, \ldots p-1$, we have the analogue of a case presenting itself in the theory of quadratic forms,—the "irregularity" of a determinant (*post*, No. 31); the difference is that here (the law being known, $N =$ a composite number) the case is not regarded as an irregular one, while the irregular determinants do not present themselves according to any apparent law.]

21. Maximum indicator—application to solution of a linear congruence. In the case $N = 48$ it was seen that the exponents were 1, 2, 4, the largest exponent 4 being divisible by each of the others, and this property is a general one, viz., if $N = a^\alpha b^\beta c^\gamma \ldots$ in the series of exponents i (or, as Cauchy calls them, indicators) of the numbers less than N and prime to it, the largest exponent I is a multiple of each of the other exponents, and this largest exponent Cauchy calls the maximum indicator; the maximum indicator I is thus a submultiple of $\phi(N)$, and it is the smallest number such that for every number x less than N and prime to it we have $x^I - 1 \equiv 0$ (mod. N). The values of I have been tabulated from $N = 2$ to 1000.

Reverting to the linear congruence $ax \equiv c$ (mod. b), where a and b are prime to each other, then, if I is the maximum indicator for the modulus b, we have $a^I \equiv 1$, and hence it at once appears that the solution of the congruence is $x \equiv ca^{I-1}$.

22. Residues of powers for an odd prime modulus. For the modulus p, if g be a prime root, then every number not divisible by p is $\equiv$ one of the series of numbers $g, g^2, \ldots g^{p-1}$; and, if k be any positive number prime to $p-1$, then raising each of these to the power k we reproduce in a different order the same series of numbers $g, g^2, \ldots g^{p-1}$, which numbers are in a different order $\equiv 1, 2, \ldots p-1$, that is, the residue of a kth power may be any number whatever of the series $1, 2, \ldots p-1$.

But, if k is not prime to $p-1$, say their greatest common measure is e, and that we have $p-1 = ef$, $k = me$, then for any number not divisible by p the kth power is $\equiv$ one of the series of f numbers $g^e, g^{2e}, \ldots g^{fe}$; there are thus only $f, = \frac{1}{e}(p-1)$, out of the $p-1$ numbers $1, 2, 3, \ldots p-1$, which are residues of a kth power.

23. Quadratic residues for an odd prime modulus. In particular, if $k = 2$, then $e = 2$, $f = \frac{1}{2}(p-1)$, and the square of every number not divisible by p is $\equiv$ one of the $\frac{1}{2}(p-1)$ numbers $g^2, g^4, \ldots g^{p-1}$; that is, there are only $\frac{1}{2}(p-1)$ numbers out of the series $1, 2, 3, \ldots p-1$ which are residues of a square number, or say quadratic residues, and the remaining $\frac{1}{2}(p-1)$ numbers are said to be quadratic non-residues of the modulus p,—we may say simply, residues and non-residues. But this result can be obtained more easily without the aid of the theory of prime roots. Every number not divisible by p is, to the modulus p, $\equiv$ one of the series of numbers $\pm 1, \pm 2, \pm 3, \ldots \pm \frac{1}{2}(p-1)$; hence every square number is $\equiv$ one of the series of numbers $1^2, 2^2, 3^2, \ldots \frac{1}{4}(p-1)^2$; and thus the $p-1$ numbers $1, 2, 3, \ldots p-1$, are one-half of them residues and the

other half non-residues of p. Thus in the case $p=11$ every number not divisible by 11 is, to this modulus, $\equiv$ one of the series ±1, ±2, ±3, ±4, ±5; whence the square of any such number is $\equiv$ one of the series 1, 4, 9, 16, 25, or say the series 1, 4, 9, 5, 3; that is, we have

$$\begin{array}{r|cccccccccc|}\text{residues} & 1, & . & 3, & 4, & 5, & . & . & . & 9, & . \\ \text{non-residues} & . & 2, & . & . & . & 6, & 7, & 8, & . & 10\end{array}.$$

Calling as usual the residues a and the non-residues b, we have in this case $\frac{1}{11}(\Sigma b-\Sigma a)=\frac{1}{11}(33-22), =1$, a positive integer; this is a property true for any prime number of the form $4n+3$, but for a prime number of the form $4n+1$ we have $\Sigma b-\Sigma a=0$; the demonstration belongs to a higher part of the theory.

It is easily shown that the product of two residues or of two non-residues is a residue; but the product of a residue and a non-residue is a non-residue.

24. The law of reciprocity—Legendre's symbol. The question presents itself, given that P is a residue or a non-residue of Q, can we thence infer whether Q is a residue or a non-residue of P? In particular, if P, Q, are the odd primes p, q, for instance, given that $13=R(17)$, can we thence infer that $17=R(13)$, or that $17=NR(13)$? The answer is contained in the following theorem: if p, q, are odd primes each or one of them of the form $4n+1$, then p, q, are each of them a residue or each of them a non-residue of the other; but, if p, q, are each of them of the form $4n+3$, then according as p is a residue or a non-residue of q we have q a non-residue or a residue of p.

The theorem is conveniently expressed by means of Legendre's symbol, viz., p being a positive odd prime, and Q any positive or negative number not divisible by p, then $\left(\frac{Q}{p}\right)$ denotes $+1$ or -1 according as Q is or is not a residue of p; if, as before, q is (as p) a positive odd prime, then the foregoing theorem is

$$\left(\frac{p}{q}\right)\left(\frac{q}{p}\right)=(-1)^{\frac{1}{4}(p-1)(q-1)}.$$

The denominator symbol may be negative, say it is $-p$, we then have as a definition $\left(\frac{Q}{-p}\right)=\left(\frac{Q}{p}\right)$—observe that $\left(\frac{-Q}{p}\right)$ is not $=\left(\frac{Q}{-p}\right)$—and we have further the theorems

$$\left(\frac{-1}{p}\right)=(-1)^{\frac{1}{2}(p-1)}, \quad \left(\frac{2}{p}\right)=(-1)^{\frac{1}{8}(p^2-1)},$$

viz., -1 is a residue or a non-residue of p according as $p\equiv1$ or $\equiv3$ (mod. 4), and 2 is a residue or a non-residue of p according as $p\equiv1$ or 7, or $\equiv3$ or 5 (mod. 8). If, as definitions, $\left(\frac{p}{-1}\right)=+1$ and $\left(\frac{p}{2}\right)=+1$, these may be written

$$\left(\frac{-1}{p}\right)\left(\frac{p}{-1}\right)=(-1)^{\frac{1}{2}(p-1)} \text{ and } \left(\frac{2}{p}\right)\left(\frac{p}{2}\right)=(-1)^{\frac{1}{8}(p^2-1)}.$$

We have also, what is in fact a theorem given at the end of No. 23,

$$\left(\frac{QQ'}{p}\right)=\left(\frac{Q}{p}\right)\left(\frac{Q'}{p}\right).$$

The further definition is sometimes convenient—

$$\left(\frac{Q}{p}\right)=0, \text{ when } p \text{ divides } Q.$$

The law of reciprocity as contained in the theorem

$$\left(\frac{p}{q}\right)\left(\frac{q}{p}\right)=(-1)^{\frac{1}{4}(p-1)(q-1)}$$

is a fundamental theorem in the whole theory; it was enunciated by Legendre, but first proved by Gauss, who gave no less than six demonstrations of it.

25. Jacobi's generalized symbol. Jacobi defined this as follows: the symbol $\left(\frac{Q}{\pm pp'p''\ldots}\right)$, where p, p', p'', .. are positive odd primes equal or unequal, and Q is any positive or negative odd number prime to $pp'p''\ldots$, denotes $+1$ or -1 according to the definition

$$\left(\frac{Q}{\pm pp'p''..}\right)=\left(\frac{Q}{p}\right)\left(\frac{Q}{p'}\right)\left(\frac{Q}{p''}\right)\ldots,$$

the symbols on the right-hand side being Legendre's symbols; but the definition may be regarded as extending to the case where Q is not prime to $pp'p''\ldots$, then we have Q divisible by some factor p, and by the definition of Legendre's symbol in this case we have $\left(\frac{Q}{p}\right)=0$; hence in the case in question of Q not being prime to $pp'p''$.. the value of Jacobi's symbol is $=0$.

We may further extend the definition of the symbol to the case where the numerator and the denominator of the symbol are both or one of them even, and present the definition in the most general form, as follows: suppose that, p, p', p'', ... being positive or negative even or odd primes, equal or unequal, and similarly q, q', q'', ... being positive or negative even or odd primes, equal or unequal, we have $P=pp'p''\ldots$ and $Q=qq'q''\ldots$, then the symbol $\left(\frac{Q}{P}\right)$ will denote $+1$, -1, or 0, according to the definition

$$\left(\frac{Q}{P}\right)=\left(\frac{q}{p}\right)\left(\frac{q}{p'}\right)\left(\frac{q}{p''}\right)\cdot\cdot\left(\frac{q'}{p}\right)\left(\frac{q'}{p'}\right)\left(\frac{q'}{p''}\right)\ldots,$$

the symbols on the right hand being Legendre's symbols. If P and Q are not prime to each other, then for some pair of factors p and q we have $p=\pm q$, and the corresponding Legendrian symbol $\left(\frac{q}{p}\right)$ is $=0$, whence in this case $\left(\frac{Q}{P}\right)=0$.

It is important to remark that $\left(\frac{Q}{P}\right)=+1$ is not a sufficient condition in order that Q may be a residue of P; if $P=2^\alpha pp'p''$.., p, p', p'',.. being positive odd primes, then, in order that Q may be a residue of P, it must be a residue of each of the prime factors p, p', p'',.., that is, we must have $\left(\frac{Q}{p}\right)=+1$, $\left(\frac{Q}{p'}\right)=+1$, $\left(\frac{Q}{p''}\right)=+1$, ... as many equations as there are unequal factors p, p', p'',.. of the modulus P.

Ordinary Theory, Second Part,—Theory of Forms.

26. Binary quadratic (or quadric) forms—transformation and equivalence. We consider a form

$$ax^2+2bxy+cy^2, =(a, b, c)(x, y)^2,$$

or when, as usual, only the coefficients are attended to, $=(a, b, c)$. The coefficients (a, b, c) and the variables (x, y) are taken to be positive or negative integers, not excluding zero. The discriminant $ac-b^2$ taken negatively, that is, b^2-ac, is said to be the determinant of the form, and we thus distinguish between forms of a positive and of a negative determinant.

Considering new variables, $\alpha x+\beta y$, $\gamma x+\delta y$, where α, β, γ, δ, are positive or negative integers, not excluding zero, we have identically

$$(a, b, c)(\alpha x+\beta y, \gamma x+\delta y)^2=(a', b', c')(x, y)^2,$$

where
$$\begin{aligned} a'&=(a, b, c)(\alpha, \gamma)^2, &&=a\alpha^2+2b\alpha\gamma+c\gamma^2,\\ b'&=(a, b, c)(\alpha, \gamma)(\beta, \delta), &&=a\alpha\beta+b(\alpha\delta+\beta\gamma)+c\gamma\delta,\\ c'&=(a, b, c)(\beta, \delta)^2, &&=a\beta^2+2b\beta\delta+c\delta^2;\end{aligned}$$

and thence
$$b'^2-a'c'=(\alpha\delta-\beta\gamma)^2(b^2-ac).$$

The form (a', b', c') is in this case said to be contained in the form (a, b, c); and a condition for this is obviously that the determinant D' of the contained form shall be equal to the determinant D of the containing form multiplied by a square number; in particular, the determinants must be of the same sign. If the determinants are equal, then $(\alpha\delta-\beta\gamma)^2=1$, that is, $\alpha\delta-\beta\gamma=\pm1$. Assuming in this case that the transformation exists, and writing $\alpha\delta-\beta\gamma=\epsilon$, and writing also

$$x' = \alpha x + \beta y,\quad y' = \gamma x + \delta y \quad \text{then conversely} \quad x = \frac{1}{\epsilon}(\delta x' - \beta y'), = \alpha' x' + \beta' y',\quad y = \frac{1}{\epsilon}(-\gamma x' + \alpha y'), = \gamma' x' + \delta' y', \quad \text{suppose,}$$

where $\alpha', \beta', \gamma', \delta'$ are integers; and we have, moreover,

$$\alpha'\delta' - \beta'\gamma' = \frac{1}{\epsilon^2}(\alpha\delta - \beta\gamma), = \frac{1}{\epsilon}, = \epsilon,$$

that is, $\alpha'\delta' - \beta'\gamma' = +1$ or -1 according as $\alpha\delta - \beta\gamma$ is $= +1$ or -1. The two forms (a, b, c), (a', b', c') are in this case said to be equivalent, and to be, in regard to the particular transformation, equivalent properly or improperly according as $\alpha\delta - \beta\gamma (= \alpha'\delta' - \beta'\gamma')$ is $= +1$ or $= -1$. We have, therefore, as a condition for the equivalence of two forms, that their determinants shall be equal; but this is not a sufficient condition. It is to be remarked also that two forms of the same determinant may be equivalent properly and also improperly; there may exist a transformation for which $\alpha\delta - \beta\gamma$ is $= +1$, and also a transformation for which $\alpha\delta - \beta\gamma$ is $= -1$. But this is only the case when each of the forms is improperly equivalent to itself; for instance, a form $x^2 - Dy^2$, which remains unaltered by the change x, y, into $x, -y$ (that is, $\alpha, \beta, \gamma, \delta = 1, 0, 0, -1$, and therefore $\alpha\delta - \beta\gamma = -1$), is a form improperly equivalent to itself. A form improperly equivalent to itself is said to be an ambiguous form. In what follows, equivalent means always properly equivalent.

27. Forms for a given determinant—classes, &c. In the case where $D, = b^2 - ac$, is a square the form $(a, b, c)(x, y)^2$ is a product of two rational factors; this case may be excluded from consideration, and we thus assume that the determinant D is either negative, or, being positive, that it is not a square. The forms (a, b, c) of a given positive or negative determinant are each of them equivalent to some one out of a finite number of non-equivalent forms which may be considered as representing so many distinct classes. For instance, every form of the determinant -1 is equivalent to $(1, 0, 1)$, that is, given any form (a, b, c) for which $b^2 - ac = -1$, it is possible to find integer values $\alpha, \beta, \gamma, \delta$, such that $\alpha\delta - \beta\gamma = +1$, and $(a, b, c)(\alpha x + \beta y, \gamma x + \delta y)^2 = (1, 0, 1)(x, y)^2$, that is, $= x^2 + y^2$. Or, to take a less simple example, every form of the determinant -35 is equivalent to one of the following forms: $(1, 0, 35)$, $(5, 0, 7)$, $(3, \pm 1, 12)$, $(4, \pm 1, 18)$,—$(2, 1, 8)$, $(6, 1, 6)$; for the first six forms the numbers a, $2b$, c have no common factor, and these are said to be *properly primitive* forms, or to belong to the properly primitive order; for the last two forms the numbers a, b, c have no common factor, but, a and c being each even, the numbers a, $2b$, c have a common factor 2, and these are said to be *improperly primitive* forms, or to belong to the improperly primitive order. The properly primitive forms are thus the six forms $(1, 0, 35)$, $(5, 0, 7)$, $(3, \pm 1, 12)$, $(4, \pm 1, 18)$; or we may say that there are represented hereby six properly primitive classes. Derived forms, or forms which belong to a derived order, present themselves in the case of a determinant D having a square factor or factors, and it is not necessary to consider them here.

It is not proposed to give here the rules for the determination of the system of non-equivalent forms; it will be enough to state that this depends on the determination in the first instance of a system of *reduced* forms, that is, forms for which the coefficients a, b, c, taken positively satisfy certain numerical inequalities admitting only of a finite number of solutions. In the case of a negative determinant the reduced forms are no two of them equivalent, and we thus have the required system of non-equivalent forms; in the case of a positive determinant, the reduced forms group themselves together in *periods* in such wise that the forms belonging to a period are equivalent to each other, and the required system of non-equivalent forms is obtained by selecting one form out of each such period. The principal difference in the theory of the two cases of a positive and a negative determinant consists in these periods; the system of non-equivalent forms once arrived at, the two theories are nearly identical.

28. Characters of a form or class—division into genera. Attending only to the properly primitive forms—for instance, those mentioned above for the determinant -35—the form $(1, 0, 35)$ represents only numbers f which are residues of 5, and also residues of 7; we have, in fact, $f = x^2 + 35y^2, \equiv x^2$ (mod. 5), and also $\equiv x^2$ (mod. 7). Using the Legendrian symbols $\left(\frac{f}{5}\right)$ and $\left(\frac{f}{7}\right)$, we say that the form $(1, 0, 35)$ has the characters $\left(\frac{f}{5}\right), \left(\frac{f}{7}\right) = + +$. Each of the other forms has in like manner a determinate character $+$ or $-$ in regard to $\left(\frac{f}{5}\right)$ and also in regard to $\left(\frac{f}{7}\right)$; and it is found that for each of them the characters are $+ +$ or else $- -$ (that is, they are never $+ -$ or $- +$). We, in fact, have

	$\left(\frac{f}{5}\right)$	$\left(\frac{f}{7}\right)$
$(1, 0, 35)$ $(4, \pm 1, 9)$	$+$	$+$
$(5, 0, 7)$ $(3, \pm 1, 12)$	$-$	$-$

and we thus arrange the six forms into genera, viz., we have three forms belonging to the genus $\left(\frac{f}{5}\right), \left(\frac{f}{7}\right) = + +$, and three to the genus $\left(\frac{f}{5}\right), \left(\frac{f}{7}\right) = - -$, these characters $+ +$ and $- -$ of genera being one-half of all the combinations $+ +, - -, + -, - +$.

The like theory applies to any other negative or positive determinant; the several characters have reference in some cases not only to the odd prime factors of D but also to the numbers 4 and 8, that is, there is occasion to consider also the Legendrian symbols $\left(\frac{-1}{f}\right), = (-1)^{\frac{1}{2}(f-1)}$, and $\left(\frac{2}{f}\right), = (-1)^{\frac{1}{8}(f^2-1)}$, and there are various cases to be considered according to the form of D in regard to its simple and squared factors respectively; but in every case there are certain combinations of characters (in number one-half of all the combinations) which correspond to genera, and the properly primitive forms belong to different genera accordingly, the number of forms being the same in each genus.

The form $(1, 0, -D)$ has the characters all $+$, and this is said to be the principal form, and the genus containing it the principal genus. For a given determinant, the characters of two genera may be compounded together according to the ordinary rule of signs, giving the characters of a new genus; in particular, if the characters of a genus are compounded with themselves, then we have the characters of the principal genus.

29. Composition of quadratic forms. Considering X, Y, as given lineo-linear functions of (x, y), (x', y'), defined by the equations

$$X = p_0 xx' + p_1 xy' + p_2 yx' + p_3 yy',$$
$$Y = q_0 xx' + q_1 xy' + q_2 yx' + q_3 yy',$$

the coefficients $p_0, p_1, p_2, p_3, q_0, q_1, q_2, q_3$, may be so connected with the coefficients (A, B, C), (a, b, c), (a', b', c'), of three quadratic forms as to give rise to the identity

$$(A, B, C)(X, Y)^2 = (a, b, c)(x, y)^2 \,.\, (a', b', c')(x', y')^2;$$

and, this being so, the form (A, B, C) is said to be compounded of the two forms (a, b, c) and (a', b', c'), the order of composition being indifferent.

The necessary and sufficient condition in order that it may be possible to compound together two given forms (a, b, c), (a', b', c'), is that their determinants shall be to each other in the proportion of two square numbers; in particular, the two forms may have the same determinant D; and when this is so the compound form (A, B, C) will also have the same determinant D. The rules for this composition of two forms of the same determinant have been (as part of the general theory) investigated and established. The forms compounded of equivalent forms are equivalent to each other; we thus in effect compound *classes*, viz., considering any two classes, the composition of their representative forms gives a form which is the representative of a new class, and the composition of any two forms belonging to the two classes respectively gives a form belonging to the new class. But, this once understood, it is more simple to speak of the composition of forms, that is, of the *forms* belonging to the finite system of representative forms for a given determinant; and it will be enough to consider the properly primitive forms.

30. The principal form $(1, 0, D)$ compounded with any other form (a, b, c) gives rise to this same form (a, b, c): the principal form is on this account denoted by 1, viz., denoting the other form by ϕ, and expressing composition in like manner with multiplication, we have $1 . \phi = \phi$. The form ϕ may be compounded with itself, giving a form denoted by ϕ^2; compounding this again with ϕ, we have a form denoted by ϕ^3; and so on. Since the whole number of forms is finite we must in this manner arrive at the principal form, say we have $\phi^n = 1$, n being the least exponent for which this equation is satisfied. In particular, if the form ϕ belong to the principal genus, then the forms $\phi^2, \phi^3, \ldots \phi^{n-1}$ will all belong to the principal genus, or the principal genus will include the forms $1, \phi, \phi^2, \ldots \phi^{n-1}$, the powers of a form ϕ having the exponent n.

31. Regular and irregular determinants. The principal genus may consist of such a series of forms, and the determinant is then said to be *regular*; in particular, for a negative determinant $D, = -1$ to -1000, the determinant is always regular except in the thirteen cases $-D = 243, 307, 339, 459, 576, 580, 675, 755, 820, 884, 891, 900, 974$ (and, Perott, in Crelle, vol. xcv., 1883, except also for $-D = 468, 931$); the determinant is here said to be irregular. Thus for each of the values $-D = 576, 580, 820, 900$, the principal genus consists of four forms, not $1, \phi, \phi^2, \phi^3$, where $\phi^4 = 1$, but $1, \phi, \phi_1, \phi\phi_1$, where $\phi^2 = 1$, $\phi_1{}^2 = 1$, and therefore also $(\phi\phi_1)^2 = 1$.

Compounding together any two forms, we have a form with the characters compounded of the characters of the two forms; and in particular, combining a form with itself, we have a form with the characters of the principal form. Or, what is the same thing, any two genera compounded together give rise to a determinate genus, viz., the genus having the characters compounded of the characters of the two genera; and any genus compounded with itself gives rise to the principal genus.

Considering any regular determinant, suppose that there is more than one genus, and that the number of forms in each genus is $= n$; then, except in the case $n = 2$, it can be shown that there are always forms having the exponent $2n$. For instance, in the case $D = -35$ we have two genera each of three forms; there will be a form g having the exponent 6,—$g^6 = 1$; and the forms are $1, g, g^2, g^3, g^4, g^5$, where $1, g^2, g^4$, belong to the principal genus, and g, g^3, g^5, to the other genus. The characters refer to $\left(\frac{f}{5}\right)$, $\left(\frac{f}{7}\right)$, and the forms are

$$\begin{array}{lll|lll} +\,+, & (1,\ 0,\ 35) & 1 & -\,-, & (3, -1, 12) & g \\ & (4,\ 1,\ 9) & g^2 & & (5,\ 0,\ 7) & g^3 \\ & (4, -1,\ 9) & g^4 & & (3,\ 1, 12) & g^5. \end{array}$$

An instance of the case $n = 1$ is $D = -21$, there are here four genera each of a single form $1, c, c_1, cc_1$, where $c^2 = 1$, $c_1{}^2 = 1$; an instance of the case $n = 2$ is $D = -88$, there are here two genera each of two forms $1, c$, and c_1, cc_1, where $c^2 = 1$, $c_1{}^2 = 1$, thus there is here no form having the exponent $2n$. (See Cayley, *Tables, &c.*, in Crelle, vol. lx., 1862, pp. 357-372.) We may have 2^{k+1} genera each of n forms, viz., such a system may be represented by $(1, \phi^2, \ldots \phi^{2n-2}; \phi, \phi^3, \ldots \phi^{2n-1})(1, c)(1, c_1) \ldots (1, c_{k-1})$, where $\phi^{2n} = 1$, $c^2 = 1$, $c_1{}^2 = 1, \ldots c_{k-1}^2 = 1$; there is no peculiarity in the form ϕ, we may instead of it take any form such as $c\phi$, $cc_1\phi$, &c., for each of these is like ϕ, a form belonging to the exponent $2n$, and such that the even powers give the principal genus.

32. Ternary and higher quadratic forms—cubic forms, &c. The theory of the ternary quadratic forms

$$(a, b, c, a', b', c')(x, y, z)^2, = ax^2 + by^2 + cz^2 + 2a'yz + 2b'zx + 2c'xy,$$

or when only the coefficients are attended to $\begin{pmatrix} a, & b, & c \\ a', & b', & c' \end{pmatrix}$, has been studied in a very complete manner; and those of the quaternary and higher quadratic forms have also been studied; in particular the forms $x^2 + y^2 + z^2$, $x^2 + y^2 + z^2 + w^2$ composed of three or four squares; and the like forms with five, six, seven, and eight squares. The binary cubic forms $(a, b, c, d)(x, y)^3, = ax^3 + 3bx^2y + 3cxy^2 + dy^3$, or when only the coefficients are attended to (a, b, c, d), have also been considered, though the higher binary forms have been scarcely considered at all. The special ternary cubic forms $ax^3 + by^3 + cz^3 + 6lxyz$ have been considered. Special forms of the degree n with n variables, the products of linear factors, present themselves in the theory of the division of the circle (the Kreistheilung) and of the complex numbers connected therewith; but it can hardly be said that these have been studied as a part of the general theory of forms.

Complex Theories.

33. The complex theory which first presented itself is that of the numbers $a + bi$ composed with the imaginary $i, = \sqrt{-1}$; here if a and b are ordinary, or say simplex positive or negative integers, including zero, we regard $a + bi$ as an integer number, or say simply as a number in this complex theory. We have here a zero 0 $(a = 0, b = 0)$ and the units $1, i, -1, -i$, or as these may be written $1, i, i^2, i^3$ $(i^4 = 1)$; the numbers $a + bi$, $a - bi$, are said to be conjugate numbers, and their product $(a + bi)(a - bi), = a^2 + b^2$, is the norm of each of them. And so the norm of the real number a is $= a^2$, and that of the pure imaginary number bi is $= b^2$. Denoting the norm by the letter N, $N(a \pm bi) = a^2 + b^2$.

Any simplex prime number, $\equiv 1$ (mod. 4), is the sum of two squares $a^2 + b^2$, for instance $13 = 9 + 4$, and it is thus a product $(a + bi)(a - bi)$, that is, it is not a prime number in the present theory, but each of these factors (or say any number $a + bi$, where $a^2 + b^2$ is a prime number in the simplex theory) is a prime; and any simplex prime number, $\equiv 3$ (mod. 4), is also a prime in the present theory. The number $2, = (1 + i)(1 - i)$, is not a prime, but the factors $1 + i$, $1 - i$ are each of them prime; these last differ only by a unit factor i—$1 + i = i(1 - i)$—so that $2, = -i(1 + i)^2$, contains a square factor.

In the simplex theory we have numbers, for instance $5, -5$, differing from each other only by a unit factor, but we can out of these select one, say the positive number, and attend by preference to this number of the pair. It is in this way—viz., by restricting $a, b, c, \ldots$ to denote terms of the series $2, 3, 5, 7, \ldots$ of positive primes other than unity—that we are enabled to make the definite statement, a positive number N is, and that in one way only, $= a^\alpha b^\beta c^\gamma \ldots$; if N be a positive or negative number, then the theorem of course is, N is, and that in one way only, $= (-1)^m a^\alpha b^\beta c^\gamma \ldots$

where $m=0$, or 1, and $a, b, c, \ldots \alpha, \beta, \gamma, .$ are as before. To obtain a like definite statement in the present theory we require to distinguish between the four numbers $a+bi, -a-bi, -b+ai, b-ai$, which differ from each other only by a unit factor $-1, \pm i$. Consider a number $a+bi$ where a and b are the one of them odd and the other even (a and b may be either of them $=0$, the other is then odd), every prime number $a+bi$ other than $\pm 1 \pm i$ is necessarily of this form, for if a and b were both even the number would be divisible by 2, or say by $(1+i)^2$, and if a and b were both odd it would be divisible by $1+i$; then of the four associated numbers $a+bi, -a-bi, -b+ai, b-ai$, there is one and only one, $a+bi$, such that b is even and $a+b-1$ is evenly even; or say one and only one which is $\equiv 1$ (mod. $2(1+i)$). We distinguish such one of the four numbers from the other three and call it a *primary* number; the units $\pm 1, \pm i$, and the numbers $\pm 1 \pm i$ are none of them primary numbers. We have then the theorem, a number N is in one way only $=i^m(1+i)^n A^\alpha B^\beta \ldots$, where $m=0, 1, 2$, or 3, n is $=0$ or a positive integer, $A, B, \ldots$ are primary primes, $\alpha, \beta, \ldots$ positive integers. Here i is a unit of the theory, $1+i$ is a special prime having reference to the number 2, but which might, by an extension of the definition, be called a primary prime, and so reckoned as one of the numbers $A, B, \ldots$; the theorem stated broadly still is that the number N is, and that in one way only, a product of prime factors, but the foregoing complete statement shows the precise sense in which this theorem must be understood. A like explanation is required in other complex theories; we have to select out of each set of primes differing only by unit factors some one number as a primary prime, and the general theorem then is that every number N is, and that in one way only, $=P \,.\, A^\alpha B^\beta C^\gamma \ldots$, where P is a product of unities, and $A, B, C, \ldots$ are primary primes.

34. We have in the simplex theory (*ante*, No. 10) the theorem that, p being an odd prime, there exists a system of $p-1$ residues, that is, that any number not divisible by p is, to the modulus p, congruent to one, and only one, of the $p-1$ *numbers* $1, 2, 3, \ldots p-1$. The analogous theorem in the complex theory is that for any prime number p other than $\pm 1 \pm i$ there exists a system of $N(p)-1$ residues, that is, that every number not divisible by p is, to the modulus p, congruent to one of these $N(p)-1$ numbers.

But p may be a real prime such as 3, or a complex prime such as $3+2i$; and the system of residues presents itself naturally under very different forms in the two cases respectively. Thus in the case $p=3$, $N(3)=9$, the residues may be taken to be

$$\begin{array}{ccc} & 1\;, & 2\;, \\ i, & 1+i\;, & 2+i\;, \\ 2i, & 1+2i, & 2+2i, \end{array}$$

being in number $N(3)-1=8$. And for $p=3+2i$, $N(3+2i)=13$, they may be taken to be the system of residues of 13 in the simplex theory, viz., the real numbers $1, 2, 3, \ldots\ldots 12$. We have in fact $5+i=(2+3i)(1-i)$, that is, $5+i \equiv 0$ (mod. $2+3i$), and consequently $a+bi \equiv a-5b$, a real number which, when $a+bi$ is not divisible by $3+2i$, may have any one of the foregoing values $1, 2, 3, \ldots 12$.

Taking then any number x not divisible by p, the $N(p)-1$ residues each multiplied by x are, to the modulus p, congruent to the series of residues in a different order; and we thus have,—say this is *Fermat's theorem* for the complex theory—$x^{N(p)-1}-1 \equiv 0$ (mod. p), with all its consequences, in particular the theory of prime roots.

In the case of a complex modulus such as $3+2i$, the theory is hardly to be distinguished from its analogue in the ordinary theorem; a prime root is $=2$, and the series of powers is 2, 4, 8, 3, 6, 12, 11, 9, 5, 10, 7, 1, for the modulus $3+2i$ as for the modulus 13. But for a real prime such as 3 the prime root is a complex number; taking it to be $=2+i$, we have $(2+i)^8-1 \equiv 0$ (mod. 3), and the series of powers in fact is $2+i, i, 2+2i, 2, 1+2i, 2i, 1+i, 1$, viz., we thus have the system of residues (mod. 3).

We have in like manner a theory of quadratic residues; a Legendrian symbol $\left[\dfrac{p}{q}\right]$ (which, if p, q, are uneven primes not necessarily primary but subject to the condition that their imaginary parts are even, denotes $+1$ or -1 according as $p^{\frac{1}{4}(Nq-1)}$ is $\equiv 1$ or $\equiv -1$ (mod. q), so that $\left[\dfrac{p}{q}\right]=+1$ or -1 according as p is or is not a residue of q), a law of reciprocity expressed by the very simple form of equation $\left[\dfrac{p}{q}\right]=\left[\dfrac{q}{p}\right]$, and generally a system of properties such as that which exists in the simplex theory.

The theory of quadratic forms (a, b, c) has been studied in this complex theory; the results correspond to those of the simplex theory.

35. The complex theory with the imaginary cube root of unity has also been studied; the imaginary element is here $\gamma, =\frac{1}{2}(-1+\sqrt{-3})$, a root of the equation $\gamma^2+\gamma+1=0$; the form of the complex number is thus $a+b\gamma$, where a and b are any positive or negative integers, including zero. The conjugate number is $a+b\gamma^2, =a-b-b\gamma$, and the product $(a+b\gamma)(a+b\gamma^2), =a^2-ab+b^2$, is the norm of each of the factors $a+b\gamma, a+b\gamma^2$. The whole theory corresponds very closely to, but is somewhat more simple than, that of the complex numbers $a+bi$.

36. The last-mentioned theory is a particular case of the complex theory for the imaginary λth roots of unity, λ being an odd prime. Here α is determined by the equation $\dfrac{\alpha^\lambda-1}{\alpha-1}=0$, that is, $\alpha^{\lambda-1}+\alpha^{\lambda-2}+\ldots+\alpha+1=0$, and the form of the complex number is $f(\alpha), =a+b\alpha+c\alpha^2\ldots+k\alpha^{\lambda-2}$, where $a, b, c, \ldots k$, are any positive or negative integers, including zero. We have $\lambda-1$ conjugate forms, viz., $f(\alpha), f(\alpha^2), \ldots f(\alpha^{\lambda-1})$, and the product of these is the norm of each of the factors $Nf(\alpha), =Nf(\alpha^2), \ldots =Nf(\alpha^{\lambda-1})$. Taking g any prime root of λ, $g^{\lambda-1}-1 \equiv 0$ (mod. λ), the roots $\alpha, \alpha^2, \ldots \alpha^{\lambda-1}$, may be arranged in the order $\alpha, \alpha^g, \alpha^{g^2}, \ldots \alpha^{g^{\lambda-2}}$; and we have thence a grouping of the roots in periods, viz., if $\lambda-1$ be in any manner whatever expressed as a product of two factors, $\lambda-1=ef$, we may with the $\lambda-1$ roots form e periods $\eta_0, \eta_1, \ldots \eta_{e-1}$, each of f roots. For instance $\lambda=13$; a prime root is $g=2$, and $\lambda-1=ef=3.4$; then the three periods each of four roots are

$$\begin{aligned} \eta_0 &= \alpha\ \ +\alpha^8+\alpha^{12}+\alpha^5, \\ \eta_1 &= \alpha^2+\alpha^3+\alpha^{11}+\alpha^{10}, \\ \eta_2 &= \alpha^4+\alpha^6+\alpha^9\ +\alpha^7. \end{aligned}$$

So also if $ef=2.6$ then the 2 periods each of 6 roots are

$$\begin{aligned} \eta_0 &= \alpha\ \ +\alpha^4+\alpha^3+\alpha^{12}+\alpha^9+\alpha^{10}, \\ \eta_1 &= \alpha^2+\alpha^8+\alpha^6+\alpha^{11}+\alpha^5+\alpha^7; \end{aligned}$$

and so in other cases. In particular, if $f=1$ and consequently $e=\lambda-1$, the e periods each of f roots are in fact the single roots $\alpha, \alpha^g, \ldots \alpha^{g^{\lambda-2}}$. We may in place of the original form of the complex number

$$f(\alpha)=a+b\alpha+c\alpha^2\ldots+k\alpha^{\lambda-2},$$

consider the new form $f(\eta)=a\eta+b\eta_1\ldots+l\eta_{e-1}$, which when $f=1$ is equivalent to the original form, but in any other case denotes a special form of complex number; instead of $\lambda-1$ we have only e conjugate numbers, and the product of these e numbers may be regarded as the norm of $f(\eta)$.

37. The theory for the roots α includes as part of itself the theory for the periods corresponding to every decomposition whatever $\lambda-1=ef$ of $\lambda-1$ into two factors, but

each of these may be treated apart from the others as a theory complete in itself. In particular, a simple case is that of the half-periods $e=2, f=\frac{1}{2}(\lambda-1)$: and, inasmuch as the characteristic phenomenon of ideal numbers presents itself in this theory of the half-periods (first for the value $\lambda=23$), it will be sufficient, by way of illustration of the general theory, to consider *only* this more special and far easier theory: we may even assume $\lambda=23$.[1]

For the case in question, $\lambda-1=ef=2.\frac{1}{2}(\lambda-1)$, we have the two periods η_0, η_1, each of $\frac{1}{2}(\lambda-1)$ roots; from the expressions for η_0, η_1, in terms of the roots we obtain at once $\eta_0+\eta_1=-1$, and with a little more difficulty $\eta_0\eta_1=-\frac{1}{4}(\lambda-1)$ or $\frac{1}{4}(\lambda+1)$ according as λ is $\equiv 1$ or 3 (mod. 4), that is, in the two cases respectively η_0, η_1, are the roots of the equation $\eta^2+\eta-\frac{1}{4}(\lambda-1)=0$, and $\eta^2+\eta+\frac{1}{4}(\lambda+1)=0$. And this equation once obtained there is no longer any occasion to consider the original equation of the order $\lambda-1$, but the theory is that of the complex numbers $a\eta_0+b\eta_1$, or if we please $a+b\eta$, composed with the roots of this quadric equation,—say the complex numbers $a+b\eta$, where a and b are any positive or negative integer numbers, including zero. In the case $\lambda=23$ the quadric equation is $\eta^2+\eta+6=0$. We have $N(a+b\eta)=(a-b\eta_0)(a+b\eta_1)=a^2-ab+\frac{1}{4}(\lambda+1)b^2$; and for $\lambda=23$ this is $N(a+b\eta)=a^2-ab+6b^2$. It may be remarked that there is a connexion with the theory of the quadratic forms of the determinant -23, viz., there are here the three improperly primitive forms (2, 1, 12), (4, 1, 6), (4, −1, 6), 23 being the smallest prime number for which there exists more than one improperly primitive form.

38. Considering then the case $\lambda=23$, we have η_0, η_1, the roots of the equation $\eta^2+\eta+6=0$; and a real number P is composite when it is $=(a+b\eta_0)(a+b\eta_1), =a^2-ab+6b^2$, viz., if $4P=(2a-b)^2+23b^2$. Hence no number, and in particular no positive real prime P, can be composite unless it is a (quadratic) residue of 23: the residues of 23 are 1, 2, 3, 4, 6, 8, 9, 12, 13, 16, 18; and we have thus, for instance, 5, 7, 11, as numbers which are *not* composite, while 2, 3, 13, are numbers which are not by the condition precluded from being composite: they are not, according to the foregoing signification of the word, composite (for 8, 12, 52, are none of them of the form x^2+23y^2), but *some* such numbers, residues that is of 23, are composite, for instance $59, =(5-2\eta_0)(5-2\eta_1)$. And we have an indication, so to speak, of the composite nature of *all* such numbers; take for instance 13, we have $(\eta-4)(\eta+5)=-2.13$, where 13 does not divide either $\eta-4$ or $\eta+5$, and we are led to conceive it as the product of two ideal factors, one of them dividing $\eta-4$, the other dividing $\eta+5$. It appears, moreover, that a power 13^3 is in fact composite, viz., we have

$$13^3=(31-12\eta_0)(31-12\eta_1), \quad (2197=961+372+864);$$

and writing $13=\sqrt[3]{31-12\eta_0}\,.\,\sqrt[3]{31-12\eta_1}$ we have 13 as the product of two ideal numbers each represented as a cube root; it is to be observed that, 13 being in the simplex theory a prime number, these are regarded as prime ideal numbers. We have in like manner

$$2=\sqrt[3]{1-\eta_0}\,.\,\sqrt[3]{1-\eta_1},\ 3=\sqrt[3]{1-2\eta_0}\,.\,\sqrt[3]{1-2\eta_1}\ \&c.;$$

every positive real prime which is a residue of 23 is thus a product of two factors ideal or actual. And, reverting to the equation $(\eta-4)(\eta+5)=-2.13$, or as this may be written

$$(\eta_1-4)(\eta_1+5)=-\sqrt[3]{1-\eta_0}\ \sqrt[3]{1-\eta_1}\ \sqrt[3]{31-12\eta_0}\ \sqrt[3]{31-12\eta_1},$$

we have $(\eta_1-4)^3$ and $(1-\eta_0)(31-12\eta_0)$ each $=14+55\eta_1$, or say

$$\eta_1-4=\sqrt[3]{1-\eta_0}\ \sqrt[3]{31-12\eta_0},$$

and similarly

$$\eta_1+5=-\sqrt[3]{1-\eta_1}\ \sqrt[3]{31-12\eta_1},$$

so that we verify that η_1-4, η_1+5, do thus in fact each of them contain an ideal factor of 13.

39. We have $2=\sqrt[3]{1-\eta_0}\,\sqrt[3]{1-\eta_1}$, viz., the ideal multiplier $\sqrt[3]{1-\eta_0}$ renders actual one of the ideal factors $\sqrt[3]{1-\eta_1}$ of 2, and it is found that this same ideal multiplier $\sqrt[3]{1-\eta_0}$ renders actual one of the two ideal factors of any other decomposable number 3, 13, &c.,

$$\sqrt[3]{1-2\eta_0}\ \sqrt[3]{1-\eta_0}=1+\eta_0,\quad \sqrt[3]{31-12\eta_0}\ \sqrt[3]{1-\eta_0}=-5-\eta_0,\ \&c.$$

Similarly the conjugate multiplier $\sqrt[3]{1-\eta_1}$ renders actual the other ideal factor of any number 2, 3, 13, &c. We have thus two classes, or, reckoning also actual numbers, three classes of prime numbers, viz., (1) ideal primes rendered actual by the multiplier $\sqrt[3]{1-\eta_0}$, (2) ideal primes rendered actual by the multiplier $\sqrt[3]{1-\eta_1}$, (3) actual primes. This is a general property in the several complex theories; there is always a finite number of classes of ideal numbers, distinguished according to the multipliers by which they are rendered actual; the actual numbers form a "principal" class.

40. General theory of congruences—irreducible functions. In the complex theory relating to the roots of the equation $\eta^2+\eta+6=0$ there has just been occasion to consider the equation $(\eta-4)(\eta+5)=-2.13$, or say the congruence $(\eta-4)(\eta+5)\equiv 0$ (mod. 13); in this form the relation $\eta^2+\eta+6=0$ is presupposed, but if, dropping this equation, η be regarded as arbitrary, then there is the congruence $\eta^2+\eta+6\equiv(\eta-4)(\eta+5)$ (mod. 13). For a different modulus, for instance 11, there is not any such congruence exhibiting a decomposition of $\eta^2+\eta+6$ into factors. The function $\eta^2+\eta+6$ is irreducible, that is, it is not a product of factors with integer coefficients; in respect of the modulus 13 it becomes reducible, that is, it breaks up into factors having integer coefficients, while for the modulus 11 it continues irreducible. And there is a like general theory in regard to any rational and integral function $F(x)$ with integer coefficients; such function, assumed to be irreducible, may for a given prime modulus p continue irreducible, that is, it may not admit of any decomposition into factors with integer coefficients; or it may become reducible, that is, admit of a decomposition $F(x)\equiv\phi(x)\psi(x)\chi(x)\ldots$ (mod. p). And, when this is so, it is thus a product, in one way only, of factors $\phi(x)$, $\psi(x)$, $\chi(x)$, .., which are each of them irreducible in regard to the same modulus p; any such factor may be a linear function of x, and as such irreducible; or it may be an irreducible function of the second or any higher degree. It is hardly necessary to remark that in this theory functions which are congruent to the modulus p are regarded as identical, and that in the expression of $F(x)$ an irreducible function $\phi(x)$ may present itself either as a simple factor, or as a multiple factor, with any exponent. The decomposition is analogous to that of a number into its prime factors; and the whole theory of the rational and integral function $F(x)$ in regard to the modulus p is in many respects analogous to that of a prime number regarded as a modulus. The theory has also been studied where the modulus is a power p^ν.

[1] In the theory of the roots α, ideal numbers do not present themselves for the values $\lambda=3$, 5, or 7; they do for the value $\lambda=23$. It is stated in Smith's "Report on the Theory of Numbers," *Brit. Assoc. Report* for 1860, p. 136, that "for the intermediate cases $\lambda=11$, 13, 17, and 19, it is uncertain whether they do or do not present themselves." The writer is not aware whether this question has been settled; but in Reuschle's *Tafeln*, 1875, no ideal factors present themselves for these values of λ; and it is easy to see that in the theory of the half-periods the ideal factors first present themselves for the value $\lambda=23$. It may be remarked that the solution of the question depends on the determination of a system of fundamental units for the values in question $\lambda=11$, 13, 17, and 19; the theory of the units in the several complex theories is an important and difficult part of the theory, not presenting itself in the theory of the half-periods, which is alone attended to in the text.

41. The congruence-imaginaries of Galois. If $F(x)$ be an irreducible function to a given prime modulus p, this implies that there is no integer value of x satisfying the congruence $F(x) \equiv 0$ (mod. p); we assume such a value and call it i, that is, we assume $F(i) \equiv 0$ (mod. p); the step is exactly analogous to that by which, starting from the notion of a real root, we introduce into algebra the ordinary imaginary $i = \sqrt{-1}$. For instance, $x^2 - x + 3$ is an irreducible function to the modulus 7, there is no integer solution of the congruence $x^2 - x + 3 \equiv 0$ (mod. 7). Assuming a solution i such that $i^2 - i + 3 \equiv 0$ (mod. 7), we have, always to this modulus, $i^2 = i - 3$, and thence i^3, i^4, &c., each of them equal to a linear function of i. We consider the numbers of the form $a + bi$, where a and b are ordinary integers which may be regarded as having each of them the values 0, 1, 2, 3, 4, 5, or 6; there are thus $7^2 = 49$, such numbers, or, excluding zero, 48 numbers; and it is easy to verify that these are in fact the numbers $i, i^2, \ldots i^{47}, i^{48}, = 1$, that is, we have i a prime root of the congruence $x^{48} - 1 \equiv 0$ (mod. 7). The irreducible function may be of the third or any higher degree; thus for the same modulus 7 there is the cubic function $x^3 - x + 2$, giving rise to a theory of the numbers of the form $a + bi + ci^2$, where i is a congruence-imaginary such that $i^3 - i + 2 \equiv 0$ (mod. 7); and instead of 7 the modulus may be any other odd prime p.

Ordinary Theory, Third Part.

42. In what precedes no mention has been made of the so-called Pellian equation $x^2 - Dy^2 = 1$ (where D is a given positive number), and of the allied equations $x^2 - Dy^2 = -1$, or $= \pm 4$. The equations with the sign + have always a series of solutions, those with the sign − only for certain values of D; in every case where the solutions exist a least solution is obtainable by a process depending on the expression of $\sqrt{D}$ as a continued fraction, and from this least solution the whole series of solutions can be obtained without difficulty. The equations are very interesting, as well for their own sakes as in connexion with the theory of the binary quadratic forms of a positive non-square determinant.

43. The theory of the expression of a number as a sum of squares or polygonal numbers has been developed apart from the general theory of the binary, ternary, and other quadratic forms to which it might be considered as belonging. The theorem for two squares, that every prime number of the form $4n + 1$ is, and that in one way only, a sum of two squares, is a fundamental theorem in relation to the complex numbers $a + bi$. A sum of two squares multiplied by a sum of two squares is always a sum of two squares, and hence it appears that every number of the form $2^a(4n + 1)$ is (in general in a variety of ways) a sum of two squares.

Every number of the form $4n + 2$ or $8n + 3$ is a sum of three squares; even in the case of a prime number $8n + 3$ there is in general more than one decomposition, thus $59 = 25 + 25 + 9$ and $= 49 + 9 + 1$. Since a sum of three squares into a sum of three squares is not a sum of three squares, it is not enough to prove the theorem in regard to the primes of the form $8n + 3$.

Every prime number is (in general in more than one way) a sum of four squares; and therefore every number is (in general in more than one way) a sum of four squares, for a sum of four squares into a sum of four squares is always a sum of four squares.

Every number is (in general in several ways) a sum of $m + 2$ $(m + 2)$gonal numbers, that is, of numbers of the form $\frac{1}{2}m(x^2 - x) + x$; and of these $m - 2$ may be at pleasure equal to 0 or 1; in particular, every number is a sum of three triangular numbers (a theorem of Fermat's).

The theorems in regard to three triangular numbers and to four square numbers are exhibited by certain remarkable identities in the Theory of Elliptic Functions; and generally there is in this subject a great mass of formulæ connected with the theory of the representation of numbers by quadratic forms. The various theorems in regard to the number of representations of a number as the sum of a definite number of squares cannot be here referred to.

44. The equation $x^\lambda + y^\lambda = z^\lambda$, where λ is any positive integer greater than 2, is not resoluble in whole numbers (a theorem of Fermat's). The general proof depends on the theory of the complex numbers composed of the λth roots of unity, and presents very great difficulty; in particular, distinctions arise according as the number λ does or does not divide certain of Bernoulli's numbers.

45. Lejeune-Dirichlet employs for the determination of the number of quadratic forms of a given positive or negative determinant a remarkable method depending on the summation of a series Σf^{-s}, where the index s is greater than but indefinitely near to unity.

46. Very remarkable formulæ have been given by Legendre, Tchebycheff, and Riemann for the approximate determination of the number of prime numbers less than a given large number x. Factor tables have been formed for the first nine million numbers, and the number of primes counted for successive intervals of 50,000; and these are found to agree very closely with the numbers calculated from the approximate formulæ. Legendre's expression is of the form $\frac{x}{\log x - A}$, where A is a constant not very different from unity; Tchebycheff's depends on the logarithm-integral li(x); and Riemann's, which is the most accurate, but is of a much more complicated form, contains a series of terms depending on the same integral.

The classical works on the Theory of Numbers are Legendre, *Théorie des Nombres*, 1st ed. 1798, 3d ed. 1830; Gauss, *Disquisitiones Arithmeticæ*, Brunswick, 1801 (reprinted in the collected works, vol. i., Gottingen, 1863; French trans., under the title *Recherches Arithmétiques*, by Poullet-Delisle, Paris, 1807); and Lejeune-Dirichlet, *Vorlesungen über Zahlentheorie*, 3d ed., with extensive and valuable additions by Dedekind, Brunswick, 1879-81. We have by the late Prof. H. J. S. Smith the extremely valuable series of "Reports on the Theory of Numbers," Parts I. to VI., *British Association Reports*, 1859-62, 1864-65, which, with his own original researches, will be printed in the collected works now in course of publication by the Clarendon Press. See also Cayley, "Report of the Mathematical Tables Committee," *Brit. Assoc. Report*, 1875, pp. 305-306, for list of tables relating to the Theory of Numbers, and Mr. J. W. L. Glaisher's introduction to the *Factor Table for the Sixth Million*, London, 1883, in regard to the approximate formulæ for the number of prime numbers. (A. CA.)

NUMENIUS, one of the so-called Neo-Pythagoreans, and a forerunner of the Neo-Platonists, was a native of Apamea in Syria, and flourished during the latter half of the second Christian century. He was a somewhat voluminous writer in philosophy and philosophical biography, but all that is known of his opinions is found in passing references by Clement of Alexandria, Origen, Eusebius, and one or two of the Neo-Platonists. He seems to have taken Pythagoras as his highest authority, and at the same time to have been unaware of any discrepancy between his own views and those of Plato, whom he further described as an "Atticizing Moses," and as deriving all his knowledge, like Pythagoras, from the East. He held a kind of trinity, the members of which he designated as πάππος, ἔκγονος, and ἀπόγονος respectively,—the first being the supreme deity, or pure νοῦς, the second the demiurge, and the third the world.

NUMERALS. The use of visible signs to represent numbers and aid reckoning is not only older than writing but older than the development of numerical language on the denary system; we count by tens because our ancestors counted on their fingers and named numbers accordingly. So used, the fingers are really numerals, that is, visible

numerical signs; and in antiquity the practice of counting by these natural signs prevailed in all classes of society. Even at this day if a Wallachian peasant wants to multiply 8 by 9 he effects this by making the fingers of each hand, counting from the thumb, represent the numbers from 6 to 10 consecutively. He therefore sets his question by stretching out the ring finger of the right hand and the middle finger of the left. He then counts that in the direction from the thumb there is one more finger on the right hand and two on the left. Multiplying 1 by 2 he gets 2 as the units of the product sought. Again the outstretched fingers are respectively the third and fourth from the thumb; adding 3 and 4 he gets 7 for the tens of the product. By this rule he does not need to know the multiplication table above 4 times 4. In the later times of antiquity the finger symbols were developed into a system capable of expressing all numbers below 10,000. The left hand was held up flat with the fingers together. The units from 1 to 9 were expressed by various positions of the third, fourth, and fifth fingers alone, one or more of these being either closed on the palm or simply bent at the middle joint, according to the number meant. The thumb and index were thus left free to express the tens by a variety of relative positions, *e.g.*, for 30 their points were brought together and stretched forward; for 50 the thumb was bent like the Greek Γ and brought against the ball of the index. The same set of signs if executed with the thumb and index of the right hand meant hundreds instead of tens, and the unit signs if performed on the right hand meant thousands.[1]

The fingers serve to express numbers, but to make a permanent note of numbers some kind of mark or tally is needed. Thus the Romans kept count of years by yearly driving a nail into the temple of Minerva. The nail in this case is a sort of hieroglyphic, and in all systems of hieroglyphics signs for numbers naturally occur. A single stroke is the obvious representation of unity; higher numbers are indicated by groups of strokes. But when the strokes become many they are confusing, and so a new sign must be introduced, perhaps for 5, at any rate for 10, 100, 1000, and so forth. Intermediate numbers are expressed by the addition of symbols, as in the Roman system ccxxxvi = 236. This simplest way of writing numbers is well seen in the Babylonian inscriptions, where all numbers from 1 to 99 are got by repetition of the vertical arrowhead 𒁹 = 1, and a barbed sign 𒌋 = 10. But the most interesting case is the Egyptian, because from its hieratic form sprang the Phœnician numerals, and from them in turn those of Palmyra and the Syrians, as illustrated in table 1. Two things are to be noted in this table—first, the way in which groups of units come to be joined by a cross line, and then run together into a single symbol, and, further, the substitution in the hundreds of a principle of multiplication for the mere addition of symbols. The same thing appears in Babylonia, where a smaller number put to the right of the sign for 100 (𒁹𒈨) is to be added to it, but put to the left gives the number of hundreds. Thus 𒌋𒁹𒈨 = 1000, but 𒁹𒈨𒌋 = 110. The Egyptians had hieroglyphics for a thousand, a myriad, 100,000 (a frog), a million (a man with arms stretched out in admiration), and even for ten millions.

Alphabetic writing did not do away with the use of numerical symbols, which were more perspicuous and compendious than words written at length. But the letters of the alphabet themselves came to be used as numerals. One way of doing this was to use the initial letter of the name of a number as its sign. This was the old Greek notation, said to go back to the time of Solon, and usually named after the grammarian Herodian, who described it about 200 A.D. I stood for 1, Π for 5, Δ for 10, H for 100, X for 1000, and M for 10,000; Π with Δ in its bosom was 50, with H in its bosom it was 500. Another way of using the alphabet depended on the fixed order of its letters. The simplest application of this principle is to use consecutive letters for consecutive numbers. Thus the 24 letters of the Ionic alphabet stood for the numbers 1 to 24, as we still see in the letters attached to the books of the *Iliad*. Another way common to the Greeks, Hebrews, and Syrians, and which in Greece gradually displaced the

Table 1.

Herodian numbers, was to make the first nine letters stand for the units and the rest for the tens and hundreds. With the old Semitic alphabet of 22 letters this system broke down at ת = 400, and the higher hundreds had to be got by juxtaposition; but when the Hebrew square character got the distinct final forms ך, ם, ן, ף, ץ these served for the hundreds from 500 to 900. The Greeks with their larger alphabet required but three supplemental signs, which they got by keeping for this purpose two old Phœnician letters which were not used in writing (Ϝ or ϛ = ו = 6, and Ϙ = ק = 90), and by adding sampi ϡ for 900.[2]

[1] The system is described by Nicolaus Rhabda of Smyrna (8th century A.D.), ap. N. Caussinus, *De eloquentia sacra et humana*, Paris, 1636. Bede gives essentially the same system, and it has survived in the East to the present day; see especially Rödiger, "Ueber die im Orient gebrauchliche Fingersprache, &c.," *D. M. G.*, 1845, and Palmer in *Journ. of Philology*, ii. 247 *sqq.*

[2] The Arabs, who quite changed the order of the alphabet and extended it to twenty-eight letters, kept the original values of the old letters (putting ص for ס and ش for ש), while the hundreds from 500 to 1000 were expressed by the new letters in order from ت to غ. In the time of Caliph Walíd (705-715 A.D.) the Arabs had as yet no signs of numeration.

Among the Greeks the first certain use of this system seems to be on coins of Ptolemy II. The first trace of it on Semitic ground is on Jewish coins of the Hasmoneans. It is the foundation of gematria as we find it in Jewish books and in the apocalyptic number of the beast (נרון קסר = 666). But we do not know how old gematria is; the name is borrowed from the Greek.

The most familiar case of the use of letters as numerals is the Roman system. Here C is the initial of centum and M of mille; but instead of these signs we find older forms, consisting of a circle divided vertically for 1000 and horizontally, Θ, or in the cognate Etruscan system divided into quadrants, ⊕, for 100. From the sign for 1000, still sometimes roughly shown in print as CIↃ, comes D, the half of the symbol for half the number; and the older forms of L, viz., ⊥ or ⊥, suggest that this also was once half of the hundred symbol. So V (Etruscan Λ) is half of X, which itself is not a true Roman letter. The system, therefore, is hardly alphabetic in origin, though the idea has been thrown out that the signs for 10, 50, and 100 were originally the Greek X, Ψ, Φ, which were not used in writing Latin.[1]

When high numbers had to be expressed systems such as we have described became very cumbrous, and in alphabetic systems it became inevitable to introduce a principle of periodicity, by which, for example, the signs for 1, 2, 3, &c., might be used with a difference to express the same number of thousands. Language itself suggested this principle, and so we find in Hebrew א̈ or in Greek ͵α = 1000. So further βMυ, βM., or simply β. = 20,000 (2 myriads). If now the larger were always written to the left of the smaller elements of a number the diacritic mark could be dispensed with in such a case as $\overline{\beta\omega\lambda\alpha}$ (instead of ͵βωλα) = 2831, for here it was plain that β = 2000, not = 2, since otherwise it would not have preceded ω = 800. We have here the germ of the very important notion that the value of a symbol may be periodic and defined by its position. The same idea had appeared much earlier among the Babylonians, who reckoned by powers of 60, calling 60 a *soss* and 60 sixties a *sar*. On the tablets of Senkerah a list of squares and cubes is given on this principle, and here the square of 59 is written 58·1—that is, $58 \times 60 + 1$; and the cube of 30 is 7·30—that is, 7 sar + 30 soss $= 7 \times 60^2 + 30 \times 60$. Here again we have value by position; but, as there is no zero, it is left to the judgment of the reader to know which power of 60 is meant in each case. The sexagesimal system, long specially associated with astronomy, has left a trace in our division of the hour and of the circle, but as language goes by powers of 10 it is practically very inconvenient for most purposes of reckoning. The Greek mathematicians used a sort of decimal system; thus Archimedes was able to solve his problem of stating a number greater than that of the grains of sand which would fill the sphere of the fixed stars by dividing numbers into octades, the unit of the second octade being 10^8 and of the third 10^{16}. So too Apollonius of Perga teaches multiplication by regarding 7 as the *pythmen* of 70, 700, and so forth. One must then find successively the product of the several pythmens of the multiplier and the multiplicand, noticing in each case what are tens, what hundreds, and so on, and adding the results. The want of a sign for zero made it impossible mechanically to distinguish the tens, hundreds, &c., as we now do.

Very early, however, a mechanical contrivance, the abacus, had been introduced for keeping numbers of different denominations apart. This was a table with compartments or columns for counters, each column representing a different value to be given to a counter placed on it. This might be used either for concrete arithmetic—say with columns for pence, shillings, and pounds; or for abstract reckoning—say with the Babylonian sexagesimal system. An old Greek abacus found at Salamis has columns which, taken from right to left, give a counter the value of 1, 10, 100, 1000 drachms, and finally of 1 talent (6000 drachms) respectively. An abacus on the decimal system might be ruled on paper or on a board strewed with fine sand, and was then a first step to the decimal system. Two important steps, however, were still lacking: the first was to use instead of counters distinctive marks (ciphers) for the digits from one to nine; the second and more important was to get a sign for zero, so that the columns might be dispensed with, and the denomination of each cipher seen at once by counting the number of digits following it. These two steps taken, we have at once the modern so-called Arabic numerals and the possibility of modern arithmetic; but the invention of the ciphers and zero came but slowly, and their history is a most obscure problem.

What is quite certain is that our present decimal system, in its complete form, with the zero which enables us to do without the ruled columns of the abacus, is of Indian origin. From the Indians it passed to the Arabians, probably along with the astronomical tables brought to Baghdad by an Indian ambassador in 773 A.D. At all events the system was explained in Arabic in the early part of the 9th century by the famous Abú Ja'far Mohammed al-Khárizmí, and from that time continued to spread, though at first slowly, through the Arabian world.

In Europe the complete system with the zero was derived from the Arabs in the 12th century, and the arithmetic based on this system was known by the name of algorithmus, algorithm. This barbarous word is nothing more than a transcription of Al-Khárizmí, as was conjectured by Reinaud, and has become plain since the publication of a unique Cambridge MS. containing a Latin translation—perhaps by Adelhard of Bath—of the lost arithmetical treatise of the Arabian mathematician.[2] The arithmetical methods of Khárizmí were simplified by later Eastern writers, and these simpler methods were introduced to Europe by Leonardo of Pisa in the West and Maximus Planudes in the East. The term zero appears to come from the Arabic sifr through the form zephyro used by Leonardo.

Thus far recent inquirers are agreed. The disputed points are—(1) the origin and age of the Indian system, and (2) whether or not a less developed Indian system, without the zero but with the nine other ciphers used on an abacus, entered Europe before the rise of Islam, and prepared the way for a complete decimal notation.

(1) The use of numerals in India can be followed back to the

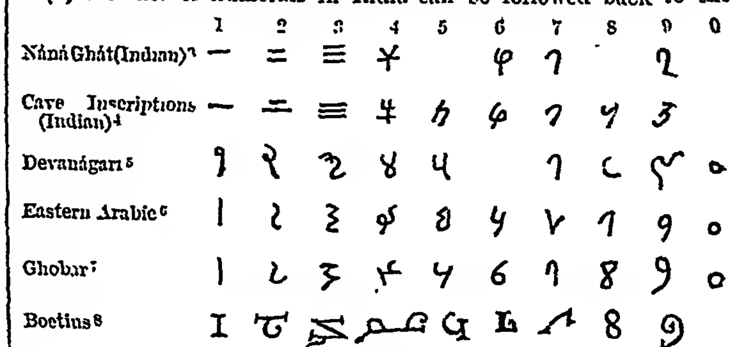

Table 2

Náná Ghát inscriptions, supposed to date from the early part of the 3d century B.C. These are signs for units, tens, and hundreds, as in the other old systems we have dealt with. Like the Indian alphabet, they are probably derived from abroad, but, as in the case

of the alphabet, their origin is obscure. The forms of the later Indian numerals for the nine digits appear to be clearly derived from the earlier system. In table 2 the first two lines give forms earlier than the introduction of the system of position, while the Devanāgarī in the third line was used with a zero and position value. The "cave" numerals were employed during the first centuries of the Christian era. The earliest known example of a date written on the modern system is of 738 A.D., while the old system is found in use as late as the early part of the 7th century (Bayley). On the other hand, there is some evidence that a system of value by position was known to Sanskrit writers on arithmetic in the 6th Christian century. These writers, however, do not use ciphers, but symbolical words and letters, so that it is not quite clear whether they refer to a system which had a zero, or to a system worked on an abacus, where the zero is represented by a blank column. There is no proof as yet for the use of any system of position in India before the 6th century, and nothing beyond conjecture can be offered as to its origin.

(2) *In Europe*, before the introduction of the algorithm or full Indo-Arabic system with the zero, we find a transition system in which calculations were made on the decimal system with an abacus, but instead of unit counters there were placed in the columns ciphers, with values from one to nine, and of forms that are at bottom the Indian forms and agree most nearly with the numerals used by the Arabs of Africa and Spain. For among the Arabs themselves there were varieties in the forms of the Indian numeral, and in particular an eastern and a western type. The latter is called ghobār (dust), a name which seems to connect it with the use of a sand-spread tablet for calculation. The abacus with ciphers instead of counters was used at Rheims about 970-980 by Gerbert, who afterwards was pope under the title of Sylvester II., and it became well known in the 11th century. Where did Gerbert learn the use of the abacus with ciphers? There is no direct evidence as to this, for the story in William of Malmesbury, that he stole it from an Arab in Spain, is generally given up as fabulous. On the other hand, no evidence is offered for an earlier use of the abacus with ciphers, except a passage describing the system in the *Geometria* ascribed to Boetius. If this book is genuine the Indian numerals were known in Europe and applied to the abacus in the 5th century, and Gerbert only revived the long-forgotten system. On this view we have to explain how Boetius got the ciphers. The *Geometria* ascribes the system to the "Pythagorici"—*i.e.*, the Neo-Pythagoreans—and it has been thought possible that the Indian forms for the numerals reached Alexandria, along with the cruder form of value by position involved in the use of the abacus without a zero, before direct communication between Europe and India ceased, which it did about the 4th century A.D. It is then further conjectured by Woepcke that the ghobār numerals of the western Arabs were by them borrowed from the system of Boetius before the full Indian method with the zero reached them; and thus the resemblance between these forms and those in MSS. of Boetius, which are essentially the same as in other MSS. of the 11th century, would be explained. This view, however, presents great difficulties, of which the total disappearance of all trace of the system between Boetius and Gerbert is only one. We have no proof that the Indians ever used such an abacus, or that they had value by position at so early a date as is required, and the ghobār numerals are too similar to those of the eastern Arabs to make it very credible that the two systems had been separated for centuries. The genuineness of the *Geometria* is still ably maintained by Cantor, but it has been attacked on other grounds than that of the passage about the abacus; and on the whole it is still an open question whether the abacus with ciphers is not the outcome of an early imperfect knowledge of the Arabic system, Gerbert or some other having got the signs and a general idea of value by position without having an explanation of the zero.

See Cantor, *Geschichte der Mathematik*, vol. i., Leipsic, 1880, as the most recent general account of the subject; also Chasles, papers in the *Comptes Rendus*, 1843; Friedlein, *Die Zahlzeichen und das elementare Rechnen der Griechen und Römer*, &c., 1869; Woepcke, *Sur l'introduction de l'arithmétique Indien en occident*, Rome, 1859, and *Mémoire sur la propagation des chiffres Indiens*, Paris, 1863. For the palæography of the Indian numerals see Burnell, *Elements of S. Indian Palæography*, 1874; and Sir E. C. Bayley in *J. R. A. S.*, 1882, 1883. For Boetius compare Friedlein's edition of his arithmetic and geometry, Leipsic, 1867, and Weissenborn in *Zeitsch. Math. Phys.*, xxiv. Other references to the copious literature will be found in Cantor and Friedlein, who also discuss the subject of the notation for fractions, which cannot be entered on here. For systems passed over here, see Pihan, *Exposé des signes de numération usités chez les peuples orientaux*, Paris, 1860. (W. R. S.)

NUMERIANUS, M. AURELIUS, Roman emperor, accompanied his father, the emperor Carus, on the Persian expedition beyond the Tigris, and along with his absent brother, Carinus, was proclaimed emperor on the death of the former (December 283). Having resolved to abandon the campaign, he was returning towards Europe when he mysteriously died before Chalcedon was reached, eight months afterwards. Arrius Aper, prefect of the pretorians, his father-in-law, suspected of having murdered him, was hastily stabbed by Diocletian, his successor. Numerianus is represented as having been a man of considerable literary attainments, as well as of singular gentleness, amiability, and purity.

NUMIDIA was the name given to a large tract of country in the north of Africa, extending along the Mediterranean Sea from the confines of Mauretania to those of the Roman province of Africa. The term was, however, employed in very different senses, and within very different limits, at different periods of time. When Carthage was at the height of its power, and the Romans first came into contact with the nations of northern Africa, the name of Numidia was applied to the whole country from the river Mulucha (now called the Mulūya), about 100 miles west of Oran, to the frontier of the Carthaginian territory, which nearly coincided with the modern regency of Tunis. It is in this sense that the term is employed by Polybius, and all succeeding historians down to the close of the Roman republic. The Numidians, as thus defined, were divided into two great tribes, the Massyli on the east, and the Massæsyli on the west,—the limit between the two territories being the river Ampsaga, which enters the sea to the west of the remarkable promontory called Tretum, now known as the Seven Capes. At the time of the Second Punic War the eastern tribe was under the government of Masinissa, who took part with the Romans in the contest, while his rival Syphax, king of the Massæsylians, supported the cause of the Carthaginians. In consequence of this, after the close of the war, Syphax's dominions were forfeited, and united with those of Masinissa, who now ruled the whole Numidian people from the frontier of Mauretania to the boundary of the Carthaginian territory. That monarch, who attained to a great age, retained the whole of these extensive dominions till his death in 148 B.C., as was the case also with his son and successor Micipsa; but after the death of the latter in 118, the ambition of his nephew JUGURTHA (*q.v.*) involved him in a war with Rome, which ended in his defeat and death in 106.

Numidia was not, however, incorporated with the Roman empire until a later period. After the death of Jugurtha the western portion of his dominions was added to those of Bocchus, king of Mauretania, while the remainder continued to be governed by native princes until the civil war between Cæsar and Pompey, in which Juba, then king of Numidia, having espoused the cause of the latter, and supported Scipio and Cato in Africa, was defeated by Cæsar, and put an end to his own life (46 B.C.). Numidia, in the more restricted sense which it had now acquired, became for a short time a Roman province, but in the settlement of affairs after the battle of Actium (30) it was restored to Juba II., son of the preceding monarch, who had acquired the favour of Augustus. A few years later, however, Juba was transferred to the throne of Mauretania, including the whole western portion of the ancient Numidian monarchy as far as the river Ampsaga, while the Roman province of Numidia, which was now definitely constituted, comprised only the tract between that river and the Tusca, which formed the western limit of the Roman province of Africa. But though thus restricted in extent—so as nearly to correspond with the modern French province of Constantine, while the kingdom of Numidia in the wider sense had included the whole of Algeria—the Roman province of Numidia attained a high degree of prosperity and civilization, and was studded with numerous towns, the importance of which is attested by inscriptions still extant, as well as by the massive remains of their ancient monuments and works of public utility. This period of prosperity continued to be favoured by unbroken

peace for more than four centuries, until the invasion of the Vandals in 428 A.D. reduced it to a condition of gradual decay; and the invasion of the Arabs in the 8th century again brought desolation upon the land, which was aggravated by continual misgovernment until the conquest of Algeria by the French within the present century.

The physical character of the country has been already described in the article ALGERIA. It may be briefly observed that the whole tract of northern Africa from the river Mulucha to the frontiers of the regency of Tunis may be divided into three parallel zones or regions: the Tell, or fertile district near the sea, the broad inland plateaus beyond it, and the Sahara, or barren region to the south of these uplands, sloping thence down to the great desert which is generally known by that name. The central upland tract assumes a more rugged and mountainous character in the eastern district, which formed the Roman province of Numidia, and now constitutes the French province of Constantine. But this elevated region breaks down abruptly towards the east, where it sends out only a few offshoots into the plains of Tunis, as well as to the south where it faces the wide expanse of the Sahara. It is here that is situated the mountain group called the Aures (the Mons Aurasius of Procopius), of which the highest summit, called by the Arabs Jebel Chellia, attains to an elevation of 7580 feet.

The name of the Numidians appears to have been nothing more than a Latinized form of the Greek term Nomades, vaguely applied by them to the wandering tribes of northern Africa. It could never have had any ethnographical signification; and there can be no doubt that the people thus designated were merely a portion of the great Berber race, which extended in ancient times from the shores of the Atlantic to the confines of Egypt, and which still, under the name of Kabyles, forms a portion of the population of both Algeria and Tunis. The Gætulians, who at the same period occupied the southern slopes of the mountains towards the Sahara, appear to have stood in much the same relation to the Numidians that the tribes called Tuaricks or Tuareg do at the present day to the comparatively civilized Kabyles of Algeria. But the Roman authority over these wanderers of the desert was of a very precarious character, and a line of outposts near the foot of the mountain range formed the limit of their practical dominion towards the south.

The chief towns of Numidia under the Romans were:—Cirta, the capital, in the interior, subsequently called Constantina, which name it still retains; Rusicada, on the coast, serving as its port, on the site now occupied by Philippeville; and east of it the more important city of Hippo Regius (well known as the see of the celebrated Augustine), near the modern Bona. South of Cirta, in the interior, were Theveste (now Tebessa) and Lambæsa (now Lambessa), with extensive Roman remains. But there were not less than ten towns with the title of "coloniæ," and in the 5th century the *Notitia* enumerates no less than 123 episcopal sees.

For details concerning the condition of Numidia as a Roman province, see *Corp. Inscr. Lat.*, vol. viii. (1881). A more popular account will be found in the *Algérie Romaine* of G. Boissière (2 vols. 8vo, Paris, 1883). (E. H. B.)

NUMISMATICS

Definition.

THE science of numismatics treats of coins and medals. It acquaints us with the metals used in their composition, their various inscriptions and devices, their mechanical execution and artistic merit. It tells us of the different denominations of coins, their relation to one another, and the laws by which they were regulated.

The earliest known coins were issued by the Greeks in the 7th century before the Christian era. By the 4th century the whole civilized world used money, each state generally having its proper coinage. This has continued to be the case to the present time; so that now there are few nations without a metal currency of their own, and of these but a small proportion are wholly unacquainted with the use of coins. The number of varieties of coins and medals of which specimens are preserved in collections may be estimated at not less than several hundred thousand; and future discoveries will probably greatly increase this sum. A series of monuments of such length and completeness affords, as might be expected, very important illustration to history and to kindred branches of knowledge. This is, indeed, the real value of numismatics, and the student will do well to keep it constantly before him.

How it illustrates history.

Coins, although they confirm history, rarely correct it, and never very greatly. The earliest belong to a time and to nations as to which we are not otherwise wholly ignorant, and they do not afford us that precise information which would fill in any important details of the meagre sketch of contemporary history. We gain from them scarcely any direct historical information, except that certain cities or princes issued money. When in later times the devices and inscriptions of the coins give more detailed information, history is far fuller and clearer, so that the numismatic evidence is rarely more than corroborative. There are, indeed, some remarkable exceptions to this rule, as in the case of the Bactrian coins, which have supplied the outlines of a portion of history which was otherwise almost wholly lost. The value of the corroborative evidence afforded by coins must not, however, be overlooked. It chiefly relates to chronology, although it also adds to our knowledge of the pedigrees of royal houses. But perhaps the most interesting manner in which coins and medals illustrate history is in their bearing contemporary, or nearly contemporary, portraits of the most famous kings and captains, from the time of the first successors of Alexander the Great to the present age, whereas pictures do not afford portraits in any number before the latter part of the Middle Ages; and works of sculpture, although occupying in this respect the same place as coins in the last-mentioned period and under the Roman empire, are neither so numerous nor so authentic. There is no more delightful companion in historical reading than a cabinet of coins and medals. The strength and energy of Alexander, the ferocity of Mithradates, the philosophic calmness of Antoninus, the obstinate ferocity of Nero, and the brutality of Caracalla are as plain on the coins as in the pages of history. The numismatic portraits of the time following the founding of Constantinople have less individuality; but after the revival of art they recover that quality, and maintain it to our own day, although executed in very different styles from those of antiquity. From this last class we can form a series of portraits more complete and not less interesting than that of the ancient period.

While coins and medals thus illustrate the events of history, they have an equally direct bearing on the belief of the nations by which they were issued; and in this reference lies no small part of their value in connexion with history. The mythology of the Greeks, not having been fixed in sacred writings, nor regulated by a dominant priesthood, but having grown out of the different beliefs

Mythology.

of various tribes and isolated settlements, and having been allowed to form itself comparatively without check, can scarcely be learned from ancient books. Their writers give us but a partial or special view of it, and modern authors, in their attempts to systematize, have often but increased the confusion. The Greek coins, whether of kings or cities, until the death of Alexander, bear sacred subjects only. Afterwards, on the regal coins, the king's head usually occupies the obverse and a sacred subject is placed on the reverse. The coins of Greek cities under the empire have usually an imperial portrait and a reverse type usually mythological. The whole class thus affords us invaluable evidence for the reconstruction of Greek mythology. We have nowhere else so complete a series of the different types under which the divinities were represented. There are in modern galleries very few statues of Greek divinities, including such as were intended for architectural decoration, which are in good style, fairly preserved, and untouched by modern restorers. If to these we add reliefs of the same class, and the best Græco-Roman copies, we can scarcely form a complete series of the various representations of these divinities. The coins, however, supply us with the series we desire, and we may select types which are not merely of good work, but of the finest. The mythology of ancient Italy, as distinct from that of the Greek colonies of Italy, is not so fully illustrated by the coins of the country, because these are for the most part of Greek design. There are, however, some remarkable exceptions, especially in the money of the Roman commonwealth, the greater number of the types of which are of a local character, including many that refer to the myths and traditions of the earliest days of the city. The coins of the empire are especially important, as bearing representations of those personifications of an allegorical character to which the influence of philosophy gave great prominence in Roman mythology.

Geography. Coins are scarcely less valuable in relation to geography than to history. The position of towns on the sea or on rivers, the race of their inhabitants, and many similar particulars are positively fixed on numismatic evidence. The information that coins convey as to the details of the history of towns and countries has a necessary connexion with geography, as has also their illustration of local forms of worship. The representations of natural productions on ancient money are of special importance, and afford assistance to the lexicographer. This is particularly the case with the Greek coins, on which these objects are frequently portrayed with great fidelity. We must recollect, however, that the nomenclature of the ancients was vague, and frequently comprised very different objects under one appellation, and that therefore we may find very different representations corresponding to the same name.

Art. The art of sculpture, of which coin-engraving is the offspring, receives the greatest illustration from numismatics. Not only is the memory of lost statues preserved to us in the designs of ancient coins, but those of Greece afford admirable examples of that skill by which her sculptors attained their great renown. The excellence of the designs of very many Greek coins struck during the period of the best art is indeed so great that, were it not for their smallness, they would form the finest series of art-studies in the world. The Roman coins, though at no time to be compared to the purest Greek, yet represent worthily the Græco-Roman art of the empire. From the accession of Augustus to the death of Commodus they are often fully equal to the best Græco-Roman statues. This may be said, for instance, of the dupondii struck in honour of Livia by Tiberius and by the younger Drusus, of the sestertii of Agrippina, and of the gold coins of Antoninus Pius and the two Faustinas, all which present portraits of remarkable beauty and excellence. The mediæval Italian medals are scarcely less useful as records of the progress and characteristics of art, and, placed by the side of the Greek and Roman coins, complete the most remarkable comparative series of monuments illustrating the history of the great schools of art that can be brought together. Ancient coins throw as great light upon the architecture as upon the sculpture of the nations by which they were struck. Under the empire, the Roman coins issued at the city very frequently bear representations of important edifices. The Greek imperial coins struck in the provinces present similar types, representing the most famous temples and other structures of their cities, of the form of some of which we should otherwise have been wholly ignorant. The little-known art of painting among the ancients does not receive so much illustration from the coins. The best Greek pieces are of too severe a style to admit of an approach to pictorial treatment, although we perceive such a tendency in the works of important schools, and during the period of decline. The Roman coins sometimes present groups which have a very pictorial character, traceable to the tendency of the sculpture of the period; this is principally about the time of the Antonines. They are, however, never so pictorial in treatment as the mediæval Italian medals. The art of gem-engraving among the ancients is perhaps most nearly connected with their coinage. The subjects of coins and gems are so similar and so similarly treated that the authenticity of gems, that most difficult of archæological questions, receives the greatest aid from the study of coins.

Literature. After what has been said it is not necessary to do more than mention how greatly the study of coins tends to illustrate the contemporary literature of the nations which issued them. Not only the historians, but the philosophers and the poets, are constantly illustrated by the money of their times. This was perceived at the revival of letters; and during the last two centuries coins were very frequently engraved in the larger editions of the classics. A want of technical numismatic knowledge in the editors, and the carelessness of the artists, combined to deprive these illustrations of much of their value. Probably in part on this account, but chiefly in consequence of the change from historical to textual criticism, ancient coins have been little used in this manner by the new school. This neglect is being remedied, although the full value of coins and medals in illustration of the literature of modern as well as of ancient times is not as yet sufficiently perceived.

Origin of the science. The science of numismatics is of comparatively recent origin. The ancients do not seem to have formed collections, although they appear to have occasionally preserved individual specimens for their beauty. Petrarch has the credit of having been the first collector; but it is probable that in his time ancient coins were already attracting no little notice. The importance of the study of all coins has since been by degrees more and more recognized, and at present no branch of the pursuit is left wholly unexplored.

Practical use. Besides its bearing upon the history, the religion, the manners, and the arts of the nations which have used money, the science of numismatics has a special modern use in relation to art. Displaying the various styles of art prevalent in different ages, coins supply us with abundant means for promoting the advancement of art among ourselves. If the study of many schools be at all times of advantage, it is especially so when there is little originality in the world. Its least value is to point out the want of artistic merit and historical commemoration in modern coins, and to suggest that modern medals should be exe-

cated after some study of the rules which controlled the great works of former times.

Definitions.—The following are the most necessary numismatic definitions.

1. A *coin* is a piece of metal of a fixed weight, stamped by authority of government, and employed as a circulating medium.[1]

2. A *medal* is a piece, having no place in the currency, struck to commemorate some event or person. Medals are frequently comprised with coins in descriptions that apply to both equally; thus, in the subsequent definitions, by the term *coins*, coins and medals must generally be understood.

3. The coinage of a country is usually divided into the classes of gold, silver, and bronze (copper), for which the abbreviations AV, AR, and Æ are employed in catalogues. In each class are comprised, not only the coins of the metal from which it takes its name, with no more than a necessary or inseparable proportion of alloy, but coins of other metallic substances, usually base, and always compound, which were generally struck in the place of the purer pieces. The principal metallic substances thus used were electrum for gold, billon for silver, brass for copper, and potin for silver and copper.

4. *Electrum* (ἤλεκτρον, ἤλεκτρος), a compound metallic substance, consisting of gold with a considerable alloy of silver. Pliny makes the proportion to have been four parts of gold to one of silver.[2] The material of early coins of Asia Minor struck in the cities of the western coast is the ancient electrum. It appears here to have at first consisted of three parts of gold to one of silver; but afterwards the proportion of silver was increased, though perhaps not everywhere. Gold largely alloyed with silver, not struck by the ancient Greeks or their neighbours, should be termed *pale gold*, as in the case of some of the late Byzantine coins.

5. *Billon*, a term applied to the base metal of some Roman coins, and also to that of some mediæval and modern coins. It is silver with a great proportion of alloy. When the base silver coins are replaced by copper washed with silver the term billon becomes inappropriate.

6. *Brass*, a compound metallic substance employed for coins. It may be used as an equivalent to the orichalcum of the Romans, a fine kind of brass of which the sestertii and dupondii were struck, but it is commonly applied indiscriminately to the whole of their copper currency.

7. *Potin*, a term applied to the base metal of which some ancient coins are composed. It is softer than billon.

8. Various other metallic substances have been used in coinage. The so-called "glass coins" of the Arabs are merely coin-weights.

9. The *forms* of coins have greatly varied in different countries and at different periods. The usual form in both ancient and modern times has been circular, and generally of no great thickness.

10. Coins are usually measured by *Mionnet's scale*, from which the greatest dimension is taken, or, when they are square, the greatest dimension in two directions. This is, however, a very unsatisfactory scale, as its divisions are of an arbitrary character, and the instruments for applying it are such as make exactness scarcely possible. A gauge graduated to inches and decimal parts of an inch or to millimetres is far more satisfactory.

11. The *weight* of a coin is of great importance, both in determining its genuineness and in distinguishing its identity. To ascertain exact weight even to the tenth of a grain is therefore necessary, and this can only be done by the careful use of excellent scales.

12. The *specific gravity* of a coin may be of use in determining the metals in its composition.

13. Whatever representations or characters are borne by a coin constitute its *type*. The subject of each side is also called a type, and, when there is not only a device but an inscription, the latter may be excluded from the term. This last is the general use. No distinct rule has been laid down as to what makes a difference of type, but it may be considered to be an essential difference, however slight.

14. A difference too small to constitute a new type makes a *variety*.

15. A coin is a *duplicate* of another when it agrees with it in all particulars but those of exact size and weight. Strictly speaking, ancient coins are rarely, if ever, duplicates, except when struck from the same die.

16. Of the two sides of a coin, that is called the *obverse* which bears the more important device or inscription. In early Greek coins it is the convex side: in Greek and Roman imperial it is the side bearing the head: in mediæval and modern that bearing the royal effigy, or the king's name, or the name of the city; and in Oriental that on which the inscription begins. The other side is called the *reverse*.

17. The *field* of a coin is the space unoccupied by the principal devices or inscriptions. Any detached independent device or character is said to be in the field, except when it occupies the exergue.

18. The *exergue* is that part of the reverse of a coin which is below the main device, and distinctly separated from it; it often bears a secondary inscription. Thus, the well-known inscription CONOB occupies the exergue of the late Roman and early Byzantine gold coins.

19. The *edge* of a coin is the surface of its thickness.

20. By the *inscription* or *inscriptions* of a coin all the letters it bears are intended; an inscription is either principal or secondary.

21. In describing coins the terms *right* and *left* mean the right and left of the spectator, not the heraldic and military right and left, or those of the coin.

22. A *bust* is the representation of the head and neck: it is commonly used of such as show at least the collar-bone, other busts being called heads.

23. A *head* properly means the representation of a head alone, without any part of the neck, but it is also commonly used when any part of the neck above the collar-bone is shown. The present article follows custom in the use of the terms *bust* and *head*.

24. A bust or head is either facing, usually three-quarter face, or in profile, in which latter case it is described as *to right* or *to left*. Two busts may be placed in various relative positions which cannot be described in English without circumlocution.

25. A bust wearing a laurel-wreath is said to be *laureate*.

26. A bust bound with a regal fillet (diadem) is called *diademed*.

27. A bust of which the neck is clothed is said to be *draped*.

28. An object in the field of a coin which is neither a letter nor a monogram is usually called a *symbol*. This term is, however, only applicable when such an object is evidently the badge of a town or individual. The term *adjunct*, which is sometimes employed instead of symbol, is manifestly incorrect.

29. A *mint-mark* is a difference placed by the authorities of the mint upon all money struck by them, or upon each new die or separate issue.

30. A coin is said to be *surfrappé* when it has been struck on an older coin, of which the types are not altogether obliterated.

31. A *double-struck* coin is one in which the die or dies have shifted so as to cause a double impression.

32. A coin which presents two obverse types, or two reverse types, or of which the types of the obverse and reverse do not correspond, is called a *mule*; it is the result of mistake or caprice.

Arrangement of Coins.—No uniform system has as yet been applied to the arrangement of all coins. It is usual to separate them into the three great classes of ancient coins (comprising Greek and Roman), mediæval and modern, and Oriental coins. The details of these classes have been differently treated, both generally and specially. The arrangement of the Greek series has been first geographical, under countries and towns, and then chronological, for a further division: that of the Roman series, chronological, without reference to geography; that of the mediæval and modern, the same as the Greek; and that of the Oriental, like the Greek, but unsystematically,—a treatment inadmissible except in the case of a single empire. Then, again, some numismatists have separated each denomination or each metal, or have separated the denominations of one metal and not of another. There has been no general and comprehensive system, constructed upon reasonable principles, and applicable to every branch of this complicated science. Without laying down a system of rules, or criticizing former modes of arrangement, we offer the following as a classification which is uniform without being servile.

1. *Greek Coins.*—All coins of Greeks, or barbarians who adopted Greek money, struck before the Roman rule or under it, but without imperial effigies. The countries and their provinces are placed in a geographical order from west to east, according to the system of Eckhel, with the cities in alphabetical order under the provinces, and the kings in chronological order. The civic coins usually precede the regal, as being the more important. The coins are further

---

[1] This definition excludes, on the one hand, paper currencies and their equivalents among barbarous nations, such as cowries, because they are neither of metal nor of fixed weight, although either stamped or sanctioned by authority; and, on the other hand, modes of keeping metal in weight, like the so-called Celtic ring-money, because they are not stamped, although perhaps sanctioned by authority. The latter has attracted so much attention that it must not be passed by without some further notice. There seems to be no reasonable doubt that the Celtic gold rings are all weight multiples of the same unit, but very seldom multiples of one another. From their form it is probable that most of them were used as ornaments, and as such they would probably have been generally made to weigh an exact weight without fractions, on the same principle that the ancients frequently avoided fractions of their measures in architecture. They belong to a time anterior to the introduction of money among the Celts, or before its general use, and one, therefore, at which precious metal must have been weighed when employed in barter. Hence an additional reason, and probably the main one, why their weight is always some multiple of the same unit. In a primitive state of society in the present day a woman often wears her dowry in coins as ornaments; and thus these Celtic rings may have been both ornaments and substitutes for money.

[2] Hist. Nat. xxxiii. 23; comp. xxxvii. 11. Pliny distinguishes two kinds of "electrum," amber, and this metallic substance. In Greek poetry the name seems to apply to both, but it is generally difficult to decide which is meant in any particular case. Sophocles, however, where he mentions τὰπὸ Σάρδεων ἤλεκτρον . . . καὶ τὸν Ἰνδικὸν χρυσόν (Ant. 1037-39), can scarcely be thought to refer to the metallic electrum.

arranged chronologically, the civic commencing with the oldest and ending with those bearing the effigies of Roman emperors. The gold coins of each period take precedence of the silver and the silver of the copper. The larger denominations in each metal are placed before the smaller. Coins of the same denomination and period are arranged in the alphabetical order of the magistrates' names, or the letters, &c., that they bear.

2. *Roman Coins.*—All coins issued by the Roman commonwealth and empire, whether struck at Rome or in the provinces. The arrangement is chronological, or, where this is better, under geographical divisions.

3. *Mediæval and Modern Coins of Europe.*—All coins issued by Christian European states, their branches and colonies, from the fall of the empire of the West to the present day. This class is arranged in a geographical and chronological order, as similar as possible to that of the Greek class, with the important exception of the Byzantine coins and the coins following Byzantine systems, which occupy the first place. The reason for this deviation is that the Byzantine money may be regarded not only as the principal source of mediæval coinage but as the most complete and important mediæval series, extending as it does without a break throughout the Middle Ages. The regal coins usually precede the civic ones, as being the more important; and the medals of each sovereign or city follow the coins.

4. *Oriental Coins.*—All coins bearing inscriptions in Eastern languages, excepting those of the Jews, Phœnicians, and Carthaginians, which are classed with the Greek coins from their close connexion with them. These coins should be arranged under the following divisions: Ancient Persian, Arab, Modern Persian, Indian, Chinese, and coins of the far East.

This method of arrangement will be found to be as uniform as it can be made, without being absolutely mechanical. It differs in some important particulars from most or all of those which have previously obtained; but these very differences are the result of the consideration of a complete collection, and have therefore an inductive origin. A general uniformity is no slight gain, and may well reconcile us to some partial defects. These defects may be remedied in large collections by the use of "cross-references" from one cabinet to another, and by the formation of independent series to illustrate the general one. A series illustrative of Greek art, and another of Græco-Roman, might be formed. A series of portraits, and another of reverse types, would be equally valuable. Others might be made to show the changes of the coinage in relation to the condition of a state, with careful indications of the weight and composition of the examples, and others to illustrate the history of a particular country or city. Thus, the Byzantine copper coinage exhibits the success or disaster of the imperial arms, and the financial state of the empire in its fluctuations, while nothing can be more interesting than to see at one view the numismatic history of a great city. We have coins of Rome under the commonwealth and the empire, under the Ostrogoths, the Byzantines, the mediæval senate, and the popes. The series of London would be not the least curious. It would begin with the Roman coins issued by the mint of Londinium at the time of Diocletian and his colleagues, comprising those of the usurpers Carausius and Allectus; then, having not long after ceased for a time, it would recommence with the Saxon pennies, including a specimen of those of King Alfred, which have for their reverse type the monogram of the city's name; and, continuing through the mediæval period, it would conclude with modern tokens and medals, among the latter of which might be placed a copy of that famous one of the first Napoleon, with the inscription "Frappée à Londres," which was intended to commemorate the success of the Boulogne expedition.

I.—Greek Coins.

General character.

There are some matters relating to Greek coins in general which may be properly considered before they are described in geographical order. These are their general character, the chief denominations, with the different talents of which they were the divisions, their devices and inscriptions, their art, and the mode of striking.

The period during which Greek coins were issued was probably not much less than a thousand years, commencing about the beginning of the 7th century B.C. and generally ending at the death of Gallienus (268 A.D.). If classed with reference only to their form, fabric, and general appearance they are of three principal types,—the archaic Greek, the ordinary Greek, and the Græco-Roman. The coins of the first class are of silver, electrum, and sometimes gold. They are thick lumps of an irregular round form, bearing on the obverse a device, with in some cases an accompanying inscription, and on the reverse a square or oblong incuse stamp (*quadratum incusum*), usually divided in a rude manner. The coins of the second class are of gold, electrum, silver, and bronze. They are much thinner than those of the preceding class, and usually have a convex obverse and a slightly concave or flat reverse. The obverse ordinarily bears a head in bold relief. The coins of the third class are, with very few exceptions, of bronze. They are flat and broad, but thin, and generally have on the obverse the portrait of a Roman emperor. It may be observed that the common division of Greek coins is into autonomous and imperial, the former comprising all except those of the Roman period which have the effigies of emperors.

Monetary systems.

The different monetary systems of the Greeks grew out of the use of different standards of weight; in other words, their coins were divisions of various talents. To investigate the origin of these monetary systems would demand a complete examination of Greek metrology, which could not be attempted in the present article. It will be well, however, to state in a few words the theory of Dr Brandis, at once the latest and the most satisfactory, though it cannot be said to completely solve the hard series of problems which the documents set before us.

The source of the Greek systems of weight has been referred to Babylonia, no link having been established with the different metrology of Egypt, a circumstance which may make us pause before finally accepting the results of the inquiry. The Babylonian weights had a twofold form,—the heavy talent, sometimes called the Assyrian, and the light talent, sometimes called the Babylonian. The heavy talent is the double of the light. Their weights and those of their divisions are thus stated by Dr Brandis on the evidence of the inscribed weights found at Nimrúd, the ancient Calah, in Assyria (see NINEVEH), which are now in the British Museum. The result is approximately true, but it has been shown by a careful reweighing of the objects that the maximum weights rise somewhat higher and the minimum fall somewhat lower than is indicated in the table.

	Grammes		Grains.						
Heavy Talent	60,600	=	936,000;	known	range	62,400	to	57,600	grammes.
Mina	1,010	=	15,600;	„	„	1,040	„	960	„
$\frac{1}{60}$ Mina	16·83	=	260;	„	„	17·33	„	16	„
Light Talent	30,300	=	468,000;	„	„	31,200	„	27,600	„
Mina	505	=	7,800;	„	„	520	„	460	„
$\frac{1}{60}$ Mina	8·415	=	130;	„	„	8·66	„	7·66	„

The heavy talent is supposed to have found its way to Greece by sea from the Phœnician coast-towns, the light talent by land through Lydia. In adopting the Babylonian weights the Phœnicians and Greeks made an important deviation. They accepted the sixtieth of the mina as their shekel or stater, but allowed only fifty instead of sixty of these units to their mina, retaining the sexagesimal division in counting sixty minæ to the talent. Thus the Phœnician and Greek talents contained 3000 shekels or staters, not 3600 sixtieths of the mina.

Two talents thus arose,—that by which the earliest Phocaic gold money was struck, derived from the heavy Babylonian, with a stater having a maximum weight of 256 grains, and the Euboic talent, derived from the light Babylonian, with a stater of 130 grains or a little more. The Phocaic was a modification of the Babylonian heavy talent, the Euboic of the light, each having the same stater as the parent weight, but a lower talent. The relation of gold to silver in the earliest days of coined money, about 700 B.C., and for long after, was 13⅓ to 1; consequently it was inconvenient to use the same standard for the two metals. Two systems for silver money are supposed to have arisen from this necessity, and it is here that the most brilliant but least conclusive part of the theory of Dr Brandis begins. The sixtieth of the heavy Babylonian mina weighed 260 grains, its sixtieth again weighed 4·3, this multiplied by 13·3 gives us the Phœnician drachm of 57 grains, introduced into Greece, and the basis of the so-called Græco-Asiatic or Phœnician silver standard. Four of these drachms produced the Phœnician stater at its maximum of 230 grains. Thus fifteen staters were equal to one gold sixtieth ($230 \times 15 \div 13\frac{1}{3} = 258\frac{3}{4}$, nearly 260). Dr Brandis therefore calls this the fifteen-stater system. The Lydians, on the other hand, are supposed to have originated a silver stater by multiplying the sixtieth of the light mina, 130 grains, by 13·3 and dividing this by ten, so as to obtain a silver stater of about 170 grains, current long after in Asia Minor. Ten of these staters would thus be equal to one gold sixtieth. This, therefore, is called the ten-stater system.

The monetary standards of the Greeks (expressed in grains) may be referred to the two original talents in the following manner:—

Heavy Talent.	Normal.	Actual.		
Phocaic talent	780,000	768,000;	used for	gold in Asia Minor.
Phœnician	690,000	660,000;	„	gold and silver.
Macedonian	„	„ ;	„	silver.
Ptolemaic	„	„ ;	„	gold and silver.
Æginetic		582,000;	„	silver.
Light Talent.				
Persic		318,000;	„	silver.
Euboic		405,000;	„	gold and silver.
Attic		405,000;	„	gold and silver.
$\frac{2}{3}$ Corinthian		270,000;	„	silver.

Denominations.

The following table exhibits the weights of the principal denominations of the Greek systems. The Corinthian talent is excluded as simply a differently divided variety of the Attic, the Rhodian as a degraded Attic. In the subsequent account of Greek money the metrology of each class will be carefully noted.

	Attic.	Æginetic.	Phœnician.	Persic
	Grains.	Grains.	Grains.	Grains.
Distater or Tetradrachm....	270	..	224	354
Stater or Didrachm	135	194	112	177
Hemistater or Drachm	67·5	97	56	88
Third or Tetrobol	45·	..	37	59
Fourth or Triobol	33·75	48	28	44
Sixth or Diobol	22·5	32	18	29
Eighth or Trihemiobol......	16·8	24	14	22
Twelfth or Obol	11·25	16	9	14

The Rhodian drachm weighed 60 grains. The Babylonian weight is somewhat lower than the Persic, and it wants the distater. The term stater is usually applied to the didrachm, but also to the tetradrachm, and at Cyrene to the drachm.[1]

The bronze standards have been less fully discussed. Some notice of them will be given under different geographical heads.

Types. In the types of Greek coins (using the term in its restricted sense) the first intention of the designers was to indicate the city or state by which the money was issued. The necessity for distinctive devices was most strongly felt in the earlier days of the art, when the obverse of a coin alone bore a design, and, if any inscription, only the first letter, or the first few letters, of the name of the people by whom it was issued. The motive which dictated the kind of type to be selected was undoubtedly a religious one.[2] There are some isolated instances in which the religious character of a type is doubtful; but these, if proved, would be only exceptions to a general rule. The piety of that age adopted religious devices, and for a long time it was held to be impious to substitute any other representations for them. To the same cause may, perhaps, be partly ascribed the preference on the most ancient coins for devices of a symbolical character to actual representations of divinities, although the difficulty of portraying the human form in the infancy of art must have had considerable influence in this direction.

Classes. Greek coins, if arranged according to their types, fall into three classes: (1) civic coins, and regal without portraits of sovereigns; (2) regal coins bearing portraits; and (3) Græco-Roman coins, whether with imperial heads or not. The coins of the first class have either a device on the obverse and the *quadratum incusum* on the reverse, or two devices; and these last are again either independent of each other, though connected by being both local, or—and this is *more common*—that on the reverse is a kind of complement of that on the obverse. It will be best first to describe the character of the principal kinds of types of the first class, and then to notice their relation. It must be noted that a head or bust is usually an obverse type, and a figure or group a reverse one, and that, when there is a head on both obverse and reverse, that on the former is usually larger than the other, and represents the personage locally considered to be the more important of the two. We must constantly bear in mind that these types are religious and local if we would understand their meaning. "I do not believe," Burgon says, "that the types of coins are, on any occasion, original compositions, but always copied (from the earliest to the lowest times) from some sacred public monument. Thus, when we find what is called a Bœotian buckler on coins, we are not to look upon the representation as *a Bœotian buckler*, but as *the buckler* of some Bœotian hero well known to the ancient inhabitants of that country, and accounted to be sacred by them. In like manner, when we find Minerva represented on coins we are not to understand the type as *a Minerva*, but *the Minerva of that place*; and, in some cases which might be brought forward, the individual statues which are represented on coins, or ancient copies, will be found to exist. The only example of originality of composition apparent on coins is where types have been *doubled* or *halved*, to express similar modifications of value."

Types of towns, &c., coins. In the following list the types of Greek coins of cities, and of kings not having regal portraits, are classed in a systematic order, without reference to their relative antiquity.

1. Head or figure of a divinity worshipped at the town, or by the people, which issued the coin, as the head of Pallas on coins of Athens, and the figure of Heracles on coins of Bœotian Thebes. Groups are rare until the period of Græco-Roman coinage.

2. Sacred natural or artificial objects,—(*a*) animal sacred to a divinity of the place, as the owl (*Athens*) and the tortoise (Ægina); (*b*) sacred tree or plant, as the silphium (Cyrene) and the olive-branch (Athens); (*c*) arms or implements of divinities, as the arms of Heracles (Erythræ), the tongs of Vulcan (Æsernia).

It is difficult to connect many objects comprised in this class with local divinities. The reason of this appears to be that the Hellenes, wherever they colonized, and nowhere more than in Greece, found an earlier system of low nature-worship, and endeavoured to incorporate it into their own more intellectual mythology, sometimes with but partial success.

3. Head or figure of a local genius,—(*a*) river-god, as the Gelas (Gela); (*b*) nymph of a lake, as Camarina (Camarina); (*c*) nymph of a fountain, as Arethusa (Syracuse).

4. Head or figure of a fabulous personage or half-human monster, as a Gorgon (Neapolis Macedoniæ), the Minotaur (Cnossus).

5. Fabulous animal, as Pegasus (Corinth), a griffin (Panticapæum), the Chimæra (Sicyon).

6. Head or figure of a hero or founder, as Ulysses (Ithaca), the Lesser Ajax (Locri Opuntii), Taras, founder of Tarentum (Tarentum).

7. Objects connected with heroes,—animal connected with local hero, as the Calydonian boar or his jaw-bone (Ætolians). Arms of heroes also occur as types, but their attribution to particular personages is difficult or impossible.

8. Celebrated real or traditional sacred localities, as mountains on which divinities are seated, the labyrinth (Cnossus).

9. Representations connected with the public religious festivals and contests, as a chariot victorious at the Olympic games (Syracuse).

The relation of the types of the obverse and reverse of a coin is a matter requiring careful consideration, since they frequently illustrate one another. As we have before observed, this relation is either that of two independent objects, which are connected only by their reference to the same place, or the one is a kind of complement of the other. Among coins illustrating the former class we may instance the beautiful silver didrachms of Camarina, having on the obverse the head of the river-god Hipparis and on the reverse the nymph of the lake carried over its waters by a swan, and those of Sicyon, having on the obverse the Chimæra and on the reverse a dove. The latter class is capable of being separated into several divisions. When the head of a divinity occurs on the obverse of a coin, the reverse is occupied by an object or objects sacred to that divinity. Thus the common Athenian tetradrachms have on the one side the head of Pallas and on the other an owl and an olive-branch; the tetradrachms of the Chalcidians in Macedonia have the head of Apollo and the lyre; and the copper coins of Erythræ have the head of Heracles and his weapons. The same is the case with subjects relating to the heroes: thus there are drachms of the Ætolian League which have on the obverse the head of Atalanta and on the reverse the Calydonian boar, or his jaw-bone and the spear-head with which he was killed. In the same manner the coins of Cnossus, with the Minotaur on the obverse, have on the reverse a plan of the Labyrinth. Besides the two principal devices there are often others of less importance, which, although always sacred, and sometimes symbols of local divinities, are generally indicative of the position of the town, or have some reference to the families of magistrates who used them as badges. Thus, for example, besides such representations as the olive-branch sacred to Pallas on the Athenian tetradrachms, as a kind of second device dolphins are frequently seen on coins of maritime places; and almost every series exhibits many symbols which can only be the badges of the magistrates with whose names they occur. Regal coins of this class, except Alexander's, usually bear types of a local character, owing to the small extent of most of the kingdoms, which were rather the territories of a city than considerable states at the period when these coins were issued.

The second great class—that of coins of kings bearing portraits—is necessarily separate from the first. Religious feeling affords the clue to the long exclusion of regal portraits,—the feeling that it would be profane for a mortal to take a place always assigned hitherto to the immortals. Were there any doubt of this, it would be removed by the character of the earliest Greek regal portrait, that of Alexander, which occurs on coins of Lysimachus. This is not the representation of a living personage, but of one who was not only dead but had received a kind of apotheosis, and who, having been already called the son of Zeus Ammon while living, had been treated as a divinity after his death. He is therefore portrayed as a young Zeus Ammon. Probably, however, Alexander would not have been able, even when dead, thus to usurp the place of a divinity upon the coins, had not the Greeks become accustomed to the Oriental "worship" of the sovereign, which he adopted. This innovation rapidly produced a complete change; every king of the houses which were raised on the ruins of the Greek empire could place his portrait on the money which he issued, and few neglected to do so, while the sovereigns of Egypt and Syria even assumed divine titles.

The reign of Alexander produced another great change in Greek coinage, very different from that we have noticed. He suppressed the local types almost throughout his empire, and compelled the towns to issue his own money, with some slight difference for mutual distinction. His successors followed the same policy; and thus the coins of this period have a new character. The obverses of regal coins with portraits have the head of the sovereign, which in some few instances gives place to that of his own or his country's tutelary divinity, while figures of the latter sort almost exclusively occupy the reverses. Small symbols, letters, and monograms on the reverses distinguish the towns in this class

[1] This information on Greek weights and coinages is wholly derived from Mr B. V. Head's [illegible] statements of Dr Brandis's results (*Numismata* [illegible] 1875, pp [illegible]; *Num. Chron.* 1875, pp 245 sq; *Proceedings of* [illegible] *Comptes Rendus* [illegible] 1867. The writer [illegible] Dr Brandis's theory.

[2] [illegible]

Græco-Roman. The Græco-Roman coins begin, at different periods, with the seizure by Rome of the territories of the Greek states. They are almost all bronze; and those in that metal are the most characteristic and important. In their types we see a further departure from the religious intention of those of earlier times in the rare admission of representations, not only of eminent persons who had received some kind of apotheosis, such as great poets, but also of others who, although famous, were not, and in some cases probably could not have been, so honoured. We also observe on these coins many types of an allegorical character.

The following principal kinds of types may be specified, in addition to those of the two previous classes. (1) Head or figure of a famous personage who either had received a kind of apotheosis, as Homer (Smyrna), or had not been so honoured, as Herodotus (Halicarnassus) and Lais (Corinth). (2) Pictorial representations, always of a sacred character, although occasionally bordering on caricature. We may instance, as of the latter sort, a very remarkable type representing Pallas playing on the double pipe and seeing her distorted face reflected in the water, while Marsyas gazes at her from a rock,—a subject illustrating the myth of the invention of that instrument (Apamea Phrygiæ). (3) Allegorical types, as Hope, &c., on the coins of Alexandria of Egypt, and many other towns. These were of Greek origin, and owed their popularity to the sculpture executed by Greeks under the empire; but the feeling which rendered such subjects prominent was not that of true Greek art, and they are essentially characteristic of the New Attic school which attained its height at Rome under the early emperors. Of this kind of type we must again speak in noticing the Roman coinage.

Those types which were common to this and the older classes were also much developed in their subjects. Thus, for instance, groups frequently took the place of single figures; and the representations of sacred localities acquired a great prominence, the most common being of buildings, which are generally temples. In the architectural types a tendency to pictorial representation is evident in the constant endeavours to depict edifices in perspective.

There is a class of coins which is always considered as part of the Græco-Roman, although in some respects distinct. This is the colonial series, struck in Roman colonies, and having almost always Latin inscriptions. As, however, these colonies were towns in all parts of the empire, from Emerita in Spain (Merida) to Ninica Claudiopolis (Nineveh) in Assyria, in the midst of a Greek population and often of Greek origin, their coins help to complete the series of civic money, and, as we might expect, do not very markedly differ from the proper Greek imperial coins except in having Latin inscriptions and showing a preference for Roman types.

Inscriptions. We have now to speak of the meaning of the inscriptions of Greek coins. These are either principal or secondary; but the former are always intended when inscriptions are mentioned without qualification, since the secondary ones are non essential. The inscription of civic money is almost always the name of the people by which it was issued, in the genitive plural, as ΑΘΗΝΑΙΩΝ on coins of the Athenians, ΣΥΡΑΚΟΣΙΩΝ on coins of the Syracusans. The inscription of regal money is the name, or name and title, of the sovereign in the genitive, as ΑΛΕΞΑΝΔΡΟΥ, or ΒΑΣΙΛΕΩΣ ΑΛΕΞΑΝΔΡΟΥ, on coins of Alexander the Great. This genitive form implies a nominative understood, which has been generally supposed to be *νόμισμα*, "money." There are four instances in which a nominative of this kind occurs in coins,—ΦΑΝΟΣ ΕΜΙ ΣΗΜΑ, "I am the badge of Phanes," on an archaic coin of Halicarnassus; ΓΟΡΤΥΝΟΣ ΤΟ ΠΑΙΜΑ, "the struck" money of Gortys, if the form suggested by M. François Lenormant be admissible, on an archaic coin of Gortys; and ΣΕΥΘΑ ΚΟΜΜΑ, "the stamp" or "coin of Seuthes," as well as ΣΕΥΘΑ ΑΡΓΥΡΙΟΝ, the "silver piece" or "money of Seuthes." The balance preponderates in favour of the idea that such a word as *νόμισμα*, or the more definite term for a piece of gold (*χρυσοῦς*), silver (*ἀργύριον*), or copper (*χαλκοῦς*), was intended. Yet the instances are not sufficient to establish the case. Besides their disagreement, it must be remembered that the coins of Phanes and Gortys belong to the infancy of money in Asia Minor and Crete, and that Seuthes was a semi-barbarous chieftain. Any one familiar with Greek epigraphy will see the danger of resting on such evidence. In the eighth edition of the *Encyclopædia Britannica* a different explanation was offered on the authority of the late Mr Burgon, who generously communicated it to the writer. He supposed the inscription to relate to the type, and that the nominative understood is the name of that type. It should be remarked that the type of the reverse of a civic coin is usually a complement of that of the obverse, and that the converse may be inferred of regal coins; there is thus in general virtually but one type, that of the tutelary divinity or sacred symbol of the city or sovereign. Athenian coins, with the inscription ΑΘΗ[ΝΑΙΩΝ] have as their obverse type the head of Athene; the meaning of the inscription, according to Burgon's explanation, would be, not "the money of the Athenians," but "Athene of the Athenians." When the name of the divinity represented is written, the nominative understood is supplied. Thus on coins of Syracuse, with the head of Arethusa as the obverse type, we read ΑΡΕΘΟΣΑ—(rev.) ΣΥΡΑΚΟΣΙΩΝ, "Arethusa of the Syracusans," and on others with the head of Zeus, ΖΕΥΣ ΕΛΕΥΘΕΡΙΟΣ—ΣΥΡΑΚΟΣΙΩΝ, "Zeus the giver of liberty of the Syracusans." There are instances in which the names of the divinity and of the people occur together, as ΕΙΡΗΝΗ ΛΟΚΡΩΝ, "Irene of the Locrians," on a coin of the Locri Epizephyrii, the obverse having the head and name of ΖΕΥΣ, as though the sense were Zeus (and) Irene of the Locrians. In the case of regal coins Burgon's theory cannot be applied in strictness. In most cases we could supply the name of the divinity represented on the reverse, as, for the gold staters of Alexander, [ΝΙΚΗ] ΑΛΕΞΑΝΔΡΟΥ, and for the silver, [ΖΕΥΣ] ΑΛΕΞΑΝΔΡΟΥ; but when the type, as of almost all the Ptolemaic coins, is a symbol, in this case the eagle, some modification is needed. If we suppose that the nominative, understood when none is expressed, or implied when a divinity is named, is some word expressing the idea conveyed by the badge, as Zeus by the eagle, we shall probably be not far from the truth. The secondary inscriptions either describe secondary types, as ΑΘΛΑ, "rewards," accompanying the representation of the arms given to the victor in the exergues of Syracusan decadrachms,[1] or are the names of magistrates or other officers, or in regal coins those of cities, or are those of the engravers of the dies, of whom sometimes two were employed, one for the obverse and the other for the reverse, or are dates. These inscriptions are often but abbreviations or monograms, especially when they indicate cities on the regal coins.

Art of coins. The importance of Greek coins as illustrating the character of contemporary art cannot be easily overrated. They are beyond all other monuments the grammar of Greek art. Their geographical and historical range is only limited by Greek history and the Greek world; as a series they may be called complete; in quality they are usually worthy of a place beside contemporary sculpture, having indeed a more uniform merit; they are sometimes the work of great artists, and there is no question of their authenticity, nor have they suffered from the injurious hand of the restorer. Thus they tell us what other monuments leave untold, filling up gaps in the sequence of works of art, and revealing local schools known from them alone.

The art of coins belongs to the province of relief, which lies between the domains of sculpture and of painting, partaking of the character of both, but most influenced by that which was dominant in each age. Thus in antiquity relief mainly shows the rule of sculpture, in the Renaissance that of painting.

Sculpture best represents character (*ἦθος*), painting expression (*τὰ πάθη*). Character is the permanent aspect of the face and figure as denoting the dominant quality. Thus a great statue may be not unfairly described by a single epithet. Expression is the transient but intense effect of some sudden feeling. A single figure in a painting requires a fuller description than a statue; the character is seen beneath the expression. Sculpture aims at embodying the ideal, and when it represents the real it must show the fulness of all qualities and even of all potentialities. Repose is the condition of sculpture. Painting having for its purpose the representation of light (colour), and the effects of light in bodies, can only deal with the circumstances of the moment. Movement is implied in painting.[2] Sculpture that is pictorial and painting that is sculpturesque belong to the decline of art. Expression of a supreme kind is, however, found in sculpture of high quality, especially in that kind of relief which lies nearest to sculpture, alto-rilievo; and character is seen in noble portraits which endeavour to represent the man in his completeness. But such sculpture is properly in groups and such painting in the single form. The group suggests the treatment of painting, the single form in pictorial art that of sculpture. Relief, as intermediate between sculpture and painting, admits separately of movement and the momentary action, but the movement must be of the most dignified and rhythmical kind, otherwise it will need colour to counteract confusion by a higher harmony, and the momentary action must be of supreme importance. Observe the dignity and rhythm of the Panathenaic frieze of the Parthenon, the want of colour in the Amazon frieze of the Mausoleum, contrasting it with the noble fragmentary chariot frieze, and the supreme moment chosen in the metopes of the Parthenon.

Relief is usually divided into three kinds, low, middle, and high (basso-, mezzo-, and alto-rilievo), and it is convenient to retain these terms while admitting that they are only roughly correct. Work to be viewed in a feeble light and from a distance must have clearness in the most necessary outlines, and that simplicity which equally marks the Panathenaic frieze. It admits of simple and general movement. This is low relief, and must not be too much raised from the background. High relief differs from sculpture in the round in that it is not necessarily detached from the background, nor usually of the full depth of true proportion, and in

[1] It is scarcely to be doubted that the arms on the Syracusan decadrachms represent a reward given to an Olympic [illegible] [illegible] [illegible].

[2] On the whole subject cf. C. O. Müller, Archäologie der Kunst, §§ [illegible]

consisting of groups to be seen from a distance, so simply treated as to be free from confusion due to the shadows upon them, and not to cast shadows. It should thus be simple in the forms. It admits of expression of the highest kind, which is almost suggested by the relation of the figures which constitute a group, but it does not allow movement. Middle relief, inasmuch as it is used for objects to be seen near, is delicate in its outlines and may be elaborate in its details. The sculptured columns of the temple of Artemis at Ephesus show the delicacy of the method and coins and gems its delight in elaboration. All coins should be treated in this manner, and it is usual in the entire range of those of the Greeks, although the influence of sculpture on relief of other kinds is constantly traceable.

It may be expected that Greek coins will bear the impress of the sister arts of sculpture and painting, filling up the gaps in the sequence of examples of the art of which we have remains, telling us somewhat of that which has but a written tradition. Our first duty is to endeavour to place the documents in the best order, separating the geographical from the historical indications, first examining the evidence of local schools, then those of the succession of styles. It is from coins alone that we can discover the existence of great local schools, reflecting the character of the different branches of the Hellenic race. In tracing the changes in these schools we gain a great addition to our ideas of the successive styles, and can detect new examples of those which owe their fame to the leading masters. But in dealing with works in relief we have the advantage due to their intermediate character. In our larger geographical horizon we can trace the character of the successive styles, not of sculpture only, but also of sculpture and painting.

Local schools. Greek coins clearly indicate three great schools, each with its subordinate groups. The school of central Greece holds the first place, including the northern group centred in Thrace and Macedonia, and the southern in the Peloponnesus, with the outlying special schools of Crete and Cyrene. The Ionian school has its northern group, Ionia, Mysia, and Æolis, and its southern, Rhodes and Caria. Beyond these are certain barbarous and semi-barbarous groups, of which the most important is that of eastern Asia Minor, Persia, and Phœnicia, with Cyprus. The school of the West comprises the two groups of Italy and Sicily.

The whole duration of the schools is limited, by the repulse of the Persians and the accession of Alexander, from 480 to 332 B.C. Before this age all is archaic, and it is hard to trace local characteristics. After it, the centralizing policy of the sovereigns and the fall of the free cities destroyed local art. In certain cultivated centres under enlightened kings a local art arose, but it speedily became general, and we have thus to think of a succession of styles during the rest of the life of Greek art. The century and a half of the local schools is significantly the great age of this art.

In the study of each school we have first to determine its character, and then to look in its successive phases for the influence of the great masters of style. Two dangers must be avoided. We must not too sharply divide the sculptors and the painters as if they always were true to the special functions of their arts. It is well to bear in mind that the earliest great painter, Polygnotus, was a portrayer of character, καλὸς ἠθογράφος, ἠθικός, as Aristotle calls him, whereas the latest great sculptors represented expression. Thus sculpture first weighed down the balance, afterwards painting; but it must be remembered that relief can be truer to painting than sculpture in the round, which is more limited by the conditions of the material and mechanical necessities. Our second danger is due to the ease with which local qualities may be ascribed to the influence of a leading style. *It is also to be borne* in mind that the movement of art in coins was during one period slower than in sculpture,—hence an influence more general than particular. Phidias and Myron do not make their mark so much as Polyclitus. In all cases the direct influence of great masters is to be looked for later than their age. The style of their time is prevalent in the coins, their actual works do not produce imitations till later, and as this is so we must regard the reflexions as influenced by the atmosphere in which they were produced. A Hera of the age of Polyclitus may be truer to the style of this artist than a later one which was produced under the influence of his famous statue.

Central Greece. The school of central Greece in its southern group, comprehending Attica, is remarkable for its widespread extent. It has its colonies in Magna Græcia at Thurium, an Athenian foundation, probably at Terina, and in Macedonia at Amphipolis and Chalcidice under Athenian rule. It alone shows instances comparable to the works of Phidias, though its most numerous fine works are of the age of Polyclitus and that of Praxiteles and Scopas. Its qualities may be seen by comparison of the same subjects as treated by the other schools and groups. The earliest works are marked more than any others by the qualities of high promise which characterized the Æginetan marbles,—the same dignified self-restraint and calm simplicity. Next we perceive a series strong in style, and showing the lofty dignity, that reposeful embodiment of character, which are the chief of the works of Phidias and his contemporaries. The coins are here remarkable for fidelity, breadth, and boldness than for delicacy of execution or elaboration of ornament. Every subject is ideal, even the portrayal of animal form. Thus the character shows us what divinity is intended and the ideality what is intended by the representation of beast or bird. From these works we pass to those which reflect the style of the time of Praxiteles and Scopas, when the influence of painting began to be felt, and art inclined towards feeling and descended to sentiment. Still, to the last, character rules these coins, and the chief difference we see is in the increased love of beauty for its own sake and the fondness for representing movement, not to the exclusion of repose, but by its side. In other respects there is little change except in the finer execution and more ornamental quality of the work. Even when the greatest achievement of the Sicilian school, the head of Persephone on the decadrachms of Syracuse, is copied by the Locrians and the Messenians, the larger quality of the school of Greece asserts itself, and the copy is better than the original: there is less artifice and more breadth. The northern group is at first ruder, in the age of Phidias severer, and afterwards it merges into the greater softness of its southern rival. If it copies, as Larissa may copy Syracuse and Neapolis in Campania, it again asserts its superior simplicity, and we prefer the copy to the original.

The Ionian school lacks the sequence which the rest of the Greek world affords. It is broken by the baneful influence of the Persian dominion, and consequently the best works belong to the earliest and latest part of the period. The earliest coins, of the Æginetan age, present nothing special; the later, of the time of Praxiteles and Scopas, comprise works not inferior to those of central Greece, and remarkable, like the Western and the Cretan, as the sole records of a school otherwise unknown. They are markedly characterized by the qualities of the style of feeling, that of Praxiteles and Scopas; but more than this, they are the expression of that style in pictorial form. They represent expression, and they treat it as it could not be treated in sculpture in the round, portraying locks streaming in the air and flowing draperies. At the same time, they are true to the highest qualities of art. Each divinity is at once recognized. Persephone has not the maidenly sweetness she wears in Hellas, but the melancholy foresight of her fate; she has not the character but the expression of the goddess. It must be remembered that, while Hellas produced the great sculptors, western Asia Minor bred the great painters after Polygnotus, himself a sculptor in painting rather than a painter. In the native land of Zeuxis, Parrhasius, and Apelles we see the evidence of the rule of painting. The execution of even the smallest works of this school is marked by the subtlest modulations of form, and here again we see the quality of the painter, who, having to represent solid objects on a plane, must have the highest knowledge of anatomy. The power of expression and the knowledge of what underlies the surface of the face are carried even in the smallest works just alluded to, as the Cyzicene hectæ, to a degree of excellence which baffles modern critical power. The technical skill is inferior to that of the West, yet the skill in modelling is far greater, and has no parallel in the medallic work of any other time or country. Ionia.

The school of the West, if we except such outlying examples of the art of Hellas as those of Thurium and Terina, has its highest expression in Italy, its most characteristic in Sicily. It has distinctive qualities throughout the age. Even in the earlier period we trace a striving after beauty and a delicacy of finish, with a weakness of purpose, that mark the school with an influence increasing to a time long after the extinction of its rivals. We trace neither clearness of character nor force of expression. The Persephone of Syracuse is merely a beautiful girl. More than this, her beauty is shown off by the portrayal of the artifices of civilized life, emphasized by tricks of style. At the same time there is a knowledge of the capacity of the materials and the form of the coin, and a masterly power of finish, on the whole a completeness of technical skill which is unequalled. The result in the lower subjects is splendid, if wanting in variety, but in the higher we miss the noble achievements of the greater schools. So far there is a general agreement in the northern and southern groups. Yet the Italian shows a nobler and simpler style, with some affinity to that of central Greece, which we look for in vain in Sicily, though we are dazzled by the rich beauty of the magnificent series of coins which marks her wealthiest age. Sicilian art has this apparent advantage, that the great cities, save Syracuse, perished in the Carthaginian invasion, or under the tyranny of the elder Dionysius. Thus we have no important works save of Syracuse during the second half of our period, and cannot judge fully to what this school would have fallen. The key to this exceptional development of Greek art is found in the absence of sculptors or painters in the West, except only Pythagoras of Rhegium at the very beginning of the age, whose influence is thought to be traceable on the money of his native town. The Western art is that of engravers accustomed to minute and decorative work, uninfluenced by sculpture or painting. Their designs will not bear enlargement, which only enhances the charm of those of the other leading schools. Those of the great Syracusan decadrachms are small; those of the minute hectæ of Cyzicus are large. The West.

Crete. The most important of the lesser schools is the Cretan. Crete, retaining the primitive life of older Hellas, was never truly civilized, but enjoyed to the last the privileges and exhibited the faults of an undeveloped condition. Producing in the age of high art neither sculptor nor painter of renown, the Cretans, to judge from their coins, were copyists of nature or art. At first rude, their work acquires excellence in design, but never in execution. While we see their poor reproductions of the designs of the Peloponnesus, we are amazed by their skill in portraying nature. Their gods are seated in trees with a background of foliage. Their bulls are sketched as they wandered in the meadows. All fitness for the mode of relief, as well as for the material and the shape of the coin, is entirely ignored. Hence a delight in foreshortening, and a free choice of subject with no reference to the circle in which it must be figured. In spite, however, of their skill, the Cretans never attempted the three-quarter face, which is at once the best suited to the surface of a coin and the most trying to the skill of the artist. Yet their work is delightfully fresh, as if done in the open air. There is no idealism, but much life and movement. In a word, the school is naturalistic and picturesque. Its works are of the highest value in the study of Greek art, but as examples of the application of that art to coins they are to be used with caution. Nowhere else do we see the artist so freely copying nature and art, nowhere so unshackled by academic rules, nowhere so little aware of the limitation of his province.

Mode of coining. It is important to study the mode in which Greek money was coined, because the forms of the pieces thus receive explanation, and true coins are discriminated from such modern falsifications as have been struck, and in some degree from those which have been cast. Our direct information on the subject is extremely scanty, but we are enabled by careful inference to obtain a very near approximation to the truth on all the most important points.

The only single ancient Greek die of the authenticity of which we are persuaded was seen by Burgon in the East. He described it, from recollection, as a piece of copper or bell-metal, in the shape of a truncated cone, flat at the top and bottom, about 3½ inches in height, and from about 3 inches in diameter at the bottom to 2 at the top. In the upper surface was cut the die for the reverse of a tetradrachm of a Seleucid king of Syria, with the type of Apollo seated on the omphalos. There appears to have been no trace of any method of fitting this to the die of the obverse. From the appearance which the coins present, it may be inferred that the Greeks placed a ball of metal, carefully adjusted to the proper weight, and cold, between two dies, and then struck the upper die a powerful blow with a very heavy hammer. There was no collar to give the coins an exactly circular form. The dies must have been of hard metal, though softer than modern ones. Some Greek coins have been found of the same die, but such as the writer has seen did not present any evidence as to the wear to which their dies had been subjected. The Roman coins appear to have been struck in the same manner, but with a more careful adjustment of the two sides, yet without a collar. Their dies, although hard, must have been, like the Greek dies, softer than those of the moderns, since, in the case of coins from the same die, we can trace the increase of imperfections through wear, and this notwithstanding the short period for which each die was used and the relatively few coins struck from it. In the case of Greek coins, there is similar evidence, in the great number which have bad or imperfect impressions, although not worn, since all these can scarcely owe their inferiority to insufficient force having been used in striking them. Some few Greek and Roman coins were cast and not struck; others were first cast to give them their general form, and then struck. Both cases, however, form very rare exceptions, and are confined to particular groups of coins and not to isolated examples.

Greek coinage of the far West. We may now pass on to notice the Greek coinage of each country, following Eckhel's arrangement. The series begins with Spain, Gaul, and Britain, constituting the only great class of barbarous Greek coinage. It must not be supposed that the money of the whole class is of one general character; on the contrary, it has very many divisions, distinguished by marked peculiarities; it has, however, everywhere one common characteristic,—its devices are corrupt copies of those of Greek or Roman coins. The earliest of these barbarous coinages begin with the best imitations of the gold and silver money of *Philip II. of Macedon.* They probably first appeared to the north of his kingdom, but the gold soon spread as far as Gaul, and even found their way into southern Britain, by which time the original types had almost disappeared through successive degradations. Next in order of time are the silver imitations of Roman family coins, the victoriati and denarii of the commonwealth, which began in Spain and passed into Gaul and Britain, being current in those countries with the gold money of Greek origin. The copper money of Spain follows the imitated silver types; that of Gaul and Britain, though showing Roman influence, is more original. It is useless to attempt a very minute classification of the subjects of these barbarous types, since the artists by whom they were executed did not properly understand them.

Side by side with these large coinages we find Greek money of colonies in Gaul and Spain, and a far ampler issue of Phœnician coins by the Carthaginian kings and cities of the Peninsula. The coinage of Hispania, corresponding to the modern Spain and Portugal, was issued during a period of about four centuries, closing in 41 A.D. There are four classes of money, which in the order of their relative antiquity are Greek, of two groups, Carthaginian, Romano-Iberian, and Latin. The first or older group of Greek money belongs to the widespread currency which reveals the maritime power of the Ionians of Phocæa. It consists of fractions of the drachm of the Phocæan standard, from the diobol or third downwards. Its later pieces are of the Phocæan colony of Emporiæ, founded by the earlier settlement of Massilia. Next in order and in part contemporary, beginning before the middle of the 4th century B.C., come the drachms of Emporiæ, which betray the influence of Siculo-Punic art. Their standard is probably Carthaginian. Of the neighbouring Rhoda, a Rhodian colony, there is similar money. Carthaginian coins of Spain begin in the same period with the issues of the great colony of Gades, following the same weights as the Emporian drachms. These are followed by the issues of the Barcides from 234 to 210 B.C., with Carthaginian types and of Phœnician weight, struck of six denominations, from the hexadrachm to the hemidrachm. Señor Zobel de Zangróniz has classed them to Spain, on the grounds of provenance and the possession of the silver mines by the Barcide kings, against Muller, who attributes them to Africa. The types are Carthaginian, and present some interesting subjects. The true Iberian currency begins not long after the Punic. The later drachms of Emporiæ, ultimately following the weight of the contemporary Roman denarius, have Iberian legends, and form the centre of a group of imitations issued by neighbouring native tribes with their distinctive inscriptions. This coinage ceased when the Roman province was formed in 206 B.C. A little before this date the Romans had begun to introduce Latin money; about this time, however, they took the backward step of permitting native coinages of Latin weight. Probably they found that native legends and types were more welcome to their subjects than those of Rome. Consequently this coinage of Spain under the republic, which lasted until 133 B.C., may be almost considered national. The two provinces Hispania Citerior and Hispania Ulterior have this marked difference: the coins of the nearer province, of silver and bronze, have always Iberian inscriptions on the reverse, and are clearly under distinct Roman regulation; those of the farther are apparently of independent origin, and consequently bear Iberian, Phœnician, Libyo-Phœnician, and Latin legends, but they are of bronze alone. The interest of these coins lies mainly in their historical and geographical information. They bear the names of tribes, often the same as those of the town of mintage. The art is poor, and lacks the quaint originality and decorative quality of that of Gaul. Ultimately the native money was wholly Latinized (133 B.C.), though political circumstances for a time renewed it under Sertorius (80-72 B.C.) in the modified form of a bilingual currency. The purely Latin issues of the two provinces, and under the empire more largely (from 27 B.C.) of the three, Tarraconensis, Bætica, and Lusitania, present little of interest. They closed in the reign of Caligula (37-41 A.D.), though in later times purely Roman money in gold and silver was issued at different times in Hispania down to the establishment of the Visigothic kingdom.

The imperial money of Hispania introduces us to one of the two great classes of provincial coins under the empire; the larger of these was the Greek imperial, bearing Greek inscriptions, the smaller the Roman colonial, with Latin inscriptions, deriving its name from the circumstance that among Greek-speaking nations the coloniæ were distinguished by the use of the Latin language on their money. In the coinage of Hispania, issued by a nation adopting Latin for official use, the aspect of the coinage is colonial, though it was not wholly issued by colonies. Many of the Spanish towns belong to the kindred class of municipia; others are neither coloniæ nor municipia. In Hispania the obverse of the coin bears, as usual in the colonial class, the head of the emperor or of some imperial personage, the reverse a subject proper to the town. The priest guiding a plough drawn by a yoke of oxen is peculiarly proper to a colonia, as portraying the ceremony of describing the walls of the city, so also an ox, with the same reference, the altar of the imperial founder, or, as connected with his cultus, a temple, probably in some cases that of Roma and Augustus. Other types, however, portray the old temples in restored Roman shapes, or indicate directly by fishes, ears of corn, and more rarely bunches of grapes, the products of the country, not, as in Greek cities, those products in relation to religion. Some original and grotesque types have a markedly local character. The money of Augusta Emerita (Merida) in Lusitania, a colony of pensioners (emeriti), is specially interesting, including as it does the silver issues of P. Carisius, the legatus of Augustus.

The coinage commonly called that of Gaul belongs to the people more properly than to the country; for it comprehends pieces issued by the Gauls or other barbarians from the borders of Macedonia and Illyricum to the English Channel and the Bay of Biscay, through Pannonia, part of Germany, Helvetia, and Gaul. It in-

fluenced the money of northern Italy, and, crossing the Channel, produced that of Britain, which has its own distinctive features. Four classes of coinage are found in these vast limits. Arranging them by date, they are the money of the Greek colony of Massilia and her dependencies, that of the Gauls and other barbarians of central and western Europe, those which can be classed to the tribes and chiefs of Gaul, and the imperial coinage of that country. The coins here attributed to the Gauls and other barbarians are by some numismatists classed to Pannonia. It is quite true that the silver money of this class is not found in Gaul, but in the case of the gold it is impossible to draw a distinct geographical line. Further, no nation is so likely to have struck the bulk of these pieces as the plunderers of the Greek cities; at the same time, there are Thracian and other barbarous mintages which are not Gaulish. The gold money cannot be limited to any one country; it is common to all, having evidently spread as a safe commercial medium; the silver, on the other hand, remained limited to the neighbourhood of the Macedonian territory. Thus, though we may separate certain eastern issues, the general designation of the whole group as issued by the Gauls and other barbarians is safest, so long as the great class of gold remains common to the whole region, and even in some varieties to Britain apart from the true British coinage—unless, indeed, its presence there is due to commerce.

Massilia.

The great mart of Massilia (Marseilles), founded about 600 B.C. by the Phocæans, was the centre of the Greek settlements of Gaul and northern Spain. Emporiæ was her colony, with other nearer towns of inferior fame. Yet Massilia always held the first place, as is proved by the abundance of her money. At first it consisted of Phocæan obols, part of the widespread Western currency already noticed in speaking of Emporiæ. These were succeeded by Attic drachms, some of which, about Philip of Macedon's time, are beautiful in style and execution. Their obverse type is the head of Artemis, crowned with olive, at once marking the sacred tree, which had grown from a branch carried by the colonists, so tradition said, with a statue of the goddess, from Ephesus, and proclaiming the value of the olive-groves of Massilia. On the reverse we note the Asiatic lion, common to it and the last colony of Phocæa, the Italian Velia in Lucania.

Gaul.

The coinage of the Gauls clearly had its origin in their predatory incursions into Greece. They there found the money of Philip and Alexander still the great currency. Civilized enough to convert their spoil from metal into money, they speedily coined gold and silver, of which the earliest examples imitate, often with no small intelligence, the gold staters or didrachms of Philip and the silver staters or tetradrachms of Alexander. From the greater rarity of Alexandrine types in silver and their absence in gold, it may be conjectured that the earliest issues were struck in Philip's reign, though the mass of the coinage must be later. The money of Gallia before the complete Roman conquest, to which it may be anterior in its commencement by half a century, belongs in the gold to degraded types of the earlier widespread currency. The undoubted gold and electrum of this class, identified as bearing regal or geographical names, are extremely limited. By far the most interesting coin of the group is the gold piece which bears the name at full length of the brave and unfortunate Vercingetorix. The silver money is comparatively common. The name of the Helvetian prince Orgetorix is likewise traced on Gaulish coins, on which it appears allied with those of native chiefs, and in a special coinage of his own, remarkable for the characteristic Swiss type of the bear. The bronze money of Gaul is still more abundant than the silver, and has a special interest from its characteristic types. The Roman coins recall those of Hispania, but are limited to a few coloniæ. They range in date from Antony and Augustus to Claudius. The principal issues are the well-known money of Lugdunum (Lyons) and Nemausus (Nimes). Those of Lugdunum may have been struck in a district around the city; the type of the famous altar of Lyons, that of Roma and Augustus, is worthy of note. The type of Nemausus, commemorating the conquest of Egypt in the crocodile and palm, is further remarkable as sometimes struck in the shape of the hind-leg of a deer, and is therefore called the *pied de biche*.

Britain.

The ancient coinage of Britain is the child of that of Gaul, retaining the marks of its parentage, yet with characters of its own due to an independent growth. Money first came in trade by the easiest sea-passage, and, once established in Kent, gradually spread north and west, until the age of the earlier Roman wars, when it was issued in Yorkshire, probably in Lincolnshire, and in a territory of which the northern limits are marked by the counties of Norfolk, Cambridge, Huntingdon, Bedford, Buckingham, Oxford, Gloucester, and Somerset. The oldest coins are gold imitations of Philip's staters which, whether struck in Gaul or Britain, had a circulation on the British side of the Channel. They are the prototypes of all later money. From a careful comparison of their weights with those of later coins, and from a study of the gradual degradation of the types, Evans places the origin of the coinage between 200 and 150 B.C. Its close may be placed about the middle of the 1st century A.D. The inscribed coins occupy the last century of this period, but are contemporary with uninscribed ones. The uninscribed coins are of gold, silver, bronze, and tin, the gold being by far the most common. There is small variety in the types, nearly all in gold and silver, and some in copper, presenting in more or less degraded form the original Gaulish type for gold. It may be suspected that all new types and the extremely barbarous descendant of the tin series are of the age of the inscribed coins, or but little earlier. The Channel Islands are remarkable for a peculiar coinage of billon, a very base silver, presenting the usual types modified by Gaulish grotesqueness. The place of this group in the British series is merely accidental; in character as in geography it is Gaulish.

The inscribed coins are evidently in most cases of chiefs, though it is certain that one town (Verulaminm) and some tribes had the right of striking money. The most interesting coins are those of known chiefs and their families—of Commius, probably the active prince mentioned by Cæsar, of Dubnovellaunus, mentioned in the famous Ancyra inscription, which has been called the will of Augustus, and most of all the large and interesting series of Cunobelinus, Shakespeare's Cymbeline, his brother Epaticcus, and his father Tasciovanns. It is evident from the coins and historical evidence collected by Evans that Tasciovanus had a long reign. His chief town, as we learn from his money, was Verulamium. His coins are in three metals, repeat the traditional types, and present new ones, some showing a distinctly Roman influence. The money of Epaticcus is scanty, but that of Cunobelinus, with Camulodunum (Colchester) for his chief town, is even more abundant than his father's, indicating a second long reign, and having the same general characteristics. The gold shows a modification of the traditional type, the silver and bronze the free action of Roman influence and a remarkable progress in art. With the death of this prince not long before 43 A.D. British coinage probably ceases, none being known of his sons, Adminius, Togodumnus, and the more famous Caractacus, though the coins of the Iceni may have continued as late as 50 A.D.[1]

Italy.

The ancient coins of Italy occupy the next place. They appear to have been struck during a period of more than 500 years, the oldest being probably of the beginning of the 6th century B.C., and the latest somewhat anterior to the time of Julius Cæsar. The larger number, however, are of the age before the great extension of Roman power, which soon led to the use of Roman money almost throughout Italy. There are two great classes, which may be called the proper Italian and the Græco-Italian; but many coins cannot be referred to either, since they present peculiarities of both. The proper Italian coins are of gold, silver, and bronze. Of these, the gold coins are extremely rare, and can never have been struck in any large numbers. The silver are comparatively common, but the bronze are very numerous and characteristic. Some of the silver coins have an incuse device on the reverse, which is almost always a repetition of that on the obverse; they are of Greek cities, but their fabric is peculiar to Italy. There are also a few with a design on the obverse and a perfectly plain reverse. The most remarkable bronze coins of this class are of the kind called æs grave, some of which were the early proper coinage of Rome, although others are known to have been struck by other Italian cities. These are very thick coins, some of which are of great size, while most have a rude appearance. The designs of the Italian coins are generally, if not always, of Greek origin, although the influence of the native mythology may be sometimes traced. The inscriptions are in Latin, Oscan, or Etruscan, and follow a native orthography; sometimes on the earlier coins they are retrograde. The art of this class is generally poor, or even barbarous. The denominations are common to Greek money, except in the case of the bronze, which follows a native system. Of this system the early proper Roman coins afford the best known examples. The Græco-Italian coins are of gold, silver, and bronze. The silver and bronze are very common, and the gold comparatively so, although struck by few states or cities. In form the silver and bronze coins are thicker than those of Greece of the same period, but there is not the same difference in the gold. The designs are of Greek origin, although here, as in the proper Italian coins, but less markedly, native influence can be detected. This influence is evident in the frequent occurrence of types symbolically representing rivers, showing a bias towards the old nature-worship, and still more in the use of Latin inscriptions, with half-Italian forms of the letters on coins otherwise Greek. Of the best art of ancient Italian money we have already spoken, and we shall have occasion to mention some of its most beautiful examples. The denominations of the gold and silver coins are unquestionably derived from those of Greece, according to the weight of the Attic talent, the heaviest gold piece being the stater or 3000th part of that talent; in silver there are few tetradrachms, the didrachms are extremely common, and smaller denominations are usually not rare. We thus learn that the silver currency was chiefly of didrachms, smaller pieces being less used, and larger ones scarcely used at all. It is important here to notice that the interchange of the native or Italian bronze coinage with the Greek silver coinage led to a double standard, silver and bronze. The bronze standard, as might be suspected, was of Italian origin, the silver of foreign introduction.

[1] This summary is from Evans's *Coins of the Ancient Britons*, London, 1864.

The peculiarity of the Italian bronze is that in its oldest cast form it was of such weight as to show the absence in some parts of the country of silver equivalents. It was long after silver had been introduced everywhere, with struck bronze equivalents, before the heavy coinage (æs grave) went out of circulation. The silver money is at first remarkable for the evidence it affords of its extraneous character in presenting two standards. Afterwards it becomes equivalent to the bronze, or supplies equivalent pieces, and is quite regular. The original condition of the Italian currencies is best illustrated by the money of Etruria about 300 B.C. Etruria, be it remembered, was an early goal of Oriental commerce by sea. At the great mart of Populonia, and in the country round, we find not only silver coins of two different foreign standards, the Attic and the so-called Persic, but also cast æs grave and later struck bronze pieces issued before the cast money had fallen into disuse. Without discussing the origin of these various currencies it is enough to note that they bear witness to the effects of a widely-spread commerce, and show that here was the meeting-point of the native system and of foreign ones.

In Italy the æs grave long ruled. Originally it was libral, the principal coin being the as, nominally of the weight of a Roman libra or pound. In the coinage of Rome the as does not seem to have ever exceeded the weight of ten ounces, or ten-twelfths of its proper weight. On the other hand, the æs grave of Etruria is occasionally heavier. The Romans made the quarter denarius, called the sestertius, the silver equivalent of the libral as; the earliest weight of this coin was about 17·156 grs.; and, the value of silver to bronze being as 1 to 250, we thus obtain 4290, or about ten libral ounces, as the original weight of the libral as. The successive reductions of the as belong to Roman numismatics, and it is only necessary here to add that they affected the local bronze coinages as Italy fell under the rule of the republic. The silver coinages, on the other hand, survived for a longer time throughout the Greek cities. Their coin corresponding to the sestertius, as the equivalent of the libral as, was the Attic diobolon, which, originally of 22·5 grs., was at once reduced to about 18, and of course reduced the didrachm at the same time, which, really Attic, became apparently Phœnician; it was the principal silver coin of the cities of Magna Græcia. The purely Italian currency rules in northern and middle Italy. The great Greek coinages are of the wealthy marts which dotted the coasts of Campania, Calabria, Lucania, and the Bruttii. Similarly we find Etruscan inscriptions on the coins of Etruria, and Oscan on those of middle and lower Italy, where they are eclipsed in number and style by the Greek issues.

Beginning in the north of Italy, the first coins that strike us are those of Populonia in Etruria. The silver money of this place is generally of the peculiar fabric in which the reverse is left perfectly plain. The æs grave of upper and middle Italy is of great importance. It presents the great oblong masses of uncertain weight, multiples of the as, which wear an aspect of great antiquity, though the elephant on one shows us that they were cast after the wars of Pyrrhus. Latium is particularly rich, even when we exclude the coinage of Rome (to be treated later). Samnium shows us a curious revival of native silver money after the local coinage of the Italian towns had been almost abolished by Rome. It was the result of the Social or Marsic War of the confederate tribes, who struck for Italy against the Roman supremacy during the years between 90 and 88 B.C. The coins present the head of Italia, and reverse types of which the most striking are warriors, varying in number, taking an oath over a sacrificial pig, and a bull for Italy goring the prostrate wolf of Rome. The inscriptions are Oscan or Latin.

reek owns f Italy.

Certain of the Greek towns of Italy deserve special mention for the splendour of their coinage,—beautiful in style and delicate in execution. In Campania (leaving the Romano-Campanian for later notice) the two most interesting currencies are of Cumæ and Neapolis, the modern Naples. Cumæ presents silver money of the archaic and the early fine style, in which last we first observe the peculiar naiveté of western Greek art before it had attained elaboration. The abundant silver coins of Neapolis are of the early and the late fine periods and of the decline. The types are usually the head of the siren Parthenope, more rarely Hera and Pallas, favourite goddesses of the Greeks of Italy; the reverse presents the man-headed bull common on Campanian money, here not a river-god as in Sicily, but the tauromorphous Dionysus. The bronze money is of good style, and age has beautified it with the rich blue or green patina due to the sulphurous soil. When we reach Calabria the Greek money startles us in astonishing wealth of beauty in the currency of the opulent and luxurious mart of Tarentum, second only to Syracuse in the whole West, of all the main periods of art, and including in the age of its greatest prosperity and its fall (the time of the contest with Rome) the most abundant gold issues of any Greek city. The gold money of Tarentum is a delight to the eye, with the varied beauty of its gem-like types, which, while they show the gem-engraver's art, prove the medallist's knowledge of the rich but opaque metallic material. Several heads of divinities adorn these coins, and the chief reverse types relate to the legendary founder, Taras, son of Poseidon. Always a youth, he appears as a charioteer, perhaps as a horseman, and riding on a dolphin,—the familiar Tarentine type. The most remarkable subject represents him with outstretched arms running to Poseidon seated on a chair. The silver coinage is chiefly of Attic didrachms, of low weight to admit the interchange of their sixth, the diobol, with the Roman libral as. The prevalent type is Taras seated on a dolphin; in earlier money the type is single, and repeated incuse on the reverse; afterwards this subject occupies the reverse, and, itself a charming composition, is delightfully varied. On the early fine coins the people or demos, personified generally as a youth, often holding a spindle, occupies the obverse, but gives place to a horseman in various attitudes, giving great scope to the engraver's skill; probably he is Taras himself, save when he is a full-grown warrior. These representations illustrate the famed horsemanship of the Tarentines, and refer to contests and games which were probably local. Heraclea in Lucania shows us didrachms of the fine age, with heads of Pallas and subjects connected with Heracles: the contest with the Nemean lion is most skilfully treated, and the series is very characteristic of the gem-engraver's art. The powerful city of Metapontum begins with early coins having the incuse reverse, and then displays a long series stretching down to the decline of art. The constant type, which recurs with the heraldic instinct of the West, is the ear of bearded wheat, reminding us of the "golden harvest" (χρυσοῦν θέρος) which the Metapontines dedicated at Delphi. Like the Tarentine badge, it first occupies the obverse, then the reverse, balanced by a charming series of heads of divinities. Persephone is the most appropriate counterpart; we also note heads of Concordia (Ὁμόνοια) and Hygieia, marked by an ingenuous grace peculiar to the early fine work of the Western school, of Leucippus the founder as a helmeted warrior (occurring on a rare tetradrachm and the usual didrachms), and many other types of unusual variety and originality of conception.

The ancient Sybaris, famous for her luxury, has left archaic coins; she was destroyed by Croton in 510 B.C., restored for a time, and then became an Athenian colony, speedily receiving the name of Thurium about 443 B.C. The result of the support of Athens in the days of Pericles was the issue of a splendid series of coins. Not only is the face of the coin occupied by the head of Pallas, and the great currency, as at Athens, of tetradrachms, but the severe beauty of the style points to the direct influence of the art of central Greece. The head of Pallas is covered by a helmet adorned with a splendid figure of the sea-monster Scylla The reverse shows a bull butting (Θούριος), in a strikingly ideal form. Probably the obverse type affords the nearest reflexion of the masterpiece of Phidias, or at least the closest following of his style. The finest coins are unsigned tetradrachms, but didrachms of cognate style give the beginning of the name of the engraver Φ. He reappears at Terina (of which town presently).

Velia, the last colony of Phocæa, whose citizens sailed away to the far west rather than submit to the Persian tyrant (544 B.C.), shows coins from its foundation. The pieces of fine work witness to an Asiatic origin in the types of the lion, devouring the stag or as a single device, while the obverse displays the head of Pallas so much in favour in Magna Græcia. The style, which lacks strength but not beauty, is Italian, and we see no trace of the pictorial qualities of Ionian art, which indeed had not taken its mature form when the exiles left the mother country.

The Bruttii are the first native Italians whom we find striking a fair Greek coinage. Their gold and silver is of late style, the gold presenting the head of Poseidon and Amphitrite on a sea-horse, the silver the head of Amphitrite and the figure of Poseidon, both with other subjects. Caulonia has early coins running down to the early fine period, mythologically interesting in type, and the later with a beautifully-designed stag on the reverse. For Croton the ruling type is the tripod. The eagle occurs on the obverse and the tripod on the reverse. The bird of Zeus is inferior to that at Agrigentum, as this again is inferior to the eagle of Elis. We note also beautiful types of Heracles seated, one of marvellously delicate work, on the reverse of which Apollo aims an arrow at the Python from behind his tripod,—a remarkable composition. The other Heracles types form a most interesting series of recollections, "memory sketches," of a famous statue, the pose of which recalls the so-called Theseus of the Parthenon, while the obverse presents the head of the Hera Lacinia worshipped on the promontory close by. The latest coins, like the parallel ones of Metapontum, are weak and pretty. The money of the Locri Epizephyrii affords two curious types of reverse, Eirene seated, of fine style, with the legend ΕΙΡΗΝΗ ΛΟΚΡΩΝ, and the later yet more remarkable subject of Roma seated while Pistis crowns her, the legend being ΡΩΜΑ ΠΙΣΤΙΣ ΛΟΚΡΩΝ. The historical reference is as yet undiscovered. There are beautiful coins of the little-known town of Pandosia, bearing the head of the nymph Pandosia (?); the reverse has the river Crathis, a splendid head of the Lacinian Hera, and Pan, being signed by an engraver who may be the same as the Φ of Thurium, though the style is different and the execution gem-like.

Rhegium was closely connected with Messene in Sicily opposite, and thus the great Sicilian currency of tetradrachms prevails.

Anaxilaus, tyrant of Rhegium from 494 to 476 B.C., early in his rule acquired Messene through Samian adventurers. The coins of both towns at first present Samian types, and then, the Samians having been expelled, Anaxilaus commemorates his Olympic victory in the mule-car. As this race only lasted from 500 to 448 B.C., its occurrence here, represented only in the style of the earliest quarter of the 5th century, is historically valuable. The same type appears at Messene and lasts longer. In both cases the reverse bears a running hare, a symbol of Pan.

The little-known town of Terina is illustrious as having produced a series of silver didrachms which, on the whole, is the most beautiful in Italy. The obverse has the head of a goddess, who is portrayed winged on the reverse,—a wonderfully fine subject, well conceived and most delicately executed in a variety of different attitudes, some recalling the Nices which adorn the balustrade of the temple of Wingless Victory at Athens. Very curiously, the money of Terina begins with an archaic coin which bears on the reverse the named figure of Wingless Victory, surrounded by the olive-wreath. Does all this indicate a religious connexion with Athens? Though the Athenian temple was not built till half a century or more after the date of the earlier coin, we may well think that the worship was of older date. The artist of the later coins, who signs Φ, is clearly the Φ of Thurium, Athenian in style if not in nationality, and perhaps he had seen the sculptures at Athens. At Terina he rules art; at Thurium he is one of several engravers; at Heraclea and Neapolis he merely introduces the stronger style; perhaps he appears once more executing a masterpiece at Pandosia. He must have had a long life and wide renown. It is significant that at Terina the later coins have a merit most unusual in the West.

ly. The coinage of Sicily is Greek. The Hellenic and Carthaginian colonies of the coast left the barbarous natives undisturbed in the inland country, and both issued Greek money, the Punic with a tincture of Phœnician style. The coinage ranges from the 6th century B.C. until the subjugation of the island by the Romans, after which a few cities struck colonial or imperial coins for a short space. The marked periods are those of the preponderance of Syracuse from 480 to 212 B.C., interrupted by the great Carthaginian wars, which were fatal to the cities of the southern coast. The coinage is in gold, mainly issued at Syracuse, in silver, and in bronze. The standard is Attic, except the earliest money of the Chalcidian colonies Himera, Messene, and Naxos, which follows the Æginetan weight. The metrology of Sicily has a distinct relation to that of Italy. Here also there is a double standard, silver and bronze, and in consequence an intrusive silver coin, differing but little from the obol, weighing 13·5 instead of 11·25 grs., the silver equivalent of the bronze litra, whose name it borrows. The litra in bronze was the Sicilian pound, equal to half an Attic mina, and to two-thirds of the Roman libra or pound. So important was the litra in Sicily that the silver litra supplanted the obol, and the didrachm was sometimes called a stater of ten litræ, the decadrachm a piece of fifty litræ, pentecontalitron. The leading coin is the tetradrachm, not, as in Italy, the didrachm.

The Sicilian money is of extremely careful artistic work, not unfrequently even in the case of bronze allowing for a more rapid execution of the die; and the highest technical excellence is attained. The art is that of the southern branch of the great Western school, generally more skilful than the art of southern Italy, but less varied. The earlier fine work has a naive beauty peculiar to the West and almost confined to Sicily; all that follows is evidently gem-engravers' work. These coins are remarkable for the frequency of artists' signatures, which for the short period of highest skill are almost universal on the larger silver money of Syracuse, and occur less frequently on that of the other great cities. As in Italy, the decline is more rapid than elsewhere in the Greek world, in consequence of the inherent weakness of the style; but it is in part due to the calamities of the island, as of lower Italy.

The fame won by the tyranni and other leading aristocrats of Sicily in the great national contests of Hellas, in the race with the quadriga, the mule-car, and the horse, led to the introduction and supremacy of types commemorating these victories, probably in most cases those achieved at Olympia. That these victories are intended is shown principally by the mode in which a chariot is portrayed at the critical moment of passing the turning-post, by the occurrence of the turning-post itself, by the correspondence of the cities issuing the type with those commemorated by Pindar, in whose *Olympic Odes* the six victories in the chariot-race are all won by Sicilians, and by the direct evidence of Aristotle (ap. Poll., v. 75) that Anaxilaus of Rhegium recorded on his coins his Olympic victory with the mule-car. It is obvious that no success could be so appropriately figured on the coinage. The religious idea was maintained; the charioteer or the horseman was not the victor, but at the same time the renown of the city was indissolubly connected with the citizen who won it. Hence these types are confined to states ruled by tyranni or oligarchies; outside Sicily they are only found at Rhegium when it was closely connected with Sicily, at Cyrene, and in the money of Philip II. of Macedon. The horseman is not a frequent type; the mule-car is limited to Messene (and Rhegium); but the quadriga becomes the stereotyped subject for the reverse of the great Sicilian tetradrachms,—the bulk of the coinage,—and only escapes heraldic sameness by a charming variety in the details. In the age of finest art a divinity of the city takes, in Homeric guise, the place of the charioteer, or Nice herself so wins the victory; commonly she hovers above about to crown the charioteer. Yet more interesting are the types connected with nature-worship, especially those portraying river-gods in the form of a man-headed bull, or a youth with the budding horns of a calf, or in the shape of a dog, where Phœnician influence is found, and also the subjects of the nymphs of fountains. These types occur on either side of the coin. The obverse of all is usually held by the head of a divinity, Persephone and Pallas taking the first place.

The leading position which Syracuse held in the island makes it proper to notice her splendid currency first, the finest for knowledge of the materials, for skill in suitably filling the space, and for delicacy of execution in the whole range of Greek money, though we miss the noble simplicity of Greece, the strong feeling of western Asia Minor, and the simple picturesqueness of Crete. These larger qualities are sacrificed to an excess of richness and even to tricks of art. Yet the beauty of the coins and their completeness,—the artist having satisfied his intention,—command our admiration; and our interest is raised by the story they tell of the vicissitudes of the great city of the West, the mother of liberty and the slave of tyrants, great in commerce, rich, luxurious, loving the arts, yet able to defend herself even under base rulers against all the power of Carthage and of Athens. Syracuse was founded in 734 B.C. by Archias of Corinth, an origin which, remembered on both sides, served her well in later history. In the 6th century, under the oligarchy of the Geomori, she issued her most archaic silver money, which, primitive as it is, gives promise of the care of the later coinage, and begins the agonistic types, thus indicating some early victory at a great Hellenic contest. Gelon, tyrant of Gela, won the chariot race at Olympia in 488 B.C., secured Syracuse in 485 B.C., and, when the Carthaginians, probably by agreement with Xerxes, invaded Sicily, utterly routed them at the great battle of Himera (480 B.C.), the Salamis of the West. These events find their record in the issue and subjects of his Syracusan money, which, however, was struck, as usual in that age, in the name of the people. The chariot type is varied, for Nice appears hovering above the victorious charioteer, about to crown the horses, and the coins issued after the great battle show the lion of Libya beneath the car in the exergue (Head, *Syracuse*, 9). These last pieces are fixed in date by the famous story how Gelon's wife Demarete, having gained favourable terms for the vanquished Carthaginians, was presented by them with a hundred talents of gold, by means of which she coined the great silver pieces of fifty litræ or ten drachms, which were called after her demaretia. They bear the head of Nice, or it may be Pallas, crowned with olive, and the quadriga and lion. The battle of Himera and the death of Gelon (478 B.C.) fix the date of these remarkable coins, which close the archaic series of Syracuse and give us a fixed point in Greek art, at about 479 B.C. There is a touch of Egyptian in their style which makes us think that Syracuse may have been influenced through Naucratis.

Syracuse.

Hieron (478-467 B.C.), the brother and successor of Gelon, continues the same types, alluding, as Head well remarks (*loc. cit.*), to his great victory over the Etruscans off Cumæ (474 B.C.), by the marine monster in the exergue of the reverse which denotes the vanquished maritime power. It is to be noted that as Gelon introduces the Nice in the chariot type, so in the horseman type we now first see Nice crowning the rider. Gelon had won an Olympic victory in the four-horse contest, Hieron in the horse-race, though he also won with the four horses in the Pythian games. With Hieron's money we say farewell to archaic art. The female heads on the obverse now have the eye in profile and show beauty and variety, and the horses are even exceptionally represented in rapid action. With the short rule of Thrasybulus, the last brother of the house, it came to an end, and the age of the democracy (466-406 B.C.) began. The victories by land and sea of Gelon and Hieron had established the power of the city on a sure basis, and fifty years of prosperity followed. To the earlier part of this age belong the beautiful transitional coins in which the female heads are marked by a youthful simplicity of beauty combined with fanciful and even fantastic treatment of the hair; the reverses remain extremely severe. Towards the close of this age there are very fine works, the first signed coins, with the old dignity yet with greater freedom of style, the horses of the quadriga in rapid movement. The contest with Athens and the victory of Syracuse (415-412 B.C.) seem to have given the impulse of which we here see the effect. To the democracy also belong the earliest gold and bronze pieces.

The tyranny of Dionysius and his successors (406-345 B.C.) is the age of the most splendid Syracusan coins, and that which shows the distinct beginning of decline. The wealth and prosperity of Dionysius led to the issue of the magnificent decadrachms, commonly but erroneously called medallions, with the heads of Persephone and Arethusa and the victorious chariot, as well as a variety of

signed tetradrachms. The tyrant, defeated at Olympia by a combination, seems to commemorate on these coins the victory he could have won, and this explanation appears to be confirmed by such indications, never all combined, as the fallen turning-post, the broken rein, and the affrighted charioteer. The Dionysian dynasty closed in nine years of anarchy, until Syracuse appealed to Corinth, and Timoleon was sent to restore order (344 B.C.). The triumph of this public-spirited statesman is witnessed by various changes in the coinage. The chief silver piece is now a didrachm of Corinthian type, corresponding in weight to the tridrachm of Corinth, and with the same types, the head of Pallas and the Pegasus; the smaller coins present some Corinthian subjects. The democracy was overthrown in 317 B.C. and the city seized by Agathocles (317-289 B.C.), the worst of the tyrants of Syracuse. In the course of his reign he adopted the royal style, and his coins, a reflexion of earlier work, give his name first without and then with the title king,—a double innovation. The tyrant Hicetas (287-278 B.C.), and the next ruler, Pyrrhus king of Epirus (278-276 B.C.), continue the coinage, Pyrrhus issuing money in the name of the Syracusans and also striking his own pieces. The departure of Pyrrhus led to the establishment by a native, the second Hieron, of a dynasty which, so long as he ruled (276-216 B.C.), restored the ancient prosperity and preponderance of the rule of his namesake. At first content with inscribing his name alone, he soon not only takes the title of king, conferred on him in the early years of his reign, but also places his portrait on the money. Of his time is the beautiful portrait of Queen Philistis, supposed to be his consort. The heads have merit, but the reverse has become merely heraldic. The money of the short reign of Hieronymus (216-215 B.C.) and of the brief democracy which fell before the Romans (215-212 B.C.) close the independent series of this great city. But her name still appears in bronze money issued after the conquest.

Other cities of Sicily.

Taking the rest of the money of Sicily in alphabetical order, we first note a very fine bronze coin bearing a beautiful female head, perhaps that of Sicilia, crowned with myrtle, and a lyre, the date of which is later than Timoleon's Syracusan issues, on one of which it is restruck. This coin is conjecturally attributed to Adranum. Ætna, better known as Catana, is represented by a unique tetradrachm, with a wonderful head of Silenus, and Zeus as the god of the volcano hard by enthroned and hurling a thunderbolt. The first great town is Agrigentum, represented by archaic, transitional, and fine coins, the fine series ending with the overthrow of the city by the Carthaginians in 406 B.C.,—a blow from which it never recovered. The usual types are the eagle and the crab, but in the age of finest art we see two eagles devouring a hare, and a victorious chariot; these occur in the rare decadrachm and the tetradrachms. The eagle is superior to that of Croton, inferior to that of Elis. Is it a sea-eagle, while the Olympian bird is the golden eagle? Many of the bronze coins are of good work. The type most worthy of note is the head of a river-god, with the name Acragas, which was that of the stream of the town, and on the reverse an eagle standing on an Ionic capital, the Olympic turning-post. The success of Agrigentum at the games is attested by Pindar, while Virgil (*Æn.*, iii. 704), Gratius (*Cyneg.*, 526), and Silius Italicus mention its ancient renown for horses. The lofty site (arduus Acragas), overlooking the sea and on the bank of the stream of the same name, makes the eagles, the crab, and the river appropriate devices, showing that Greek types have a local fitness, while chosen with a religious intention.

The money of Camarina is of especial beauty and interest. The fifth of Pindar's *Olympic Odes*, to Psaumis the Camarinæan, affords an excellent commentary upon it. The earliest coin we know is a didrachm of about this time, whereas there are many pieces of from fifty to a hundred years earlier of most of the other important cities of Sicily. Camarina, however, was then but lately inhabited (*νέοικον ἕδραν*), having been recently twice devastated by the Syracusans. This piece has on the obverse a helmet upon a round shield and on the reverse a pair of greaves, between which is a dwarf palm (*Chamærops humilis*). The arms are those of some divinity or hero; the palm may represent the sacred grove (*ἄλσος ἁγνόν*) in which the temple of the chief divinity probably stood. This piece is followed by tetradrachms and didrachms of the best period, most beautiful in style, and varying a little from difference of age. The tetradrachms bear on the obverse the head of Heracles in the lion's skin, and on the reverse Pallas as a victor at the Olympic games in a quadriga. It was Pallas, protector of the city (*πολιάοχε Παλλάς*), whose sacred grove was made more illustrious by the success of Psaumis. The didrachms have on the obverse the head of a river-god, portrayed as a young man with small horns and with wet hair. Of the two rivers of Camarina, the Oanus and the Hipparis, the Hipparis is here represented, for in one case the name is given on the coin. Pindar seems to show the same preference, for, while he merely mentions the Oanus (*ποταμόν . . . Ὤανον*), he speaks of the sacred channels by which the Hipparis watered the city (*σεμνοὺς ὀχετούς, Ἵππαρις οἷσιν ἄρδει στρατόν*). On the reverse the nymph Camarina (*Ὠκεανοῦ θύγατερ . . . Καμαρίνα*) is seen carried across her lake (*ἐγχωρίαν . . . λίμναν*) by a swan swimming with expanded wings, while she aids it by spreading her veil in the manner of a sail. Some of these didrachms have on either side, around the chief device, fresh-water fishes. The series of Catana comprises fine archaic tetradrachms and others of the time of the best art. The archaic tetradrachms have the types of a river in the form of a man-headed bull and of the figure of Nice. The head of Apollo succeeds, with for reverse the victorious quadriga, in one case passing the turning-post, an Ionic column.

Gela is represented by coins of which the archaic tetradrachms must be especially mentioned. They have on the obverse the forepart of the river-god Gelas, whence the city took its name. The Gelas is represented as a bull, having the face of a bearded man. On the reverse is a victorious quadriga at the Olympic games, in some examples represented passing an Ionic column, as on coins of Catana. A tetradrachm of the later period of the age of good art has types of the head of the Gelas as a young man horned, surrounded by three fishes, and on the reverse Nice in a biga with a wreath above. The money of Himera is of great interest. The oldest didrachms of Himera, which probably began in the 6th century B.C., bear on the obverse a cock and on the reverse an incuse pattern. They are succeeded by transitional tetradrachms, which bear on the one side a victorious quadriga and on the other a nymph sacrificing, near whom a little Silenus stands under the stream of a fountain issuing from a lion's head in a wall. Leontini is represented by tetradrachms with the head of Apollo and the victorious car, which gives place to a lion's head. The series of Messene begins, when the town was called Zancle, or, as it is written upon the coins, Dancle, with early drachms or smaller pieces of the Æginetan weight, and of very archaic work. On the obverse is a dolphin, and around it a sickle, and on the reverse is a shell in the midst of an incuse pattern. The place is said to have received its name on account of the resemblance of the harbour to a sickle (*ζάγκλον* or *ζάγκλη*). Next to these first coins of Zancle may be placed, as the oldest piece of the Attic weight, a tetradrachm with the Samian types, a lion's scalp on one side and on the other the head of a bull, and bearing the inscription ΜΕΣΣΕΝΙΟΝ. This coin was doubtless struck during the rule of the Samians, who took the place about 494 B.C., at the instigation of Anaxilaus tyrant of Rhegium, by whom they were subsequently expelled (Thucyd., vi. 4). The next pieces are the earliest of those which have on the obverse the mule-car and on the reverse a running hare, like the contemporary coins of Rhegium, with the same devices and equally of the rule of Anaxilaus. These types cease at Rhegium, though they continue at Messene, some of the tetradrachms bearing them being of the age of fine art. When the town had been seized by the Mamertini, money was struck with their name, thus borne by the later coins, which are of bronze. They are good, but not of the best style. Naxos is represented by handsome transitional tetradrachms and others of the fine period, and by smaller silver pieces, chiefly of the earlier time.

There are some coins of the city of Panormus, but most of those which have been classed to it are of the Carthaginians, issued both in Sicily and in Africa. Nothing is more probable than that many of these pieces were struck at Panormus, but there is no sure means of distinguishing any such, and, if there were, the mere fact of their having been issued at the place would not justify us in classing them to it. Segesta is represented by coins of the archaic and of the good period. We first notice the head of the nymph Segesta and a hound, probably a river-god, then the same type for obverse associated with a young hunter accompanied by two hounds,—a charming composition. Another interesting type is a victorious car driven by Persephone, who carries ears of corn.

In the series of the city of Selinus the first coins are didrachms, bearing on the obverse a leaf and on the reverse an incuse square. The city and the river of the same name no doubt derived their name from the plant *σέλινον*, the leaf of which must be here intended. There is some difficulty as to its identification; the plant sacred at Selinus appears to be, as Colonel Leake supposes, wild celery (*Apium graveolens*); but it does not follow that the "selinon" with which the victors at the Isthmian and Nemean games were crowned was really the same species. Tetradrachms and didrachms of transitional and of good art have devices of more than usual interest. The obverse exhibits a river-god, sometimes the Selinus, sometimes the Hypsas, sacrificing at the altar of Æsculapius, while on the didrachm a wading-bird is sometimes seen behind him, as if departing. This subject appears to allude to the draining of the pestiferous marshes. The reverse of the tetradrachms generally shows a quadriga in which Apollo stands drawing his bow, while Artemis is charioteer. The reference must be equally to the driving away of the pestilence.

Sic- Pun- mo-

We have still to mention the main characteristics of the true Siculo-Punic coins, that is, those actually struck by the Carthaginians in Sicily. A careful examination shows that the Punic money must be separated into three distinct divisions—the coinage of the Carthaginians in Africa, in Sicily, and in Spain. The Sicilian coins are adjusted to the Attic talent, like those of the Greek cities of the island, and show Greek style modified by barbarian influence. The known towns are Solus, Motya, Panormus (?), and Heraclea

Minoa. The leading types are imitated from Syracusan money. This series must not be confounded with the large Attic issues of Carthage, which are distinguished by special types not found in the Sicilian money, such as the horse's head and the palm-tree; the head of Persephone links these coins with the true Siculo-Punic.

The islands near Sicily issued coins which belong to the Carthaginian series, except Lipara, of which there is heavy bronze money on the Sicilian system, having on the obverse a head of Hephæstus, or sometimes a figure of the same divinity seated, holding a hammer and a vase, which he seems to have just formed.

The Tauric Chersonese, &c. In the Tauric Chersonese there are interesting coins, in the three metals, of the city of Panticapæum, the modern Kertch. Their obverse usually bears the head of Pan and their reverse a griffin and other subjects; some are of fine Greek style. The money of Sarmatia, of Dacia, and of upper and lower Mœsia is chiefly bronze of the Græco-Roman class. In Sarmatia we may notice the autonomous and imperial pieces of Olbia, and in Dacia the series bearing the name of the province. The Roman colonia Viminacium in upper Mœsia is represented by numerous coins of a late time. Of Istrus, in lower Mœsia, there are drachms having a strange type on the obverse, representing two beardless heads, those of the Dioscuri, side by side, the one upright and the other upside down; on the reverse is an eagle devouring a fish. The style of these coins, it may be noticed, is in general fair, though it sometimes approaches to barbarism. There are abundant Greek imperial coins of Marcianopolis and Nicopolis, while Tomi is represented in this class as well as by autonomous money.

Thrace. The coins of Thrace are of high interest. Here and in Macedonia we observe the early efforts of barbarous tribes to coin the produce of their silver mines, and the splendid issues of the Greek colonies; and we see in the weights the influence of the Asiatic Greeks, the Athenians, and the Persians. The oldest coins are of the 5th century B.C., and there are others of all subsequent times, both while the country was independent and while it was subject to the Romans, until the cessation of Greek coinage. Some of the best period are of the highest artistic merit. So long as they maintain any general distinctive peculiarities of fabric and design, that is, from their commencement until the age of Philip, the Thracian coins resemble those of Macedonia. The money of Abdera comprises tetradrachms and smaller coins of the periods of archaic and fine art, all but the latest of the Phœnician standard, ultimately superseded by the Persic. The principal type is a seated griffin. The reverse type, an incuse square, has at first four divisions, but in the age of the finest art contains a variety of beautiful subjects. Ænus is remarkable for the great beauty of some of its coins. These are tetradrachms of Attic weight, of the late archaic and best ages. The interesting turning-point from growth to maturity is seen in a vigorous head of Hermes in profile, wearing the petasus. A little later is the splendid series of facing heads, the broad, severe, and sculptural treatment of which is truly admirable, and far superior to the more showy handling of the same subject in later drachms. A goat is the reverse type of the larger coins. The money of the city of Byzantium begins with coins on the Persic standard of good style, having on the obverse a bull above a dolphin and on the reverse an incuse square of four divisions, and closes with the series of bronze coins issued under the empire. The Roman colonia of Deultum and the city of Hadrianopolis deserve a passing notice. Of Maronea, anciently famous for its wine, there is an interesting series beginning with small archaic coins. After these we notice fine tetradrachms of Phœnician weight, having on the obverse a prancing horse and on the reverse a vine within a square. The standard changes to Persic, of which there is a beautiful series of didrachms. Then the series is interrupted by the rule of the Macedonian kings, and resumed in a barbarous coinage of the native Thracians, issued in the second and first centuries before the Christian era, consisting of spread Attic tetradrachms with the types of the head of beardless Dionysus crowned with ivy and on the other side his figure. The Greek imperial coins of Pautalia and Perinthus are worthy of notice. Among those of the latter town we may mention fine pieces of Antoninus Pius and Severus, and large coins, commonly called medallions, of Caracalla and other emperors. The money of the imperial class issued by Philippopolis, Serdica, and Trajanopolis should also be noticed. In the Thracian Chersonese the most important series is one of small autonomous silver pieces, probably of the town of Cardia. There is a limited but highly interesting group of coins of Thracian kings and dynasts. The earliest are of kings of the Odrysæ, including Seuthes I., who began to reign in 424 B.C., and whose money bears the two remarkable inscriptions ΣΕΥΘΑ ΚΟΜΜΑ and ΣΕΥΘΑ ΑΡΓΥΡΙΟΝ. It closes with the issues of Roman vassals; they begin with Coson, who puts on his gold staters the type of the Junia family, the first consul between his lictors, marking his allegiance to Brutus, and an eagle. Lysimachus, commonly classed as king of Thrace, belongs to the group of Alexander's western successors. Among the islands of Thrace, Imbros with its trace of Pelasgic worship, and, equally with Lemnos, showing evidence of Athenian dominion, and Samothrace with the Asiatic worship of Cybele yield in interest to Thasos. Here a long and remarkable currency begins with very early Persic didrachms, the obverse type a centaur carrying a nymph, the reverse an incuse square of four divisions. Under the Athenian supremacy we see a decline of weight, and in style the attainment of high excellence. The design of the obverse now reminds us of the work of Alcamenes at Olympia, grand in spite of careless execution. After this we observe coins of Phœnician weight bearing for their obverse types the head of Dionysus. These are of the best period of art, and some tetradrachms are among the very finest Greek coins. The head of Dionysus is treated in a sculptural style that is remarkably broad and grand. The massive, powerful features, and the formal hair, nearly falling to the neck in regular curls like those of the full beard, are relieved by a broad wreath of ivy-leaves, designed with great delicacy and simplicity. The reverse bears a Heracles kneeling on one knee and discharging his bow,—a subject powerfully treated. Of a far later period there are large tetradrachms, much resembling those of Maronea, with the same type of the beardless Dionysus, but on the reverse Heracles. There are coins of Pæonian kings, which are chiefly silver, and have a resemblance to those of the Macedonian sovereigns, although they are somewhat barbarous. They range from 359 to 286 B.C.

Macedonia. The money of Macedonia both civic and regal is of great variety and interest. It begins at an early time, probably towards the end of the 6th century B.C. The old pieces are of silver, bronze having come into use a century later, and gold about the middle of the 4th century B.C. The character of the coinage resembles that of Thrace; the earliest pieces are of the Phœnician, Babylonic, and Attic standards, the heavier form of the Babylonic, the Persic, appearing later. The most remarkable denominations are the Phœnician octadrachms and dodecadrachms. The largest coins are of the time of Alexander I. and somewhat earlier, and indicate the metallic wealth of the country more than its commercial activity. Philip II. adopted for gold money, which he was the first Macedonian king to issue, the Attic weight, striking staters on that system, while he maintained the Phœnician standard for his silver coinage. Alexander the Great made the weight of the gold and silver money the same by employing the Attic system for both; and from his time no coins of kings of Macedonia in these metals were struck on any other system. The series of Roman Macedonia begins with coins of the "regions" issued by permission of the senate and bearing the name of the Macedonians, from 158 to 146 B.C.; others follow of the Roman province. The coinage of Acanthus comprises fine archaic tetradrachms of Attic weight and others of Phœnician weight and very vigorous in style, of the commencement of the period of good art. The type of their obverse is a lion seizing a bull. The money of Ænea is chiefly interesting from its bearing the head of the hero Æneas; and on one extraordinary coin of archaic fabric, an Attic tetradrachm, the subject is the hero carrying Anchises from Troy, preceded by Creusa carrying Ascanius; this is in date before 500 B.C., and is preserved in the Berlin Museum. The town of Amphipolis is represented by a long series. There are Phœnician tetradrachms having on the obverse a head of Apollo, facing, sometimes in a splendid style, which recalls the art of the immediate successors of Phidias, as seen, for instance, in the famous bronze female head in the British Museum. The reverse type is a flaming torch in an incuse square. There are also many Greek imperial bronze pieces of this city. The territory of Chalcidice is eminent for the excellence of some of its silver coins. These are Phœnician tetradrachms of the best period struck by the Chalcidian League (392-379 B.C., and later), Olynthus being probably the mint. The obverse bears the head of Apollo in profile crowned with laurel. It is in very high relief and treated with great simplicity, though not with the severity of somewhat earlier pieces. The delicacy of the features is balanced by the simple treatment of the hair and the broad wreath of laurel. On the reverse is a lyre. There is an early series of coins of Lete. Some are of a remote date and none later than about the time of Alexander I. The obverse type is a satyr with a nymph, and on the reverse is an incuse square divided fourfold, first diagonally and then in squares. Mende has money of Attic weight, the types being connected with Silenus, who on a tetradrachm of fine art is portrayed reclining, a wine-vase in his hand, on the back of an ass; the reverse bears a vine. Of Neapolis (Datenon) there are early coins with the Gorgon's head and the incuse square, which changes, as at Lete, and in the period of fine art gives way to a charming head of Nice crowned with olive. There is a very early Attic tetradrachm of Olynthus, with a quadriga, and an eagle within a double square, the only coin, save Philip's gold and silver and the money of Cyrene, which repeats the idea of the great Sicilian currencies, the record of Olympic victory. Orthagoria, better known as Aristotle's birthplace Stageira, has a few remarkable coins of good art and a peculiar style. The coins of Philippi in the three metals are mainly of the time of Philip II., who, having found a rich gold mine near Crenides, changed its name to Philippi. The gold coins are Attic staters, the silver pieces of the Phœnician or Macedonian weight, like Philip's own money. All bear the head of young

Heracles in a lion's skin, and a tripod. Imperial pieces were struck by the city as a colonia. There is a long series of Thessalonica, beginning with Greek bronze coins, the latest of which are asses with on the obverse the Roman head of Janus in strange combination with a Greek inscription. Then follow pieces of imperial time and others with imperial effigies. Uranopolis has a few coins with very curious astronomical types, probably issued by the eccentric Alexarchus, brother of Cassander. The issues of the Thraco-Macedonians are extremely interesting. They are all just anterior to, or it may be contemporary with, Alexander I. of Macedon. The leading coins are octadrachms of the Phœnician standard. They have usually but one type, the reverse bearing a quadripartite incuse square. Their sudden appearance and heavy weight are due to the working of the silver mines on the border of Macedonia and Thrace. The usual types are a warrior leading a horse or a yoke of oxen. The coins bear the names of the Bisaltæ, Getas king of the Edoni (whose only two coins, differing dialectically in their inscriptions, were found in the Tigris in 1818, and are now in the British Museum), the Orrescii, and other tribes. Besides these there are very curious Phœnician dodecadrachms of an unknown tribe, bearing the unusual type of an ox-car, in which is a figure seated, and on the reverse a triquetra.

Kings of Macedonia. The oldest coins of the Macedonian kings are of Alexander I., from 498 to 454 B.C., the contemporary of Xerxes. These are Phœnician octadrachms, having on the obverse a hero by the side of a horse, and coins of a lower denomination with the same or a similar type. The money of Alexander's successors illustrates the movement of art, but it is not until the reign of Philip II. that we have an abundant coinage. He first strikes gold pieces, chiefly Attic didrachms, from the produce of his mine near Philippi. They are of fair but somewhat careless style, and bear on the obverse the head of Ares. On the reverse is a victorious Olympic biga. These coins were afterwards known as Φιλίππειοι and the gold money of Alexander as Ἀλεξανδρεῖοι—appellations which probably did not include larger or smaller pieces. Horace calls the gold coins of Philip "Philips" ("regale nomisma Philippos," *Epist.* ii. 1, 232). The silver coinage of Philip is mainly composed of tetradrachms of the Phœnician talent. Their type of obverse is a head of Zeus, and of reverse either a mounted hero wearing a causia or a victor in the horse-race with a palm,—these last coins being the best of Philip's, although the horse is clumsy.

The coinage of Alexander the Great, both in the number of the cities where it was issued and in its abundance, excels all other Greek regal money; but its art is, without being despicable, far below excellence. The types are not remarkable in themselves, and there is a great sameness characterizing the entire series. The system of both gold and silver is Attic. The gold coins are distaters or gold tetradrachms, staters or didrachms, hemistaters or drachms, with their half or a smaller denomination. The types of the distaters or staters, which last were the most common pieces, are for the obverse the head of Pallas and for the reverse Nice bearing a trophy-stand. The largest silver piece is the decadrachm, which is of extreme rarity. The types of the tetradrachms and most of the lower coins are on the obverse the head of Heracles in the lion's skin and on the reverse Zeus seated, bearing on his hand an eagle. The head has been supposed to be that of Alexander, but this is not the case, although there may be some assimilation to his portrait. The great currency was of tetradrachms. The coinage was struck in different cities, distinguished by proper symbols and monograms. The classification of the series is difficult, but is gradually advancing. The bronze money is not remarkable.

The coinage of Alexander is followed by that of Philip Arrhidæus, with the same types in gold and silver. That of Alexander IV. was alone issued by Ptolemy I. In these coins the types of Alexander were modified. Meanwhile Seleucus, Lysimachus, and Antigonus, king of Asia, struck Alexander's money with their own names, and the tetradrachms of Macedonia were generally of this kind until the time of Philip V. The same coinage, marked by a large flat form, was reissued later by the cities of western Asia, when the Romans, after the battle of Magnesia in 190 B.C., restored the liberties which Alexander had granted. The series of Alexandrine money is interrupted by various small coinages and the later issues of Lysimachus, king of Thrace, with the first Greek regal portrait, the head of Alexander with the ram's horn, as the son of Zeus Ammon, sometimes a work worthy of Lysippus and an excellent indication of his style. The reverse has a figure of Pallas holding a little Nice. The coins of Demetrius I. (Poliorcetes) comprise fine tetradrachms, some of the types of which have an historic reference. They bear either on the obverse his portrait with a bull's horn and on the reverse a figure of Poseidon, or on the one side a winged female figure (Nice or Fame) on the prow of a galley, blowing a trumpet, and on the other Poseidon striking with his trident. The latter types cannot be doubted to relate to the great naval victory which Demetrius gained over Ptolemy. The tetradrachms of Antigonus I. (Gonatas), which are of inferior style and work to those of Demetrius, have types which appear to refer in like manner to the great event of his time. The obverse type is a Macedonian buckler with the head of Pan in the midst, and the reverse type Pallas Promachos. The head of Pan is supposed to have been taken as a device in consequence of the panic which led to the discomfiture of the Gauls at Delphi. The money of Demetrius II. is unimportant, but Antigonus Doson is represented by tetradrachms with the head of Poseidon, and Apollo seated on a galley. The tetradrachms of Philip V. have on the obverse a head in the helmet of Perseus, representing Philip in the character of that hero, or else the hero himself, perhaps assimilated to the king. The reverse bears a club. Other tetradrachms and smaller coins have a simple portrait of Philip. The tetradrachms of Perseus are of fair style, considering the time at which they were struck. They bear on the one side the king's head and on the other an eagle on a thunderbolt.

Thessaly. The coin systems of northern Greece, Thessaly, Epirus, Corcyra, Acarnania, and Ætolia present certain difficulties which disappear if we consider them as originally Æginetan, modified in the west by Corinthian, and later by Roman, influence. The coinage of Thessaly presents very few specimens of a remote period, while pieces of the best time are numerous. These are in general remarkably like the finest coins of Sicily and Italy, although the style is simpler. The prevalence of the horse and horseman is significant. The money of the Thessalian Confederacy, being of late date (196-146 B.C.), is of little interest. The commonest types are the head of Zeus crowned with oak and the Thessalian Pallas Itonia in a fighting attitude. The coinage is resumed in imperial times. Of the town of Gomphi or Philippopolis there is a beautiful drachm, having on the obverse a female head, facing, which is probably that of a nymph as the city. The coins of Lamia are also to be noticed for their beauty. The drachms bear the head of Lamia, the mistress of Demetrius Poliorcetes, and young Heracles, who probably represents Demetrius. The series of Larissa begins with archaic pieces and some of the early period of good art, but sometimes of rather coarse execution. The small silver pieces have very interesting reverse types relating to the nymph of the fountain, and to be compared for mutual illustration with the didrachms of Terina and with some of those of Elis. These are followed by coins of fine work. The usual obverse type is the head of Larissa, the nymph of the fountain, facing, and on the reverse is generally a horse, either free or drinking. The head is treated in a very rich manner, like that of the fountain-nymph Arethusa, facing, on tetradrachms of Syracuse; indeed, the resemblance to the Sicilian type is most remarkable. If it be a copy, it is simpler and bolder than the original. The bronze money is also good. The coins of Pharsalus and Pheræ are also worthy of note. Of the tyrants of Pheræ Alexander is represented by coins.

Illyria. The coinage of Illyria is usually of inferior or rude art; the pieces are Æginetic, ultimately changing to Attic. Of Apollonia there is a large series. The earliest have the Corcyræan types of the cow and the calf and the floral pattern; the latest, usually, the head of Apollo and three nymphs dancing round a fire, the outer ones holding torches. Dyrrachium, which never bears on its coins the more famous name of Epidamnus, is represented by an important series. First there are Æginetan didrachms with Corcyræan types. These are succeeded by tridrachms with Corinthian types, and, of course, on the Attic standard; and then the old types are resumed, but apparently without a return to the former weight. Dyrrachium, it must be remembered, was founded partly by Corcyræan and partly by Corinthian colonists.

Epirus. The coins of Epirus are of higher interest and beauty than those of Illyria. Of the Epirots there are bronze coins of the regal period, and both silver and bronze of the republic (238-168 B.C.), with the heads of the Dodonæan Zeus and Dione, together or apart. The city of Ambracia is represented by beautiful silver pieces, with on the one side a veiled female head and on the other a kind of obelisk. The series of Greek imperial money of Nicopolis must also be mentioned. The coinage known to us of the kings of Epirus begins under Alexander I. His coins have been found in the three metals, but they are rare. It is probable that both gold and silver were struck in Italy while he was in that country. The coins of Pyrrhus in all metals are of high interest, and remarkable for their beauty, though the style is usually florid. There can be little doubt that they were for the most part struck in Italy and Sicily, at Tarentum and Syracuse. The tetradrachm has for the type of the obverse a head of the Dodonæan Zeus crowned with oak and for that of the reverse Dione seated. A fine didrachm bears on the obverse a head of Achilles helmeted, with for the reverse Thetis on a sea-horse carrying the shield of her son. Among the copper coins of Pyrrhus we must remark the beautiful ones with the portrait of his mother Phthia.

Corcyra. The coinage of the island of Corcyra begins with very early didrachms and drachms of the 6th century. The types are the cow suckling the calf and the floral pattern, as at Dyrrachium. These leading subjects are varied in later times by others illustrating the Corinthian origin of the nation, its maritime power, and the fame of its wine. Not the least curious are the bronze pieces with galleys bearing their names, as Strength, Freedom, Glory, Orderly

Government, Chace, Corcyra, Comus, Cypris, Victor of People, Victory, Youth, Pallas, Foremost, Preserver, Fame, Light-bearer. The abundant bronze series goes on under the emperors.

Acarnania. The coins of Acarnania are not remarkable for beauty or for variety in their types. The money of several cities in the 4th century B.C. is that of Corinthian colonies. We must mention that of the Acarnanian League (229-168 B.C.), which bears the head of the Achelous as a man-headed bull and the seated Apollo Actius. Of Leucas there are silver coins and an abundant series in bronze.

Ætolia. In Ætolia the gold and silver coins of the Ætolian League have some merit (279-168 B.C.). The gold pieces have on the obverse the head of Pallas or that of Heracles in the lion's skin and on the reverse Ætolia personified, seated on Gaulish and Macedonian shields,—a curious historical type. These subjects recur, with others indicating the hunter-life of the population, on the silver money; of especial interest is the head of Atalanta and the Calydonian boar, and the spear-head with which he was slain, in both silver and bronze. On some of the copper the spear-head and the jaw-bone of the boar are seen.

Locris. The coinage of Locris, Phocis, and Bœotia is entirely on the Æginetic standard. The coins of the Locri Epicnemidii are mainly didrachms, struck at Opus, with the head of Persephone and the figure of the Lesser Ajax in a fighting attitude, sometimes accompanied by his name. These coins were struck between 369 and 338 B.C., and are remarkable for the manner in which a Syracusan head is copied, and, as appears in other cases in Thessaly and elsewhere, not weakened but presented in a stronger and purer form. So much higher was the conception of art in Hellas than in the West.

Phocis. The money of Phocis begins at a very early age, perhaps the 7th century B.C., and extends in silver down to the conquest by Philip (346 B.C.). The prevalent types are a bull's head and that of a goddess or nymph. Delphi, geographically included in Phocis, strikes very remarkable money, wholly distinct in types from the Phocian. The principal subjects are heads of rams and goats, the symbols of Apollo as a pastoral divinity, a dolphin (Apollo Delphinius), the omphalos and tripod, and a negro's head, which has not been satisfactorily explained. The Amphictyonic Council struck beautiful didrachms, probably on the occasion of Philip's presidency (346 B.C.), with the head of Demeter, and the Delphian Apollo seated on the omphalos. Under Hadrian and the Antonines there is an imperial coinage of Delphi, some pieces bearing the representation of the temple of Apollo, on one type the letter E appearing between the columns of the face, representing the mystic Delphic EI, on which Plutarch wrote a treatise.

Bœotia. The coinage of Bœotia is chiefly of a period anterior to the reign of Alexander, under whom the political importance of Thebes and the whole country came to an end. The main characteristic of the money is the almost exclusive use of the Bœotian shield as the obverse type, marking the federal character of the issues. These were struck by various cities, or by Thebes as ruling the League. The earliest pieces are drachms, presumably of Thebes, and certainly of Haliartus and Tanagra, issued between 600 and 550 B.C. These are followed by didrachms of the same and other cities until the time of the Persian War. The result of the unpatriotic policy of Thebes and most of the towns of Bœotia was the degradation of the leading city, and the coins reveal the curious fact that Tanagra then became the centre of the League-coinage. We now notice the abandonment of the old incuse reverse and the adoption of regular types, the wheel at Tanagra and the amphora at Thebes. These types increase and indicate several cities during the short period of Athenian influence (456-446 B.C.). The democratic institutions were next overthrown, and Thebes became again the head of Bœotia, and struck alone and in her own name, not in that of the League. To the earlier part of this period belong splendid didrachms with reverse types chiefly representing Heracles, subsequently varied by heads of Dionysus in a series only less fine. With the peace of Antalcidas (387 B.C.) Thebes lost her power, the League was dissolved, and the other Bœotian cities issued a coinage of some merit. In 379 B.C. Thebes became the chief state in Greece, and the patriotic policy of Pelopidas and Epaminondas is shown in the issue of the Bœotian coins at the great city without any name but that of a magistrate. Among those which occur is ΕΠΑΜ or ΕΠΑΜΙ, who can scarcely be any other than the illustrious general. The battle of Chæronea (338 B.C.), swiftly followed by the destruction of Thebes, closes the historic coinage, save only for the appearance of new League-money of Attic weight, with the head of Zeus and the figure of Poseidon, issued between 288 and 244 B.C. (On the whole subject see Head's *Coinage of Bœotia*.)

Attica. In Attica the great series of Athens is dominant. Eleusis alone in that country having issued an unimportant bronze coinage of good style while Athens was independent. The Athenian money begins with the issues which were struck under Solon's monetary law, practically adopting the Euboic standard instead of the Æginetic, by which the Attic weights were divided into the commercial and the monetary. The monetary standard became so famous through the widespread traffic of Athens as to give the name Attic to all subsequent measures which followed it except the Corinthian, and the term Euboic gradually fell into disuse. The earliest coins are tetradrachms of full weight (270 grains), with an extremely archaic head of Athene helmeted to the right, and within an incuse square an owl to the right with the letters ΑΘΕ. These may be early in the 6th century B.C. Soon afterwards a sprig of olive appears in the upper left corner of the square. The coins of the age of the Persian War have olive-leaves forming an upright wreath on the helmet of Athene. To this period belongs the decadrachm with the owl facing, its wings open. In the same age a crescent is added—symbol of the lunar character of the goddess—between the olive-sprig and the owl. These types continue during the period of fine art, with slight modification and the abandonment of the incuse square, but with no mark of the splendour of Athens as the centre of Greek sculpture. No doubt commercial reasons dictated this conservative policy, which makes the coinage of Athens a disappointment in numismatics. Her money was precious for its purity not only in the Greek world but among distant barbarians, so that imitations reach us from the Punjab and from southern Arabia, and any change would have injured their wide reception. There are many divisions of silver coinage with the types a little varied, and some different ones; and during the age of supremacy gold was issued in small quantities and bronze introduced. The Macedonian empire put an end to the autonomy of Athens, and when the money is again issued it is of a wholly new style and the types are modified. The great series of spread tetradrachms may be dated from the accession of Philip V. (220 B.C.), and lasted until the capture of the city by Sulla (86 B.C.). The obverse type is a head of Athene with a richly-adorned helmet, unquestionably borrowed from the famous statue by Phidias in ivory and gold, but a poor shadow of that splendid original, and an owl on an amphora within an olive-wreath. The earliest coins have the monograms of two magistrates, the later the names of two who are annual, and one changing about every month, but ultimately dropped. The occurrence in these of the names of Antiochus IV. (Epiphanes), before he came to the throne, of Mithradates VI. and his creature Aristion, helps to fix the dates. The abundance of this money shows the great commercial importance of Athens in these later times. Remarkable bronze coins of a later age bear two representations of the Acropolis and the great edifices. Both have on the obverse a head of Minerva. The reverse of one represents the Acropolis, with the grotto of Pan, the statue of Pallas Promachus, the Parthenon, and the Propylæa, with the steps leading up to the latter. The reverse of the other shows the theatre of Dionysus, above which are caverns in the rock, and higher still the Parthenon and the Propylæa. There are also Greek imperial pieces of Megara.

Ægina. The money of the island of Ægina is of especial interest, since with it Greek coinage is said to have originated. The story is that, at a time when Ægina was a dependency of Argos, Phidon king of Argos struck the first Greek money there, probably in the seventh century B.C. It is said that previously silver was formed into spikes (ὀβελίσκοι), of which six made a handful (δραχμή), and that thus the name of the drachm and its sixth, the obolus, originated; but this account may be an invention of later times. There can be no doubt, however, that the earliest Æginetan coins are of extreme antiquity. The weight is of course on the Æginetic standard. The oldest pieces are very primitive didrachms, bearing on the obverse a turtle and on the reverse a rude incuse stamp. Afterwards the stamp becomes less rude, and later has a peculiar shape. There are some coins of the early part of the fine period of excellent work. The great currency was of didrachms. The bronze coins are not remarkable, but some appear to be of an earlier time than most Greek pieces in this metal.

Achaia. The series of Achaia begins under the Achæan League, some time after 330 B.C., when we first find coins of the Achæans, with no distinction of cities,—a purely federal coinage. The silver coins, like the later ones, are either Attic tetrobols or Æginetic hemidrachms. Then follows the money of the ten cities of the Old League, beginning about 280 B.C.—Dyme, Patræ, Tritæa, Pharæ, Ægium, Bura, Caryneia, Leontium, Ægira, and Pellene. In 251 B.C. Sicyon, Corinth, and Megara added their strength to the little alliance; the towns of Arcadia and Argolis followed, then Sparta, Messene, and Elis. The type of the silver is the head of Zeus Homagyrius, the reverse with the monogram of the Achæans in a laurel-wreath. After the earliest money the reverse bears the symbols or monograms of the cities which struck. The oldest bronze repeats the silver types; the rest bears a standing Zeus and a seated Demeter, with the name of the city at full length.

Corinth. Corinth is represented by a very large series of coins, the weight of which is always on the Corinthian standard, equivalent to Attic but differently divided,—the Corinthian tridrachm, the chief coin, corresponding to the Attic didrachm. The oldest pieces, of the 6th century B.C., bear on the obverse Pegasus with the letter ϙ, koppa, the initial of the name of Corinth, and on the reverse an incuse pattern. In course of time the head of Athene in an incuse square occupies the reverse. The incuse square disappears, as generally elsewhere, in the early period of fine art. Of the age of the excel-

lence and decline of art we find beautiful work, though generally wanting in the severity of the highest Greek art. Pegasus is ordinarily seen galloping, but sometimes standing or drinking, the koppa is usually retained, and the helmet of Athene, always Corinthian, is sometimes bound with an olive-wreath. The smaller coins have the same reverse, but on the obverse a charming series of types, principally female heads, mostly representing Aphrodite. There are some drachms with Bellerophon in a combatant attitude mounted on Pegasus on the one side and the Chimæra on the other. The autonomous bronze money is poor, but often of fair work, and interesting, especially when the type relates to the myth of Bellerophon. Under the Romans this city was made a colonia; and we have a large and interesting series of the bronze coins struck by it as such, including the remarkable type of the tomb of Lais. The colonies of Corinth form a long and important series, struck by Acarnanian towns with Corcyra, and in the west by Locri Epizephyrii in Italy and Syracuse. They range from the time of Timoleon, about 340 B.C., to the age of the earlier successors of Alexander, perhaps having ended in the time of Pyrrhus, probably shortly after 295 B.C. The colonies broke loose from Corinth and struck their own money, retaining the old types for commercial purposes, and Syracuse and Locri found it advisable to follow the same course, which in the case of Syracuse was not uninfluenced by gratitude to the mother-city and her noble citizen Timoleon. The coins are distinguished by the absence of the koppa and bear the names or monograms of the cities.

There are bronze coins of Patræ as an important Roman colonia, and silver and bronze money of Phlius, both of the period of good art. The coinage of Sicyon, on the Æginetic standard dominant in the rest of the Peloponnesus, is disappointing for a famous artistic centre. It begins shortly before the period of fine art; in that age the silver is abundant and well executed, but the leading types, the Chimæra and the flying dove within an olive-wreath, are wearying in their repetition, and good work could not make the Chimæra an agreeable subject. Small coins with types of Apollo are the only subjects which suggest the designs of the great school of Sicyon.

Elis. The money of Elis, or the Eleans, is inferior to none in the Greek world in its art, which reaches the highest level of dignified restraint, and in the variety of its types, which are suggested by a few subjects. The leading types are connected, as we might expect, with the worship of Zeus and Hera and Nice, the divinities of the great Panhellenic contest at Olympia. The prevalent representations are the eagle and the winged thunderbolt of Zeus, the head of Hera, and the figure of Nice. The series begins early in the 5th century B.C. with coins, some of which are didrachms (Æginetic), having as subjects an eagle carrying a serpent or a hare and on the reverse a thunderbolt or Nice bearing a wreath,—archaic types which in their vigour promise the excellence of later days. From 471 to 421 B.C., while Elis was allied with the Spartans, such types continue; the eagle and Nice (sometimes seated) are both treated with great force and beauty, and the subject of seated Zeus is remarkable for its dignity. The Argive alliance (421-400 B.C.) seems marked by the pre-eminence given to Hera, whose head may suggest the famous statue of Polyclitus at Argos. This alliance broken, the old types recur. Magnificent eagles, some admirably designed on a shield, and eagles' heads, the seated Nice, and fantastically varied thunderbolts mark this age. The types of an eagle struggling with a serpent and an eagle's head are marked with the letters ΔΑ. Professor Gardner has conjectured that they may be the work of the great sculptor Dædalus of Sicyon, who at this very time produced a trophy for the Eleans at Olympia. The political events of the age do not seem any longer to affect the coinage. Thus the return of the heads of Hera has no historical significance that we can trace. They are remarkable for their beauty, which is still severe, while around there are marks of the luxurious style of decline, and here the eagle-types have lost their vigour. The age of Philip is soon reached, and shows a marked decline in the coinage. It closes with imperial money, some types of which have a local interest, notably two of Hadrian bearing the head and figure of Zeus, copied from the famous statue by Phidias, of which the earlier currency appears to present no reflexion.[1]

Cephallenia, &c. Cephallenia gives us the early silver coins of Cranii, the money of Pale, of charming style, with the figure of Cephalus on the reverse, and that of Same, all cities of this island. Of the island of Zacynthus there are silver pieces, usually of rather coarse work, but sometimes of the style of the best Cephallenian money. The coins of Ithaca are of bronze. They are of interest on account of their common obverse type, which is a head of Ulysses.

Messene. Returning to the mainland, we first notice the money of Messene, or the Messenians. The earliest coin is a splendid Æginetic didrachm having on the obverse a head of Persephone, and excels in design the similar subjects on the money of Syracuse, from which it must have been copied, for it is of about the time of Epaminondas. Still more than the Locrian type this shows the purer style of Greece, which, copying Syracusan work, raised its character. On the reverse is a figure of Zeus Ithomatas. The other silver coins are of about the period of the Achæan League. The bronze money is plentiful, but not interesting. Lacedæmon, as we might have expected, has no early coins, the silver money being, like so much of that of the Greek cities, of the age of the Achæan League. Among the types of the autonomous bronze pieces may be noticed the head of the Spartan lawgiver Lycurgus, with his name. The series of Argos in Argolis begins with coins of an early period. The standard is Æginetic. The first pieces are the drachm with a wolf on the obverse, and on the reverse A, the initial letter of the name of the people, in an incuse square; the hemidrachm, with the forepart of a wolf; and the diobolon, with a wolf's head. Among coins of the period of good art we must especially notice those which have for the obverse type the head of Hera wearing a stephanos,—a design which is not equal to that of the coins of Elis, the style being either careless or not so simple. The reverse type of one of these coins, a drachm, represents Diomedes stealthily advancing with the palladium in his left hand and a short sword in his right. Of the town of Trœzen there are silver coins of the best period of art.

Arcadia. Of the money of Arcadia some pieces are doubtless among the most ancient struck by the Greeks; and the types of these and later coins are often connected with the remarkable myths of this primæval part of Hellas, showing particularly the remains of its old nature-worship. The first series to be noticed is that of the Arcadian League; it begins about 500 B.C. with hemidrachms having the type of Zeus Lycæus seated, the eagle represented as if flying from his hand, and a female head. Of a later time, from the age of Epaminondas, there are coins with the head of Zeus, and Pan seated on the Arcadian Olympus, a series of which the didrachms are very fine. The coins of Heræa begin deep in the 6th century B.C. The earliest have for obverse type the veiled head of Hera, and on the reverse the beginning of the name of the town, sometimes between wavy ornaments. The antiquity of Mantinea is in like manner attested by its money. The silver coins of a very early time have on the obverse a bear, representing Callisto the mother of Arcas, who was worshipped here, and on the reverse the letters MA, or three acorns, in an incuse square. Later coins, especially the bronze, have subjects connected with the worship of Poseidon at this inland town. The silver money of Megalopolis is important for art, as we know the city to have been founded in 370 B.C. The types are the same as those of the Arcadians of the same period, the heads of Zeus and of Pan. The silver coins of Pheneus must be noticed as being of fine work. The didrachms of the age of Epaminondas have a head of Persephone, and Hermes carrying the child Arcas. The obverse type is interesting as a copy, improved on the original, of the Syracusan subject, as in Locris and Messene. As in Locris, the merit is in the greater force and simplicity of the face, here most successful, the hair being treated more after the Syracusan manner than after that of the Messenians, who simplified the whole subject. The finest coin attributed to Stymphalus is a magnificent didrachm of the age of Epaminondas, with a head of the local Artemis laureate, and Heracles striking with his club, no doubt a subject connected with the Stymphalian birds. The smaller silver coins have on the one side a head of Heracles and on the other the head and neck of a Stymphalian bird, most resembling those of a vulture. There were representations of these birds in the temple of Artemis. The series of Tegea is not important, but two of the reverse types of its bronze coins are interesting as relating to the story that Athene gave a jar containing the hair of Medusa to her priestess Sterope, daughter of Cepheus, in order that she might terrify the Argives should they attack Tegea in the absence of Cepheus, when Heracles desired his aid in an expedition against Sparta.

Crete. The peculiar position of Crete and her long isolation from the political, artistic, and literary movements of Hellas have been already touched on. It is not until the age when the Macedonians and the Achæan League are striving for the leadership of Hellas that Crete appears in the field of history, but then only as the battle-ground of rival powers. The most remarkable influence of this age was when Athens, by the diplomacy of Cephisodorus, succeeded about 200 B.C. in drawing the Cretans into a great league against Philip V. of Macedon. That this project took actual shape is proved by the issue at all the chief mints of the island of tetradrachms with the well-known types of Athens, to be distinguished from the Atticizing types of other cities at this time. In the meanwhile the inborn love of adventure in her youth had been satisfied by hired service to the surrounding kingdoms, and hence grew a piratical instinct which ultimately cost the Cretans their freedom at the hand of Rome.

The oldest coins are probably of about 500 B.C., but few cities seem to have issued many until a hundred years later. Then there is a great outburst of coinage, sometimes beautiful, sometimes barbarously careless, which lasts until Alexander's commercial policy is seen in the appearance of his money with Cretan symbols in lieu of the old autonomous money. As Alexander's successors grew weak and no one of them could control Crete, the old rights were restored and the Cretan cities again coin their own types until the Roman conquest (67 or 66 B.C.). The chief issue is of silver; bronze is less abundant; and gold is unknown. The Cretan types

[1] See Professor Gardner's *Elis*, on the whole subject.

have a markedly local character, yet they copy in some instances other coinages. The chief divinities on the pieces are Zeus, Hera, Poseidon, Heracles, and Britomartis, and the leading myths are those of Minos, the story of the Minotaur and the labyrinth being prominent, and also that of Europa. There is frequent reference to nature-worship as in Sicily, yet with a distinctive preference for trees, the forms of which, however, lend themselves readily to the free representation of Cretan art, which may in part explain their prominence. The weight is at first Æginetic, falling almost to Attic; and in the resumption of the coinage after Alexander's time it is Attic.

Of the island in general there are Roman silver coins of the earlier emperors, some of which are of fine work for the period. The inscriptions are in Latin, or partly in Latin and partly in Greek. In the autonomous civic series there are didrachms of Aptera. The obverse bears a female head wearing a stephane and the reverse a warrior before a sacred tree. Of Chersonesus, the port of Lyctus, called on the coins Chersonasus, there are didrachms of coarse style, mainly copied from the splendid piece of Stymphalus in Arcadia. The head of Artemis is here appropriated to Artemis Britomartis, who had a temple at the place, and the reverse of Heracles striking with his club is varied by the substitution of the figure of Apollo seated. The silver money of Cnossus is of great interest. The oldest coins are archaic in style, and may be as early in date as the expedition of Xerxes. They bear the figure of the Minotaur as a bull-headed man, kneeling on one knee, and a mæander-pattern, in one case enclosing a star (the sun), in another a female head (Ariadne?). The antiquity of these coins disproves the supposition that the Cretan labyrinth at Cnossus was an invention of the later poets. Of the early time of good art there are didrachms of Cnossus with the head of Persephone and an unknown divinity, and the labyrinthine pattern enclosing the sun or the moon or a bull's head for the Minotaur, and at length becoming a regular maze. To this time belongs the wonderful coin in the Berlin Museum with Minos seated, his name in the field, and the head of Persephone within the mæander-pattern. In the later age of fine art a head of Hera wearing a stephanos occupies the obverse of didrachms and drachms, and the reverse has a maze through which the way may be clearly traced. The head is closely copied from the same type of Argos, and despite its beauty shows a distinct inferiority, unlike the copies of Syracuse by artists of the mainland. This series closes with Alexander's empire, and the native coinage disappears until the league of Cephisodorus revives it with the Athenian tetradrachm of Attic weight, bearing the name of the Cnossians. It is of inferior style, and is followed by base coins with heads of Minos and Apollo, and the Labyrinth, either square as before or in a new circular form, which is interesting as showing it was a mere matter of tradition. There are interesting coins of Cydonia, some of them of beautiful style and work. One is remarkably like a coin of Aptera, and bears an engraver's name, Neuantus,—a point showing the importance attached by the Cretans to the designs of their money. The head is that of a Mænad, and the reverse has a figure of the traditional founder Cydon, stringing his bow. The style is good, but the execution poor. A drachm presents a most beautiful repetition of the subject of Cydon. Gortys, or Gortyna, is represented by most remarkable coins, which generally allude to the myth of Europa. Didrachms of archaic style have on the obverse Europa carried by the bull and on the reverse the lion's scalp. These pieces are followed by a remarkably fine class of spread didrachms; the best are of about 400 B.C. They have on the obverse Europa seated in a pensive attitude on the trunk of a tree, doubtless the sacred plane at Gortyna, mentioned by Pliny, which was said never to shed its leaves, and on the reverse a bull suddenly turning his head as if stung by a fly. Nothing in Greek art exceeds the skill and beauty of these designs. The truth with which the tree is sketched, one engraver even indicating the letters cut by visitors in the trunk, and the graceful position of the forlorn Europa are as much to be admired as the fidelity with which the bull is drawn, even when foreshortened, sharply turning his head, with his tongue out and his tail raised. These designs, beautiful in themselves, are strikingly deficient in fitness, and afford equally strong illustrations of the excellencies and of the one great fault of the art of Cretan coins. Many pieces of the same class are of rude execution. There is a tetradrachm of the Athenian group having the symbol of a butting bull. Later silver coins have the head of Minos. The coins of Hierapytna are remarkable for bearing the representation of a date-palm. Of Itanus there are remarkable coins, the earlier, some of which are of good style, with the subject of a Triton [illegible] (Glaucus?) and two sea-monsters, changed for a head of Athene and an eagle, the Triton frequently appearing in the field as a symbol. Lyctus, on the coins Lyttus, is represented by strangely rude pieces, with the types of a flying eagle and a boar's head which is curiously foreshortened. The coins of Phæstus form a most interesting series. Among the didrachms are some of admirable work, with on the obverse Heracles slaying the Hydra with his club and on the reverse a bull. Others have on the obverse Heracles seated on the ground, resting. Another noticeable obverse type is the beardless Zeus seated in a tree, with his Cretan name ϜΕΛΧΑΝΟΣ, where the Ϝ stands for the digamma. On his knee is a cock in the attitude of crowing, showing that he was a god of the dawn. The most remarkable coins of Phæstus are, however, those that bear representations of Talus, the man of brass, said to have been made by Hephæstus or Dædalus. One of these is a didrachm, on which he is portrayed as a winged youth, naked, bearing in each hand a stone, and in a combatant attitude. This figure is accompanied by his name. A similar design is seen on a bronze coin. The reader will recollect that Apollonius Rhodius (*Argonaut.*, iv. 1638 *sq.*) relates that Talus prevented the Argonauts from landing in Crete by hurling stones at them, until he was destroyed by the artifice of Medea.

The important town of Polyrrhenium, or Polyrrhenia (but one ρ on the coins), is represented by carefully-executed coins with a head of Zeus and a bull's head. A later piece has a remarkable obverse type, a whiskered head of Apollo, probably a Macedonian sovereign in that character. This is of Attic weight. Præsus has on its earlier coins the Gorgon's head and an archer, or an archer and an eagle; later, Zeus seated, and, after the Cretan fashion, foreshortened. The coins of Priansus comprise didrachms of an unusual style and type, a head of a goddess or nymph, the hair, bound by narrow bands crossed diagonally, filling the large field. Priansus also shows the remarkable type of Persephone seated beside a date-palm, placing her right hand on the head of a serpent, in reference to the myth of the birth of Zagreus. As usual, the figure is foreshortened. The reverse has a standing figure of Poseidon. Rhaucus has Poseidon beside his horse. The rare didrachm of Sybrittia, or Sybrita, may fitly close the series; the obverse has a charming subject, Dionysus seated on a running panther, and the reverse Hermes drawing on his right buskin,—a delightful figure. Another beautiful type is a seated Dionysus.

The coinage of Eubœa is all on the native standard, of which the Attic was a variety. It includes some of the very earliest Greek money. The older coins comprise tetradrachms, didrachms, and smaller pieces; the later are uniformly tetrobols. The pieces which bear the name of the Eubœans date from the fine period to the fall of Hellenic liberty, the silver lasting only to Alexander's time. They bear the head of a nymph and that of an ox. One variety is very beautiful. The great cities have a far more interesting series. Carystus begins in the time of the Persian War with the type of the cow and calf, as in Corcyra, and its special badge is the cock. Chalcis, the mother of Western colonies, has already in the 6th century a long series with the wheel-type and an incuse diagonally divided, and later, a nymph's head and an eagle devouring a serpent. Eretria begins as early as Chalcis, but the obverse type is the Gorgon's head. This is succeeded by the same type and a panther's head, and fine late archaic coins bear the cow and the cuttle-fish. Of Histiæa the usual type is the head of a Mænad and a female figure seated on the stern of a galley. Eubœa.

Among the other islands classed after Eubœa, Amorgos must not be passed by, as a bronze coin of Ægiale, one of its towns, presents the curious type of a cupping-glass. The silver money of Carthæa and Coressus in Ceos is extremely old, beginning in each case in the 6th century and ending early in the 4th. The weight is Æginetic, and there are didrachms and smaller coins. The usual types of Carthæa are an amphora and then a bunch of grapes; that of Coressus is a cuttle-fish and dolphin. Naxos is represented by early Æginetic didrachms and coins of the fine period, the latter being chiefly bronze pieces of remarkably delicate and good work. The types are Dionysiac. Of Paros there are early Æginetic didrachms with the type of a kneeling goat and beneath a dolphin. Of the third and second centuries B.C. there are Attic didrachms with a head, possibly of Artemis, at first of a charming style, and a goat on the reverse. There are very archaic Æginetic didrachms of Siphnos. Some of the bronze pieces are of the best period and very fine. Of Tenos there are silver coins of the age of the kings. The head of the bearded Ammon occurs on tetradrachms following the Attic standard, and on smaller pieces that of the younger Ammon, both heads laureate as well as horned; the reverse type is Poseidon. Cyclades and Sporades.

The coinage of Asia begins with that of Asia Minor. It falls into certain great classes—first, the ancient gold and electrum, Lydian and Greek, in time succeeded by electrum or gold and silver, all struck in the west and mainly on the coast. Then the Persian dominion appears in the silver money of the satraps, circulating with the gold and silver of Persia, and the Greek money is limited to a few cities of the coast, none save the electrum of the great mint of Cyzicus uninterrupted by the barbarian. With the decay of the barbarian empire the renewed life of the Greek cities is witnessed by a beautiful coinage along the coast from the Propontis to Cilicia. On Alexander's conquest autonomy is granted to the much-enduring Hellenic communities, and is again interrupted, but only partially, by the rule of his successors, for there was no time at which Asia Minor was wholly parcelled out among the kings, Greek or native. The Romans, after the battle of Magnesia (190 B.C.), repeated Alexander's policy so far as the cities Asia Minor.

of the western coast were concerned, and there is a fresh outburst of coinage, which, in remembrance, follows the well-known types of Alexander. When the province of Asia was constituted and the neighbouring states fell one by one under Roman rule, the autonomy of the great cities was gradually reduced to a shadow. Still the abundant issues of imperial coinage, if devoid of high merit, are the best in style of late Greek coins, and for mythology the richest in illustration.

Oldest coinage. The oldest money is the electrum of Lydia, which spread in very early times along the western coast. This coinage, dating from the 7th century B.C., has an equal claim with the Æginetic silver to be the oldest of all money. Probably the two currencies arose at the same period, and by interchange became the recognized currency of the primeval marts; otherwise we can scarcely explain the absence of Asiatic silver, though it is easy to explain that of European electrum or gold. The electrum of the coins is gold—the precious metal washed down by the Pactolus—with a native alloy of a fourth part of silver. Its durability recommended it to the Lydians, and it had the advantage of exchanging decimally with gold, then in the ratio 13·3 to silver. But this commercial advantage allowed the issue of electrum coins on silver standards, while it was natural to coin them on those of gold; hence a variety of weight-systems perplexing to the metrologist. The first coins were undoubtedly struck by a Lydian king, probably as early as about 700 B.C. They follow the Babylonic silver standard. The obverse is plain and merely marked with lines, the original rough surface of the die, while the reverse has three depressions, an oblong one flanked by two squares. Later the same people issued money on the Phœnician silver standard. This double currency, as Head suggests, was probably intended for circulation in the interior and in the coast towns to the west, the Babylonic weight being that of the land trade, the Phœnician that of the commerce by sea. Ultimately Crœsus abandoned electrum, and, reducing the Phœnician weight by one-fourth, the proportion of silver in the electrum, he produced a Babylonic gold stater, and again by similarly reducing the Babylonic weight he obtained a Euboic gold stater. His silver was Babylonic only, the silver stater exchanging as the tenth of the Euboic gold stater. These results are explained by the metrological data given earlier in this article. The Greek marts of the western coast were not long in imitating the example of Lydia; hence a series of early electrum staters, on the Phœnician weight, of Miletus, Ephesus, Cyme, Chios, Clazomenæ, Lampsacus, Abydos, and Samos, with smaller pieces which add other mints to the list. The Euboic weight naturally found its way into the currencies, but was as yet limited to Samos. Phocæa, Teos, and Cyzicus, with other towns, followed from a very early period the Phocaic standard, which for practical purposes may be called the double of the Euboic. Consequently their stater was twice as heavy as the Euboic gold stater. They alone before Crœsus issued gold money, which was superseded at Phocæa and Cyzicus by electrum. This is the main outline of the native coinage of Asia Minor before the Persian conquest. Its later history will appear under the several great towns, the money of Persia being treated in a subsequent place.

Bosporus, Colchis, Pontus. The first countries of Asia Minor are Bosporus and Colchis, the coins of the cities of which are few and unimportant. The autonomous coinages of the cities of Pontus are more numerous, but none of them are archaic or deserve to be characterized as fine. There are also imperial pieces. The bronze coins are sometimes large and often thick. The only place meriting a special notice is Amisus, which almost alone of the cities of Pontus seems to have issued autonomous silver money. This is continued under the emperors in the form of Roman denarii and larger pieces. The common subjects of the bronze money of this place relate to the myth of Perseus and Medusa, a favourite one in this country.

The regal coins are of the old kingdoms of Pontus and of the Cimmerian Bosporus, of the two united as the state of Bosporus and Pontus under Mithradates VI. (the Great), and as reconstituted by the Romans when Polemon I. and II. still held the kingdom of Mithradates, which was afterwards divided into the province of Pontus and the kingdom of Bosporus. The early coinage of the kingdom of Bosporus is of little interest. Of that of Pontus there are tetradrachms, two of which, of Mithradates IV. and Pharnaces I., are remarkable for the unflinching realism with which their barbarian type of features is preserved. Mithradates VI., king of Bosporus and Pontus, is represented by gold staters and tetradrachms. The portrait on the best of these is fine despite its dramatic quality, characteristic of the later schools of *Asia Minor*. The kings of Bosporus struck a long series of coins for the first three centuries after the Christian era. Their gold money is gradually depreciated and becomes electrum, and ultimately billon and bronze. They bear the heads of the king and the emperor and are dated by the Pontic era.

Paphlagonia. In Paphlagonia we must specially notice the coins of the cities Amastris and Sinope. The silver pieces of the former place bear a youthful head in a laureate Phrygian cap, probably representing Men or Lunus,—Amastris, the foundress, being seated on the reverse. On the late bronze money the bust of Homer occurs. There are also bronze coins of the imperial class. The silver pieces of Sinope are plentiful. The types are the head of the nymph Sinope and, as at Istrus, an eagle preying on a dolphin.

Bithynia. Bithynia is represented by a more important series. Of the province generally there are Roman silver medallions of the weight of cistophori (to be presently described), with Latin inscriptions, and imperial bronze pieces with Greek inscriptions. There is a long series of imperial bronze of Apamea as a colonia. The ordinary silver coins of Chalcedon strikingly resemble on both sides those of Byzantium, a circumstance confirmatory of the statement that the two cities were colonized at nearly the same time from Megara. Of Cius, also called Prusias ad Mare, there are gold staters and smaller imperial silver pieces. Hadriani and Hadrianotheræ issued imperial bronze money. Of Heraclea there are silver coins of good style; these are of the Persic standard. The obverse type is a head of Heracles, either bearded or beardless, in the lion's skin; the most interesting reverse type is a female head wearing a tiara on which are three turrets, probably that of the town personified. Of the tyrants of Heraclea there are silver coins of Clearchus, of Timotheus and Dionysius ruling together, and of Dionysius ruling alone. Of the imperial class there is a large series of Nicæa, and there are many coins of Nicomedia. The series of Bithynia closes with the money of its kings, consisting of Attic tetradrachms and bronze pieces. The tetradrachms bearing the name of Prusias are of Prusias I. and II. The bronze coins with the same name, some of which are fine, cannot be otherwise classed than to Prusias I. or II., since we do not know by which of the two they were issued. Of Nicomedes II. and III. there are only tetradrachms.

Cyzicus, Mysia. The fine Greek coinage of Asia may be considered to begin with Mysia. Cyzicus is in numismatics a most important city. The famous electrum Cyzicene staters were struck here for nearly a century, from 478 to 387 B.C., as Head conclusively argues (*Num. Chron.*, 1876, p. 277). During that whole period they were not only the leading gold coinage in Asia Minor but the chief currency in that metal for the cities on both shores of the *Ægean*; for it must be remembered that their alloy of silver was not allowed any value. The actual weight is of the Phocaic standard, just over 248 grains, so as to be equivalent to a Babylonic gold stater. The division was the hecta or sixth. The abundance of the staters and hectæ and the variety of their types, which usually are common to both denominations, led some numismatists to suppose that Cyzicus was a central mint striking for neighbouring cities their own coinage, but our present knowledge of the types of these cities shows that this was not the case. But it is certain that the staters of Cyzicus served as gold for other great marts which struck little or no money in that metal, and contented themselves with issuing the hectæ; hence an instinct that they were striking for the use of others may have led the Cyzicene moneyers to use great freedom in the choice of subjects. Many they invented and some they borrowed, retaining for themselves the distinctive badge of the tunny-fish beneath the type. This type occupied the obverse of the coin, while the reverse was invariably the quadripartite incuse square in four planes of the so-called mill-sail pattern. The coins are very thick and the edges are rude. The art is frequently of great beauty, though sometimes careless. After the earlier examples it shows the dominant influence of painting, being characterized by flowing lines and an intensity of expression in some of the finest examples, and always recalling painting or relief rather than sculpture in the round. The subjects are heads, figures, groups, and animals. The silver coinage of Cyzicus is distinctly local. It comprises beautiful tetradrachms of the Rhodian standard. The obverse bears a head of Persephone with a veil on the back, wound round her head, and a wreath of ears of corn. This is an example of the best Greek art, equally simple, delicate, and graceful, and in the expressive style of the Ionian school. Above the head is the inscription **ΣΩΤΕΙΡΑ**, which may be compared with **ΚΟΡΗ ΣΩΤΕΙΡΑ ΚΥΖΙΚΗΝΩΝ**, on a late copper coin, accompanying a head which is probably that of the younger Faustina in the character of Persephone. The reverse type of the finest tetradrachms is a lion's head in profile above a fish. Both late autonomous and imperial coins in bronze are well executed and full of interest, the two classes running parallel under the earlier emperors.

Lampsacus. Lampsacus is represented by a long series of coins. There are archaic and fine silver coins with a janiform female head, and on the reverse that of Athene in a Corinthian helmet, besides a few of other types. Contemporary with the later silver are electrum staters of Rhodian weight with a half-Pegasus and peculiar quadripartite incuse square. These are succeeded by splendid gold staters with various types of obverse and the half-Pegasus on the reverse. The most remarkable type is a bearded head with streaming hair in a conical cap, bound with a wreath, singularly pictorial in treatment as well as in expression, and roughly executed as if by a great artist unused to medal work. In contrast to this is a most carefully executed head of a Mænad with goat's ear, still markedly in a painter's style. This head is in repose; that of another Mænad with human ear is marked by its expression of

frenzy. Of Parium there are very early silver coins, interrupted and resumed in the period of good art. The leading type is the Gorgon's head.

num. The money of the great city of Pergamus or Pergamum is chiefly of a late time. There are, indeed, small gold and silver pieces of the good period, the former being very rare; the leading type is an archaic figure of Pallas. The silver coinage is next supplied by the money of the kings of Pergamum, followed by cistophori, which began under the kingdom. The bronze pieces of the city are numerous, both autonomous and imperial, the two classes overlapping, and there are medallions of the emperors. The local worship of Æsculapius is especially prominent under the Roman rule. The chief coins of the kings are Attic tetradrachms, with on the obverse a laureate head, supposed to be that of Philetærus, the founder of the state, and on the reverse a seated Athene, the common type of Lysimachus, from whom Philetærus revolted. This type is but twice varied by the heads of later kings. The inscription is always ΦΙΛΕΤΑΙΡΟΥ, a monogram sometimes indicating the name of the king by whom the coin was issued. The absence of the regal style is noticeable, and, though in the usual type the diadem is generally shown as wound round the laurel-wreath, it does not always appear. There are also unimportant bronze coins of the kings. The cistophorus was so called from its obverse type, the cista mystica, a basket from which a serpent issues, the whole enclosed in an ivy-wreath. The reverse type represents two serpents, and between them usually a bow-case. The half and the quarter of the cistophorus have on one side a bunch of grapes on a leaf or leaves of the vine, and the club with the lion's skin of Heracles within an ivy-wreath. They were tetradrachms equal in weight to three Attic drachms or three denarii, and the half and the quarter would be exchangeable with Roman coins, three quinarii and a quinarius and sestertius respectively. These coins became abundant when the kingdom of Pergamum was transformed into the province of Asia, and are struck at its chief cities, Pergamum, Parium, Adramyttium, Thyatira, Sardis, Smyrna, Ephesus, Tralles, Nysa, Laodicea, and Apamea. They have at first the names of Greek magistrates, afterwards coupled with those of Roman proconsuls or propraetors. The silver medallions of Asia, the successors of the cistophori, range from Mark Antony to Hadrian and Sabina. They bear no names of cities, but some may be attributed by their references to local forms of worship. The obverse bears an imperial head, the reverse a type either Greek or Roman. The art is the best of this age, more delicate in design and execution than that of any other pieces, the Roman medallions excepted.

The Troad. The coinage of the Troad is interesting from its traditional allusions to the Trojan War. Of Abydos there is a fine gold stater, with the unusual subject of Nice sacrificing a ram, and the eagle, which is the most constant type of the silver money,—a series chiefly noticeable for the coarse style and bad fabric of the late Attic tetradrachms. One of the few imperial coins commemorates the legend of Hero and Leander. The late tetradrachms of Alexandria Troas bear the head of Apollo Smintheus, and on the reverse his figure armed with a bow; the inscription is ΑΠΟΛΛΩΝΟΣ ΣΜΙΘΕΩΣ ΑΛΕΞΑΝΔΡΕΩΝ. There is a long series of the town as a colonia, of extremely poor work. Dardanus has remarkable silver coins, both early and fine. Ilium Novum strikes late Attic tetradrachms with a head of Athene, and on the reverse the same goddess carrying spear and distaff, with the inscription ΑΘΗΝΑΣ ΙΛΙΑΔΟΣ. On the autonomous and imperial bronze we notice incidents of the tale of Troy, as Hector in his car, or slaying Patroclus, or fighting; the other side, for this coin is autonomous, shows the wolf and twins, and again the flight of Æneas. Of Scepsis, which is said to have been the capital of a Dardanian kingdom for a long period between the fall of Troy and the age of Alexander, there are early silver coins, and some of its bronze money is of good style. The island of Tenedos is represented by very early coins, and others of the fine and late periods. The usual obverse type of all the silver pieces is a Janus-like combination of two heads, probably those of a Zeus and a Hera; and the reverse type of all but the oldest is a two-headed axe.

Æolis. In Æolis the most noteworthy coins are the late tetradrachms of Cyme and Myrina, both of the time of decline, yet with a certain strength which relieves them from the general weakness of the work of that age. Cyme has the head of the Amazon Cyme, and a horse within a laurel-wreath; Myrina, a head of Apollo and his figure with lustral branch and patera. The rest of the coins of these and other towns are bronze, autonomous and imperial.

Lesbos. Lesbos is remarkable for having coined in base as well as pure silver, its early billon coins being peculiar to the island, and not easily classed to the cities like the silver. They are of various weights, as if the alloy had not been reckoned at first, but afterwards admitted, unlike the electrum of the coast, in which the silver was always excluded from the value. Methymna has very interesting archaic silver coins, with the boar and the head of Athene, her helmet adorned with a Pegasus rising above her forehead. There are later coins of about 400 B.C. and about Alexander's time. The types are the head of Athene and the lyre. The weight is Attic. Of Mytilene there are few coins until late in the Persian dominion. The types are the head of Apollo and the lyre. The style is fine for the period, with the strongly expressive quality that marks the contemporary western Asiatic currencies, and the execution is careful. There is a long and important series of the imperial time, including very interesting commemorative coins, some probably of persons of legend as Nausicaa, or of remote history as Sappho, others of benefactors of the city as Theophanes the friend of Pompey, from whom he obtained for this his native place the privileges of a free city. The usual style for these persons is hero or heroine, but Theophanes is called a god, and Archedamis, probably his wife, a goddess.

The money of Ionia is abundant and beautiful. Clazomenæ is the first city of interest. Here we observe a very early tetradrachm of Attic weight with the types of a lion gnawing his prey, and the forepart of a winged sow. Drachms and smaller coins follow with the forepart of the sow and an incuse. Then there is the break frequently noticeable in Asia Minor, and the coinage begins anew with splendid coins of the age before Alexander, having for types the head of Apollo, three-quarter face, and a swan. The chief pieces, the gold drachm and a half or octobol, and the silver stater or tetradrachm, present two types of the head of Apollo, very grand on the gold and the silver, with the signature of Theodotus, the only known Asiatic engraver, and richly beautiful on the other silver piece. These coins are marked by the intense expression of the school of western Asia Minor. Colophon has a very early Attic didrachm, followed by transitional Persic coins with the head of Apollo and the lyre, next the common break, during which the famous pieces with a regal portrait, to be noticed under Persia, were probably issued, and then, about Alexander's time, an over-refined repetition of the earlier type. Ionia.

The money of Ephesus is historically interesting, but very disappointing in its art, which is limited by the small range of subjects and their lack of beauty. The leading type is the bee; later the stag and the head of Artemis appear. Thus the subjects relate to the worship of the famous shrine. The oldest coins are electrum and silver, both on the Phœnician standard. The type is a bee and the reverse is incuse. The silver coinage continues with the same types, unbroken by the Persian dominion, until in 394 B.C. a remarkable new coin appears. When Conon and Pharnabazus defeated the Lacedæmonian fleet and liberated the Greek cities of Asia from Spartan tyranny a federal coinage was issued by Rhodes, Cnidus, Samos, and Ephesus, with their proper types on the reverse, but on the obverse the infant Heracles strangling two serpents; these are Rhodian tridrachms. About this time the Rhodian standard was introduced, and a series of tetradrachms began with the bee, having for reverse the forepart of a stag looking back, and behind him a date-palm. This type continues till 301 B.C. on the Rhodian standard, which is then abandoned, and the Attic supersedes it for a short time. Bronze now begins. The head of Artemis as a Greek goddess next occupies the obverse, and the mint of Ephesus also issues tetradrachms of Lysimachus. He subsequently gave the city the name of Arsinoe, his wife, and a few coins record this short-lived change. The next coins repeat the head of Artemis, and the forepart of the stag and the palm-tree again occupy the reverse. The head is specially beautiful, and the whole coin of most careful work. The Ptolemaic rule is commemorated by the splendid octadrachm of Queen Berenice II. struck here. At this time the Attic standard was abandoned, and the Rhodian, then very popular in the commerce of the eastern Mediterranean, was adopted. The city afterwards fell into the hands of Antiochus III. About this time Alexandrine tetradrachms were here minted; it would seem most reasonable to date them from the peace of 189 B.C., when the Romans endeavoured to conciliate the cities of the coast, but there are reasons for supposing that they began earlier with a monetary alliance between Ephesus and the great Phœnician mart Aradus. The Attic weight was thus restored, and there is a long issue of drachms on that standard, with the types of the bee, and the stag standing on the nearer side of the palm-tree. To the same age belong the Ephesian tetradrachms of the kings of Pergamum, to whose territory the Romans had assigned Ephesus, and undated cistophori. When in 133 B.C. the Roman people inherited the kingdom of Pergamum, an issue of dated cistophori began at Ephesus, which was the chief city of the Roman province of Asia. This is not interrupted by the revolt, when Ephesus took the side of Mithradates (87-84 B.C.), which, however, is marked by a series of gold Attic didrachms and a solitary coin of strange weight, which may be a half-aureus issued by Sulla (84 B.C.), as Mommsen ingeniously supposes. The Roman rule is next marked by the issue of proconsular cistophori. After the disturbance caused by the civil wars these cease, and there are only bronze pieces, which we may suppose to be of the latest days of the republic. The imperial money follows, of far higher interest than the autonomous. There are many representations of the temples of the city, including that of the famous shrine of Artemis, which shows the bands of sculpture on the columns, as well as many other remarkable subjects, particularly the Zeus of rain seated on Mount Prion, a shower falling from his left hand, while below are seen the temple of Artemis and the river-god Cayster; on another coin the strange Asiatic figure Ephesus.

of the goddess, frequent in this series, stands between the personified rivers Caÿster and Cenchrius (see Head's *Ephesus*).

Erythræ has fine coins, mainly transitional, with a horseman about to mount his steed, and a flower. These are Persic, and after a long pause there is a series of Rhodian weight of about Alexander's age, and later Attic, having types connected with Heracles. The series of autonomous bronze is large. *The money of the Ionian* Magnesia begins with the issue of Themistocles, when he was dynast under Persian protection. In the decline of the Oriental power the city strikes her own money, with the types of an armed horseman and a humped bull butting, surrounded by the labyrinth pattern which symbolizes the river Mæander. The weight is Persic. After a long pause we observe the currency recommencing with spread tetradrachms of the decline of art, more delicately executed than those of Cyme and Myrina, with a bust of Artemis and a figure of Apollo standing on a mæander and leaning against a lofty tripod, the whole in a laurel-wreath. The great city of Miletus is disappointing in its money. The period of its highest prosperity is too early for an abundant coinage, yet in the oldest electrum issues we see the lion of Miletus. *It is not*, however, until the confederacy with Athens after the battle of Mycale that there is a common silver coinage, with the lion's head and a star, of Attic weight. Later money with the same types seems to show the influence of the Carian princes. It closes with beautiful coins bearing the head of Apollo facing and the lion looking back at a star, with the inscription ΕΓ ΔΙΔΥΜΩΝ ΙΕΡΗ, showing, whatever be the word understood, that this was the "sacred" money of the famous temple at Didyma. Next come fine coins of about Alexander's time, differing from the last in having the head in profile. The weight is equally Phœnician. The types continue through a series of various standards with very rare Attic gold staters. Phocæa is represented by two very interesting currencies: an electrum series of hectæ like that of Cyzicus, but of inferior purity, characterized by a seal, the badge of the town, beneath the type; and also a widespread early silver coinage, apparently common to the Western colonies of the city. The autonomous money is wholly anterior to the Persian conquest. Smyrna first strikes late Attic tetradrachms, with the turreted head of Cybele or the city or the Amazon Smyrna, and an oak-wreath sometimes enclosing a lion. A rare silver coin presents on the reverse the seated figure of Homer, also occurring in the autonomous bronze, of which there is very much, partly of imperial time as well as a long series of imperial bronze. Among the bronze coins we notice those with the head of Mithradates. The earlier imperial coins are of delicate work. Those of the young Vespasian are historically interesting.

Miletus. Smyrna.

Teos. Of Teos there are early Æginetic didrachms, bearing on the one side a seated griffin with curled wings and on the other a quadripartite incuse square. These ceased at the moment when the population left the town, destroyed by the Persians, and fled to Abdera, where we recognize their type on the coinage of the time. There are much later coins of less importance.

Chios. Chios and Samos, islands of Ionia, are represented by interesting currencies. Chios struck electrum and abundant silver. The type was a seated sphinx with curled wing, and before it stands an amphora, above which is a bunch of grapes; the reverse has a quadripartite incuse. The coins begin before the Persian conquest (490 B.C.), and are first archaic and then of fine style. There is apparently a gap in the later Persian period. Afterwards there is a cessation of money until Sulla's time, when silver is again struck and bronze seems to begin.

Samos. The coinage of Samos is artistically disappointing, but as a whole has many claims to interest. The earliest money must have included electrum, but we are unable to discriminate between the rival claims of Lesbos and Samos; some pieces, however, cannot reasonably be doubted to belong to Samos. The silver begins before 494 B.C., when history comes to our aid to make a marked division. The types are the well-known lion's scalp and bull's head, of Oriental origin, both probably connected with the worship of Hera. They are continued in the next period, and the Athenian conquest (439 B.C.) is only marked by the introduction of the olive-spray as a constant symbol on the reverse and the more important change from degraded Phœnician to Attic weight. Notwithstanding the regularity of their coin type, the Samians, having joined the anti-Laconian alliance after Conon's victory in 394 B.C., struck the coin with Heracles strangling the serpents already noticed under Ephesus; the Rhodian weight is thus introduced. We next notice an Alexandrine tetradrachm of the class of those issued after the battle of Magnesia. There is nothing further of interest until the long series of imperial money, which, though wanting in beauty of style, is not without interesting types. Of the mythological subjects the most remarkable is the Asiatic figure of the Samian Hera, which clearly associates her with the group of divinities to which the Ephesian Artemis belongs. Very noticeable also are the representations of Pythagoras, seated or standing, touching a globe with a wand (see Professor Gardner's *Samos*).

Caria. The money of Caria does not present any one great series. Autonomous silver coins are not numerous except at Cnidus, and rarely of good style. *Antiochia has late Attic silver pieces*; as this city was founded by Antiochus I., its coinage is important as fixing the date of similar money of Miletus. There are imperial coins of this town, and of Aphrodisias, worthy of notice. Cnidus is represented at first by archaic coins going down to about 480 B.C. Their weight is Æginetic, and the types are a lion's head and the head of Aphrodite. There are, after a break, coins of Rhodian weight, about 400 B.C., others preceding Alexander, and others, again, after his age. An imperial coin represents the famous statue of Aphrodite by Praxiteles. Of Halicarnassus there are small silver pieces of the age of good art, and others of subsequent times, including that of the Carian kings, and the silver money continues after Alexander. Among the imperial types the head of Herodotus is noteworthy. There is late silver money of Iasus with the head of Apollo, and a youth swimming beside a dolphin around which his arm is thrown. It is interesting to compare this type with the similar subjects of Tarentum. Idyma has silver pieces of fine style on which the head of Apollo is absolutely facing, *as sometimes at Catana in Sicily*; the reverse type is a fig-leaf. Myndus on its late silver perhaps shows in the head-dress of Isis a trace of the Ptolemaic occupation. Tabæ has also late silver; and of Termera we have the rare coin of its tyrant Tymnes, dating about the middle of the 5th century and struck on the Persic system.

The Carian kings prove their wealth by their series of coins, which bear the names of Mausolus, Hidrieus, and Pixodarus, Artemisia, the widow of Mausolus, being absent. The weight is Rhodian; the types are the three-quarter head of Apollo, and Zeus Labrandeus standing, holding the labrys or two-headed axe. Mausolus strikes tetradrachms, Pixodarus gold of Attic weight. His silver is the best in the series, and clearly shows the Ionian style in its quality of expression.

Calymna heads the islands of Caria. Its money begins with curious archaic Persian double drachms bearing a barbarous helmeted male head and on the reverse a lyre incuse. Later there are coins of about 400 B.C. The series of Cos begins with small archaic pieces, the type a crab and the reverse incuse. Next come fine coins of transitional style and Attic weight, with the types of a discobolus before a tripod, and a crab. The wrestlers of Aspendus may be compared with the remarkable obverse type. The common break then interrupts the issue, and a new coinage occurs before the time of Alexander. The weight is Rhodian, the types the head of Heracles and the crab. After Alexander there is another currency which ceases about 200 B.C. It is resumed later with the new types of the head of Æsculapius and his serpent. This continues in Roman times. The bronze of that age comprises a coin with the head of Hippocrates and on the reverse the staff of Æsculapius. Xenophon's head likewise occurs, and the portrait of Nicias tyrant in Cos (c. 50 B.C.) on his bronze. Imperial money ends the series. Of the island of Megiste there are charming little silver pieces of about 400 B.C. with Rhodian types, the head of Helios in profile and the rose.

Calymna and Cos.

The island of Rhodes, great in commerce and art, has a rich series of coins. The want of variety in the types—at the city of Rhodes almost limited to the head of Helios and the rose—is disappointing, but happily the principal subject could not fail to illustrate the movements of art, one of which had here its centre, and the continuity of the money affords valuable metrological evidence. The city of Rhodes was founded c. 408 B.C. on the abandonment by their inhabitants of the three chief towns of the island, Camirus, Ialysus, and Lindus. The money of Camirus seems to begin before 480 B.C. The type is the fig-leaf, the weight Æginetic, later degraded or changed to Persic. The coins of Ialysus, of the 5th century, follow the Rhodian standard. Their types are the forepart of a winged boar and an eagle's head of a vulturine type. The money of Lindus, apparently before 480 B.C., is of Phœnician weight, with the type of a lion's head. The people of the new city of Rhodes adopted another standard, the Attic, and very shortly abandoned it, except for gold money, using instead that peculiar weight which has been called Rhodian but may better be considered to be heavy Phœnician; this they retained until the last years of their independent coinage, when they resumed the Attic. The types are the three-quarter face of Helios and the rose. The first series was issued from the building of Rhodes to 304 B.C., the chief coins being the gold stater and the silver tetradrachm. There is a grandeur and noble outlook in the countenance of Helios which well befits his character, but the pictorial style is evident in the form of the hair and the expression, which, with all its reserve, has a dramatic quality. From 304 to 186 B.C. there is a change of type, and the head of Helios is radiate. The profile head which now also occurs, and the constant pictorial handling of the hair, not, as before, in its outlines only, but also in its masses, show the qualities of Lysippus. It is perplexing to note that the standard of weight is below that of those coins which Ptolemy I. struck for Alexander IV. on the Rhodian weight; but this difficulty disappears if we regard the standard as Phœnician, and both the Rhodians and Ptolemy as borrowers. The Alexandrine tetradrachms, which were issued after the battle of Magnesia, find a place in the Rhodian mintage.

Rhodes.

Small coins follow this currency. In 166 B.C. favourable political circumstances cause a new issue of money. The Attic gold staters of this age have a strikingly dramatic style, pointing to the great local school; the silver, with the head of Helios in profile,—in the gold it is three-quarter face,—is still marked by careful execution. In the latest coins, from 88 to 43 B.C., the Attic standard, now universal, whether the chief coin was called drachm or denarius, again appears. During the age after Alexander there is an abundant bronze coinage, with some pieces of unusual size. The series closes with a few imperial coins ranging from Nerva to Marcus Aurelius.

Lycia.

The early coinage of Lycia introduces us at once into a region of Asiatic mythology, art, and language, raising many questions as yet without an answer. The standard of the oldest coins is Persic, and it falls perhaps under Athenian influence, until it becomes equivalent with the Attic. The Lycian character belongs to the primitive alphabets of Asia Minor, which combine with archaic Greek forms others which are unknown to the Greek alphabet, and it expresses a native language as yet but imperfectly understood. The art is stiff and delights in animal forms, sometimes of monstrous types, which recall the designs of Phœnicia and Assyria. The most remarkable symbol is the so-called triquetra, an object resembling a ring, to which three or four hooks are attached. It is supposed to be a solar symbol like the swastika. The oldest money, probably dating from about 480 B.C., has a boar or his fore-part and an incuse. This is succeeded by a series in which the hooked ring is the usual reverse type. It bears Lycian inscriptions, which may usually denote tribes; one certainly indicates the town of Tlos. This coinage probably reaches as late as Alexander's time. It is followed by silver and bronze money of the Lycian League before Augustus and under his reign, but ceasing in that of Claudius,—the usual types of the chief silver piece, a hemidrachm, being the head of Apollo and the lyre. Besides this general currency there are some special ones of towns not in the League. The imperial money rarely goes beyond the reign of Augustus, and is resumed during that of Gordian III. There is a remarkable coin of Myra of this emperor, showing the goddess of the city, of a type like the Ephesian Artemis, in a tree; two woodcutters, each armed with a double axe, hew at the trunk, from which two serpents rise as if to protect it and aid the goddess. Phaselis is an exceptional town, for it has early Greek coins, the leading type being a galley.

Pamphylia.

The coinage of Pamphylia offers some examples of good art distinctly marked by the Asiatic formality. Aspendus shows a remarkable series of Persic didrachms, extending from about 480 B.C. to Alexander's time. The oldest coins have the types of a warrior and the triskelion or three legs, more familiarly associated with Sicily; it is probably a solar symbol. One has an extraordinary reverse type, in which the triskelion is engraved upon an advancing lion, also held to have a solar meaning. These coins are followed by a long series with the types of two wrestlers engaged and a slinger. The main legend is almost always in the Pamphylian character and language. There are also very curious imperial types. The money of Perga is very interesting. It begins in archaic style, and is resumed after the age of Alexander with Greek types of the Artemis of Perga. Her figure in a remarkable Asiatic form occurs in the long imperial series. Bronze coins earlier in date than the silver money with the Greek types have the Pamphylian title of the goddess, read by W. M. Ramsay (*Hellenic Journal*), ϜΑΝΑΣΣΑΣ ΠΡΕΙΙΑΣ, "of the queen of Perga." Side has at first Persic didrachms of about 480 B.C., their types the pomegranate and dolphin and mystical eye, or pomegranate and dolphin and head of Athene; then there are satrapal money of about 400 B.C. and late Attic tetradrachms, their types being the head of Athene and Nice, of about the first century B.C., for they are imitated by Amyntas, king of Galatia.

Pisidia, &c.

The money of Pisidia is chiefly imperial. There is a long series of this class of the colonia Antiochia. The autonomous coins of Selge have the wrestlers and the slinger of Aspendus in inferior and even barbarous copies. Of Isauria and Lycaonia a few cities strike coins of imperial class or time.

Cilicia.

Cilicia, a coastland, is numismatically of high interest. Celenderis, a colony of Samos, has archaic coins of Æginetic weight, their type a goat, the reverse being incuse. These are followed by a splendid coinage of transitional and fine art, with a horseman seated sideways on the obverse and on the reverse a goat kneeling on one knee. The latest, about 400 B.C., are free from stiffness, and the horseman may be favourably compared with the similar types of Tarentum. The weight is the Persic didrachm. Mallus has a most interesting series of silver coins, some with curious Asiatic types. Of Nagidus there are Persic didrachms of good style, one interesting type being Aphrodite seated, before whom Eros flies crowning her, with, on the other side, a standing Dionysus. Soli has silver coins of the same weight, the types being the head of Athene, one variety imitated from remote Velia, and a bunch of grapes; they are anterior to Alexander. The coinage of Tarsus begins with rough and thick tetradrachms of Attic weight, evidently issued soon after Alexander's reign, and for no long time subsequently. The types are the Baal of Tarsus and a lion. The autonomous bronze of the Seleucid age shows the remarkable subject of the pyre of Sandan, the local form of Heracles; and there is a long and curious imperial series.

Cyprus.

The coinage of the great island of Cyprus is, as we might expect from its monuments, almost exclusively non-Hellenic in character. The weight-system, except of gold, which is Attic, is Persic, save only in the later coins of the kings of Salamis, who strike on the reduced Rhodian standard. The art is usually very stiff down to about 400 B.C., with types of Egypto-Phœnician or Phœnician or of Greek origin. The inscriptions are in the Cyprian character, belonging to the interesting group of alphabets of Asia Minor, of which the Lycian and Pamphylian are instances. The character has been read, and the attributions of the coins are thus taking shape. The prevalent types are animals or their heads, the chief subjects being the bull, eagle, sheep, lion, the lion seizing the stag, the deer, and the mythical sphinx. The divinities we can recognize are Aphrodite, Heracles, Athene, Hermes, and Zeus Ammon. But the most curious mythological types are a goddess carried by a bull or by a ram, in both cases probably Astarte, the Phœnician Aphrodite. The most remarkable symbol is the well-known Egyptian sign of life. The coins appear to have been struck by kings until before the age of Alexander, when civic money appears. There are two well-defined currencies, that of the kings of Salamis, who claimed a Greek origin, and that of the Phœnician dynasty of Citium. The coins of the Salaminian line are in silver and gold. The earlier have Cyprian, the later Greek inscriptions, the types generally being native, though after a time under Hellenic influence. They are of Evagoras I., Nicocles, Evagoras II., Pnytagoras, and Nicocreon, and the coinage is closed by Menelaus, brother of Ptolemy I., who, of course, does not take the regal title. The kings of Citium from 448 to 332 B.C., Baalmelek, Azbaal, Melekiaton, and Pumiaton, strike silver and in one case gold, their general types being Heracles, and the lion seizing the stag. Bronze begins soon after 400 B.C., and of the same age there are autonomous pieces, one of Paphos in silver, and several of Salamis in bronze. There is Greek imperial money from Augustus to Caracalla. The most remarkable type is the temple at Paphos, represented as a structure of two stories with wings. Within the central portion is the sacred stone, in front a semicircular court.

Lydia.

The earliest coinage of Lydia is no doubt that of the kings, already described. The next currency must have been of Persian darics (gold) and drachms (silver), followed by that of Alexander, the Seleucids, and the Attalids of Pergamum, and then by the cistophori of the province of Asia. There is an abundant bronze coinage of the cities, autonomous from the formation of the province, and of imperial time, but mostly of the imperial class. The largest currencies are of Magnesia, Philadelphia, Sardis, Thyatira, and Tralles. The art is not remarkable, though good for the period, and the types are mostly Greek.

Phrygia.

The coinage of Phrygia has the same general characteristics as that of Lydia. Among noteworthy types must be noticed Men or Lunus, the Phrygian moon-god, and the legendary Minos. There are curious types of Apamea, surnamed Kibotos or the Ark, and more anciently Celænæ. One of Severus represents the legend of the invention of the double pipe, a type already described. Of the same and later emperors are coins bearing the famous type of the ark of Noah and the name ΝΩΕ. The town of Cibyra is remarkable for a silver coinage, of which the large pieces have the weight of cistophori. They are of the first century B.C., and were probably struck by one or more tyrants of the four confederate cities of which Cibyra was the head, a state which came to an end 84 B.C.

Galatia.

Galatia has little to offer of interest. Trajan issued bronze imperial coins for the province, and there is imperial money of Ancyra and Pessinus, besides other series of less importance. The only remarkable regal issue is that of Amyntas, Strabo's contemporary, who struck tetradrachms, imitating the late money of Side.

Cappadocia, &c.

With the coinage of Cappadocia we bid farewell to Greek art and enter on the domain of Oriental conventionalism, succeeded by inferior Roman design coarsely executed. There is one large imperial series, that of Cæsarea, which numismatists have unduly increased by the introduction of many uncertain coins, all of which cannot even be proved to be Asiatic. The issues range from Tiberius to Gordian III., and are in silver and bronze. The most common type is the sacred Mount Argæus, on which a statue is sometimes seen,—a remarkable type curiously varied. There are scanty issues of a few other towns. There is an interesting series of coins of the kings of Cappadocia, who struck Attic drachms, and far more rarely tetradrachms. The usual names are Ariarathes and Ariobarzanes, the first being that of the old line who claimed descent from one of the Persian chiefs who slew the Magian. The earliest coins are of Ariarathes IV. (220-163 B.C.). The rare tetradrachms of Orophernes a successful claimant in the next reign, bear a fine portrait. There are also tetradrachms of Ariarathes V. and of another king of the same name, a son of Mithradates of Pontus, put by him on the Cappadocian throne. The coins of Archelaus, the last king set up

by Antony, have a good head on the obverse. Of Armenia there are a few silver and bronze coins of late sovereigns.

Syria. The great series of Syrian money begins with bronze coins of Trajan, struck, according to his custom, for the province. From these we pass to the money of the Seleucid kings of Syria, only rivalled for length and abundance by that of the Ptolemies, which it excels in its series of portraits, though it is far inferior in its gold money and wants the large and well-executed bronze pieces which make the Egyptian currency complete. The gold of the Seleucids is scarce, and their main coinage is a splendid series of tetradrachms bearing the portraits of the successive sovereigns. The reverse types are varied for the class of regal money. The execution of the portraits is good, and forms the best continuous history of portraiture for the third and second centuries before our era. The reverses are far less careful. The weight is Attic, but the cities of Phœnicia were ultimately allowed to strike on their own standard. Seleucus I. began by striking gold staters and tetradrachms with the types of Alexander the Great. The same king, like his contemporaries, then took his own types: for gold staters, his head with a bull's horn, and on the reverse a horse's head with bull's horns; for tetradrachms, Alexander's head in a helmet of hide with bull's horn and lion's skin, and Nice crowning a trophy, or the head of Zeus, and Athene fighting in a car drawn by four or two elephants with bull's horns. The Zeus and elephant-car type is remarkable for presenting in some cases the names of Seleucus I. and his son Antiochus I. as colleagues. Antiochus I., like his father, first struck tetradrachms with Alexandrine types, and then with his own head, Heracles seated and Apollo on the omphalos occupying the reverse. The portrait of Antiochus has a characteristic realism, though marked by the deep recessing of the eye which is a characteristic of the school of Lysippus. The tetradrachms assigned to Antiochus II., Seleucus II., Antiochus Hierax (a doubtful attribution), Seleucus III., and young Antiochus his son are not specially noteworthy. Antiochus III. is represented by a fine and interesting series. He alone of the Seleucids seems to have struck the great octadrachm in gold in rivalry of the Ptolemies. His portrait is vigorous, and the elephant which varies the seated Apollo on the reverse of his silver tetradrachms relieves the heraldic dryness of that type. There are rare copper coins of the rebel satraps Molon and Achæus. The regal series is continued under Seleucus IV., and again becomes interesting with the money of Antiochus IV. (Epiphanes). His portrait is extremely characteristic, marked by the mad obstinacy which is the key to the tyrant's history. The most remarkable coin is a tetradrachm with the head of Antiochus in the character of Zeus, an instance of audacity unexampled in coinage. In his time mints became numerous in the bronze coinage, and there is a remarkable series in that metal with Ptolemaic types, marking his short-lived usurpation in Egypt. Passing by his son Antiochus V., we note a great change in the coinage of Demetrius I. The silver tetradrachms now bear both mints and dates, a custom that generally prevails henceforward. In one type the heads of Demetrius and Queen Laodice occur side by side. One of these coins in the British Museum is struck on a tetradrachm of Timarchus, the revolted satrap of Babylon, who takes the style "Great King." With Alexander I. (Balas) Tyre and Sidon begin to strike royal tetradrachms on their own Phœnician weight. The money of Demetrius II. follows, then that of the young Antiochus VI., with the most carefully executed portrait in the whole series, which, despite its weakness, has a certain charm of sweetness that marks it as a new type in art. The same artist's hand seems apparent in the fine portrait of the cruel usurper Tryphon, whose features have a beauty of expression that must surely be ideal, and also in the picturesque spiked Macedonian helmet with a goat's horn and cheek-piece which occupies the reverse, on which is written after "King Tryphon" the strange title "autocrator." Antiochus VII. continues the series with, amongst other coins, the solitary bronze piece of Jerusalem, bearing the lily and the Seleucid anchor. On his money of Tarsus we note the first appearance of the pyre of the local Oriental divinity. The restored Demetrius II. now reappears, the Phœnician money with his beardless head, the rest usually with the beard he had grown in his Parthian captivity. Alexander II. (Zebina) follows, and then Cleopatra, widow of Demetrius II., Alexander I., and Antiochus VII., next appears as colleague of her son Antiochus VIII. Her coarse features are in keeping with the vileness of her character. Antiochus VIII. alone amid the subsequent Seleucids has an interesting coinage, and the empire closes with the coarse money of the Armenian Tigranes, his portrait with the lofty native tiara, and for reverse Antioch seated, the Orontes swimming at her feet.

Commagene. There is a copper coinage of the cities of Commagene, Samosata, and Zengma, and less important mints. The money of Samosata is of the time of the kings of Commagene and also imperial, this showing the type of the city derived from the famous statue of Antioch. The series of Zeugma is imperial, and has the subject of a temple on a mountain. The money of the kings of Commagene is in bronze, of late date, and not of much interest.

Cyrrhestica has bronze coins of a few cities, nearly all imperial, the chief mints being Cyrrhus and Hierapolis. The last bear the inscription ΘΕΑΣ ΣΥΡΙΑΣ ΙΕΡΟΠΟΛΙΤΩΝ, and have figures of the goddess seated on a throne flanked by lions or riding on a lion, thus directly connecting her with Cybele. Cyrrhestica.

Of Chalcidene there are bronze coins of Chalcis and of the tetrarchs, and Palmyrene shows only the small bronze pieces of Palmyra, the money of Zenobia and the family of Odenathus being found in the series of Alexandria. Chalcidene, &c.

Seleucis and Pieria, the brother states (on the coins ΑΔΕΛΦΩΝ ΔΗΜΩΝ), have bronze coins, dated (149-147 B.C.) and undated. But the bulk of the money of this territory is of the great city of Antioch on the Orontes. This long series, second only to that of Alexandria in quantity, is of far less interest from the want of variety in the types, but it is curious chronologically. The coinage is both autonomous bronze before and of Roman times, and imperial base metal and bronze. The base metal money is at first of debased silver, then of potin, and at last of bronze washed with silver. The imperial bronze coins have at the same time both Greek and Latin inscriptions, the last with S.C. Trajan combines the Greek inscription with the Latin S.C., and when the city had been made a colonia by Caracalla this is indicated in Greek inscriptions from Elagabalus downwards. No less than four eras are used. The era of the Seleucids, the dates being from 97 to 37 B.C., occurs on the autonomous money; so also the Pharsalian era, from 38 to 22 B.C., and on imperial coins as late as Titus; the Actian era on autonomous coins, from 6 B.C. to 13 A.D., continuing under the early emperors; and the Cæsarian era on the autonomous class, from 55 to 158 A.D. The mass of imperial coins and all after Titus are dated by the tribunitian years of the emperors. The leading types are the figure of Antioch seated, the river Orontes swimming at her feet, from the famous statue by Eutychides, and the eagle on a thunderbolt, a palm in front. Under Hadrian the eagle is represented carrying an ox's leg, a reference to the story of the foundation of the city when an eagle carried off part of the sacrifice and deposited it on the site which was consequently chosen. There are few other types. The art is rude, though certain base metal coins show a largeness and decision in the heads, while wanting Hellenic refinement. The imperial series is very full and has an historical value as showing what emperors ruled Syria. It includes money of Sulpicius Antoninus, the Uranius Antoninus of Roman gold also struck in Syria. The series ends with Valerian, though it begins anew in the Roman provincial money of the reform of Diocletian, to be noticed later. Antioch.

Of Apamea there are bronze coins of the age of the Seleucids, the elephant type which occurs being appropriate. At Emesa in the bronze imperial money Sulpicius Antoninus reappears, one of his coins having for reverse the characteristically Syrian type of a sacred conical stone in a temple. The money of Gabala is autonomous and imperial, with, in this class, curious mythological types. Laodicea has an important series. It begins with Phœnician tetradrachms and bronze money of the later Seleucids. The tetradrachms have a turreted and veiled female bust of the city, a favourite Syrian and Phœnician type. These autonomous coins are followed by an imperial coinage like that of Antioch; from Caracalla downwards Laodicea is a colonia; the inscriptions become Latin, then, very strangely, Greek on the obverse of the coins and Latin on the reverse. Seleucia has a similar autonomous and imperial currency, but does not become a colonia. There is a curious type of an apparently open shrine of *Zeus Casius* containing a sacred stone. Apamea, &c.

In Cœle-Syria there is bronze of Damascus, late autonomous and imperial; the city becomes a colonia. The imperial money of Heliopolis, a colonia, shows a great temple in perspective, another temple containing an ear of corn as the central object of worship, and a view of the Acropolis with the great temple upon it, and steps leading up the rock. Cœle-Syria.

The coinage of Phœnicia is a large and highly interesting series. The autonomous money is here important, and indicates the ancient wealth of the great marts of the coast. The earliest coins were struck during and shortly after the Persian rule, and the most important classes have not been certainly fixed. It is therefore needful to speak of them before describing the attributed money of the cities. These coins are of Phœnician weight, except one class, which follows the Persic standard. The great currency is of silver octadrachms. The types, limited in number, are Oriental in character; the leading one is the war-galley; the king of Persia also occurs, and the fish-god Dagon. The art is hard, but has a force that reminds us of archaic Greek; it is, however, Oriental. The inscriptions are in the Phœnician character. Three great classes are distinguished. Octadrachms range from about 400 B.C. to Alexander's time. The types are a war-galley in full sail and the king in a car; then for the obverse the war-galley beneath the walls of a fort, and below two lions. Didrachms with a similar obverse have for reverse the king slaying a lion. Octadrachms follow with the war-galley and the king in his car apparently followed by a vassal. These coins have been assigned to Sidon. A series of tetradrachms is of less importance. The obverse has a Phœnicia.

dolphin or the king as an archer on a sea-horse, the reverse an owl with the Egyptian symbols of sovereignty, the crook with the flail across it. These are after 400 B.C. and have been given to Tyre, but the Egyptian influence would perhaps suggest some town nearer the southern border of Palestine. A third class of money of the same age is of Persic weight. The earliest pieces have a head supposed to be of Melkarth and a war-galley, the later examples bearing dates. The dated series continues, but the obverse type changes to Dagon. These are assigned to Aradus. The series bearing the names or symbols of cities would not be difficult to class were it not for their constant interruption by Ptolemaic and Seleucid coins and by the issue of Alexandrine tetradrachms. Berytus has bronze, both autonomous and of the city as a colonia. The types of interest are the founding of the colonia, Poseidon, not always of a purely Greek type, Poseidon and the nymph Berytus, the temple of the same divinity, and the eight Phœnician gods or Cabiri. To Byblus we may class with certainty a Phœnician currency, that of the native kings from about 400 B.C. to Alexander's age. The imperial coinage presents a very curious perspective representation of a temple in Græco-Phœnician style, with a conical edifice in the court. Cæsarea ad Libanum shows in its imperial money a strange type of Elagabalus, a half-figure of the Syrian goddess in a shrine. She wears a cap like a papyrus head and is enwrapped in shapeless drapery. The shrine is of Egyptian style, and a sceptre with a bird upon it is beside the goddess. Marathus has a very fine Phœnician tetradrachm of 226 B.C., with the head of the city turreted and a youth holding an aplustre and seated on bucklers. This is a work of Greek design and style, as is also a small coin of the year following with the head of Queen Berenice II., then reigning. The copper is dated from 198 to 153 B.C.

Sidon. The undoubted money of Sidon begins with Alexandrine gold and silver, dated shortly after the king's reign. This was followed by other Alexandrine money, interrupted by that of Ptolemy II., Arsinoe II., and Ptolemy III. Ptolemy IV. also struck here and Antiochus IV. in bronze; and later Seleucids issued tetradrachms from 151 to 114 B.C. The era of the autonomy of Sidon was 111 B.C. There are tetradrachms dated by this reckoning with the head of the city and an eagle on a rudder, across him a palm. In the bronze we observe the type of Europa carried by the bull. Some pieces of this class have Phœnician as well as Greek inscriptions. The imperial money shows a curious shrine on wheels. In the time of Elagabalus Sidon is characterized as a colonia. The type of a temple of Astarte as a local Aphrodite is worth notice. The series closes with Julia Mæsa. Tripolis has an interesting but limited autonomous and imperial series. The worship of the Dioscuri is here associated with Asiatic religion. Architecturally these coins are highly curious.

Tyre. The early money that can be classed with certainty to Tyre exhibits similar historical vicissitudes to that of Sidon. Before she gained her independence the Seleucids struck here from 149 to 125 B.C., and in that very year the autonomous era begins. The tetradrachms dated by this era bear the head of the Tyrian Heracles in a Greek form, and the eagle on a rudder, across him the palm. The latest coin of this series known to us is a didrachm of 66 A.D. There is also autonomous bronze. The imperial class begins with Severus, and under him the constitution of the colonia is shown; but the most interesting type is a serpent coiled round an egg, between a date-palm (the phœnix or tree of Phœnicia) and a murex, the shell which produced the Tyrian purple. The series ends with Gallienus. Aradus has Alexandrine coins, and acquired its independence in 258 B.C. From this date it struck, first its chief coins with Alexandrine types, then drachms with the types of Ephesus, the bee, and the stag on this side of the date-palm, and lastly tetradrachms with the bust of the city and Nice holding an aplustre and a palm within a wreath. These are of heavy Phœnician weight. The imperial coinage ranges from Tiberius to Gordian III.

Palestine. In Galilee there are a few autonomous and imperial coins of Ptolemais, which was a great mint under the earlier Ptolemies; and other towns are represented. In Peræa there is an imperial series of Gadara. Samaria has money of Cæsarea, both autonomous and imperial, the last for the most part colonial, and also imperial of Neapolis, among the types of which occurs the interesting subject of Mount Gerizim surmounted by the Samaritan temple. The coinage of Judæa is an interesting series. The money of Jerusalem is of high interest, and more extensive than appears at first sight. Here was struck the coin of Antiochus VII., with the native lily as a type, the series of the Maccabæan princes, that of the Roman procurators, and the bronze coins countermarked by the tenth legion, quartered by Titus in the ruins of the city. One of these bears the remarkable symbol of a pig. After the reduction of Judæa in the reign of Hadrian, Jerusalem was rebuilt as a colonia with the name Ælia Capitolina. The earliest coin commemorates the foundation. The coinage lasts as late as Hostilian. Ascalon strikes autonomous silver and bronze, including remarkable tetradrachms with the portraits of Ptolemy Auletes, of his elder son Ptolemy XIV., and of his daughter Cleopatra. There is also money of Gaza of some importance, and of Joppa, both previously mints of the earlier Ptolemies.

Jewish coinage. The independent Jewish coinage begins with the famous shekels. They have been assigned to various periods, but the preponderance of evidence would class them to Simon Maccabæus, to whom the right of coining was granted by Antiochus VII. The series is of shekels and half-shekels, of the weight of Phœnician tetradrachms and didrachms. The obverse of the shekel bears the inscription "the shekel of Israel," and for type the pot of manna, or it may be a sacred vessel of the temple, above which is the initial of the word year, and the letter indicating the year of issue. The reverse reads "Jerusalem the Holy," and the type is a flowering branch, either Aaron's rod that budded or a native lily. The half-shekel differs in having the inscription "half-shekel" on the obverse. The types are markedly peculiar; the obverse inscription is equally so, for the regular formula of the neighbouring cities would give nothing but the name of the city; but the reverse inscription is like that of Tyre and Sidon, for instance, "of Tyre sacred and inviolable," of Sidon the same. This agreement is confirmatory of the assignment to Simon Maccabæus. This coinage bears the dates of years 1, 2, 3, 4 (rare), and 5 (one specimen only). There is great difficulty as to the date. It may be reckoned from the beginning of Simon's actual rule (142 B.C.), or from that of his official rule, which is stated to have been used by the Jews as an era (141 B.C.), or from the decree of Antiochus VII. granting him the right of coinage (c. 140-139 B.C.). On the whole, the evidence in favour of the official date is best. Any one of the three modes of dating would allow five annual issues. There is another explanation which must not be hastily dismissed. It may be that the computation is by sabbatical years, and the fact that there are two types of year 1 lends some colour to this supposition, though if it be admitted there would be a gap of six years between the first and second issues, as both types of year 1 have an inscription modified on the coins of years 2 to 5. There are bronze "half-shekels" and "quarter-shekels" of the year 4. These may be later. The certain coins of the successors of Simon are small bronze pieces of John Hyrcanus, of Judas Aristobulus, of Alexander Jannæus, who strikes bilingual Hebrew and Greek and also Hebrew coins, showing his native name to have been Jonathan, and of Antigonus, who has the Hebrew name Mattathiah. The Maccabæan coinage is followed by that of the Herodian family, equally of bronze, the two most important issues being those of Herod the Great and Herod Agrippa II. The money of the procurators of Judæa, in part parallel with the Herodian, is of small bronze coins, struck between 6-7 A.D. and 58-59 A.D., the latest period of their administration being as yet unrepresented. These are followed by two important classes, the money of the first revolt (66-70 A.D.) and that of the second (suppressed 135 A.D.). Both risings caused the issue of native silver coinage, some of which may be assigned with certainty to each, while the assignment of others is doubtful. Of the first revolt are silver and bronze pieces with the name of Eleazar the priest, silver of Simon, and large and smaller bronze pieces with the name of Simon the prince of Israel. Of the second revolt are restruck denarii with the name of Simon, which appears to have been that of the leader surnamed Bar-cochab or Bar-coziba. Of the first or second revolt are shekels with the name of Simon, the obverse type a gate of the temple, and on the reverse a bundle of branches and a citron, symbols of the feast of tabernacles. Though these differ, it is rash to assign one variety to the earlier and another to the later revolt. Besides this native currency there are coins struck in Palestine by Vespasian, Titus, and Domitian. (See Madden's *Jewish Coinage*, new ed.)

Arabia. Of Roman Arabia there are bronze imperial coins of Bostra and less important mints. In Mesopotamia the colonia of Carrhæ deserves notice, and the city of Edessa, which issues imperial money as a colonia, and has a series of coins of its kings, striking with Roman emperors in silver and bronze. Curiously, this and the colonial issue are long contemporary. The colonial coinages of Nisibis and of Rhesæna, which became a colonia, close the group.

Assyria. Babylonia. Assyria is remarkable for the imperial money of the ancient city of Nineveh, which appears as a colonia with the name Niniva Claudiopolis. The money of Babylon struck by the usurpers Molon and Timarchus has been noticed under the Seleucids.

The coins of Africa are far less numerous than those of the other two continents, as Greek, Phœnician, and Roman civilization never penetrated beyond Egypt and the northern coast to the west. The series of Egypt is first in geographical order. As yet no coins have been here assigned of a date anterior to Alexander. The old Egyptians kept their gold, electrum, and silver in rings, and weighed them to ascertain the value. During the Persian rule the Persian money must have been current, and the satrap Aryandes is said to have issued a coinage of silver under Darius I. In the papyri of this age the argenteus of the temple of Ptah is mentioned, and this has been thought to be a coin of Persian type generally assigned to Phœnicia. (Revillout, in *Revue Égyptologique*.) With Alexander a regular Greek coinage must have begun, and some of his coins may be of Egyptian mints. With Ptolemy I. the great Ptolemaic currency begins which lasted for three centuries. The characteristics of this coinage are its splendid series of gold pieces and the size of the bronze money. The execution of the earlier heads

Egypt.

is good; afterwards they become coarse and careless. At first the fine pieces were issued by the Phœnician, Cyprian, and other foreign mints, the Egyptian work being usually inferior. While the Seleucids were still striking good coins, the Ptolemies allowed their money to fall into barbarism in Egypt and even in Cyprus. The obverse type is a royal head, that of Ptolemy I. being the ordinary silver type, while that of Arsinoe II. was long but not uninterruptedly continued on the gold. The head of Zeus Ammon is most usual on the bronze coinage. A type once adopted was usually retained. Thus Ptolemy I., Arsinoe II., Ptolemy IV., Cleopatra I., have a kind of commemoration in the coinage on the analogy of the priesthoods established in honour of each royal pair. The almost universal type of reverse of all metals is the Ptolemaic badge, the eagle on the thunderbolt, which, in spite of variety, is always heraldic. For art and iconography this series is far inferior to that of the Seleucids. The weight after the earlier part of the reign of Ptolemy I. is Phœnician for gold and silver and either Attic or Egyptian for the bronze. The chief coins are octadrachms in gold and tetradrachms in silver, besides the abundant bronze money. Ptolemy I. appears to have issued his money while regent for Philip Arrhidæus; it only differs in the royal name from that of Alexander; but as yet it has not been possible to separate Ptolemy's coinage from that of the other generals. He then struck money for Alexander IV. on the Attic standard with the head of Alexander the Great, with the horn of Ammon in the elephant's skin and Alexander's reverse. He soon adopted a new reverse, that of Pallas Promachos, and next lowered the coins to the Rhodian standard. This money he continued to strike after the young king's death until he himself took the royal title, when he issued his own money, his portrait on the one side and the eagle and thunderbolt with his name as king on the other, and adopted the Phœnician standard. This type in silver, with the inscription "Ptolemy the king," is thenceforward the regular currency. He also issued pentadrachms in gold, and he or his successor octadrachms in silver. Ptolemy II. (Philadelphus), the richest of the family, continued his father's coinage, and, having acquired the cities of Phœnicia, struck money there with his father's title Soter, while the Egyptian coinage merely bore the title of king: the one was a commemorative coinage, the other, though bearing the portrait of Ptolemy I., was issued in the name of the reigning sovereign. Philadelphus probably began the issue of the gold octadrachms with the busts of Ptolemy I. and Berenice I., Ptolemy II. and Arsinoe II., and certainly struck beautiful octadrachms in gold and decadrachms in silver of Arsinoe II., the gold being long afterwards continued. The Phœnician octadrachms and tetradrachms are dated by the king's reign. Philadelphus also began the great bronze issues of the system which includes the largest coin, sometimes exceeding 1400 grains in weight. Ptolemy III. (Euergetes I.) continued his father's coinages, after a while abandoning the dates in Phœnicia. He also struck fine gold octadrachms with his own portrait. His queen Berenice II., striking in her own right as heiress of the Cyrenaica and also as consort, but with the royal title only given to heiresses in the Ptolemaic line, issued a beautiful currency with her portrait, both octadrachms and decadrachms like those of Arsinoe, and a coinage for the Cyrenaica of peculiar divisions. Under Ptolemy IV. (Philopator) the coinage in its scantiness bears witness to the decline of the state, but the gold octadrachms are continued with his portrait and that of Arsinoe III. Ptolemy V. (Epiphanes) still strikes octadrachms with his portrait, and begins the continuous series of the tetradrachms of the three great cities of Cyprus, which, bearing regnal years, afford invaluable aid in the classing of his and the later coinages. Among the money of the regency of Cleopatra I. must be noticed a copper coin with her portrait. Contemporaneously with it begins the series of Ptolemy VI. (Philometor), broken by the invasion of Antiochus IV. (Epiphanes). This and the money of Philometor's brother and successor Ptolemy Physcon are only remarkable for the many dates they bear, and so with the coinage of succeeding kings, all showing a gradual degradation of art and ultimately a great debasement in metal. In the latest series, the money of the famous Cleopatra VII., it is interesting to note the Egyptian variety of her head, also occurring on Greek imperial money and on that of Ascalon. In Egypt we have the best executed and one of the youngest portraits, and it shows that her face was marked by strong characteristics of acuteness and mobility rather than of beauty.

Under the Roman rule the imperial money of Alexandria, the coinage of the province of Egypt, is the most remarkable in its class for its extent and the interest and variety of its types; and it deserves a more careful study than it has received. It begins under Augustus and ends with the usurper or patriot Achilleus, called on his money Domitius Domitianus, overthrown by Diocletian, thus lasting longer than Greek imperial money elsewhere. In the earlier period there are potin coins continuing the base tetradrachms struck by Auletes, and bronze money of several sizes. The types are very various, and may be broadly divided into Greek, Græco-Roman, and Græco-Egyptian. The Græco-Roman types have the closest analogy to those of Rome herself; the Græco-Egyptian are of high interest as a special class illustrative of the latest phase of Egyptian mythology. These native types do not immediately appear, but from the time of Domitian they are of great frequency. The money of Trajan, Hadrian, and Antoninus Pius is abundant and interesting. A coin of Antoninus, dated in his sixth year, records the beginning of a new Sothiac cycle of 1460 years, which happened in the emperor's second year (139 A.D.). The reverse type is a crested crane, the Egyptian bennu or phœnix, with a kind of radiate nimbus round its head, and the inscription ΑΙΩΝ. Under Claudius II. (Gothicus) and thenceforward there is but a single kind of coin of bronze washed with silver. In this series we note the money of Zenobia, and of the sons of Odenathus, Vabalathus and Athenodorus.

Coins of the nomes of Egypt were struck only by Trajan, Hadrian, and Antoninus Pius. Their metal is bronze, and they are of different sizes. They were struck at the metropolis of each nome, and their types relate to the local worship, and so illustrate the Egyptian religion under a form modified by Greek influence. The inscriptions are the names of the nomes. There is an exceptional coin of the town of Pelusium.

Passing by the unimportant coinage of the Libyans, we reach the interesting series of the Cyrenaica, the one truly Greek currency of Africa. It begins under the line of Battus (640-450 B.C.), and reaches to the Roman rule as far as the reign of Augustus. There are coins without the name of any city, which we may consider to be of the Cyrenaica generally, and others of Cyrene, Barca, Euesperides, and smaller towns. The weight of the gold always, and of the silver until some date not long after 450 B.C., is Attic; afterwards it is Phœnician, of the Samian variety. The ruling types are the silphium plant and its fruit, and the head of Zeus Ammon, first bearded then beardless. The art is vigorous, and in the transitional and fine period has the best Greek qualities. It is clearly an outlying branch of the school of central Greece. The oldest coins are of the class which is without the name of any city. So archaic are they that they may vie in antiquity with the first issues of Lydia and of Ægina, and date in the 7th century B.C. The money of Cyrene begins later, it may be a little before the fall of the kings in 450 B.C. It comprises a fine gold series of Attic staters with the types of the Olympian Zeus, more rarely Zeus Ammon, and a victorious quadriga. Barca has a smaller coinage than Cyrene. It comprises a wonderful tetradrachm (Phœnician), with the head of Ammon bearded, boldly represented, absolutely full face, and three silphiums joined, between their heads an owl, a chameleon, and a jerboa. The money of Euesperides is less important. The Ptolemaic currency of the Cyrenaica has been already noticed. Cyrene

Syrtica and Byzacena offer little of interest. Their coins are late bronze, first with Punic inscriptions, then in imperial times with Latin and Punic or Latin. Latin and Greek are used in the same coins at Leptis Minor in Byzacena.

In Zeugitana the great currency of Carthage is the last representative of Greek money, for, despite its Orientalism, its origin is Hellenic, and of this origin it is at first not unworthy. Its range in time is from about 400 B.C. to the fall of Carthage in 146 B.C. The earliest coins are Attic tetradrachms of the class usually called Siculo-Punic. It has been usual to consider these coins as having been wholly struck by the Carthaginians in Sicily, like the undoubted Sicilian money of their settlements there and those absolute imitations of Syracusan money which may be as reasonably classed to the island. But those who insist on the attribution of the whole so-called Siculo-Punic class to Sicily leave Carthage without any but a provincial coinage for at least half a century. It is far more reasonable to infer that the earliest coinage of Carthage was struck for the whole dominion, that with purely Sicilian types being limited to Sicily. The next issues are of gold and electrum and silver, degenerating into potin. The weights are extremely difficult. In the silver money the Phœnician standard is almost universal, and we note the drachm, didrachm, tetradrachm, hexadrachm, octadrachm, decadrachm, and dodecadrachm. Coins are also found which appear to follow the Persic standard, unless they are octobols and their doubles. While the silver is thus explicable, the gold and electrum money is very puzzling, and its very varying weights can only be explained by the theory that silver was the standard, and gold was constantly fluctuating in its relation. The earlier types are the horse or half-horse crowned by Nice and the date-palm, the head of Persephone and the horse and palm-tree, a female head in a cap, in splendid style, and a lion and a palm, and a head of young Heracles and a horse's head with a palm. It will be noted that the horse and the palm-tree are most constant. On the later coins the obverse is uniformly occupied by the head of Persephone and the reverse by the horse, sometimes with the palm, the horse's head and Pegasus being rare varieties. The bronze money imitates the later silver. The few inscriptions are extremely difficult. One that seems certain is קרת חדשת, the "new city," Carthage. The art of the earlier coins is sometimes purely Greek of Sicilian style. There is even in the best class a curious tendency to exaggeration, which gradually develops itself and finally becomes very barbarous. Roman Carthage has a bronze coinage which is insignificant. There are a few other towns which issued money with Roman legends, Utica, however, having first Punic and then Carthage

Latin inscriptions. The denarii of Clodius Macer, who revolted in 68 A.D., are curiously illustrative of his policy, which was to restore the Roman republic.

Numidia. The cities of Numidia have Punic inscriptions, and there are interesting coins of Juba I., his denarii presenting his portrait of a characteristic Libyan type. Of Mauretania there are civic coins, chiefly using Punic characters, and an interesting regal series, mainly denarii, of Bogud II., Juba II. with his consort Cleopatra, daughter of Mark Antony and the famous Egyptian queen, and of Ptolemy their son, the last of the great family of the kings of Egypt.

II.—Roman Coins.

The Roman coinage is of two great classes,—the republican, commonly called the family coinage, and the imperial; the first lasted from the origin of money at Rome to the reform of Augustus in 16 B.C., and the second from this date to the fall of the Western empire in 476 A.D. The origin of the republican coinage is one of the hardest problems in archæology. The evidence of the money is at variance with that of the ancient writers, and in setting these aside we are at variance with the best authorities of our time; but the general principles of criticism must be maintained here as in other matters of early Roman story.

Oldest Roman money. The oldest money of Rome was of bronze, and it is stated that it was first cast as *æs rude*. This statement is confirmed by the discovery of shapeless masses of bronze, evidently broken off from large quadrilateral masses, and then rendered of a roughly uniform weight. To the *æs rude* succeeded the *æs signatum*, the stamped bronze. This step is attributed to Servius Tullius by ancient authority; it is said that he adopted the types of a sheep, ox, or pig; and large masses of bronze have been found which present animal types, including the pig. These are held to represent the coinage traditionally attributed to the regal age, though it is admitted that they are for the most part contemporary with the first circular money, the libral, the origin of which Mommsen dates about 450 B.C. All the masses, however, which bear a distinct type are clearly later than 300 B.C., as is proved by their style; and in the case of the elephant type we are forced, by the first appearance of the animal in Italy under Pyrrhus, to adopt a still later date. Moreover, the date of 450 is too early for the origin of the circular money; consequently the idea of any trace of the supposed regal coinage must be abandoned, though the late ingot may be descended from a currency intermediate between the æs rude and the libral circular money. The first regular Roman coinage consists of a series of cast pieces, the as of a pound weight, libral, and its chief divisions, the semis (half), triens (third), quadrans (fourth), sextans (sixth), and uncia (twelfth). The as was not cast of full weight; the older specimens usually weigh from 11 to 9 unciæ, on an average 10. The origin of this system is assigned by Mommsen to the decemvirs, on the ground of their legal institution, and particularly from the condition in the Lex Julia Papiria (430 B.C.) that fines should not be paid in cattle but in money. Admitting the law to be correctly stated in its original form, it proves no more than that money was current in Rome. The libral coinage cannot, either in style or in type, possibly be much anterior to 350 B.C. It is easy to mistake barbarism for archaism, but a practised eye will see that the types of these coins do not present a trace of archaism, and are imitations of the types which originated in the latter part of the 5th century, and were in fashion in the fourth. The heads of Jupiter and the beardless Hercules are of this class. We must therefore suppose that the fines were paid in metal by weight or in Greek money, which if it was bronze no doubt was also weighed.

Gold and silver. At first there was no corresponding gold or silver, but the pound of bronze was held to be equal to a scruple of silver. Campanian gold and silver money with the name of the Romans or Rome was next struck to supply the want. The silver is of Greek weight, with types usually connected with Roman legend. From one of the earliest reverses being distinctly borrowed from the money of the Syracusan tyrant Agathocles, who began to reign in 317 B.C., we cannot date the first issue before about 300 B.C. The scanty gold in two or three groups is evidently of later dates; it presents great metrological difficulties. The libral as fell in course of time from a weight of 10 to one of 8 unciæ, and was at length reduced to a weight of 4, or that of a triens, and thus became triental. This is shown by the colonial coins of Italy to have occurred about 269 B.C., probably in that very year, when the silver coinage of Rome began. The dupondius (2 asses), tressis (3), and decussis (10) were now issued at Rome, also the semuncia (½ oz.) and the quadruncia (4 oz.). Casting was ultimately abandoned and all coins struck, and by about 254 B.C., or soon after, the triental system became sextantal: the multiples of the as and divisions of the uncia now cease. The silver coinage was first issued in 269 B.C.: it consisted of the denarius of 4 scruples or 72 grains (72 denarii being struck to the pound), the quinarius of 2 scruples, and the sestertius of 1. As the old as libralis was equal to 2½ triental asses, the new sestertius was equal to the as libralis; as the coin was still in circulation this was inevitable, and the words sestertius and æs grave are used synonymously. The relative value of silver to bronze being thus maintained, the silver sestertius was exchanged for the old as of 10 unciæ, which was a real coin, whereas the new as of 4 unciæ (triental) was a mere token. The value in the bronze, X, was inscribed on the denarii instead of IV. The bronze money soon became a token currency. The victoriatus was issued in 228 B.C., not much after the denarius; it was of 3 scruples, or three-fourths of the heavier coin, and was intended to serve in the provinces for the Illyrian drachms of light Attic weight; it could pass at Rome. The first purely Roman gold money is that of Sulla, probably struck in Greece. Julius Cæsar struck similar coins in 49 B.C. To Octavian is due the settlement of the gold coinage. In 217 B.C. the standard was reduced; the denarius was struck at 80 to the pound, and the as became uncial. The denarius remained stationary for nearly three centuries, and its purity was maintained. The fate of the divisions of the denarius is too complicated to be here noticed, but it may be remarked that in 104 B.C. the quinarius appeared with the type of the victoriatus, which had disappeared, but with its own mark Q. When the as fell from sextantal to uncial, the value changed from one-tenth to one-sixteenth of the denarius, but, as troops were still paid at 10 asses to the denarius, the X almost always appears as the mark of value on the silver piece. By this reduction the relation of silver to bronze fell to less than half the original value still current in accounts, and became 1 to 112. Thus the bronze money represented more than double its metal value. In 89 B.C. the semuncial as was introduced, and from 80 B.C. bronze coinage ceased until Augustus issued his new currency in that metal.

The Roman coinage was struck both in the city and elsewhere. Types. Consequently the Roman, Italian, and other issues must be carefully discriminated. In the city the right of striking was delegated to the monetary triumvirs, who could coin individually or together, but as a rule they acted independently. The earlier bronze and silver coins have fixed types. The obverse types are—for the as the head of Janus Bifrons, for the semis that of Jupiter, the triens Pallas, the quadrans Hercules, the sextans Mercury, and the uncia Roma. The reverse type is always a prow. The marks of value are—for the as I, for the semis S, and a certain number of balls equivalent to the value in ounces for the lower denominations. The original types of the denarius were for the obverse the head of Roma with a winged helmet and the mark of value X behind, and for the reverse the Dioscuri on horseback charging. In 100 B.C. a new type is introduced for the obverse, and a new reverse appears a century earlier, but the great abundance of types dates from 93 B.C. These are so characteristic that it is necessary to notice them particularly. The primary religious motive is to be traced in them as in the types of Greek money, but their having been selected to distinguish families instead of cities or peoples gives them a character of their own. It is this character which ultimately rendered the introduction of contemporary portraits almost a matter of course. The subject of the obverse is usually the head of a divinity, or a personification, or a traditional or an historical personage, ultimately one living, and the reverse bears a mythological, symbolical, traditional, or historical subject.

The following are the chief classes to which the types may be reduced:—

1. Head or figure of a divinity worshipped at Rome; as head of Jupiter (fam. Petillia), figures of the Dioscuri (Junia) or of a divinity worshipped by the family or individual striking the coin, as head of Neptune (Pompeia, coin of Sextus Pompeius).
2. Sacred natural or artificial object; as pontifical implements (Antonia). This class is not large; sacred animals rarely occur.
3. Head or figure of a personification of a country or town; as heads of Hispania (Carisia), Roma (Julia), Alexandria (Æmilia).
4. Head or figure of an allegorical personage; as heads of Pavor (Hostilia), Pallor (id.), Honos and Virtus (Fufia, Mucia).
5. Fabulous monster; as Scylla (Pompeia).
6. Head or figure of an ancestral personage; as head of Numa (Calpurnia), Ancus Marcius (Marcia).
7. Events connected with ancestors; as figure of Marcus Lepidus, as TVTOR REG[IS], crowning Ptolemy Epiphanes (Æmilia).
8. Places connected with historical exploits, and of a votive character; as pharos of Messene (Pompeia, of Sextus, probably commemorating the sea-fight off Messene, 38 B.C.).
9. Symbolical representations of contemporary events; as a general welcomed on landing by a country or city (Minatia).
10. Heads of living personages exercising dictatorial power, or in very high authority; as head of Sulla (Cornelia).
11. Representations connected with military matters; as legionary standards (Antonia).

Besides the principal designs there are symbols and numerals, generally to be regarded as having been indicative of successive issues from the mint. The inscriptions, which are in the nominative, are usually on the obverse the name of the personage represented and on the reverse the name of the person who issued the coin; the latter sometimes occurs on the obverse. Some of the most curious types strikingly illustrate Roman instinct. Being the choice of a multitude of persons of different families, they have an individuality lacking to the money of the Greek cities, which

gave little choice to the coining authority or to the artist, and to the Greek royal coinages, which slipped speedily into heraldry. The family coins show a delight in recording the achievements of the house, and sometimes are so personal as to rank with modern medals, the spirit of which is even outdone in such a subject as Sulla's dream. With the Greeks the historical sense is latent until the age of the kings, and then does not pass beyond portraiture and at first a scanty symbolical commemoration of events; with the Romans, even before portraits are introduced, the desire to record events is intensely strong. Thus we have not only such legendary subjects as the rape of the Sabines and Tarpeia crushed beneath the bucklers, which may be classed with the Greek mythical types, but also past historical events, as Marcus Æmilius Lepidus crowning Ptolemy Epiphanes, to whom he was governor, and Paullus Æmilius raising a trophy, while Perseus, king of Macedon, and his two children stand before him, and also events of the present, as the reverse type of Brutus, the cap of liberty between two daggers with the inscription EID MAR, and on a piece of Sextus Pompey the pharos of Messene above a Roman galley and for reverse Scylla striking with a rudder. The special mythology and superstition of Rome is not less fully illustrated, as well as the coming in of Greek ideas, in such a manner that many types thoroughly Greek alternate with purely Roman ones. The art of the republican coins reflects that of contemporary Greek money, but is never equal to the better style of the late Hellenic issues.

Augustus. The history of the imperial coinage is full of metrological difficulties. These arise from the conditions fixed by Augustus (16-15 B.C.), by which the emperor alone coined gold and silver, the senate alone bronze. Consequently the senate was wholly at the mercy of the emperor. Augustus struck the aureus at 40 to the pound, equal to 25 denarii at 84 to the pound. He introduced a new bronze coinage in two metals, the sestertius of 4 asses and dupondius of 2, both in fine yellow bronze (orichalcum), and the as semis and quadrans in common red bronze. The finer coins were struck on the standard of the as of a quarter of an uncia, the inferior ones on that of the half uncia. *This gives the following proportionate values:*—

Gold.	Silver.	Orichalcum.	Bronze.
1	11·91	333·3	666·66
	1	28	56
		1	2

The as is nearly equal in size and weight to the dupondius, but is distinguished by its metal and inferior fabric. All the bronze bears the letters S.C., *senatus consulto.* Emperors not acknowledged by the senate are without bronze money; thus we have no specimens of Otho or Pescennius Niger.

Changes under later emperors. Nero reduced the aureus to $\frac{1}{45}$th of the pound, and the denarius to $\frac{1}{96}$th, its purity being officially reduced. Under Trajan there was a further debasement of the denarius. Marcus Aurelius fixed the aureus, which had recovered its weight, at $\frac{1}{45}$th of the pound; the denarius had already been further debased, and under Septimius Severus it was half alloy. Caracalla introduced a new coin, called after him the argenteus Antoninianus. It was struck at $\frac{1}{54}$th to $\frac{1}{64}$th of the pound, and seems to have been originally a double denarius struck on a lower standard. The characteristic of this coin is that the head of the emperor is radiate as Sol, that of the empress on a crescent as Luna. Under Elagabalus the taxes were paid in gold alone; this was ruinous, for the treasury paid in debased silver at nominal value, which had to be used to purchase gold by the taxpayer at real value. Under Severus Alexander there was the latest large issue of denarii and sestertii. The senate made another effort to continue a bronze currency by striking under Philip the large bronze quinarius or Philippus æreus, while the base metal argenteus had become a piece of bronze washed with silver. At length in the time of Gallienus the argenteus contained no silver whatever. Aurelian (270-275 A.D.) attempted a reform of the coinage by which the previous coin was reduced from its nominal to its intrinsic value. The coins were now of tinned bronze and marked with their real value, 20 or 21 denarii of account, the signs XXI, KA (Greek), and XX being used as indexes of value. These coins replace at once the base silver and the bronze, which now disappear. The moneying right of the senate had become illusory by the depreciation of silver, which had ceased to have any real value. Aurelian entirely suppressed this right; Tacitus and Florian restored it for a few years, after which the S.C. disappears from the coinage. The reform of Aurelian caused an outbreak at Rome which was of a serious character, but it was maintained by him and by Tacitus. Aurelian also suppressed all local mints but Alexandria. It was the work of Diocletian to restore the issue of relatively pure money in the three metals. Before 293 A.D. the coinage of silver recommences with the denarius of the standard of Nero, $\frac{1}{96}$th of the pound, marked with the figures XCVI. Between 296 and 301 A.D. two tinned bronze coins were struck, the follis and the centenionalis. The follis was marked XXI, like the similar but very much smaller coin of Aurelian. The denarius was the unit of reckoning.

Constantine, probably in 312 A.D., desiring to rectify the gold coinage, which had long been quite irregular in weight, reduced the chief gold piece to $\frac{1}{72}$d of the pound, and issued the solidus, a piece destined to play a great part in commercial history. It was never lowered in weight, though many centuries later it was debased, long after it had become the parent of the gold coinages of Westerns and Easterns alike throughout the civilized world. The index LXXII is sometimes found on the first solidi; and after 367 A.D., when the edict of Constantine was renewed, the Greek equivalent OB was constantly used. Under Constantius II. (360 A.D.) and Julian the silver denarius or argenteus was suppressed, and the siliqua of $\frac{1}{144}$th of the pound took its place. The follis having been withdrawn by Arcadius and Honorius, was reissued a century later by Zeno, with XL to indicate the value of 40 denarii. It will be seen that a fuller system of bronze was originated by Anastasius, the Byzantine emperor.

Provincial mints. Under Augustus the Roman monetary system became the official standard of the empire, and no local mint could exist without the imperial licence. Thus the Greek imperial money is strictly Roman money coined in the provinces, with the legends and types of the towns. Many cities were allowed to strike bronze, several silver, and one, Cæsarea in Cappadocia, gold. The silver becomes limited about Nero's time, but lasts under the Antonines. Afterwards there are a few currencies of base metal. The bronze increased in mints and quantity in the second century, but, through the debasement of the Roman silver, one city after another ceased to strike about the middle of the third. Only Alexandria and Antioch survived by following the tactics of Rome with their own base metal coins. Purely Roman gold and silver was coined in certain of the provinces, in Spain and Gaul, and at the cities of Antioch and Ephesus. When the base silver had driven the Greek imperial bronze out of circulation, Gallienus established local mints which struck in pure Roman types. Diocletian increased the number of these mints, which lasted until the fall of the empire of the West, and in the East longer. These mints were, with others added later, Londinium (or Augusta), Camulodunum, Treviri, Lugdunum, Arelate (or Constantina), Ambianum, Tarraco, Carthago, Roma, Ostia, Aquileia, Mediolanum, Siscia, Serdica, Sirmium, Thessalonica, Constantinopolis, Heraclea, Nicomedia, Cyzicus, Antiochia (ultimately Theupolis), and Alexandria. A few were speedily abandoned.

Types and inscriptions. The obverse type of the imperial coins is the portrait of an imperial personage, emperor, empress, or Cæsar. It begins under Julius Cæsar, though the republican money goes on under Augustus, in whose reign the privileges of the moneyers ceased. The type only varies in the treatment of the head or bust,—if male, laureate, radiate, or bare; if female, sometimes veiled, but usually bare. The reverse types of the pagan period are mythological of divinities, allegorical of personifications, historical of the acts of the emperors. Thus the coins of Hadrian, besides bearing the figures of the chief divinities of Rome, commemorate by allegorical representations of countries or cities the emperor's progresses, and by actual representations his architectural works. The inscriptions are either simply descriptive, such as the emperor's names and titles in the nominative on the obverse, or partly on the obverse and partly on the reverse, and the name of the subject on the reverse; or else they are dedicatory, the imperial names and titles being given on the obverse in the dative and the name of the type on the reverse. Sometimes the reverse bears a directly dedicatory inscription to the emperor. The inscriptions on the earlier imperial coins from Tiberius to Severus Alexander are generally chronological, usually giving the current or last consulship of the emperor and his tribunitian year. In the latter part of the third century the mints are indicated by abbreviations in the exergue of the reverse, with also the number of the issue. There are sometimes signs of value in the field of the reverse. These characteristics apply to the pagan empire; under the Christian empire there are modifications, mainly in the character of the reverse types. These are generally allegorical and free from pagan intention, though their source is pagan, as in the common types of Victory. Purely Christian types are rare. The most remarkable is the Christian monogram formed of the Greek letters XP. The inscriptions are simpler, and in the reverses necessarily show the same change as the types. Of great interest is the inscription HOC SIGNO VICTOR ERIS, on coins dating not long after the victory of Constantine over Licinius. There is some variety in both types and inscriptions, but little that is absolutely new.

Art of imperial coins. The art of Roman imperial coins, although far inferior to that of Greek, is well worthy of study in its best ages, for its intrinsic merit, for its illustration of contemporary sculpture, and on account of the influence it exercised on mediæval and modern art. These coins were first designed under the revival of Greek art, during the influence of the New Attic school. The Romans had properly no art of their own. Their greatest temples and the statues of their gods were copies or imitations by Greeks of Greek originals, besides such earlier statues as were brought from Greece. The Greeks who were first called in to work for their masters were the artists of a school which was emphatically imitative, not in any way inventive, and their successors were debased by the false taste of their patrons.

There is a marked inferiority in the Roman coinage to the Græco-Asiatic work of the same times. With a tendency to follow the dramatic styles, the artists who worked at Rome had power enough to produce fine and highly characteristic portraits, of which the famous bust, miscalled Clytie, is the most striking example. Thus, though the grandeur and the purity of design and execution of the older masters are gone, we have in their place a strikingly faithful portraiture, which is deeply gratifying to the historical sense. The best age is the Augustan, which may be said to last through the rule of the Claudian emperors, and is decidedly under New Attic influence. This is succeeded by the second, that of the Antonines, from Trajan to Commodus. The Augustan work is larger and more refined, that of the Antonines more elaborate and laborious. Then follows a swift decline, with a temporary revival in the age of Diocletian and Constantine, when an attempt, necessarily weak, was made to improve the art of the coins; thenceforward it slowly declined. In the Augustan age two manners may be recognized, the Greek and the Græco-Roman, the one repeating earlier works, the other portraying living persons and events. Under the Antonines we notice, as a distinct reaction against the poor idealism of the age, which even occasionally endeavoured to treat portraits in an ideal style, a vigorous realism which looks like the actual parent of the Italian Renaissance in its classical phase. Midway between these stands the realistic style of the age. Among the finest examples of art in the Roman coinage are the portraits of Livia as Pietas, Justitia, and Salus, and that of the elder Agrippina. For stern realism the head of Nero is most remarkable. the growth of whose bad passions may be seen in the increasing brutality of his features and expression. The medallion series is full of charming subjects, though when they have been treated by Greek artists of earlier ages the contrast is trying; the most satisfactory are the representations of older statues; the purely new compositions are either poor inventions, or have a theatrical air that removes them from the province of good art.

III.—Mediæval and Modern Coins of Europe.

The period of the mediæval and modern coins of Europe must be considered to begin about the time of the fall of the Western empire, so that its length to the present day is about 1400 years. It is impossible to separate the mediæval and modern coins, either in the entire class, because the time of change varies, or in each group, since there are usually pieces indicative of transition which display characteristics of both periods. The clearest division of the subject is to place the Byzantine coinage first, then to notice the characteristics of its descendants, and lastly to sketch the monetary history of each country.

Byzantine empire. The Byzantine money is usually held to begin in the reign of Anastasius (491-518 A.D.). The coinage is always in the three metals, but the silver money is rare, and was probably struck in small quantities. At first both the gold and the silver are fine, but towards the close of the empire they are much alloyed. The gold coin is the solidus of Constantine, with its half and its third, the so-called semissis and tremissis. The chief silver coin was the miliarision, of a lower weight than the solidus, and its half, the keration. Heraclius, in 615 A.D., coined a larger piece, the hexagram, weighing 105 grains. This coin was discontinued, and afterwards the miliarision and keration were coined until the conquest of Constantinople by the Latins. The silver money of the restored Greek empire is obscure. In 498 Anastasius introduced a new copper coinage, bearing on the reverse, at and about his time. the following indexes of value as the main type: M, K, I, E, Δ, Γ, B, and A, or 40 nummi, 20, 10, 5, 4, 3, 2, and 1. These coins bear beneath the indexes the abbreviated name of the place of issue. Justinian I. added the regnal year in 538 A.D., his twelfth year. The money of this class presents extraordinary variations of weight, which indicate the condition of the imperial finances. The Alexandrian coins of this class begin under Anastasius and end with the capture of the city by the Arabs. They have two denominations, IB and S. or 12 and 6, and there is an isolated variety of Justinian with ΛΓ (33). The Alexandrian bronze never lost its weight, while that of the empire generally fell, and thus some of the pieces of Heraclius, while associated with his sons Heraclius Constantinus and Heracleonas, have the double index IB and M. The Vandals of Carthage had a peculiar double system of their own with the indexes XLII, XXI, XII, and IIII. Under Basil I. the bronze money appears to have been reformed, but the absence of indexes of value makes the whole later history of the coinage in this metal very difficult. There was one curious change in the aspect of the money. Early in the 11th century the solidus begins to assume a cup-shaped form, and this subsequently became the shape of the whole coinage except the smaller bronze pieces. These novel coins are called numini scyphati. The types, except when they refer simply to the sovereign, are of a religious, and consequently of a Christian character. This feeling increases to the last. Thus, on the obverse of the earlier coins the emperors are represented alone, but from about the 10th century they are generally portrayed as aided or supported by some sacred personage or saint. On the reverses of the oldest coins we have such types as a Victory holding a cross, but on those of later ones a representation of Our Saviour or of the Virgin Mary. Subsequently some allegorical religious types are introduced, as that of the Virgin Mary supporting the walls of Constantinople. The principal inscriptions for a long period almost invariably relate to the sovereign, and express his name and titles. The secondary inscriptions of the earlier coins indicate the town at which the piece was struck, and, in the case of the larger bronze pieces, the year of the emperor's reign is also given. From about the 10th century there are generally two principal inscriptions, the one relating to the emperor and the other to the sacred figure of the reverse, in the form of a prayer. The secondary inscriptions at the same time are descriptive, and are merely abbreviations of the names or titles of the sacred personages near the representations of whom they are placed. From the time of Alexius I. (Comnenus) the principal inscriptions are almost disused, and descriptive ones alone given. These are nearly always abbreviations, like the secondary ones of the earlier period. The language of the inscriptions was at first Latin with a partial use of Greek; about the time of Heraclius Greek began to take its place on a rude class of coins, probably local; by the 9th century Greek inscriptions occur in the regular coinage; and at the time of Alexius I. Latin wholly disappears. The Greek inscriptions are remarkable for their orthography, which indicates the changes of the language. Of the art of these coins little need be said. It has its importance in illustrating contemporary ecclesiastical art in the West, but is generally inferior to it both in design and in execution.

Besides the regular series of the Byzantine empire, in which we include the money assigned to the Latin emperors of Constantinople, there are several cognate groups connected with it, either because of their similarity, or because the sovereigns were of the imperial houses. There are the coinages of the barbarians to be next noticed, and the money of the emperors of Nicæa, of Thessalonica, and of Trebizond. The last group consists of small silver pieces, which were prized for their purity; they were called Comnenian aspers (ἄσπρα Κομνήνατα), the princes of Trebizond having sprung from the illustrious family of the Comneni. *Cognate groups.*

The coinage of the other states of Christian Europe will be best understood if we view it generally in successive periods, afterwards more particularly describing the currencies of the chief countries. The periods have been well defined as—(1) transitionary period, from Roman to true mediæval coinage, from the fall of Rome (476) to the accession of Charlemagne (768); (2) true mediæval age, during which the Carlovingian money was the currency of western Europe, from Charlemagne to the fall of the Swabian house (1268); (3) early Renaissance, from the striking of the florin in Florence (1252) to the classical Renaissance (1450); (4) the classical Renaissance, from 1450 to 1600; (5) the modern period. (C. F. Keary in the *Antiquary*, 1883.) *Periods of other European coinage.*

1. The Roman money was adopted and imitated by the barbarian conquerors of the empire. They struck in gold, silver, and bronze, gold being the favourite metal. The names of the kings soon appear upon the silver and bronze, but the gold money is at first a copy of the Byzantine, then monograms of kings appear, and at last their names in full save when the money in the Frankish series is of civic issues. The currencies of this period are those of the Ostrogoths in Italy, the Vandals in Africa, the Visigoths in Spain, the Franks in Gaul, and the Lombards in Italy. The most important coinages of this age are of gold. *Transitional;*

2. The inconvenience of gold money when it represents a very large value in the necessaries of life must have caused its abandonment and the substitution of silver by the Carlovingians. The denier (denarius) or penny of about 24 grains was at first practically the sole coin. The solidus in gold was struck but very rarely, perhaps as a kind of proof of the right of coining. The Byzantine solidus or bezant was used and probably the equivalent Arab gold. The Arab silver piece, the *dirhem*, was almost exactly the double of the denier, and seems to have been widely current in the north. The new coinage spread from France, where it was first royal and then royal and feudal, to Germany, Italy, where the Byzantine types did not wholly disappear, England, Scandinavia, Castile, and Aragon. In Germany and France feudal money was soon issued, and in Italy towns and ecclesiastical foundations largely acquired the right of coinage from the empire, which was elsewhere rare. The consequence of the extended right of coinage was a depreciation in weight, and in the middle of the 12th century the one-sided pennies called bracteates appeared in Germany, which were so thin that they could only be stamped on one side. The types of this whole second coinage are new, except when the bust of the emperor is engraved. The most usual are the cross; and the church as a temple also appears, ultimately taking the form of a Gothic building. There are also sacred figures, and more rarely heads in the later age. *Mediæval;*

3. The true herald of the Renaissance was the emperor Frederick II. In restoring the gold coinage, however, he followed in the steps of the Norman dukes of Apulia. With a large Arab population. these *Of early Renaissance;*

princes had found it convenient to continue the Oriental gold money of the country, part of the great currency at that time of all the western Moslems, and Roger II. also struck Latin coins of his own as DVX APVLIAE, the first ducats. Frederick II., continuing the Arab coinage, also struck his own Roman gold money, solidi and half solidi, with his bust as emperor of the Romans, Cæsar Augustus, and on the reverse the imperial eagle. But the calamities which overwhelmed the Swabian house and threw back the Renaissance deprived this effort of any weight, and it was left to the great republics to carry out the idea of a worthy coinage,—a necessity of their large commercial schemes. The famous gold florin was first issued in 1252. The obverse type is the standing figure of St John the Baptist, the reverse bears the lily of Florence. The weight was about 54 grains, but the breadth of the coin and the beauty of the work gave it dignity. The commercial greatness of Florence and the purity of the florin caused the issue of similar coins in almost all parts of Europe. Venice was not long in striking (in 1280) a gold coin of the same weight as the florin, but with the types of a standing figure of Christ, and the doge receiving the gonfalon at the hands of St Mark. It was first called the ducat, the name it always bears in its inscription; later it is known as the zecchino or sequin. Though not so largely imitated as the florin, the extreme purity of the sequin was unquestioned to a time within the memory of living persons. Genoa likewise had a great gold currency, and the other Italian states struck in this metal. It is significant of the power of the Italian republics that the later Mameluke sultans of Egypt found it convenient or necessary for their position between Europe and India to adopt the weight of the florin and sequin for their gold money. Many varieties of gold money appear in course of time in France, England, and to a less extent in other countries. The need for a heavier silver coinage caused the issue of the large denier (grossus denarius), afterwards called the gros and groat. This coin appears in the 14th century, and at the same time the large German bracteates are issued. The types are now very various and distinctly worthy of the art of the time, which as yet is purely decorative and conventional, so that portraits are not possible. The religious intention also is gradually giving way to the desire to produce a beautiful result, and the symbol of the cross is varied to suit the decorative needs of the coin. Heraldic subjects also appear, and in the shield, which is frequently a reverse type, we see the origin of the usual modern reverse of the most important coins.

Of classical Renaissance, and modern. 4, 5. With the classical Renaissance we find ourselves in the presence of modern ideas. The elaborate systems of coinage of the various states of Europe are soon to begin, and the prevalence of a general currency to become for the time impossible. Silver money now gains new importance with the issue of the thaler or dollar in Germany, in 1515. This great coin speedily became the chief European piece in its metal, but as it was coined of various weights and varying purity it failed to acquire the general character of the denier. The style of this age is at first excellent. The medals gave the tone to the coinage. Art had wholly thrown off the rules of the age before and attained the faculty of portraiture and the power of simply representing objects of nature and art. Great masters now executed medals and even coins, but speedily this work became a mere matter of commerce, and by the beginning of the modern period it was fast falling into the poverty and barbarism in which it has ever since remained. The details of the numismatics of these two periods belong to the notices of the money of the several countries.

Money of account. A word must be added on money of account. While the denier was the chief and practically the sole coin, the solidus passed from use as a foreign piece into a money of account. The solidus was the German schilling (shilling), which contained usually 12 deniers. As there were 20 shillings to the pound of silver, we obtain the reckoning by £ s. d., libræ, solidi, and denarii. The pound as a weight contained 12 ounces, and its two-thirds was the German mark of 8 ounces.

Art. It would be interesting, did space permit, to notice fully the art of this entire class, to examine its growth, and to trace its decline, but, as with that of Greek and Roman coins, we must mainly limit ourselves to the best period. This is a space of about a hundred and fifty years, the age of the classical Renaissance, from the middle of the 15th century to the close of the 16th. The finest works are limited to the first half century of this period, from a little before 1450 to about 1500, in Italy, and for as long a time, beginning and ending somewhat later, in Germany. The artists were then greater than afterwards, and medal-making had not degenerated into a trade; but with the larger production of the period following the work was more mechanical, and so fell into the hands of inferior men. The medals of this first period may not unworthily be placed by the side of its sculpture and its painting. Not only have some of its medallists taken honourable places in a list where there was no room for ignoble names, but to design medals was not thought an unworthy occupation for the most famous artists. There are, as we should expect, two principal schools, the Italian and the German. The former attained a higher excellence, as possessing not merely a finer style but one especially adapted to coins or medals. The object which the artists strove to attain was to present a portrait or to commemorate an action in the best manner possible, without losing sight of the fitness of the designs to the form and use of the piece on which they were to be placed. For the successful attainment of this purpose the style of the later pre-Raphaelites was eminently suited. Its general love of truth, symmetrical grouping, hard drapery, and severely faithful portraiture were qualities especially fitted to produce a fine portrait and a good medal. It is to be noted that their idea of portraiture did not depend on such a feeling for beauty as influenced the Greeks. Rather did it set before it the moral attainments and capabilities of the subject. The German art, a product of engravers in metal, is really goldsmith's work, except in Albert Dürer's case. Thus it is not so suitable to numismatic designs. The portraits of the German coins and medals are sometimes even more characteristic than those of the Italian, and the groups often show great vigour; but both are less appropriate. They display also too great a profusion of detail, by which the effect of the boldness of the outlines is frequently lost; yet they have much originality and vigour, and will reward an attentive study. Both these schools, but especially the Italian, afford the best foundation for a truly excellent modern medallic art. The finest coins and medals of Italy and Germany have an object similar to that which it is sought to fulfil in the English, and their nearness in time makes many details entirely appropriate. Thus, without blindly imitating them, modern artists may derive from them the greatest aid.

There are some delicately beautiful Italian medals of the 16th century, too closely imitated from the Roman style. A vigorous realistic school, the only great one of modern times, arose in France before the close of the 16th century and lasted into the next. It was rendered illustrious by Dupré and the inferior but still powerful Warin. From this age until the time of Napoleon there is nothing worthy of note. The style of his medallists is the weak classical manner then in vogue, but yet is superior to what went before and what has followed.

It is not intended here to enter in any detail into the various divisions of the subject already treated in its main outlines. The questions that would require consideration are of too complicated and technical a nature to be illustrated within reasonable limits; the principal matters of inquiry may, however, be indicated.

The money of the Iberian Peninsula begins with the Visigothic series, which consists of gold pieces. The money of Portugal is regal, and not of great interest except as affording indications of the wealth and commercial activity of the state in the early part of the 18th century. The coinage of Spain is almost without exception regal, but a more curious class than that of Portugal. The coins of the early contemporary kingdoms, such as those of Aragon, and of Castile and Leon, are especially worthy of examination. We may mention as of a very peculiar character a large gold piece in the coinage of the latter state, called the *Dobla de la Vanda*, from its bearing the shield of the famous order of knighthood of the Vanda or Band. Of this there are examples assigned to John I. (1379-90) and John II. (1406-54). The money of the sole monarchy is less worthy of notice. The city of Barcelona is represented by coins bearing the names of various kings. The medals of Spain are not important.

The coinage of France forms a large series. It begins with the money of the Merovingian dynasty. This consists almost wholly of gold pieces, imitated from those of the late Roman and Byzantine rulers, as already mentioned, the commonest denomination being the tremissis, or third part of the sou d'or (solidus). The coins are rare, and bear either the names of a king and a city or of a moneyer and a city. They are barbarous in their art. Under the princes of the Carlovingian dynasty the principal coins are deniers, and after a time oboles also, gold money being extremely rare. They bear the name of the king and that of the city where they were struck, and have a more original character than the earlier pieces, although they are still barbarous. The money of the Capetian house begins with coins like those of the line preceding it. By degrees the coinage improves. In the 13th century gold pieces were issued. There are several denominations of these and of silver coins, but to some different names are applied for various types with the same weight, as the *denier Parisis* of Paris, and the *denier Tournois* of Tours, both of base metal. At the time of Philip VI. the coins are fine. The modern coinage may be considered to begin under Henry II., whose portrait is of good work. During this period there is no very remarkable feature in the current money, except the occurrence in the 17th century of the pieces of the sort termed *pied fort*, which we must regard as a kind of pattern. The seignorial coins of France during the Middle Ages are important. The medals are far more interesting than the modern coins. Their interest begins in the age of the last Valois kings and Henry IV.; there is a long and historically important series of Louis XIV., and another of a new artistic character under the first republic and the reign of Napoleon I. Almost every great event, from the beginning of the power of that emperor until his

fall, is commemorated in this last series, unequalled in its class for completeness. The designs, notwithstanding their false classical style and that mannerism which appears to be essential to modern French art, are executed with great care and skill.

England. The English coinage begins with two uncertain classes, which, wherever struck, certainly formed the currency of the country during the interval from the departure of the Romans, about 450 A.D., until the issue of money with royal names by the Saxon kings, towards the end of the 8th century. One of these classes consists of imitations of the latest Roman copper money, and the other of the small silver pieces to which the name of *sceattas* is applied, having rude types which are sometimes of Roman origin, but sometimes original, and occasionally with Runic inscriptions. The former were first issued and then the latter. The regular coinage begins no doubt under the so-called Heptarchy. There is money of the kingdoms of Mercia, Kent, the East Angles, and Northumbria. The chief coins are silver pennies, but sceattas also occur; and of Northumbria there are *styca*s, which are pieces of a base metal in the composition of which copper is the largest ingredient. The most interesting coins of this group are those of Offa, king of Mercia; these are silver pennies, remarkable for their quaint designs and their relatively careful execution. Of this period, but extending into the earlier part of that of the sole monarchs, there are coins issued by the archbishops of Canterbury and York. The money of the sole monarchs, whether Saxons or Danes, is strictly a continuation of that of the Heptarchy; it consists almost wholly of silver pennies, which latterly were cut into halves and quarters to form halfpennies and farthings. Under the Normans and earlier Plantagenets the same coinage continues; but under Edward III. there is regular gold money, of which the chief piece is the noble of six shillings and eightpence; and the silver groat now appears. The obverse type of the noble, representing the king in a ship, probably commemorates Edward's victory over the French fleet off Sluys in 1340. At this time there is a visible improvement in the art of the coinage, which moves with the succession of styles until the close of the Tudor age. Of Henry VIII. we have gold and silver coins of most existing denominations, as well as of earlier ones long since abandoned. The finest piece is the sovereign, a large flat coin of gold, bearing on its obverse the figure of the king (whence its name) on his throne. The reign of Queen Elizabeth marks the transition from the Gothic to the modern style and the introduction of the new method of coining with the use of the mill. The coinage of Charles I. presents great varieties owing to the civil war. The scarcity of gold in the royal treasury during the troubles induced the king to coin twenty- and ten-shilling pieces of silver, in addition to the crowns and smaller denominations. One of the most remarkable of his pieces is a crown struck at Oxford. It bears on the obverse the king on horseback, with a representation of the town beneath the horse, and on the reverse the heads of the "Oxford Declaration." Of equal interest are the siege-pieces of many castles famous in the annals of those days. The coinage of the Commonwealth is of a plainness proper to the principles of those who sanctioned it. The great Protector, however, caused money to be designed of his own bearing his head. It is not certain that this was ever sent forth, and it is therefore put in the class of patterns. Simon, the chief of English medallists, designed the coins which are unequalled in the whole series for the vigour of the portrait (a worthy presentment of the head of Cromwell) and the beauty and fitness of every portion of the work. Henceforward there is a decline in the coinage, although skill is perceived in the portrait of William III., whose grand features could scarcely have failed to stimulate an artist to more than a common effort. Queen Anne's money is also worthy of note, on account of the attempt, on Dean Swift's suggestion, to commemorate current history on the copper coinage, which led to the issue of the famous farthings. These have been the cause of an extraordinary delusion, to the effect that a very small number (some say three) of these pieces were struck, and that their value is a thousand pounds each, instead of usually some shillings. In consequence many imitations have been forged, and such are constantly brought to collectors by unfortunate labourers and the like, who imagine that they possess the greatest numismatic treasure in the world. After this there is little to remark, except the baseness of the art of the coins under the first three Georges, until the genius of Pistrucci gave a worthier form to the currency. Besides the regal coinage there is scarcely any baronial money, the class being represented by a few pieces, generally struck by personages of the royal house, and all belonging to the period of the close of the Norman line and the beginning of the Plantagenet.

The English medals are far more interesting for their bearing on events than as works of art. The best are almost all by foreigners, but the fine pieces of the Simons form notable exceptions. The medals of the Tudors are good in style, and show some excellent portraits, in particular those by Trezzo and Stephen of Holland. There is one of Mary Queen of Scots by Primavera, representing her in middle life, which is perhaps her most characteristic portrait. Elizabeth's are of historical importance, and the same is the case with the richer series of the Stuart period, often of fine style. These include works by Warin, the Simons, and the Roettiers, besides the excellent coin engravers Briot and Rawlins. The most curious pieces are those popular issues relating to current events, such as the so-called "Popish plot." From this time there are no works deserving notice except military and naval medals, the historical interest of which makes some amends for their poverty of design and execution. The English tokens form a curious class. They are of two periods: the earlier, which are generally of copper, were issued at the middle of the 17th century and somewhat later; the later, which are mainly of copper, were struck during the scarcity of the royal coinage in this metal at the end of the last century, and during the earlier years of the present century. Both were chiefly coined by tradesmen, and bear their names. The colonial money of England was until lately unimportant, but now it is not unworthy of the wealth and activity of the dependencies. The money struck by the English kings for their French dominions forms a peculiar class, mainly French in its character, termed the Anglo-Gallic. This may be used to fill some gaps in the regal series of England; for instance, it supplies us with money of Richard I., of whom no English coins bearing his name are known.

Scotland. The coinage of Scotland is allied to that of England, although generally ruder; but it seems to have been more influenced in the early period from England, and towards its close from France. The oldest pieces are silver pennies or sterlings, resembling the contemporary English money, of the beginning of the 12th century. In the 15th and 16th centuries there is an important coinage, both in gold and silver, not the least interesting pieces being those of Queen Mary, many of which bear her portrait. The indifferent execution of the coins of this period is traceable to the disturbed state of the kingdom.

Ireland. The money of Ireland is more scanty and of less importance than that of Scotland. The pieces most worthy of notice are the silver pennies of the early Danish kings. Of later times there is little that is interesting, except the forced currency of James II. during his attempt to maintain himself in the island.

Belgium and Holland. Belgium occupies the next place in our arrangement. Its coinage comprises many pieces struck by foreign rulers, and has little of an independent character in either the regal or the seignorial class. It closely resembles the money of France and Germany. The series of Holland is similar in character until the period of the revolt of the provinces. The medals are highly interesting, more especially those which were struck by the Protestants in commemoration of current events. Most of these are of silver, but a few are in gold. There is also a remarkable series of bronze medallets or jettons, which form a continuous commentary on history during the 16th and early part of the 17th centuries. Both are interesting, as largely illustrating not only local events but also those of the chief European states. Such are the pieces recording the raising of the siege of Leyden, likened to the destruction of Sennacherib's army, the assassination of William the Silent, and the discomfiture of the Armada, affording striking indications of the zeal, the piety, and the confidence in the right which built up the great political structure of the Dutch republic. After this time the medals lose much of their interest.

Switzerland. The money of Switzerland illustrates the varying fortunes of this central state, and the gradual growth of the stronghold of European freedom. First we have the gold money of the Frankish kings, among whose mints Basel, Lausanne, St Maurice, Sitten (Sion), and Zurich already appear. The silver deniers, which Charlemagne made the coinage of the empire, are issued by fewer mints; the dukes of Swabia struck coins in Switzerland, and the empire granted during the 10th and to the 13th century the right of coinage to various ecclesiastical foundations, bishoprics, and abbeys. Bern and Zofingen were allowed mints by the emperor Frederick II., and the civic coinage of Switzerland then began in the period of the bracteates. Other towns gained the same right, as well as the counts of Kyburg, Hapsburg, &c. The 14th century witnessed the rise of the Swiss confederation, and by degrees the cantons struck their own money. These, together with the coins of some few sees and abbacies, form the bulk of Swiss money of the mediæval and modern periods. The separate cantonal coinage, interrupted by the French occupation, was finally suppressed in 1848, when a uniform currency was adopted by the whole republic. The monetary systems of the cantonal and ecclesiastical mints were extremely complicated. This was partly due to the variety of coins, partly to the debasement practised by the ecclesiastical mints. Geneva had a peculiar system of her own.

The most interesting coinages are those of Basel (the see, canton, and city), Bern, a large series, the see of Chur, the abbey of St Gallen, the great issue of Geneva (the bishopric, the city, and the canton), the see of Lausanne, Lucerne, the Forest Cantons, the bishopric of Sitten, and the long currency of Zurich. Some of the earlier large coins of the Middle Ages, particularly thalers, are interesting for their bold work and their sacred and heraldic subjects. Throughout the Swiss series we are awakened to a higher than archæological sentiment by the traditions and records of two great periods, the age when the Irish missionaries planted the

faith in the wild valleys of the Alps, and the days when the cantons fought for freedom and smote their powerful oppressors on every side. The medals of Switzerland are mostly of modern times, and lack beauty and historical value.

Modern Italy and Sicily.

Italy, with Sicily, has peculiar features. Here the barbaric coinages were mixed with the Byzantine issues which marked the recovery of the Eastern empire, and left a lasting influence in the north at Venice, and in the south at Beneventum. Later the Arab conquest left its mark in the curious Oriental coinages of the Normans of Sicily and the emperor Frederick II., mixed after his fashion with Latin coinage. The earliest money is that of the barbarians, Ostrogoths and Lombards, and local Byzantine issues in Sicily. This is followed by the deniers of Charlemagne and his successors, supplanted by the gold currencies of the Normans and Frederick II. The age of the free cities is marked by the great coinages of Florence, Venice, and Genoa, while the Angevin and Aragonese princes coined in the south, and the popes began to issue a regular currency of their own at Rome. The Italian princes of the next period coined in Savoy, and at Florence, Modena, Mantua, and other cities, while Rome and the foreign rulers of the south continued their mintages, Venice and Genoa of the republics alone surviving. The Italian monetary systems have already been touched on in the introductory notice. For art the series is invaluable. First in Italy the revival influenced the coins, and in them every step of advance found its record. The Italian medals are without rivals in the works of modern times.

Following the geographical order which is best suited to the Italian coinage, we first notice the money of Savoy, which is inferior in art to that of the rest of the country. It begins in early times, and merges in the class of the Sardinian kingdom, which becomes the kingdom of Italy. Genoa is the first of the great republics. She struck gold money from the time of the general origin of civic coinage in that metal; these are ducats and their divisions, and after a time their multiples also. In the 17th century there are very large silver pieces. In the money of Mantua there first occur really fine coins of Gianfrancesco III. (1484-1519) and Vincenzo II. (1626-1627), these last splendid examples of the late Renaissance, in large pieces of gold and silver; the portrait is fine, and the hound on the reverse a powerful design. The vicissitudes of the story of Milan find their record in no less than nine groups of money—Carlovingian deniers, money of the republic, then imperial again, next of the Visconti family, succeeded by that of the Sforza line, next of Louis XII. of France, of the restored Sforza, of Charles V. by Spanish right and his successors of Spain, and lastly of Austria. There are extremely fine coins of the 15th century, showing great beauty in their portraits. The money of Florence is disappointing in its art. The Athens of the Middle Ages had the same reason as her prototype to preserve as faithfully as might be the types and aspect of her most famous coin, the gold florin, and thus those who expect to see in this series the story of Italian art will be much disappointed. The silver florin was first struck in 1181. It is heavier than the denier, weighing about 27 grains, and bears the lily of Florence and the bust of St John the Baptist. These are thenceforward the leading types, the flower never changing, but the representation of the saint being varied. On the gold florin the Baptist is represented standing, while in the contemporary silver florins he is seated. In the 14th century the arms of a moneyer appear in the field, two such officers having had the right of striking yearly, each for six months. The coins of the duchy from 1532, in spite of their new types, are not a fine series; the best are those of Alessandro, designed by Cellini.

Venice as a mint even surpasses Florence in conservatism, and, the early style being distinctly Byzantine, this is the more striking in a great artistic city. We find Venice as an imperial mint issuing Carlovingian deniers, but the doges begin to coin, placing their own names on their currency, in the 12th century. The most famous silver coin, the matapane, was first struck in the brilliant time of Enrico Dandolo (1192-1205). This coin is a grossus weighing about 33 grains, with on the obverse St Mark giving the standard or gonfalon to the doge, both figures standing, and on the reverse the seated figure of the Saviour. The famous Venetian zecchino or sequin, the rival of the florin of Florence, appears to have been first issued under Giovanni Dandolo (1280-1289). On the obverse St Mark gives the gonfalon to the kneeling doge, and on the reverse is a standing figure of the Saviour within an oval nimbus. The matapane slightly changes after the second third of the 14th century, and at its close becomes a new coin, the grossetto. Niccolo Trono (1471-1473) introduces his portrait on most of his coins, but this custom is not continued. By the latest part of the 15th century large silver coins appear. The archaic style changes in the beginning of the 16th century, but there is no later movement. The large silver pieces increase in size, and large gold is also struck; the last doge, Ludovico Manin (1788-1797), issued the 100-sequin piece in gold, a monstrous coin, worth over £40. The doges of Venice issued a peculiar silver token or medallet, the osella, five of which they annually presented to every member of the Great Council. Antonio Grimani instituted this custom in 1521, and it lasted to the end of the republic. Two dogaressas struck similar medallets. Their types are usually allegorical; some are commemorative. As a class they resemble the Dutch copper jettons, but are less historical and hence less interesting.

The series of the coins of Rome is rather of historical than of artistic merit. The popes begin to strike money with Adrian I. (772-794 A.D.), whose deniers are in a Byzantino-Lombard style that characterizes the coinage of Beneventum. Before the papal coinage closes the senate asserts the right to a mint. We then see on the silver the style of the senate and Roman people, and ROMA CAPUT MUNDI. Some coins have the figures of St Paul and St Peter, others Rome seated and a lion. Charles of Anjou, king of Sicily, strikes as a senator. The gold ducat of about 1300 imitates the types of the Venetian sequin. St Peter here gives the gonfalon to a kneeling senator. The arms of the moneying senator next appear in the field. There are small copper pieces of the famous tribune Rienzi. The papal coinage is resumed at Avignon; and Urban V., on his return to Rome, takes the sole right of the mint. The subsequent coins, though they have an interest from their bearing on the history of art, are disappointing in style. There is indeed a silver coin of Julius II. struck at Bologna and attributed to Francia, with a very fine portrait. We have beautiful gold coins of Giovanni Bentivoglio, lord of Bologna, who employed Francia at his mint, and we know that the artist remained at his post after Julius II. had taken the city. There are also pieces of Clement VII. by Cellini, vigorous in design but careless in execution. The papal portraits are highly characteristic and interesting. It is, however, in the fine series of papal medals that we find a worthier artistic record.

The coinage of Sicily, afterwards that of the Two Sicilies, or Naples and Sicily, begins with the Normans. Theirs is a curiously mixed series. The gold money is almost wholly Arabic, though Roger II. struck the Latin ducat, the earliest of its class; the silver is Arabic, except the great Latin scyphati of Roger II. with Roger III.; the copper is both Latin and Arabic. The gold series of the emperor Frederick II. shows the first sentiment of reviving classical art, its work being far in advance of the age. These are Latin coins; he also struck small Arabic pieces in gold. Under Conrad, Conradin, and Manfred there is an insignificant coinage, copper only, but with Charles of Anjou (1266-1285) the gold money in purely mediæval style is very beautiful, quite equal to that of his brother St Louis of France. After this time there is a great issue of gigliati, silver coins with for reverse a cross fleurdelisée cantoned with fleurs-de-lis. These coins acquired a great reputation in the Levant, and were even struck by the emirs of Asia Minor. With Alphonso, the founder of the Aragonese line, we note the old style of the coins, which are in singular contrast to his fine medals. Good portraiture begins on the money of Ferdinand I., his successor. The later coinage is interesting only for its illustration of the varying fortunes of the Two Sicilies. There is a curious early gold coinage of the Lombard dukes of Beneventum, which follows the Byzantine type.

Italian medals.

Italian medals are next in merit to the works of the Greek die-engravers. Their true beginning and highest excellence are under Vittore Pisano, the Veronese painter, who worked from 1439 to 1449. They are of two classes, the finer and more original, struck in the 15th century, and the more classical of the 16th, after which the style declines rapidly. In spite of classical influence, the earlier medals are independent works, marked by simple vigorous truthfulness. The designs are skilful and the portraits strongly characteristic, but deficient in beauty. As the art became popular the execution of medals passed into the hands of inferior artists, and by degrees striking became usual for the smaller pieces; at the same time, a slavish imitation of the classical style weakened or destroyed originality and stamped the works with the feebleness of copies. Yet the delicacy of design and technical skill of these later medals often give them an undeniable charm. The great medallists of the first age are Pisano, Matteo de' Pasti, Enzola, Boldu, Sperandio, Gentile Bellini, Bertoldi, Gambello, Filippino Lippi, and Francesco Francia, who in style belongs to the next age, in which must be mentioned Pomedello, Benvenuto Cellini, Leone Leoni, Giovanni Cavino "the Paduan," Pastorino of Siena, Giacomo da Trezzo, and Pietro Paolo Galeotto, called Romano. Among the most important works are all the medals of Pisano, particularly those of Alphonso the Magnanimous, with the reverses of the boar-hunt and the eagle and lesser birds of prey, those of Sigismondo di Malatesta, his brother surnamed Novello, Lionello d'Este, John VIII. (Palæologus), Nicolo Piccinino, Inigo d'Avalos (marquis of Pescara), Gianfrancesco di Gonzaga (marquis of Mantua), Ludovico III. of the same family, the great humanist Vittorino da Feltre, and of the artist himself, a portrait eminently witnessing his fidelity to nature. He is great in portraiture, great in composition and design, and marvellously skilful in depicting animals. Pisano alone represents the moral qualities of his subject in their highest expression and even capability. That he has high ideal power is seen at once if we compare with his portrait Pasti's inferior though powerful head of Sigismondo di Malatesta. Pasti's medal of Isotta, wife of Sigismondo, is also noteworthy; likewise Gentile Bellini's head of Mehemet

II., the conqueror of Constantinople,—interesting works, lacking Pisano's technical skill. In the later age Cavino executed a wonderful series of imitations of Roman sestertii, which have been frequently mistaken for originals. In art these Italian works frequently surpass the originals in spite of a degree of weakness inseparable from copies. A comparison of the Italian with the Roman pieces is thus most instructive. The works of Pastorino of Siena are especially charming. Historically the Italian medals supply the defects of the coinages of Florence and Rome, and in a less degree of Venice. The papal series is invaluable as a continuous chronicle of art.

Germany. The money of Germany is like that of Italy far too various for it to be possible here to do more than sketch some of its main features. The metrological systems are Merovingian, Carlovingian, that of the bracteates, and those of the later mediæval and modern issues in a complicated form. There are several classes, the coinages of the emperors, the electors, the smaller lords, the religious houses, and the free towns. The art is behind that of Italy in time, and on the whole far inferior to it in merit. Some of the later mediæval examples are of good style, and the Renaissance is ushered in by some beautiful pieces. Yet other coins of this very time are surprisingly barbarous, and there is an immediate decline in the better works. The imperial money, even when limited to what is strictly German by the exclusion of the issues of the French and Italian mints, forms a large series. It begins with the deniers of Charlemagne; and, except the solidus of Louis I., for a long time there is no gold. The true bracteates begin under Frederick I; the money of Frederick II. is chiefly of Sicily and Italy, and his gold Sicilian coins do not belong to the German series. Under the house of Austria there are fine dollars of Maximilian I., and a splendid double dollar on which the emperor appears as a horseman. It is after this time that art declines. Passing in review the currencies of the chief states, we are arrested by the historical dollars of Louis I., king of Bavaria, which have the merit of an excellent purpose. The series of Brandenburg, ultimately merging in that of Prussia, is not noteworthy but for some fine early medals. Brunswick shows the exceptional great mining-thalers, generally spread coins, multiples of the dollar 1¼, 2, 3, 4, 5, 8, and 10. Cologne has a representative series. Striking under the Merovingian kings and the Carlovingian emperors, it continued an imperial mint until the reign of Otho IV. (1198-1218). The archbishops began to coin under Bruno (953-965), and only ceased in 1801. The city had also the right of coinage after the emperors ceased to exercise it, but her money is unimportant. The wealthy mart of Hamburg is chiefly remarkable for the great gold pieces of the 16th and 17th centuries, of the weight of 2½, 5, and 10 ducats, with the types of the city and the fleet and allegorical subjects. The city of Magdeburg shows a variety of bracteates. Mainz has the same features as Cologne, Merovingian and Carlovingian money, the imperial mint going on to the reign of Sigismund, who granted the city the right of coinage in 1420, so that a few civic coins were issued before the privilege was surrendered to the archbishops in 1462. The archbishops have a series of coins from 1021 to 1813. These comprise remarkable large bracteates of the 12th century, with curious ecclesiastical types, combining figures of saints and prelates with architectural detail. Of Nuremberg there is a long gold series, but the artistic fame of the city is not supported by her coinage. The electors palatine have a series in which we note the florin of Rupert IV. (1356-1390), followed by ducats. The money of the archbishops of Salzburg comprises some early pieces, but ranges mostly from the end of the 15th century, and is strong in gold. The Saxon lines are well represented. They begin with large bracteates of the 12th or 13th century, but the most interesting coins are of the age of the Reformation, bad in style and execution, but bearing characteristic portraits. The grandmasters of the Teutonic Order struck money second in importance to that of the knights of St John issued at Rhodes and Malta. The archbishops of Treves coined similar issues to those of their brethren of Cologne and Mainz to the year 1803.

German medals. The German medals stand in importance next to those of Italy. They have this distinctive peculiarity of origin, that their first artists, instead of being, as in Italy, painters or sculptors, were goldsmiths, the craftsmen of Nuremberg and Augsburg. Consequently minute work and love of chasing make them technically inferior as medals to the Italian works, though these qualities are balanced by great vigour and truthfulness. Later in origin than the rival school, the German dates from the early part of the 16th century. Albert Durer is the greatest medallist, and his medals are wholly superior to those of a mere worker in metal. Heinrich Reitz is next in merit. The portrait of Albert Dürer's father by the artist, and a female bust in very low relief, are of high excellence. For historical interest the heads of Luther, Erasmus, Charles V., Maximilian and Mary of Burgundy are very noteworthy. The subject of German medals has not yet been sufficiently studied.

Norway, Denmark, and Sweden. The coins of the Scandinavian states, Norway, Denmark, and Sweden, are almost wholly regal, there being few ecclesiastical and civic pieces. The origin of the types is clearly English and due to the Danish conquest of England. The Norwegian series begins with the pennies of Harold Hardrada, slain at Stamford Bridge; there are next bracteates, and then coins of the Danish kings. The money of Denmark begins with pennies of Cnut (Canute), which are like his English mintage; so also are those of Hardicanute, but Magnus and Svend Estridsen have some very Byzantine obverse types, which is curious in connexion with the relations of the Norsemen to the Byzantine emperors. Later coins are of German types and barbarous work. A good mediæval style begins with Erik of Pomerania. Later coins are not remarkable. Sweden has very few early coins, their denominations being the penny and the bracteate. There are good mediæval coins of Albert of Mecklenburg (1363-1387). The money of Gustavus Adolphus is historically interesting. Under Charles XII. there is highly curious money of necessity. The daler is struck as a small copper coin, sometimes plated. The types include the Roman divinities. At the same time and later there was a large issue of enormous plates of copper, stamped with their full value in silver money as a countermark.

Russia. The Russian coinage begins in the 15th century. It consists of very curious little silver pieces struck under Byzantine influence. Gold is common in the reign of Peter the Great and of fair style, and though the silver is at first of the old barbarous type. Nicholas introduced a platinum coinage of about two-fifths the value of gold.

Poland, Hungary. The series of Poland begins in the 11th century with bracteates. There is a regular coinage from Uladislaus Jagello (1382-1434). The town of Dantzic, while part of the kingdom, is remarkable for the issue of large gold pieces with the kings' portraits and civic reverses, the most important being of the 16th and 17th centuries. Hungary has its own coinage from Stephen I. (1000-1038). Under Charles Robert of Anjou (1308-1342) the florin is introduced, and appears also with the type varied as a ducat. The money of the illustrious John Hunyady as regent is of high interest. The abundance of gold about this time and onwards shows the metallic wealth of the land. The Hungarian money of the house of Austria presents no noteworthy features. The coinage of the Transylvanian princes of the 16th and 17th centuries is chiefly of ducats, witnessing, like the Hungarian, to the wealth of the soil. There are early coins of the patriarchate of Aquileia and of the kingdom of Servia, now revived after four centuries and a half of subjugation, whence the only interest of the modern money as well as of that of Roumania and Greece.

Crusaders. There is a most interesting class of coins struck during the Middle Ages within the limits of the present Turkish empire, the money of the Crusaders and other Latin princes of the East. The multitude of states thus designated have been classed by Schlumberger, the authority on the subject, in the following order, the chief divisions of which are here given:—first group, principalities of Syria and Palestine, counts of Edessa, princes of Antioch, kings of Jerusalem, counts of Tripoli, fiefs of Jerusalem, crusaders who struck imitations of Arab coins, kings of Cyprus, lords of Rhodes, grandmasters of the order of St John at Rhodes, to which may be added the later grandmasters at Malta; second group, Latin emperors of Constantinople, Frankish princes and lords of Greece and the Archipelago whose power was due to the crusade of 1204, such as the princes of Achaia, the dukes of Athens, Neapolitan kings who struck money for their Eastern possessions, Latin lords of the Archipelago, the Genoese at Chios, the Gattilusi at Mytilene, the Genoese colonies, the Venetian colonies, the Turkoman emirs of western Asia Minor who struck Latin coins. The most important currencies are the copper of the counts of Edessa, the billon and copper of the princes of Antioch and the kings of Jerusalem, the silver and copper of the counts of Tripoli, and the gold imitations of Arab dinars, the currency in that metal of the crusaders of Palestine. These *Bisantii Sarracenati*, or Saracen bezants, are at first imitations of Fatimite dinárs, known to have been struck by Venetian moneyers at Acre, and probably at Tyre and Tripoli also. After these coins had been current for nearly a century and a half they were forbidden on account of their Mohammedan aspect by Pope Innocent IV. The Venetians then issued gold and silver coins with the same aspect but with Christian inscriptions. The kings of Cyprus issued a really good coinage in the three metals and in billon. The last money of the kingdom is the fixed currency of the gallant Bragadin during the war which lost the island to the republic. The coinage of the order of St John begins on the conquest of the island of Rhodes and the suppression of the Templars; the earliest coins known are of Foulques de Villaret, the first grandmaster at Rhodes in the earliest years of the 14th century, and the last of the Rhodian series are of Villiers de l'Isle-Adam, the gallant defender of the island who was forced to capitulate to the Turks and sail for a new home in 1523. The coinage is of fine gold, silver, billon, and copper. On the establishment of the order at Malta in 1530 it is resumed there till the capture of the island by the French at the close of last century; it has little interest except as showing the wealth of the order. The other currencies of the crusaders, notwithstanding their great historical interest, are far less remarkable numismatically.

America. Of the money of America little need be said here. Neither the coinages of the Spanish and Portuguese dependencies, and of the

states which succeeded them, nor those of the English colonies and of the United States, present much that is worthy of note. In style they all resemble those of the parent countries, but, *originating* in the decline of art, they are inferior in style and work. They are most remarkable in the south for the abundance of gold and silver. The chief coin is the dollar. Some coins are of historical interest, and there are a few rarities, such as the colonial money of Lord Baltimore struck for Maryland, the pine-tree coins of Massachusetts, and the hog-money of Bermuda.

IV.—ORIENTAL COINS.

Oriental coins may be best classed as ancient Persian, Arab, modern Persian and Afghan, Indian, and Chinese, and other issues of the far East. The first place is held by the money of the old Persian empire, the Parthians, and the Sasanians. The conquests of the Arabs introduce a new currency, carried on by the Moslem inheritors of their empire. The modern Persian and Afghan money, though of Arab origin, is distinguished by the use of the Persian language with Arabic. The Indian currencies, though Greek, Sanskrit, Arab, and Persian in their inscriptions, must be grouped together on account of their mutual dependence. They rise with the Bactrian kings, whose Greek types are gradually debased by the Indo-Scythians and Guptas; these are followed by a group of currencies with Sanskrit legends; next follow the money of Arab conquerors and the great series of the Pathans of Delhi and subsidiary dynasties, with Arabic inscriptions; the main series is continued in the currency of the Moguls, who largely use Persian, and the last series is closed by local currencies mainly with Sanskrit or Arabic legends. The Chinese coinages form the source and centre of the group of the far East, which, however, includes certain exceptional issues. The order throughout is historical, each empire or kingdom being followed by the smaller states into which it broke up, and then by the larger ones which were formed by the union of these fragments.

Ancient Persia. The Persian coinage was originated by Darius I. (Hystaspis) about the time that he organized the empire in satrapies (516 B.C.). The regular taxation thus introduced made a uniform coinage necessary. Avoiding the complex *gold system* of Crœsus, which was intended to accommodate the Greek cities in commercial relation with Lydia, Darius chose two weights. the gold stater of Crœsus of 126 grains and the silver drachm of 84. He raised the weight of both, the gold to about 130 grains and the silver to 86. Thus one gold piece was equal to twenty silver. The gold coin was called the daric, the silver the siglus. The metal was very pure, especially that of the daric. Thus not only were the Lydian gold and silver coins of inferior weight thrown out of circulation, but the Persian gold, from its purity, became dominant, and was the chief gold currency of the ancient world so long as the empire lasted. The issuing of gold was a royal prerogative. Silver money was coined not only by the king but in the provinces by satraps, who used local types, and by tributary states. The following classes must be distinguished: (1) regal, (2) provincial with regal types, (3) satrapal, (4) of tributary states. The art of Persian coins varies according to the locality, from the beautiful work of the west coast of Asia Minor to the more formal style of Cilicia and the thoroughly hieratic stiffness of Phœnicia and Persia.

The regal coinage is of darics and double darics in gold and of sigli in silver. The obverse type is the king as an archer, the reverse an irregular oblong incuse. The darics show differences of style, and must extend through the whole period of the empire. The sigli no doubt run parallel with them. Both these denominations are uninscribed. The double darics are of late style, and nearly all bear either Greek letters or monograms or symbols, sometimes both. They are undoubtedly of the last age of the empire or subsequent to its fall.

The provincial coins with regal types appear to be mostly Phœnician; the most important classes have been already noticed. But they also occur beyond this territory, as at Mallus in Cilicia, where the Persian regal archer is combined with the reverse of Heracles strangling the Nemean lion, with the inscription ΜΑΛ.

The satrapal coinage is very important and interesting. It belongs mainly to Cilicia. The most remarkable series is that with a bearded head wearing a tiara, with various reverses, certainly struck at Colophon, Cyzicus, and Lampsacus, and in one instance bearing the name of the satrap Pharnabazus, but usually the word "king" in Greek. The coin of Colophon shows a splendid portrait, one of the finest instances of Ionian work. It has been held to represent Artaxerxes II. (Mnemon), but has been lately assigned to Pharnabazus on the ground that the head-dress is not the proper regal kidaris. This is an objection, yet it seems inconceivable that the king of Persia would have countenanced the issue of the portrait of a satrap at a time when no Greek dynast dared to place his head on his own coinage. Of other satrapal issues those of Datames, of Tiribazus, and Cilician issues, struck at Tarsus, are specially noteworthy. Their inscriptions are Aramaic.

The coinages of the tributary states have been in part noticed in their geographical order; it is difficult to separate them from the provincial issues with regal types.

Parthians. The conquest of Alexander did not wholly destroy the independence of Persia. Within less than a century the warlike Parthians, once subjects of Persia, revolted (*249-8 B.C.*) *against* the Seleucids and formed a kingdom which speedily became an empire, ultimately the one successful rival of Rome. Their money is Greek in standard and inscriptions, as well as in the origin of types. The coins are silver, following the Attic weight, the chief piece being the drachm, though the *tetradrachm* is not infrequent; there are also bronze coins, but none in gold are known. The drachm has the head of the king on the obverse, diademed or with a regal head-dress, and on the reverse the founder Arsaces seated, holding a strung bow. the later tetradrachms varying this uniformity. Every kind is styled Arsaces, to which many of the later sovereigns add their proper names. The inscriptions are usually long, reaching a climax in such as **ΒΑΣΙΛΕΩΣ ΒΑΣΙΛΕΩΝ ΑΡΣΑΚΟΥ ΜΕΓΑΛΟΥ ΔΙΚΑΙΟΥ ΕΠΙΦΑΝΟΥΣ ΘΕΟΥ ΕΥΠΑΤΟΡΟΣ ΦΙΛΕΛΛΗΝΟΣ** of the 11th Arsacid, Mithradates III., where we see the double influence of Persian and Seleucid styles and the desire to conciliate the Greek cities. Very *noticeable* are the coins which bear the portraits of Phraataces (14th king) and his mother, the Italian slave Musa, with the title queen (**ΘΕΑΣ ΟΥΡΑΝΙΑΣ ΜΟΥΣΗΣ ΒΑΣΙΛΙΣΣΗΣ**).

Sasanians. The Persian line of the Sasanians arose about 220 A.D., and wrested the empire from the Parthians in 226-7, under the leadership of Ardashir or Artaxerxes. This dynasty issued a national and thus Oriental coinage in gold and silver. The denominations follow the Roman system, and there are but two coins, equivalent to the aureus or solidus and the denarius. The obverse has the king's bust, usually wearing a very large and elaborate head-dress, varied with each sovereign, and on the reverse the sacred fire-altar, ordinarily flanked by the king and a priest. The attachment which Ardashir, the founder, bore to Zoroastrianism established this national reverse type, which endured through the four hundred years of the sovereignty of his line. The inscriptions are Pahlavi.

Caliphates. The Arab coinage forms the most important Oriental group. It has a duration of twelve centuries and a half, and at its widest *geographical extension* was coined from Morocco to the borders of China. When the Arabs made their great conquests money became a necessity. They first adopted in the East imitations of the current Persian silver pieces of the last Sasanians, but in Syria and Palestine of the Byzantine copper, in Africa of the gold of the same currency. Of these early coins the Sasanian imitations are very curious with Pahlavi inscriptions and shorter ones in Arabic (Cufic). The regular coinage with purely Moslem inscriptions begins with the issue of a silver coin at Basrah, in 40 A.H., by the caliph 'Alí; after subsequent efforts thus to replace the Sasanian currency, the orthodox mintage was finally established, in 76 A.H., by 'Abd al-Melik. The names of the denominations and the weight of that of gold are plainly indicative of Byzantine influence. There were three coins. The dínár of gold took its name from the aureus or denarius aureus, of which the solidus must have been held to be the representative, for the weight of the Arab coin, 66 grains and a fraction, is clearly derived from the Byzantine gold piece. The dirhem of silver is in name a revival of the Greek drachm; it weighs at most 45 grains and a fraction. The copper piece is the fels, taking its name from the follis of the Greek empire. Commercially the gold easily exchanged, and the silver soon passed as the double of the Carlovingian denier. For long these were the only coins issued, except, and *this* but rarely, *half* and quarter dinárs. There are properly no types. There was indeed an attempt in the early Byzantino-Arab money to represent the caliph, and in the course of ages we shall observe some deviations from the general practice of Islam, particularly in the coinage of the atábegs and in Mohammedan coinages not of the Arab group, the modern Persian and that of the Moguls of Delhi. The inscriptions are uniformly religious, save in some Tatar coinages and that of the Turks. In general the coins are for the first five centuries of their issue remarkably uniform in fabric and general appearance. They are always flat and generally thin. The whole of both sides of the coins is *occu*pied by inscriptions in the formal Cufic character, usually arranged horizontally in the area and in a single or double band around. Towards the fall of the caliphate a new type of coin begins, mainly differing in the greater size of the pieces. There are new multiples of the dínár and ultimately of the dirhem, and the silver pieces frequently have their inscriptions within and around a square, a *form* also used *for* gold. The Cufic character becomes highly ornamental, and speedily gives way to the flexuous naskhí of modern writing. The inscriptions are religious, with the addition of the year by the era of the Flight, the month sometimes being added, and the mint occurs uniformly on silver and copper, but does not appear on the gold until after the fall of the Omayyad dynasty. Subsequently the official name of the caliph occurs. The religious part of the inscriptions is various, the most usual formulæ being the profession of the Moslem faith: "There is no deity but God; Mohammed is the apostle of God," to which the Shí'ites or

followers of 'Alí in Persia and Africa add "'Alí is the friend of God." The Moorish coins give long formulæ and religious citations and ejaculations, and they, like the money of the Pathans of Delhi of the Indian class, have occasionally admonitions urging or suggesting the purer use of wealth. As Arab and other dynasties arose from the dismemberment of the caliphate, the names of kings occur, but for centuries they continued to respect the authority of their religious chief by coining in his name, even in the case of the shadowy 'Abbásids of Egypt, adding their own names even when at war with the caliph, as though they were mere provincial governors. After the fall of the caliphate some new denominations came in, chiefly of heavier weight than the dirhem and dínár, but the influence of the commercial states of Italy made the later Egyptian Mamelukes, the Turks, and the later Moors adopt the gold sequin. In more modern times the dollar found its way into the Moslem coinage of the states bordering on the Mediterranean. It can be readily seen that Arab coins have no art in the same sense as those of the Greeks. The beautiful inscriptions and the arabesque devices of the pieces of the close of the Middle Ages have, however, a distinct artistic merit.

Omayyads. The Omayyad coins owe their only historical value to the evidence which the silver affords of the extent of the empire at different times. The first separation of that empire dates from the overthrow of this dynasty by the 'Abbásids, speedily followed by the formation of the rival Omayyad caliphate of the West with its capital at Cordova. 'Abbásids. The 'Abbásid money has the same interest as that which it succeeded, but its information is fuller. Towards the fall of the line it becomes very handsome in the great coins, which are multiples of the dínár. The Spanish Omayyads struck silver almost exclusively. Their rise was followed by that of various lesser lines—the Edrisids (Æ) and Aghlabids (N chiefly) in western Africa, the Benî Túlún (N), and, after a short interval, the Ikhshídids (N), both of Turkish origin, in Egypt. Meanwhile a new caliphate arose in western Africa which subdued Egypt, the Fátimite of the line of 'Alí, and for a while the allegiance of the Moslems was divided between three rival lines, the Omayyads of Spain, the Fátimites of Africa, and the 'Abbásids of Baghdád. The Fátimites introduced a new type of dínár, with the inscriptions in concentric circles, and struck little but gold. In the interim the Persians, who had long exercised a growing influence at the court of Baghdád, revived their power in a succession of dynasties which acknowledged the supremacy of the caliphate of Baghdád, but were virtually independent. These were the Táhirids, Saffárids, Sámánids, Ziyárids, and Buweyhids, who mostly struck silver, but the last gold also. As the Persians had supplanted the Arabs, so they were in turn forced to give place to the Turks. The Ghaznawids formed a powerful kingdom in Afghánistan (N, Æ), and the Seljúks established an empire (N), which divided into several kingdoms, occupying the best part of the East. Of these dynasties the Seljúks of Rúm or Asia Minor first strike a modern type of Arab coinage (Æ). The Seljúk dominions separated into many small states, the central ruled by atábegs or generals, and the similar Turkoman Urtukees. The atábeg money and that of the Turks of the house of Urtuk are mainly large copper pieces bearing on one side a figure borrowed from Greek, Roman, Byzantine, and other sources. They form a most remarkable innovation. In the same age the great but short-lived empire of Kharezm arose in the far East. The first caliphate to disappear was that of Spain, which broke up into small dynasties, some claiming the prerogative of the caliphates. They chiefly struck base silver (billon) coins. The Christian kings gradually overthrew most of these lines. In the meantime various Berber families had gained power in western Africa and the Murábits (Almoravids) and Muwahhids (Almohadis) crossed the straits and restored the Moslem power in Spain. They struck gold money of fine work, and that of the later Muwahhids is remarkable for its size and thinness. At the fall of the Muwahhids the only powerful kingdom remaining was the Arab house of Granada, which, supported by the Berbers of Africa, lingered on until the days of Ferdinand and Isabella. The Fátimite dynasty was supplanted by the Kurdish line of the Eiyúbis, the family of Saladin, who ruled Egypt, Syria, and Mesopotamia, with a number of vassal states, some governed by princes of their own family, some by the older lines of the atábeg class which they allowed to survive. In Egypt the Eiyúbi coinage is of gold, elsewhere of silver and copper. The caliphate of Baghdád, which latterly was almost limited to that town, though its abundant heavy gold coinage at this very time indicates great wealth, was overthrown by the new power of the Mongols (1263 A.D.), who established a group of empires and kingdoms, comprising the whole Eastern world eastward of the Euphrates and thence extending northward and reaching into Europe. The most important of these states for their money are that of the Mongols of Persia, founded by Hulagu, the conqueror of Baghdád, and that of the khans of the Golden Horde. Both struck silver, but there is also gold coinage of the Mongols of Persia, who more frequently use the Mongol character for their names and titles than is done under the kindred line. The power of the Mongols was held in check by the Mamelukе kings of Egypt, slave-princes, who struck money in the three metals. The Mongol power waned, but was revived by Timur, who during his rule (1397) recovered all that had been lost. He and his successors struck silver, copper, and brass money. The Turks, whose power had been gradually growing, after a desperate struggle with Timur, gradually absorbed the whole Mohammedan world west of the Tigris, except only Morocco, where they had but a momentary dominion. Their money, of gold, silver, base metal, and bronze, is devoid of historical interest. In Tunis and Morocco a group of Berber lines long maintained themselves, but at length only one survived, that of the sherifs of Morocco, claiming Arab descent, now ruling as the sole independent Moslem dynasty of northern Africa. Its recent coinage is singularly barbarous. It may be remarked that Tunis and Egypt have long coined Turkish money in their own mints, the more western state latterly adding the name of its hereditary prince to that of the sultan.

The coins of the shahs of Persia have their origin with Ismá'íl (1502). Persia. They are struck in the three metals, and are remarkable for the elegance of their inscriptions, sometimes in flowing Arabic, sometimes in the still more flexuous native character. The inscriptions are at first Arabic; after a time the religious formulæ are in this language and the royal legend in Persian, usually as a poetical distich. The Persian series is also remarkable for the autonomous issues of its cities in copper, the obverse bearing some type, usually an animal. The coins of the Afghans form a class resembling in inscriptions those of the Persians, and equally using Persian distichs. They commence with Ahmad Sháh Durani.

The Indian series begins with the money of the Greek kings of India. western India, commonly known as Bactrian,—a misnomer, only the earlier sovereigns having ruled Bactria. Between Alexander's money and the Græco-Indian series there is a curious class, the very rare gold and silver of Andragoras, dynast of Parthia, and the silver of an Indian prince, Sophytes. The Græco-Indian weight is at first Attic; coins are struck of gold, silver, bronze, and rarely nickel. The gold stater is limited to the earlier kings; the silver tetradrachm is struck at first with divisions; the Persic didrachm and drachm ultimately supersede it; the bronze is either round or of the square form peculiar to India. The types are Greek and very various. The inscriptions are at first Greek, but at an early time a native Indian inscription appears as a concession; it occupies the reverse of bronze, and in time of silver money, and gives a translation of the Greek inscription. The character used is of two Indian alphabets, the common one being styled Bactrian Pali. Diodotus, the first Græco-Indian king, revolted against the Syrian ruler about 250 B.C.; his money is Greek in its art. Under Euthydemus I., the next king, begins that peculiar style which gives these coins their special interest. It is realistic and vigorous, in portraiture reminding us of the best Italian medals. This is in part due to the leading away of the artists from Greek models to portray another race, for the heads are unmistakably Indian; but it is also significant of an innate strength not to be traced in the portraits of the Ptolemies and the Seleucids. Here we plainly see the first impulse of Greece in the formation of Indian art, after it had been influenced by working in a new atmosphere. The portrait of Demetrius in an elephant's skin is very remarkable, and should be compared with the wholly ideal treatment of that of Alexander on the coins of Alexander IV. struck in Egypt. After one reign later the order of kings becomes obscure, but the style gives the relative ages of groups, which must be the money of contemporary lines. Agathocles is noticeable for having struck commemorative coins of Alexander the Great, Diodotus, and Euthydemus I. Another characteristic portrait is that of Antimachus in the petasus or Greek hat. Eucratides struck the only Greek gold medal known to us, the great piece weighing twenty staters, now in the French cabinet. The later Greek money is of less interest; it ends with Hermæus, perhaps about 50 B.C. Then follows a group of dynasts with barbarous names, who adhere more or less closely to Greek originals. A Parthian class breaks in in consequence of the conquests of Mithradates I. The Indo-Scythian class, which is of much interest, is fixed approximately to periods by finds in which aurei occur ranging from the earlier Roman emperors to the Antonines. This coinage is of gold and bronze, silver being almost unknown. The weights are Roman. The types are usually the figure or the bust of the king, and on the reverse a divinity. The inscriptions are first Greek and the ordinary Indian of the Græco-Indian coins, then, strangely, Greek only, barbarous enough. Cadphises strikes the double aureus and the aureus. Under Canerces and his successors we notice aurei with an uncommon variety of divinities of Indian, Persian, Greek, and Roman mythology, as well as Buddha. The Gupta series is contemporary with the Indo-Scythian. It was struck in Kanauj, in the centre of northern India. It is a remarkable gold coinage, good and debased, as well as bronze. The mythological types are Indian alone, interesting and in good native style, which now first appears on coins in a pure form. The inscriptions are in Sanskrit letters. There is a series of silver coins struck in Cacch (Cutch) by the Sáh kings of Saurastrán; they are derived from the later money of the Græco-Indian class. The

types are royal portraits and Buddhist emblems, &c., of no great interest.

Quite as early as the invasion of Alexander, if not earlier, is a most curious class of square silver and bronze coins, punch-marked with a variety of devices, which circulated in northern India, and probably originated the square bronze coinage of the Græco-Indian kings.

The Arabs in the first days of conquest had subdued Sind, and founded an independent state on the banks of the Indus; but it is hard to subdue India from this direction, and the strangers decayed and disappeared. The Pathan kings came of the Ghuri stock which rose on the ruins of the empire of Ghazneh. Mohammad ibn Sám made Delhi his capital, and here he and his successors, Pathans or slave-kings, ruled in great splendour, latterly rivalled by a line of Pathans of Bengal. Of the Pathans of Delhi we have an abundant coinage, the principal pieces being the gold mohur of about 168 grains, and the silver rupee of about the same weight, besides many pieces of bronze, and at one period of base metal. The coins are large and thick, with the profession of Islam or the style of the caliph on one side, on the other the name and titles of the reigning king. Mohammad ibn Taghlak struck coins with a great variety of inscriptions, some in the name of the shadowy 'Abbásid caliphs of Egypt, whose successors were for a time similarly honoured by later sovereigns. Towards the close of the rule of the Pathans several dynasties arose in central and southern India and struck similar money, the kings of Guzerat, of Málwá, and of the Deccan. The Pathan lines closed with Shér Sháh, an Afghan, the last ruler of Bengal. Bábar, the Turki, of the family of Timur, seeking a kingdom, adventured on the conquest of Hindustan; and after long wars with Shér Sháh, carried on by Bábar's son Humáyún, the famous Sháh Akbar, grandson of the invader, was at length peaceably settled on the throne of Delhi, and he and his successors, the so-called Moguls of Delhi, practically subdued the whole of India. They retained the existing standard, but used the Arabic and Persian languages like the shahs of Persia. Akbar (1556) issued a splendid coinage in gold and silver, far more elegant than that of the Pathans, but the money of his son, Jahángír, is still more remarkable. He issued the famous zodiacal mohurs and rupees, as well as those astonishing Bacchanalian mohurs on which he is represented holding the wine-cup. Scarcely less strange is the money of the beautiful queen Núr-Jahán. Under Sháh Jahán there is a visible falling away in the merit of the coins, and an ordinary modern style is reached in the reign of Aurungzeb. To the close of the rule of Sháh 'Alam, the last Mogul who actually reigned, gold and silver money is abundant. Latterly, native states coin with Arabic and also with Sanskrit inscriptions. The most important are the kings of Oude, the nizams of the Deccan, and the kings of Mysore, besides the maharajas of Indore and the kings of Nepál. The coinage of Tipu Sultán (Tippu Sáhib) is extremely curious from his innovations in the calendar. Besides these there are a multitude of small states. Most of the Indian princes acknowledged the emperor of Delhi, but some struck independently. At last the English coinage of India has swept away nearly all these moneys, though some native states still issue their own, while those under English protection occasionally acknowledge on their coins the supremacy of the queen as empress.

It is not yet possible to give a full summary of the strange coinages of China and the farther East, the published researches having been generally uncritical and unsupported by the examination of native literary sources. Thus only some general facts may be safely stated.

China. The money of China, more certainly than the square punch-marked coinage of India, may claim an origin independent of the Lydian and Greek issues. The oldest specimens may be assigned to the 6th century before our era, a time at which the existing coins of other nations could scarcely have been known in the far East; nor is there any connexion in form, type, or metal with the other currencies. Like nearly all subsequent Chinese money, the earliest is of bronze and cast. The shapes of the coins are most eccentric, representing knives, and, in De la Couperie's opinion, mining-tools. To these succeed the well-known round pieces with a square hole in the centre for the purpose of stringing them together, the coins to which the name "cash" is applied by Europeans. The value of these coins depended on the weight, which is inscribed upon them. We must, however, bear in mind that we have frequently to deal with a merely conventional weight and value due to financial schemes. Thus the inscription always records official value, but not always true weight or true value. There is no type whatever, but always an inscription on one or both sides. The occurrence of an occasional symbol cannot be held to be a deviation from this rule. The main inscription is usually placed opposite the four sides of the central square on the obverse. As a rule this inscription at its fullest gives the emperor's official name during life, and the value of the coin and an indication of its authoritative exactness. When a reverse inscription is introduced, it gives the value of the coin. The inscriptions are in Chinese characters of different kinds, and under the present dynasty Manchu has also been employed. Some coins bear indications of mints. The most interesting Chinese coins are those of small rival dynasties and of rebels, the study of which is important for the elucidation of the obscurities of the history of the country. The Chinese medals are talismans, usually larger than the coins, and bear both subjects and inscriptions. They are distributed by Taouist and Buddhist priests of temples. The money of Corea and Annam is similar to that of China, and Chinese coins were long the currency of Java, which more recently has issued the money of its Mohammedan princes.

The empire of Japan shows in its coinage that Chinese source modified by the influence of native independence which marks all its institutions. Thus, while the copper currency closely resembles that of China, there is also a gold and silver coinage. The gold consists of plates of the form of a flattened oval with large inscriptions in indian ink painted on the surface, and small contermarks punched into it. The "cobang," which is the largest coin, was chiefly used for presents by the Japanese princes. Its intrinsic value is about £25. There are several lesser denominations in gold, and a series of silver pieces, the larger, ingots, used as presents to inferiors, and the smaller, which are sometimes of a long rectangular shape, more properly a silver currency. There are also temple medals of a magical character like those already noticed as cast in China. Japan.

Notwithstanding the general books covering many sections for which no special works are indicated, it will be felt that this list is very defective. This is partly due to the multitude of essays in various periodicals, but mainly to the neglect of certain branches of the subject and to the want of full catalogues of the great collections of Europe. NUNEATON, a market-town of Warwickshire, England, is situated near the Leicestershire border, on a branch of the river Anker, on the Coventry Canal, and on three railway lines, 97 miles north-west of London, and 22 east

of Birmingham. It consists principally of one long street with a cross street leading to the market-place. The church of St Nicholas is a large and handsome structure in various styles of architecture, and consists of nave, chancel, and aisles, with a square embattled tower having pinnacles at the angles. It contains several interesting monuments. The new church of St Mary the Virgin was erected in 1877 on the ruins of the old priory. A free grammar-school was founded in the reign of Edward VI., and an English free school for the instruction of forty boys and thirty girls by Richard Smith in 1712. A library and reading-room was established in 1851, and a literary institute in 1865. The ribbon industry is of less importance than formerly, but there are ironworks, cotton, hat, elastic, and worsted factories, curriers, and tanneries. Nuneaton derives its name from a priory of nuns founded here in 1150. In the reign of Henry III. a weekly market was granted to the prioress. The population of the urban sanitary district (area 6021 acres) in 1871 was 7399, and in 1881 it was 8465.

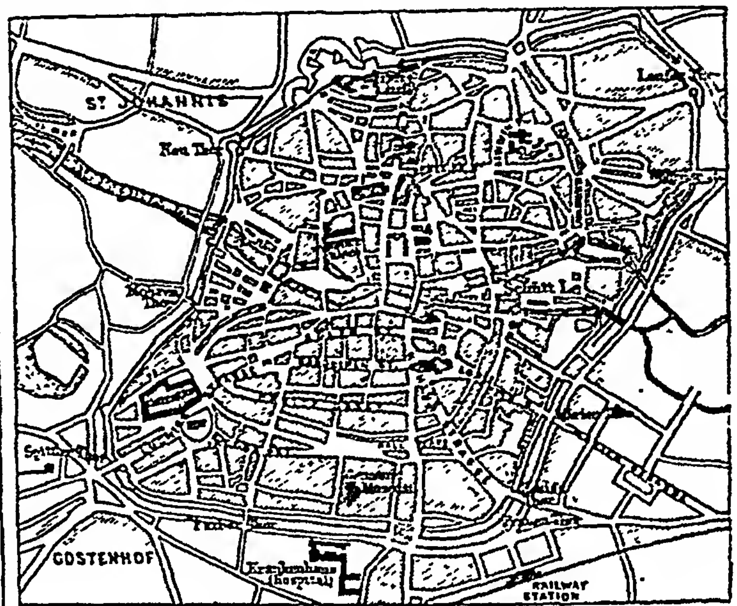
NUÑEZ or Nonius, Pedro, Portuguese cosmographer, was born at Alcacer do Sal in 1492, and died at Coimbra, where he was professor of mathematics, in 1577. He published several works, including a copiously-annotated translation of portions of Ptolemy (1537), and a treatise in two books, *De arte atque ratione navigandi* (1546). See Navigation.

NUÑEZ CABEZA DE VACA, Alvaro (*c.* 1490-1564), Spanish explorer, was the lieutenant of Pamfilo Narvaez (*supr.* p. 234) in the expedition which sailed from Spain in 1527; when Narvaez was lost in the Gulf of Mexico, Cabeza de Vaca succeeded in reaching the mainland somewhere to the west of the mouths of the Mississippi, and, striking inland with three companions, succeeded, after long wandering and incredible hardship, in reaching the Pacific coast in 1536. Returning to Spain in 1537, he was appointed "adelantado" or administrator of the province of Rio de la Plata in 1540. Sailing from Cadiz in the end of that year, after touching at Cananea (Brazil), he landed at the island of St Catharine in the end of March 1541. Leaving his ships to proceed to Buenos Ayres, he set out in November with about 150 men to find his way overland to Ascension (Asuncion) for the relief of his countrymen there. After an interesting journey through the country of the Guaranis, the little band reached their destination in the following year. After various successes in war and diplomacy, in his dealings with the Indians, Nuñez quarrelled with his countryman Domingo de Irala, whose jealousy he had excited, and the final result was that he was sent home under arrest in 1544, and banished to Africa by the council of the Indies. Eight years afterwards he was recalled, and appointed to a judgeship in Seville, where he died in 1564.

The *Naufragios* ("Shipwrecks") of Cabeza de Vaca, which relate to the Florida expedition and his journey through what is now New Mexico, appeared at Valladolid in 1544; the work has frequently been reprinted, and an annotated English translation was published by Buckingham Smith in 1851. His *Comentarios* chronicle the events of the South American expedition. Both works occur in Barcia's *Hist. Prim. d. l. Ind. Occ.*

NUREMBERG (in German, *Nürnberg*), the second town of Bavaria in size and the first in commercial importance, is situated in the district of Middle Franconia, in a sandy but well-cultivated plain, 95 miles to the north-west of Munich. It is divided by the small river Pegnitz into two parts, called respectively the Lorenzerseite and the Sebalderseite, after the two principal churches.

Formerly among the richest and most influential of the free imperial towns, Nuremberg is one of the few cities of Europe that have retained their mediæval aspect substantially unimpaired. It is still surrounded with its ancient feudal walls and moat, though of late several breaches have had to be made to meet the exigencies of modern traffic. Of the 365 towers which formerly strengthened the walls, nearly 100 are still *in situ*, and a few of the interesting old gateways have also been preserved. Most of the streets are narrow and crooked, and the majority of the houses have their gables turned towards the street. The general type of architecture is Gothic, but the rich details, which are lavished with especial freedom in the interior courts, are usually borrowed from the Renaissance. Most of the private dwellings date from the 16th century, and there are almost none of earlier date than the 15th century. A praiseworthy desire to maintain the quaint picturesqueness of the town has induced most of the builders of new houses to imitate the lofty peaked gables, oriel windows, and red-tiled roofs of the older dwellings; and it is easy for the visitor to Nuremberg to



Plan of Nuremberg.

1. Church of St Sebald. 3. Town House. 5. Museum.
2. Library. 4. Church of Our Lady. 6. Church of St Lawrence.

fancy himself carried back to the Middle Ages. Altogether it is difficult to conceive of a more piquant contrast than that afforded by the two chief towns of Bavaria—Munich, stamped with the brand-new impress of the 19th century, and Nuremberg, presenting a faithful picture of a well-to-do town of 300 years ago.

A good survey of this interesting town may be obtained from the old burg or castle, picturesquely perched on the top of a rock on the north side of the town. It is supposed to have been founded by the emperor Conrad II. about the year 1024, and dates in its present form mainly from the reign of Frederick Barbarossa (*c.* 1158). It was restored in careful harmony with its original appearance in 1854-56, and part of the interior is fitted up as a residence for the royal family. The two Late Romanesque chapels, one above the other, are interesting; the lower was the burial-place of the burggraves. Among the instruments of torture preserved in the castle is the famous "Iron Virgin" of Nuremberg. In the court is a linden tree said to be over 700 years old. The castle of Nuremberg was a favourite residence of the emperors of Germany, and the imperial regalia were kept here from 1424 to 1806.

Nuremberg contains numerous interesting churches, the finest of which are those of St Lawrence, St Sebald, and Our Lady, three Gothic edifices of the 13-15th centuries. All three are notable for their elaborately-carved doorways, in which free play has been given to the exuberant fancy of the Gothic style, and all three enshrine valuable treasures of art. In the church of St Lawrence, the largest of the three, is the masterpiece of the sculptor

Adam Krafft, consisting of a ciborium or receptacle for the host, in the form of a florid Gothic spire 65 feet high; the carving of this work is exquisitely minute and delicate. In front of the altar hangs a curious piece of wood-carving by Veit Stoss, representing the Salutation. The shrine of St Sebald, in the church of St Sebald, consisting of a bronze sarcophagus and canopy, in the richest Gothic style, adorned with numerous statues and reliefs, is looked upon as one of the greatest achievements of German art. It was executed by Peter Vischer, the celebrated artist in bronze, who was occupied on the work for thirteen years (1506-19) and has here shown himself no unworthy rival of Lorenzo Ghiberti. The church of Our Lady possesses some fine old stained glass windows and some paintings by Wohlgemuth. The Aegidienkirche, a building of last century, contains a good altarpiece by Van Dyck.

The town-house, an edifice in the Italian style, erected in 1616-19, contains frescos by Dürer and a curious stucco relief of a tournament held at Nuremberg in 1446. The new law courts, the hospitals, and the barracks are also imposing structures, but the most interesting secular buildings in the town are the houses of the old patrician families, already referred to. Among the most characteristic of these are the old residence of the counts of Nassau, and the houses of the Tucher, Funk, and Peller families. A special interest attaches to the dwellings of Albert Dürer, Hans Sachs, the cobbler-poet, and Johann Palm, the patriotic bookseller who was shot by order of Napoleon in 1806. Statues of Dürer, Sachs, and Melanchthon (the reputed founder of the grammar-school) have been erected; and the streets are further embellished with several fountains, the most noteworthy of which are the Schöne Brunnen, in the form of a large Gothic pyramid, adorned with statues (1385-96) and the Gänsemännchen or goose-mannikin, a clever little figure by Labenwolf. On the way to the cemetery of St John, which contains the graves of Dürer, Sachs, Behaim, and other Nuremberg worthies, are Krafft's Stations, seven pillars bearing stone reliefs of the Passion, and ranked among the finest works of the well-known sculptor.

The charitable, educational, scientific, and artistic institutions of Nuremberg are on a scale worthy of its ancient dignity. The Germanic National Museum, established in an old Carthusian monastery, has one of the most important historical collections in Germany. It includes a picture-gallery with works by Holbein, Dürer, Wohlgemuth, &c. The Bavarian Industrial Museum is also a very creditable institution. The municipal library contains about 800 manuscripts and 50,000 printed books, some of which are of great rarity.

Though not of so great relative importance as of yore, Nuremberg still occupies a high place among the industrial and commercial centres of Europe. The principal manufactures are lead pencils, colours, gold and silver wire, gold and silver foil, railway plant, tobacco, playing-cards, and lastly the "Dutch" toys and fancy articles in metal, carved wood, ivory, &c., which are collectively known as "Nuremberg wares." A great proportion of the toys exported from Nuremberg are really made by the peasants of Thuringia. The pencil manufactory of Faber, the railway works of the Nuremberg Company, and Zeltner's ultramarine factory are among the most important of their class in Europe. Large quantities of Nuremberg manufactures are sent to India and America, the exports to the United States alone being valued at £800,000 in 1882. Brewing, lithography, and map-publishing are also extensively carried on. Nuremberg is the chief market on the Continent for hops, and in 1882 the "turn over" in the trade in this article was £4,000,000. The bronze foundry established by Professor Burgschmiet, and now carried on by Professor Lenz, produces numerous admirable and important castings; and in the artistic handicrafts generally Nuremberg artisans are honourably distinguished. In addition to numerous railways, trade is facilitated by the Ludwig canal, connecting the Danube and the Main. The railway from Nuremberg to Fürth was the first in Germany. Nuremberg's money-market is also of some importance.

The population of Nuremberg at the height of its prosperity has been estimated at as high a figure as 150,000, but there seems good reason to believe that it did not exceed 40,000 to 50,000 souls. In 1818 it had sunk to 27,000, but since then it has steadily increased. At the census of 1880 the town contained 99,519 inhabitants, 76,886 of whom were Protestants, 19,143 Roman Catholics, and 3032 Jews. According to a local estimate the population had risen to 103,255 at the beginning of 1883. Several of the patrician families of Nuremberg can trace their descent in a direct line for four or five centuries, and still occupy the houses built by their forefathers. A few of them are said to possess very complete and interesting domestic archives.

History.—The first authentic mention of Nuremberg, which seems to have been called into existence by the foundation of the castle, occurs in a document of 1050; and about the same period it received from Henry III. permission to establish a mint, a market, and a custom-house. It is said to have been destroyed by the emperor Henry V. in 1105, but if this was the case the town must have been very speedily rebuilt, as in 1127 we find the emperor Lothair taking it from the duke of Swabia and assigning it to Henry the Proud, duke of Bavaria. We now first hear of an imperial officer styled the burggrave of Nuremberg, who, however, seems to have been merely the military governor of the castle, and to have exercised no sway over the citizens. This office came into the hands of the counts of Hohenzollern at the beginning of the 13th century, and "burggrave of Nuremberg" is still one of the titles of their descendant, the emperor of Germany. The government of the town was vested in the patrician families, who, contrary to the usual course of events in the free towns, succeeded in permanently excluding the civic guilds from all share of municipal power. Conrad III. (1138-1152) reunited Nuremberg to the empire, and for the next three or four centuries the town was specially favoured by the German monarchs, who frequently resided and held diets here. In 1219 Frederick II. conferred upon it the rights of a free imperial town, and in 1355 it witnessed the promulgation of the famous "Golden Bull" of Charles IV. At the beginning of the 15th century the burggraves of Nuremberg, who had in the meantime raised themselves to the rank of princes of the empire, were invested with the margraviate of Brandenburg, and sold the castle of Nuremberg to the town. They, however, reserved certain rights, which resulted in keenly-contested feuds between the burghers and the margraves Albert Achilles (1449), Frederick (1502), and Albert Alcibiades (1552).

The quarrel with the margraves, however, did not interfere with the growth of the town's prosperity, which reached its acme in the 16th century. Like Augsburg, Nuremberg attained great wealth as an intermediary between Italy and the East on the one hand, and northern Europe on the other. Its manufactures were so well known that it passed into a proverb—"Nuremberg's hand goes through every land." Its citizens lived in such luxury that Æneas Sylvius (Pope Pius II., 1405-1464) has left it on record that a simple burgher of Nuremberg was better lodged than the king of Scotland. The town had gradually extended its sway over a territory nearly 500 square miles in extent, and was able to furnish the emperor Maximilian with a contingent of 6000 troops. But perhaps the great glory of Nuremberg lies in its claim to be the principal font of German art. Its important architectural features have already been described. The love of its citizens for sculpture is abundantly manifest in the statues and carvings on their houses. Adam Krafft (c. 1455-1507), Veit Stoss (c. 1450-1532), and Peter Vischer (c. 1455-1529) form a trinity of sculptors of which any city might be proud. In painting Nuremberg is not less prominent, as the names of Wohlgemuth (1434-1519) and Albert Dürer (1471-1528) sufficiently indicate. In the decorative arts the Nuremberg handicraftsman attained great perfection in ministering to the luxurious tastes of the burghers, and a large proportion of the old German furniture, silver-plate, stoves, and the like, which we now admire in industrial museums, was made in Nuremberg workshops. Wenzel Jamnitzer (1508-1585), the worker in silver, is perhaps eminent enough to be added to the above list of artists. Its place in literary history—by no means an unimportant one—Nuremberg owes to Hans Sachs (1494-1576) and the other meistersänger. A final proof of the vigorous vitality of Nuremberg at this period may be found in the numerous inventions of its inhabitants, which include watches (at first called "Nuremberg eggs"), the air-gun, gun-locks, the terrestrial and celestial globes, the composition now called brass, and the art of wire-drawing.

Nuremberg was the first of the imperial towns to throw in its lot with the Reformation (in 1525), and it embraced Protestantism with its wonted vigour. Its name is associated with a peace concluded between Charles V. and the Protestants in 1532. The first blow to its prosperity was the discovery of the sea-route to India in 1497; and the second was inflicted by the Thirty Years' War, during which Gustavus Adolphus was besieged here in an entrenched camp by Wallenstein. During the eight or ten weeks that the blockade lasted no fewer than 10,000 inhabitants of Nuremberg are said to have died of want or disease. The downfall of the town was accelerated by the illiberal and short-sighted policy of

its patrician rulers; and the French Revolution reduced it to such a degree that in 1796 it offered itself and its territories to the king of Prussia on condition that he would pay its debts (9,000,000 gulden). Prussia, however, refused the offer. In 1803 Nuremberg was allowed to maintain its nominal position as a free city, but in 1806 it was annexed to Bavaria. During this century its progress has been one of uninterrupted prosperity, and it is now the chief commercial town in South Germany.

Authorities.—Priem, *Geschichte der Stadt Nürnberg* (1874); Daniel, *Handbuch der Geographie* (new ed., 1881); *Jahresbericht der Handels- und Gewerbekammer für Mittelfranken*, 1882; Schrag, *Neuester Wegweiser durch die Stadt Nürnberg* (11th ed., 1879). Various illustrated works on the artists and art-treasures of Nuremberg have been published by Schrag of Nuremberg. (J. F. M.)

NURSIA. See SABINES.

NUT. The term nut is applied to that class of fruit which consists generally of a single kernel enclosed in a hard shell. Botanically speaking, nuts are one-celled fruits with hardened pericarps, more or less enveloped in a cupule or cup, formed by the aggregation of the bracts. In commerce, however, the term has a wider application and embraces many fruits having hard woody indehiscent shells or coverings without reference to their enclosed seeds or kernels, besides leguminous pods, and even tuberous roots. A great number of nuts enter into commerce for various purposes, principally as articles of food or sources of oil, and for several ornamental and useful purposes. For the most part the edible nuts are very rich in oil, with only a small percentage of the other carbohydrates, starch, sugar, &c., and they also contain a large proportion of nitrogenous constituents. Thus possessing rich nutrient principles in a highly-concentrated form, nuts are by themselves rather difficult of digestion, and the liability of many of them to become rancid is also a source of danger and a hindrance to their free use. Oleaginous nuts used for food are likewise employed more or less as sources of oil, but on the other hand there are many oil-nuts of commercial importance not embraced in the list of edible nuts. The following is an alphabetical enumeration of the more important nuts, and of products passing under that name, used either as articles of food or as sources of oil:—

Name.	Source.	Locality.	Remarks.
Almond	*Amygdalus communis*, var. *B. dulcis*	S. Europe	Food, oil. See vol. i. p. [illegible]
Almond (bitter)	*Amygdalus communis*, var. *A. amara*	....	Oil. See vol. i. p. 633.
Arnut	Tubers of *Bunium flexuosum* and other species	Great Britain	Food.
Bambarra ground nut	*Voandzeia subterranea*	W. Africa	Food.
Ben nut	*Moringa pterygosperma*	E. Indies	Oil. See Oils.
Bitter nut	*Carya amara* (swamp hickory)	N. America	See Hickory, vol. xi. p. 790.
Brazil nut	*Bertholletia excelsa*	S. America	Food, oil. See vol. iv. p. 241.
Bread nut	*Brosimum Alicastrum*	W. Indies	Food.
Butter or Souari nut	*Caryocar nuciferum*	Guiana	Food.
Cahoun nut	*Attalea Cohune*	Honduras	Oil.
Candle nut	*Aleurites triloba*	S. Sea Islands	Oil. See Oils.
Cashew nut	*Anacardium occidentale*	W. Indies	Food, oil. See vol. v. p. 173.
Chestnut	*Castanea vesca*	S. Europe	Food. See vol. v. p. 605.
Cob, Filbert, or Hazel	*Corylus Avellana*	England, Spain	See Hazel, vol. xi. p. 545.
Cob nut of Jamaica	*Omphalea diandra*	W. Indies	Food.
Coco nut	*Cocos nucifera*	E. Indies	Food, oil. See vol. vi. p. 102.
Cola nut	*Cola acuminata*	W. Africa	Food.
Dika nut	*Irvingia Barteri*	W. Africa	Food, oil.
Gingko nut	*Salisburia adiantifolia*	Japan	Food, oil.
Ground nut	*Arachis hypogæa*	Tropics	See Ground Nut, vol. xi. p. 221.
Hickory nut	*Carya alba*	N. America	See Hickory, vol. xi. p. 790.
Hog nut	*Carya porcina*	N. America	Eaten by animals.
Mocker nut	*Carya tomentosa*	N. America	See Hickory, vol. xi. p. 790.
Moreton Bay chestnut	*Castanospermum australe*	Australia	Food.
Nutmeg	*Myristica moschata*	E. Indies	Spice. See Nutmeg.
Nutmeg (wild)	*Myristica fatua*, *M. tomentosa*, &c.	Tropics	Spice. See Nutmeg.
Olive nut	*Elæocarpus Ganitrus*, &c.	E. Indies	Food.
Palm nut	*Elæis guineensis*	W. Africa	Oil. See Palm.
Pecan nut	*Carya olivæformis*	N. America	Food, oil. See Hickory, vol. xi. p. 790.
Pekea nut	*Caryocar butyrosum*	Guiana	Food.
Physic nut	*Curcas purgans*	Tropical America	Oil. See Oils.
Pine nut	*Pinus Pinea*, &c.	Italy	Food.
Pistachio nut	*Pistacia vera*	Italy	Food.
Queensland nut	*Macadamia ternifolia*	Australia	Food.
Ravensara nut	*Agathophyllum aromaticum*	Madagascar	Spice.
Rush nut	*Cyperus esculentus*	S. Europe	Food.
Sapucaya nut	*Lecythis Ollaria*	Brazil	Food.
Tahiti chestnut	*Inocarpus edulis*	S. Sea Islands	Food.
Walnut	*Juglans regia*	Asia, Europe	Food, oil.
Water chestnut	Various species of *Trapa*	Kashmir, &c.	Food.

There remain to be enumerated a number of nuts of commercial value for turnery and ornamental purposes, for medicinal use, and for several miscellaneous applications in the arts. These include:—

Name.	Source.	Locality.	Remarks.
Betel nut	*Areca Catechu*	E. Indies	See vol. iii. p. 626.
Bladder nut	*Staphylea pinnata*	Cent. Europe	Necklaces.
Bomah nut	*Pycnocoma macrophylla*	Africa	Tanning.
Bonduc nut	*Guilandina Bonduc*	India	Medicine, beads.
Clearing nut	*Strychnos potatorum*	India	Clearing water.
Coquilla nut	*Attalea funifera*	Brazil	Turnery.
Corozo nut or vegetable ivory	*Phytelephas macrocarpa*	Brazil	See vol. xiii. p. 524.
Cumaru nut	*Dipterix odorata*	Brazil	Perfume.
Groo-groo nut	*Acrocomia sclerocarpa*	S. America	Beads.
Horse chestnut	*Æsculus Hippocastanum*	Europe	Starch. See vol. v. p. 6[illegible].
Marking nut	*Semecarpus Anacardium*	E. Indies	Marking ink and varnish.
Nut galls	*Quercus infectoria*	Levant	Dyeing and ink making. See Galls, vol. x. p. 45.
Poison nut	*Strychnos Nux-Vomica*	E. Indies	Medicine. See Nux Vomica.
Sassafras nut	*Nectandra Puchury*	S. America	Aromatic.
Snake nut	*Ophiocaryon paradoxum*	S. America	Curiosity.
Soap nut	*Sapindus Saponaria*	W. Indies	Washing; ornamental.

The application of the term nut to many of these products is purely arbitrary, and it is obvious that numerous other bodies not known commercially as nuts might with equal propriety be included in the list. Most of the nuts of real commercial importance are or will be separately noticed, and here further allusion is only made to a few which form current articles of commerce, not otherwise treated of.

The Bread nut of Jamaica is the fruit of a lofty tree, *Brosimum Alicastrum*. It is about an inch in diameter, and encloses a single seed, which, roasted or boiled, is a pleasant and nutritious article of food.

The Souari or Surahwa nut, called also the "Butter nut of Demerara," and by fruiterers the "Suwarrow nut," is the fruit of *Caryocar nuciferum* (*Rhizobolaceæ*), a native of the forests of Guiana, growing 80 feet in height. This is perhaps the finest of all the fruits called nuts. The kernel is large, soft, and even sweeter than the almond, which it somewhat resembles in taste. The few that are imported come from Demerara, and are about the size of an egg, somewhat kidney-shaped, of a rich reddish-brown colour, and covered with large rounded tubercles.

The Pekea nut, similar in appearance and properties, is the produce of *Caryocar butyrosum*, growing in the same regions of tropical America.

The Jamaica Cob nut is the produce of a euphorbiaceous tree, *Omphalea diandra*, the seeds of which resemble in taste the ordinary cob or hazel nut. The seed, however, contains a deleterious embryo, which must not be eaten.

Cola, Kola, or Goora nuts are the produce of *Cola acuminata* (*Sterculiaceæ*), a tree native of tropical Africa, now introduced into the West Indies and South America. The nuts form an important article of commerce throughout Central Africa, being used over a wide area as a kind of stimulant condiment. The nuts, of which there are numerous varieties, are found to contain a notable proportion of theine, as much as 2·13 per cent., besides theobromine and other important food-constituents, to which

circumstances, doubtless, their valuable properties are due.

Coquilla nuts, the large seeds of the palm, *Attalea funifera*, the piassaba of Brazil, are highly valued for turnery purposes. They have an elongated oval form, 3 to 4 inches in length, and being intensely hard they take a fine polish, displaying a richly-streaked brown colour.

The Marking nut, *Semecarpus Anacardium*, is a fruit closely allied in its source and properties to the CASHEW NUT (*q.v.*). The marking nut is a native of the East Indies, where the extremely acrid juice of the shell of the fruit in its unripe state is mixed with quicklime, and used as a marking-ink. The juice also possesses medicinal virtues as an external application, and when dry it is the basis of a valuable caulking material and black varnish. The seeds are edible, and the source of a useful oil.

Physic nuts are the produce of the euphorbiaceous tree, *Curcas purgans*, whence a valuable oil, having similar purgative properties to castor oil, is obtained. The plant is a native of South America; but is now found throughout all tropical countries.

Pine nuts are the seeds of several species of *Pinus*, eaten in the countries of their growth, and also serving to some extent as sources of oil. Of these the most important are the Stone Pine, *Pinus Pinea*, of Italy and the Mediterranean coasts, and the Russian Stone Pine, *Pinus Cembra*. The *Pinus Sabiniana* of California and *P. Gerardiana* of the Himalayas similarly yield edible seeds. These seeds possess a pleasant, slightly resinous flavour.

The Pistachio nut is the fruit of *Pistacia vera*, L. (*Anacardiaceæ*). It is a native of Syria. Although a remarkably delicious nut and much prized by the Greeks and other Eastern nations, it is not well known in Britain. It is not so large as a hazel nut, but is rather longer and much thinner, and the shell is covered with a somewhat wrinkled skin. The small nut of *Pistacia Lentiscus*, L., not larger than a cherry stone, is also occasionally imported from Smyrna, Constantinople, and Greece.

Ravensara nuts, the fruit of *Agathophyllum aromaticum* (*Lauraceæ*), a native of Madagascar, is used as a spice under the name of the Madagascar clove nutmeg.

The Sapucaya nut, a Brazilian fruit, is seen occasionally in fruit-shops. It is produced by a large tree, *Lecythis Ollaria*, or "Cannon-ball tree." Its specific name is taken from the large urn-shaped capsules, called "monkey-pots" by the inhabitants, which contain the nuts. The sapucaya nut has a sweet flavour, resembling the almond, and if better known would be highly appreciated. It is, however, scarce, as the monkeys and other wild animals are said to be particularly fond of it. This nut, which is of a rich amber-brown, is not unlike the Brazil nut, but it has a smooth shell furrowed with deep longitudinal wrinkles.

Soap nuts are the fruits of various species of *Sapindus*, especially *S. Saponaria*, natives of tropical regions. They are so called because their rind or outer covering contains a principle, saponine, which lathers in water, and so is useful in washing. The pods of *Acacia concinna*, a native of India, possess the same properties, and are also known as soap nuts. (J. PA.)

NUTATION. See ASTRONOMY, vol. ii. pp. 794-5.

NUTCRACKER, the name given by Edwards in 1758 (*Gleanings*, No. 240) to a bird which had hitherto borne no English appellation, though described in 1544 by Turner, who, meeting with it in the Rhætic Alps, where it was called "Nousbrecher" (*hodie* "Nussbrecher"), translated that term into Latin as *Nucifraga*. In 1555 Gesner figured it and conferred upon it another designation, *Caryocatactes*. It is the *Corvus caryocatactes* of Linnæus and the *Nucifraga caryocatactes* of modern ornithology. Willughby and Ray obtained it on the road from Vienna to Venice as they crossed what must have been the Sömmerring Pass, 26th September 1663. The first known to have occurred in Britain was, according to Pennant, shot at Mostyn in Flintshire, 5th October 1753, and about fifteen more examples have since been procured, and others seen, in the island. In further continuation of the particulars already given (CROW, vol. vi. p. 618), it may here be stated that a careful monograph of the species by the Ritter Victor von Tschusi-Schmidhoffen was printed at Dresden in 1874 with the title of *Der Tannenheher*, which is one of its many German names. Contrary to what was for many years believed, the nest of the Nutcracker seems to be invariably built on the bough of a tree, some 20 feet from the ground, and is a comparatively large structure of sticks, lined with grass. The eggs are of a very pale bluish-green, sometimes nearly spotless, but usually more or less freckled with pale olive or ash-colour. The chief food of the Nutcracker, though it at times searches for insects on the ground, appears to be the seeds of various conifers, which it extracts as it holds the cones in its foot, and it has been questioned whether the bird has the faculty of cracking nuts—properly so called—with its bill, though that can be used with much force and, at least in confinement, with no little ingenuity. The old supposition that the Nutcrackers had any affinity to the Woodpeckers (*Picidæ*) or were intermediate in position between them and the Crows (*Corvidæ*) is now known to be wholly erroneous, for they undoubtedly belong to the latter Family. (A. N.)

NUTHATCH, in older English NUTHACK, from its habit of hacking or chipping nuts, which it cleverly fixes, as though in a vice, in a chink or crevice of the bark of a tree, and then hammers them with the point of its bill till the shell is broken. This bird was long thought to be the *Sitta europæa* of Linnæus; but that is now admitted to be the northern form, with the lower parts white, and its buff-breasted representative in central, southern, and western Europe, including England, is known as *Sitta cæsia*. It is not found in Ireland, and in Scotland its appearance is merely accidental. Without being very plentiful anywhere, it is generally distributed in suitable localities throughout its range—those localities being such as afford it a sufficient supply of food, consisting during the greater part of the year of insects, which it diligently seeks on the boles and larger limbs of old trees; but in autumn and winter it feeds on nuts, beech-mast, the stones of yew-berries, and hard seeds. Being of a bold disposition, and the trees favouring its mode of life often growing near houses, it will become on slight encouragement familiar with men; and its neat attire of ash-grey and warm buff, together with its sprightly gestures, render it an attractive visitor. It generally makes its nest in a hollow branch, plastering up the opening with clay, leaving only a circular hole just large enough to afford entrance and exit; and the interior contains a bed of dry leaves or the filmy flakes of the inner bark of a fir or cedar, on which the eggs are laid. In the Levant occurs another species, *S. syriaca*, with somewhat different habits, as it haunts rocks rather than trees; and four or five representatives of the European arboreal species have their respective ranges from Asia Minor to the Himalayas and Northern China. North America possesses nearly as many; but, curiously enough, the geographical difference of coloration is just the reverse of what it is in Europe—the species with a deep rufous breast, *S. canadensis*, being that which has the most northern range, while the white-bellied *S. carolinensis*, with its western form, *S. aculeata*, inhabits more southern latitudes. The Ethiopian Region seems to have no representative of the group, unless it be the *Hypositta corallirostris* of Madagascar. *Callisitta* and *Dendrophila* are nearly allied

genera, inhabiting the Indian Region, and remarkable for their beautiful blue plumage; but some doubt may for the present be entertained as to the affinity of the Australian *Sittella*, with four or five species, found in one or another part of that continent, which doubt is increased by the late Mr Forbes's discovery (*Proc. Zool. Society*, 1882, pp. 569-571) that the genera *Acanthisitta* and *Xenicus*, peculiar to New Zealand, and hitherto generally placed in the Family *Sittidæ*, belong really to the Mesomyodian group and are therefore far removed from it. The unquestioned members of the *Sittidæ* seem to be intermediate between the *Paridæ* and the *Certhiidæ*, and some authors comprehend them in either one or the other of those groups. (A. N.)

NUTMEG. The spice known in commerce under this name is the kernel of the seed of *Myristica fragrans*, Houtt., a diœcious evergreen tree, about 50 to 60 feet high, found wild in the Banda Islands and a few of the neighbouring islands, extending to New Guinea but not to the Philippines. Nutmeg and mace are almost exclusively obtained from the Banda Islands, although the cultivation has been attempted with varying success in Singapore, Penang, Bengal, Réunion, Brazil, French Guiana, and the West Indies. The trees yield fruit in eight years after sowing the seed, reach their prime in twenty-five years, and bear for sixty years or longer. Almost the whole surface of the Banda Islands is planted with nutmeg trees, which thrive under the shade of the lofty *Canarium commune*. The light volcanic soil, shade, and excessive moisture of these islands, where it rains more or less during the whole year, seem exactly to suit the requirements of the nutmeg tree. In Bencoolen the tree bears all the year round, but the chief harvest takes place in the later months of the year, and a smaller one in April, May, and June. In the Banda Islands the fruits are collected in small neatly-made oval baskets at the end of a bamboo, which prevents bruising, the baskets being open for half their length on one side and furnished with a couple of small prongs projecting from the top, by which the fruit-stalk is broken, the fruit falling into the basket. The ripe fruit is about 2 inches in diameter, of a rounded pear-shape, and when mature splits into two halves, exposing a crimson arillus surrounding a single seed. When the fruit is collected the pericarp is first removed; then the arillus is carefully stripped off and dried, in which state it forms the mace of commerce. The seed consists of a thin hard testa or shell enclosing a kernel, which, when dried, is the nutmeg. To prepare the nutmegs for use, the seed enclosing the kernel is dried at a gentle heat in a drying-house over a smouldering fire for about two months, the seeds being turned every second or third day. When thoroughly dried the shells are broken with a wooden mallet or flat board and the nutmegs picked out

Flowers, Fruit, and Seed of Nutmeg.

and sorted, the smaller and inferior ones being reserved for the expression of the fixed oil which they contain, and which forms the so-called oil of mace.

The dried nutmegs are then rubbed over with dry sifted lime. The process of liming, which originated at the time when the Dutch held a monopoly of the trade, was commenced with the view of preventing the germination of the seeds, which were formerly immersed for three months in milk of lime for this purpose, and a preference is still manifested in some countries for nutmegs so prepared. It has, however, been shown that this treatment is by no means necessary, since exposure to the sun for a week destroys the vitality of the kernel. Nor is the dry liming process needful, for nutmegs keep well in their natural shell, in which form they are usually exported to China. The weight of the shells, however, adds one-third to the cost of freight, hence this plan is not generally adopted. Penang nutmegs are never limed. The entire fruit preserved in syrup is used as a sweetmeat in the Dutch East Indies.

"Oil of mace," or nutmeg butter, is a solid fatty substance of a reddish-brown colour, obtained by grinding the refuse nutmegs to a fine powder, enclosing it in bags and steaming it over large cauldrons for five or six hours, and then compressing it while still warm between powerful wedges, the brownish fluid which flows out being afterwards allowed to solidify. Nutmegs yield about one-fourth of their weight of this substance. It is partly dissolved by cold alcohol, the remainder being soluble in ether. The latter portion, about 10 per cent. of the weight of the nutmegs, consists chiefly of *myristin*, which is a compound of *myristic acid*, $C_{14}H_{28}O_2$, with glycerin. The fat which is soluble in alcohol appears to consist, according to Schmidt and Roemer (*Arch. Pharm.* [3], xxi. pp. 34-48), of free myristic and stearic acids; the brown colouring matter has not been satisfactorily investigated. Nutmeg butter yields on distillation with water a volatile oil to the extent of about 6 per cent., consisting almost entirely of a hydrocarbon called *myristicene*, $C_{10}H_{16}$, boiling at 165° C. It is accompanied by a small quantity of an oxygenated oil, *myristicol*, isomeric with carvol, but differing from it in not forming a crystalline compound with hydrosulphuric acid. Mace contains a similar volatile oil, *macene*, boiling at 160° C., which is said by Cloëz to differ from that of nutmegs in yielding a solid compound when treated with hydrochloric acid gas.

The annual imports of nutmegs to the United Kingdom amount to from 400,000 to 800,000 ℔, each ℔ consisting of about 110 fair-sized nutmegs, and of mace from 60,000 to 80,000 ℔ per annum. The former are valued at from three to five shillings per ℔, and mace at from one to three shillings per ℔.[1] Long, wild, or male nutmegs, the produce of *M. tomentosa* and *M. fatua*, are sometimes imported in small quantities. Several species of *Myristica* yield fatty oils, which form commercial products, but none of these are remarkable for fragrance.

The name nutmeg is also applied to other fruits or seeds in different countries. The Jamaica or calabash nutmeg is derived from *Monodora Myristica*, the Brazilian from *Cryptocarya moschata*, the Peruvian from *Laurelia sempervirens*, the New Holland or plume nutmeg from *Atherosperma moschata*, the Madagascar or clove nutmeg from *Agathophyllum aromaticum*, and the Californian or stinking nutmeg from *Torreya myristica*. The cotyledons of *Nectandra Puchury* were at one time offered in England as nutmegs.

Journ.* [1], xi. p. 516; Wallace, *Malay Archipelago*, i. p. 452, 1869; Bickmore, *Travels in E. Indian Archipelago*, 1868, p. 225; *Pharmacographia* (2d. ed.), p. 502; *Journ. Pharm. Soc.* [3], xiii. p. 304.

[1] This spice seems to be an especial favourite with the people of the United States, since the export to that country exceeds that to all Europe combined.

NUTRITION

By the term nutrition, employed in its widest sense, is understood the process, or rather the assemblage of processes, concerned in the maintenance and repair of the living body as a whole, or of its constituent parts or organs. The term has, however, usually been limited in systematic treatises on physiology to a study, mainly statistical, of the relations which exist between a living being and the medium which it inhabits, embracing a determination of the gains and losses of the organism under the different conditions to which it may be exposed. Such a statistical study has already been pursued in the article DIETETICS, and we shall therefore in the present article, restricting our attention to the animal kingdom, consider nutrition in the more general sense above referred to, including—(1) a study of the function of digestion; (2) a sketch of the processes concerned in the absorption of matter into the blood; (3) an account of the chemical processes which have their seat in the tissues and organs of the body; (4) an account of the processes whereby redundant matters, or such as are the products of waste, are removed from the animal economy; (5) a reference to the transformations of energy which are associated with the exchange of the matters of the body; (6) a brief reference to the processes of growth, decay, and death.

With the exception of the chemical processes concerned in respiration, which will be treated of at length under that head, this article will therefore include a short discussion of the chemical operations of the body generally, and particularly as they are exemplified in the case of man.

General Introductory Considerations.—There is no conception which we can form in reference to a living being, however rudimentary its structure, which is so general as the following:—a living animal, so long as it manifests those attributes which characterize it as living, is the seat of continual transformations of potential into kinetic energy. Such transformations are connected with oxidation of organic matters which, primarily derived from the vegetable kingdom, have been *assimilated*, *i.e.*, have been converted into the substance of the animal, and are effected through the agency of oxygen gas introduced into the body in the process of respiration. The act of living is an act of combustion in which the animal body actually burns, and the energy at the disposal of the body, and which is employed in raising its temperature or effecting the movements which are essential to its continued life, is energy which was potential in the organic constituents burned. The main products of the combustion of the body are carbonic acid and water, besides certain other less completely oxidized substances, which are the analogues of the sooty and tarry products of combustion in a furnace. Of these products some, as carbonic acid and a part of the water formed, are removed from the body almost as soon as they are formed, while others are thrown off at intervals.

It follows from what has been stated that the act of living necessarily implies not only transformation of energy but actual waste of the matter of the body, and that if an animal is continuously to manifest the phenomena of life it must be supplied with oxidizable organic matter to take the place of that which has been oxidized. Accordingly, animal life is impossible unless the creature, besides receiving continual supplies of oxygen gas, receives at intervals supplies of food. The food of an animal consists (1) of oxidizable organic matters which, although they may have been derived in part or wholly from some other animal body, have primarily been built up through the instrumentality of vegetable organisms,—these organic matters belong to a few well-defined groups; (2) of mineral matters, including large quantities of water, which form an important part of the substance of the body, and the presence in and passage of which through the organism is essential to the physical processes which have their seat in it.

In brief, the animal body is the seat of processes of disintegration associated with the manifestation of kinetic energy, and of processes of integration in which oxidizable matters take the place of the oxidized constituents. If life is to continue, in a sense, indefinitely it is essential that the processes of integration and disintegration should balance, *i.e.*, that the receipts of the body in assimilable oxidizable matter should balance the expenditure of the body both in matter and energy. There are, it will be observed, very close analogies between an animal and such a mechanism as a steam-engine, the energy at the disposal of both being primarily derived from the oxidation of combustible matters. Some of the most salient points of difference must, however, not be lost sight of. (1) The waste of the essential parts of such a machine as a steam-engine is insignificant, and bears no definite relation to the work done. The kinetic energy of the machine is primarily due to oxidation processes taking place in the furnace, and in no respect to changes in the substance of the machine. The animal, on the other hand, wastes continuously in all its parts and organs, and much of its energy is derived immediately from material which has become part and parcel of the various mechanisms. (2) Any substance capable of being rapidly oxidized (burned), and thus of generating heat, may be used as fuel for a steam-engine, provided its combustion admits of being conducted with safety in its furnace, whilst the substances which can form the food of animals belong to a limited number of groups, which include but a comparatively small number of bodies. The constituents of food have not only to supply energy to the body, but they must further be capable of prior conversion into the very substance of the animal body, into its very "flesh and blood."

Moreover, the constituents of food must be free from all traces of the peculiar substances which we term "poisons," and which by their presence have the power of impairing and arresting the action of various organs of the body.

I.—FUNCTION OF DIGESTION.

Hunger and Thirst.—These terms are used to express peculiar sensations which are produced by and give expression to general wants of the system, satisfied respectively by the ingestion of organic solids containing substances capable of acting as food, and by water or liquids and solids containing water.

Hunger is a peculiarly indefinite sensation of craving or want which is referred to the stomach, but with which is often combined, always indeed in its most pronounced stages, a general feeling of weakness or faintness. The earliest stages are unattended with suffering, and, leading the animal to wish and seek for food, are characterized as "appetite for food." Hunger is normally appeased by the introduction of solid or semi-solid nutriment into the stomach, and it is probable that the almost immediate alleviation of the sensation under these circumstances is in part due to a local influence, perhaps connected with a free secretion of gastric juice. Essentially, however, the sensation of hunger is a mere local expression of a general want, and this local expression ceases when the want is satisfied, even though only liquid and no solid food is introduced into the stomach, or even though no food be introduced into the stomach, the needs of the economy being satisfied by the introduction of food through other

channels, as, for example, when food which admits of being readily absorbed is injected into the large intestine.

Thirst is a peculiar sensation of dryness and heat localized in the tongue and throat. Although thirst may be artificially produced by drying, as by the passage of a current of air over the mucous membrane of the above parts, normally it depends upon an impoverishment of the system in water. And, when this impoverishment ceases, in whichever way this be effected, the sensation likewise ceases. The injection of water into the blood, the stomach, or the large intestine appeases thirst, though no fluid is brought in contact with the part to which the sensation is referred.

The sensations the causes of which we have briefly attempted to trace lead us, or when urgent compel us, to take food and drink into the mouth. Once in the mouth, the entrance to the alimentary canal, the food begins to undergo a series of processes, the object of which is to extract from it as much as possible of its nutritive constituents. It cannot be sufficiently emphasized that food in the alimentary canal is, strictly speaking, outside the confines of the body; as much so as the fly grasped in the leaves of the insectivorous *Dionea* is outside of the plant itself. The mechanical and chemical processes to which the food is subjected in the stomach and intestines are processes which have their seat and conditions outside the body which it is destined to nourish, though unquestionably the body is no passive agent, and innumerable glands have to come into action in order to supply the chemical agents which shall dissolve and render assimilable those constituents of the food which are capable of being absorbed into the organism, and of forming part and parcel of its substance.

Structure of the Organs of Digestion in Relation to their Function.—The processes to which the food is subjected, though manifold, are divisible into two great groups: (1) the food must be subjected to the action of certain juices which dissolve insoluble alimentary matters, and modify these no less than certain of the soluble alimentary substances; and (2) it must be mechanically mixed with those juices, and propelled more or less slowly from beginning to end of the alimentary canal. In accordance with this twofold function the alimentary canal is divisible into two distinct but intercalated anatomical tubes,—(1) an internal tube of mucous membrane, and (2), investing this closely, an external muscular tube.

The musculo-membranous double tube thus formed is not, indeed, regularly tubular throughout. At the beginning it forms the irregular cavity of the *mouth*, which contains the *tongue* and the masticatory *teeth*. Thence it passes through the *fauces* and beneath the pendulous *uvula* and *soft palate* into the *pharynx*. Afterwards it proceeds as a regular tube, the *œsophagus*, or gullet, until the level of the diaphragm is reached,—the muscular partition between the thorax and the abdomen. Having passed through this structure, the narrow tube of the œsophagus suddenly dilates at the cardiac orifice into the bag called the *stomach*, at the further or *pyloric orifice* of which the tube resumes its narrow uniform calibre, and forms successively the *duodenum*, the *jejunum*, and the *ileum*,—parts of the small intestine, of which, in man, the duodenum takes up twelve fingers' breadth, the ileum the lower three-fifths, and the jejunum the remainder of the total length of 20 feet. The small intestine diminishes somewhat in calibre from duodenum to ileum, and at the lower end of the latter opens suddenly into the much wider large intestine, which it joins, not at the extreme end, which is a cul-de-sac, the *caput cæcum coli*, but at a point a little lower down. The margins of the aperture by which the small opens into the large intestine point or project into the latter in such a manner that, while they readily permit the passage of matters from small to large intestine, any backward movement of the contents of the large intestine would have the effect of compressing the lips of the opening and closing it; this arrangement constitutes the so-called *ilio-cæcal valve*. Connected with the *caput cæcum coli* is a small diverticulum like a narrow glove finger, called the *vermiform appendage*. The first and greater part of the large intestine is known as the *colon*, the last as the *rectum*. The total length is from 5 to 6 feet. Its lower orifice is called the *anus*.

Both muscular and membranous (mucous) tubes are continuous from mouth to anus, and at these, the superior and inferior orifices, the mucous membrane which constitutes what we have hitherto termed the membranous tube is continuous with the skin which covers the general surface of the body. This mucous membrane is covered throughout at its free surface by an epithelium, and gives lodgment to glands, whose characters differ in different parts of the tube in accordance with the function of the part. Below the epithelium is a connective tissue analogous to the *cutis vera* of the skin, which in parts has the character of ordinary fibro-areolar tissue, but in all parts from the stomach downwards has the character of so-called adenoid connective tissue, as it is found in the follicles of lymphatic glands. Its meshes support a rich supply of fine blood-vessels, lymphatic vessels, and doubtless also of delicate nervous filaments. Besides these elements there are found numerous small bundles, or in parts even sheets, of involuntary muscular fibres, which probably give to the mucous membrane the power of limited self-contraction, of such a nature as to further the flux and reflux of fluids in the myriad lymphatic vessels of the part, and perhaps to influence in no small degree the outpouring of the secretion of certain of the glands. To the fairly continuous tract or sheet of involuntary muscle which lies at the base or deepest part of the mucous membrane or *mucosa* the term of *muscularis mucosæ* (*tunica*) is applied.

FIG. 1.—Divisions of the Alimentary Canal. M, mouth; Ph, pharynx; Œ, œsophagus; S, stomach; D, duodenum; J, jejunum; I, ileum; AV, appendix vermiformis; AC, ascending colon; HF, hepatic flexure; TC, transverse colon; SF, splenic flexure; DC, descending colon; *Sg*, sigmoid flexure; R, rectum; L, larynx; *e*, Eustachian tube; G, gall-bladder; H, hepatic duct; DC', common bile-duct; P, pancreatic duct. (From Turner's *Anatomy*, fig. 177.)

In addition to the glands which lie embedded in and open upon the surface of the mucous membrane of the alimentary canal, others of larger size and not in immediate relation with its walls communicate with the interior of the tube by ducts which open into it, and which pour into it their secretion; such glands are the salivary glands, the pancreas, and the liver.

The muscular tube in the greater part of its extent consists of two layers of involuntary, non-striated, pale, muscular fibres,—an inner layer whose fibres encircle the tube, and an outer one whose fibres run parallel to the long axis of the tube. But this is not the arrangement of every part. There is an apparent rather than a real exception in the stomach, where some layers of fibres of the circular coat course over the dilated walls of the alimentary tube in an oblique direction, giving rise to an oblique layer. In the œsophagus or gullet, besides the typical circular and longitudinal layers, there is at the upper part a second longitudinal layer which takes up a position internal to—that is, nearer the mucous membrane than—the circular layers. In the upper part of the gullet also the muscular fibres are not unstriped, but, although certainly involuntary, are striated like voluntary muscles.

In the mouth the muscular tube is most irregular and most defective, for the mucosa is in parts directly applied to the bony boundaries, as over the hard palate and gums; in another part it invests the muscular prominence of the tongue; whilst in other regions it lies upon the constrictors of the pharynx and the inner aspect of certain other muscles, as those of the cheeks, lips, and floor of the mouth. The membranous tube is united to the muscular tube by a loose layer of connective tissue containing many blood-vessels and lymphatic vessels and nerves for the supply of the mucosa; it is often called the *submucosa*.

The mucous membrane is the seat of various secreting glands, which lie embedded in its substance and open upon its surface,—simple or branched tubular recesses running through the depth of the layer, lined by epithelium, continuous with, though not always resembling, that of the surface, and opening at the surface by minute pores. In the mouth, pharynx, and œsophagus those form the *acinous* or *racemose* glands, which, according to certain subordinate features which they present, and also according to certain of the characters of the fluids which they secrete, are separated into mucous and serous glands. In the stomach they are represented

by the simple or branched tubular gastric glands. In the duodenum we find them as simple tubular deep sockets, the glands or *crypts of Lieberkühn*, and also as the compound acinous glands of Brunner, which dip below the level of the mucosa and lie in the submucosa. In the jejunum, ileum, and large intestine they appear again as the crypts or follicles of Lieberkühn.

The membranous tube is not everywhere exactly concentric and conterminous with the muscular tube. In the mouth and pharynx it is almost entirely so, but at the gullet the muscular tube so tightly encloses the membranous that the latter is forced into longitudinal plications to find room for itself. In the stomach the membranous layer is raised into ridges or *rugæ*, which intersect and give the surface a honeycomb-like aspect. In the upper part of the small intestine the membranous tube is raised into deep annular or, more correctly, crescentic folds, running across the direction of the gut like incomplete diaphragms, or a series of membranous ledges; these are the *valvulæ conniventes*. In the colon the two tubes are so disposed as to form a regular series of saccules or pouches, adding largely to the capacity of the gut. All these foldings greatly increase the superficies of the membranous tube. A further enlargement is effected in the small intestine in an exceedingly interesting fashion; the surface of the mucosa is thickly studded with innumerable fine short projections resembling the pile of velvet. These are invested by surface epithelium, and amongst them, at their foot, open the before-mentioned crypts of Lieberkühn. They are the so-called *villi*. Each contains a lymphatic vessel, blood-vessels, and involuntary muscular fibres, all supported by adenoid connective tissue like that of the mucosa below; the lymphatic is in the axis of the villus, the muscles form the next layer, and the blood-vessels lie immediately beneath the epithelium. When the muscular layer of the villus contracts it must of necessity compress the lymph-vessel, whilst causing no impediment to the flow of blood.

We have described the mucosa of the stomach and intestines as containing a framework of adenoid reticular tissue like the tissue of lymphatic follicles. It is, indeed, identical with this,—a network of branched cells with oval nuclei, the meshes of which are crowded with lymph-corpuscles with round nuclei. At certain points in the intestines the adenoid tissue of the mucosa presents local nodular enlargements; the mucosa at these points becomes so much thicker that it swells up at the free surface beneath the epithelium into rounded eminences about as large as millet-seeds or the heads of small pins; and at the under surface of the mucosa it dips into the submucous tissue in a similar manner. At the base of this nodule of adenoid tissue in the submucosa there is usually a network of wide, thin-walled, lymphatic vessels. Many of these rounded masses are scattered irregularly over the small and large intestines as the *solitary follicles* or *glands*, but at the lower end of the ileum they form little colonies, often covering an area an inch or more in length, situated at that part of the intestine which is remote from the attachment of the mesentery. They then constitute the so-called *Peyer's patches*.

Nodular adenoid masses are, however, not limited to the adenoid mucosa of the intestines. They are occasionally, though rarely, found in the stomach; they exist beneath the mucous membrane of the tongue, and a colony of them forms the mass of the tonsil on each side,—the almond-shaped body situated between the posterior and anterior pillars of the fauces.

The intrinsic nerves of the alimentary tube consist of two systems of nervous networks with ganglion-cells lying at the nodes; one is found in the submucous layer (*plexus of Meissner*), the other lies between the longitudinal and circular muscles (*plexus of Auerbach*, or *plexus myentericus*).

The whole of the intestines, and the stomach as well, are sustained in the abdominal cavity by sheets of delicate membrane, formed by folds of peritoneum, and called, in the case of the intestinal portion of the tube, the *mesentery*. Between the layers of the mesentery run the vessels and nerves for the supply of the bowel. In addition to blood-vessels there are numerous thin-walled lymphatic vessels called *lacteals*, which are fed by the rich network of lymphatic vessels of the mucosa and submucosa, and which run in the mesentery to the back of the abdominal cavity. Here they are collected into a large lymphatic reservoir, the *receptaculum chyli*, from which a duct, the *thoracic duct*, proceeds along the side of the vertebral column to open into the venous system at the junction of the subclavian and jugular veins on the left side of the neck. The lacteal and lymphatic vessels, whose course has been briefly sketched, are interrupted at many points by the presence of lymphatic glands. These may be simply regarded as labyrinthine systems of vessels into which the simple afferent lymphatic or lacteal vessels open, and each of which is surrounded and penetrated by adenoid connective tissue, like that of the intestinal mucosa. After a meal the lacteal vessels are filled with a milky fluid, the *chyle*. They were discovered by Aselli in the year 1626.

It must not be thought that the glands of the mucous membrane of the alimentary canal are alone engaged in the preparation of the solvent digestive fluids. Other organs there are lying away from the alimentary canal which pour their secretions into it by ducts at various points. In the neighbourhood of the mouth there are three pairs of *salivary glands*. The *parotid* glands lie outside the cheek over the lower jaw, just in front of the meatus of the ear. The ducts of this pair course along the cheeks and pierce them opposite the second upper molar tooth on each side; these are the two ducts of Stenson. A second pair of glands, the *submaxillary*, lies beneath the ramus of the lower jaw and beneath the floor of the mouth; their ducts run forward to open beneath the tongue; these are the ducts of Wharton. The third pair, the *sublingual*, lies on the floor of the mouth, beneath the mucous membrane anterior to the openings of the ducts of Wharton. The ducts of these glands are numerous and open by many apertures on the floor of the mouth, some opening into the ducts of Wharton. These constitute the ducts of Rivinus.

About three or four inches below the pylorus the ducts of two large glands open into the small intestine by a common orifice; these are the ducts of Wirsung, or *pancreatic ducts*, from the pancreas on the left, and the common bile-duct from the liver on the right.

FIG. 2.—Nutritive System of Dog. A, œsophagus or gullet; B, lungs; C, vena cava; D, liver; E, stomach; F, spleen; G, receptaculum chyli; H, pancreas; I, duodenum; J, entrance of biliary and hepatic ducts; K, jejunum; L, ileum; M, cæcum; N, colon; O, rectum; P, kidneys, with the supra-renal capsules above; R, urinary bladder; S, thoracic duct; 1, parotid gland; 2, salivary gland of neck; 3, submaxillary and other salivary glands; 4, jugular and subclavian veins; 5, situation of thymus and thyroid glands; 6, entrance of thoracic duct into left subclavian vein, near the jugular; 7, left auricle; 8, right auricle; 9, left ventricle; 10, right ventricle; 11, gall-bladder; 12, vena portæ; 13, mesenteric glands; 14, lymphatic vessels; 15, lacteal vessels; 16, branches of the portal vein; 17, ureters.

Movements of the Alimentary Canal.—When food is introduced into the mouth it is submitted to the operation of mastication. The incisors or cutting teeth divide it into portions of suitable size, which are thrust under the broad faces of the molar or grinding teeth by the alternate movements of tongue and cheeks. Softer portions of food are crushed between tongue and hard palate, especially such as are taken for their sapid properties to please the palate and increase the flow of saliva. Mastication consists of movements of the lower jaw upon the upper, viz., (1) vertical movements brought about by the temporal and the internal pterygoid and masseter muscles on the one hand, and by the digastric, mylo-hyoid, and other depressor muscles attached to the lower jaw on the other; (2) horizontal movements, forwards and backwards, effected by the external pterygoid muscles; when one of these muscles alone contracts, the forward movement of the chin is changed to a forward and lateral movement by the rotation of the jaw around the opposite condyle as a pivot; after being moved forward the jaw is retracted by the horizontal fibres of the temporal muscle; (3) grinding movements effected by a combination of the various muscles already mentioned.

That the tongue and cheeks are not frequently nipped between the teeth is an indication of the perfect co-ordination of a very complex series of movements. The controlling sensations are chiefly conveyed along the fibres of the fifth cranial nerve. The motor fibres of the same nerve supply the chief but not all the muscles of mastication.

After the food has been reduced to a proper consistency by the combined influence of the mechanical movements of the jaws, tongue, and cheeks, and the action of the saliva, it is rolled into a mass or bolus ready for swallowing. The bolus is pushed on the dorsum of the tongue, which is hollowed into a shallow trough to receive it. It is easy to conceive how this shape of the tongue is brought about when we consider that the tongue is provided with vertical fibres, with horizontal antero-posterior fibres, and

with horizontal lateral fibres, in addition to its extrinsic muscles. The tip of the tongue is then raised against the hard palate in such a manner as to form an angle in which the bolus lies. By the approximation of the tongue to the palate the angle is lessened and the bolus is, in consequence, driven backwards. This constitutes the first stage in the act of swallowing, and is a voluntary act. At the end of the first stage the morsel of food has passed beyond the level of the anterior pillars of the fauces. The acts of the second stage are very complicated, and probably are entirely involuntary. The posterior pillars of the fauces approach one another in the middle line, and the uvula falls into the space left between them. The fleshy curtain thus extemporized is then drawn up towards the hind wall of the pharynx, which is drawn a little forwards and upwards to meet it. Thus the passage into the nose is completely shut. Meanwhile the vocal cords of the larynx draw near to one another; the epiglottis is pushed backwards over the larynx, and the whole larynx is drawn suddenly upwards and forwards beneath the root of the tongue. In this manner the entrance into the respiratory passages is protected. Finally, the anterior pillars of the fauces are made to meet over the tongue in order to prevent the regurgitation of the food. There is but one way open to the bolus; the sudden drawing forward of the larynx and the base of the tongue in fact "cuts the ground" from under the ball of food, which thereupon falls into the grasp of the "constrictors" and enters upon the third and final stage in the act of deglutition. This, even more certainly than the second stage, is purely involuntary. The constrictors contract from above downwards and force the morsel of food into the upper portion of the œsophagus. Once in the gullet, the mass of food is driven downwards by the so-called "peristaltic" movements of the tube—the circular fibres contract one after another from above downwards, lessening the calibre of the tube in successive stages, whilst the longitudinal fibres seem to have the function of drawing the tube over the bolus as a stocking is drawn over the foot.

Deglutition is a reflex act, in so far as it is involuntary, the centre for which lies in the medulla oblongata; destruction of this centre implies incapacity to swallow. The centre, though normally under the influence of the higher centres, may, however, act quite independently of these, as is evidenced by the fact that animals in which the cerebral hemispheres were absent have occasionally survived for a short time, and have still been able to suck and swallow. Although the excised gullet often exhibits a true peristalsis, which doubtless depends upon a local nervous mechanism, the normal movements in the body seem to be regulated from the medulla oblongata.

At the entrance of the stomach the food meets the barrier opposed by the contracted cardiac orifice; the contraction must be overcome before the food can gain admittance. The relaxation is certainly an active process under the control of the medulla oblongata through the vagus nerve, since section of the vagi causes a block to the progress of food from the œsophagus into the stomach.

In the stomach the food is detained for a period which varies very greatly with its digestibility, but which in the human subject is not often longer than four or five hours. It is subjected to a rubbing and rolling action of the stomach-walls and a modified peristalsis, which causes the food to move slowly from the cardiac orifice along the greater curvature to the pylorus, whence it returns along the small curvature to the cardiac end again. The gastric movements are slight at first, but gradually increase in vigour. The pylorus is tightly closed at the beginning of a meal, but becomes more and more relaxed as digestion proceeds, so that, whilst at first only the finer parts of the gastric contents can pass, afterwards the coarser parts and even solid lumps of imperfectly-digested aliments are permitted to escape into the duodenum. We possess little accurate knowledge as to the nervous mechanism of the stomach. Are the movements caused immediately by the local nervous ganglia situated in its walls? Or does the impulse to move descend directly from the encephalic centre along the pneumogastric nerves? All that we know is (1) that movements of an excised stomach are induced with great difficulty, (2) that stimulation of the vagus will often cause movements of the stomach, and (3) that section of the vagi impedes the passage of food out of the stomach. The movements of the stomach have been said to cease altogether during sleep.

When the gastric contents, to which the term chyme is often applied, pass through the pylorus into the duodenum, they begin to move onward by the pure peristaltic action of the small intestines. The powerful annular fibres contract one after another, driving the food onward, as water may be squeezed along an india-rubber tube by the compression of the hand. The longitudinal fibres contract in such a manner that the intestine is drawn over the advancing mass. The movements always occur (in health at least) in a direction from the stomach to the ileo-cæcal valve; here they stop and never pass as a continuous wave to the large intestine.

Peristalsis may be exhibited by an excised intestine independently of any extrinsic nervous apparatus. Stimulation of the vagus nerve, as a rule, excites the intestinal movements, while excitation of the splanchnic nerves tends to still them. When the blood stagnates in the intestinal vessels active peristalsis ensues. As the splanchnic nerves are also the vaso-motor nerves of the intestines, excitation of them produces constriction of the blood-vessels and comparative bloodlessness.

After passing through the ileo-cæcal valve the intestinal contents, which have been very greatly diminished in amount owing to the process of absorption that has gone on, quickly assume the characteristic appearance of fæces. The undigested and insoluble parts of the food, mixed with mucus, with epithelial débris, and with some substances derived from the secretions of the alimentary canal, notably with some biliary products, must be cast out; this is effected by the act of defæcation. The anus is normally kept firmly closed by the contraction of two sphincter muscles,—the external, which is one of the skeletal muscles, and the internal, which is formed by a special development of the lowest rings of the circular layer of muscles of the intestine. In the act of defæcation these sphincters are relaxed, while the contraction of the rectum forces its contents downwards. The levatores ani are brought into play by the will and exert an action similar to that previously referred to as performed by the longitudinal fibres of the intestine. Of special influence in aiding the expulsion of the contents of the bowel is the contraction of the abdominal muscles which follows a preliminary fixation of the diaphragm by a deep inspiration.

The act of defæcation is essentially a reflex act. The centre which presides over the sphincters of the anus lies in the lumbar portion of the spinal cord. This centre is under the control of the brain, under the influence of which its activity is either increased or inhibited.

Vomiting, or the ejection of the contents of the stomach through the mouth, is an act of considerable complexity; (1) the cardiac orifice of the stomach is relaxed or, to be accurate, thrown open by the operation of some reflex nervous mechanism with which the vagus is connected; (2) contraction of the muscular coat of the stomach occurs; (3) the abdominal walls are powerfully compressed, and the diaphragm is at the same time strongly fixed by closure of the glottis. As concurrent phenomena in ordinary vomiting may be mentioned the sense of nausea and the free flow of saliva which occurs during and indeed before the act.

Vomiting may, within certain limits, be inhibited by taking a series of deep and rapid inspirations at a time when the sense of nausea is becoming unbearable.

True vomiting seems to be impossible without the aid of the abdominal muscles, as, for example, when the abdomen is laid open. In such conditions emetics cause active opening of the cardiac orifice and movements of the stomach-walls, but not the full and free expulsion of the contents. Vomiting is usually a reflex act, the centre for which lies in the medulla oblongata near the centre for respiration, though it is reasonable to suppose that it may occur not only as a reflex act but as a result of direct stimulation of the centre or centres associated with it.

Secretions of the Alimentary Canal.—Production of the Alimentary Juices.—We have described the movements of the alimentary tube by which the food is triturated and agitated, and finally propelled from mouth to anus. One object of these movements is to mix together the food and certain solvent juices which are poured upon the food at various points. We have now to give an account of these juices and their properties. They are produced in, or by the agency of, the epithelium cells lining the interior of glands which are either situated in the walls of the alimentary canal or which empty their secretion into it. Though these cells derive the materials necessary to their metabolic activity from the blood, the substances which they elaborate and which are characteristic of the secretions that they help to form are not found in the blood, but are products of the activity of the protoplasm of the cells themselves. The act of secretion is a function of the living cell, and not a mere act of filtration or diffusion through the vascular walls to the cell-substance. It often involves the elaboration of entirely new substances. The act of secretion is, or may be, under the control of the nervous system; it may be started, inhibited, and the products of the secretion may be variously modified, by the stimulation of distant nerves. In some glands certainly, and possibly in all, the elaboration of the specific secretion of the gland takes place in two well-defined stages, and the two stages are indicated by differences in the anatomical appearances of the gland-cells.

The characteristic constituents of the several juices which are specially concerned in the chemical changes of the alimentary canal are certain so-called "unorganized" ferments, which we shall, following the suggestion of Kühne, denominate *enzymes*. Like all ferments, these are capable, under suitable circumstances, of initiating specific changes in certain bodies with which they are brought into contact, changes which may be incommensurably great when contrasted with the magnitude of the mass of the ferment engaged. "Unorganized" or, as they have also been called, "unformed" ferments differ, however, from the "organized" or "formed" in that, whilst they are the products of the activity of living cells, when once formed they cease to be living, are unconnected with any organized form, and have no power of reproduction or increase.

The enzymes for the most part exert their action unimpaired in the presence of certain bodies which kill the great majority of organized ferments; thus salicylic acid does not hinder peptic and tryptic digestion, whilst it prevents the putrefactive changes which are very apt to occur in the latter case, and which are connected with the development of organized ferments. Certain enzymes, as the diastatic ferment of saliva and pancreatic juice, are, however, destroyed by salicylic acid.

As will be shown in detail in the sequel, the secreting cells of glands which produce enzymes exhibit marked differences corresponding to different states of activity. In the case of the secreting cells of the pancreas the cells appear to produce and store up for a time a body, a *zymogen*, from which subsequently the tryptic enzyme *trypsin* is set free. The progress of research may perhaps establish the existence of zymogens corresponding to the other enzymes.

Usually the glandular organs which produce the alimentary juices contain stored up within them their characteristic enzymes, which may be extracted by digesting the comminuted organ in water, or still better in glycerin, which dissolves them nearly all, and furnishes solutions which preserve their activity long unimpaired. Enzymes are all insoluble in strong alcohol, so that the tissues from which they are to be extracted may be first dehydrated by digestion in absolute alcohol and afterwards extracted with glycerin. Solutions of enzymes are rendered inactive by boiling or by exposure to a temperature above 70° C. The principal enzymes of the alimentary canal belong either to the group of *proteolytic* or to that of *diastatic* or amylolytic ferments: the enzymes of the first group (pepsin and trypsin) dissolve proteids and effect their more or less perfect decomposition; the enzymes of the second class (as ptyalin and the diastatic ferment of the pancreas) dissolve starch and produce from it a series of bodies which will be discussed in reference to the action of saliva on starch.

Besides the proteolytic and amylolytic ferments, there occur in the alimentary canal a *curdling* ferment, an *inverting* ferment, and perhaps a *fat-decomposing* ferment.

All enzymes exert a more energetic action at a moderately high than at a low temperature, though the influence of a rise in temperature is more marked in some cases than in others. The reaction of the medium in which they are placed influences remarkably the activity of certain enzymes; thus pepsin, the proteolytic ferment of the stomach, is inactive in neutral or alkaline solutions, the presence of a free acid being essential to its activity, whilst trypsin, the proteolytic ferment of the pancreas, acts with feebleness in solutions which are neutral or faintly acid, since it needs for the full exercise of its powers a decidedly alkaline medium. The enzymes appear to possess the power of rapidly inducing, at the temperature of the animal body, in bodies subjected to them similar chemical operations to those which can be brought about with great slowness by prolonged heating with dilute mineral acids, or by the prolonged action of boiling water or superheated steam. These operations are of the nature of *hydrolytic* decompositions, that is to say, such as are connected with the union of the elements of water with the decomposing body.

Salivary Glands and Secretion of Saliva.—There are no secreting glands in the body which have been subjected to so elaborate a study as the salivary glands, whether we consider their structure or the circumstances which influence or accompany the act of secretion. We shall therefore give the results of researches on these glands at much greater length than those referring to the other glands concerned in the preparation of the alimentary juices.

As has been already said, the saliva is secreted by several glands of which the ducts pour their secretion into the cavity of the mouth, where it is mingled and constitutes the "mixed saliva." The chief of these glands are the parotid, the submaxillary, and the sublingual glands, though their secretion is mixed with that of small glands (mucous and serous) scattered through the mucous membrane of the mouth and tongue, which are included under the term "buccal" glands.

The salivary glands all belong to the group of acinous or compound racemose glands. According to the researches of Heidenhain, they may, however, be divided into two groups, which he has denominated serous or albuminous and mucous glands, according to the structure of the cells of their acini, their chemical characters, and the nature of the secretion which they elaborate.

To the group of serous glands belong the parotid of man and the majority of animals, the submaxillary gland of the rabbit, and some of the glands of the tongue; to that of mucous glands belong the submaxillary and sublingual glands in most animals, some of the glands of the tongue, and the œsophageal glands. Glands belonging to the former of these classes secrete a fluid containing some, though it may be only a small quantity, of a proteid coagulable by heat, and resembling, if not identical with, serum-albumin; the mucous glands, on the other hand, as their name implies, secrete a liquid free from albumin, but containing more or less mucin.

In the serous glands the epithelium lining the acini is composed of comparatively small, rounded, or polygonal cells, of which the outlines are not very distinct until acted upon by certain reagents. No cell-wall is present; the protoplasm, which is not coloured by carmine, presents many dark granules, and surrounds an irregularly saccular or rounded nucleus which is coloured by carmine.

In the mucous glands the characteristic (mucous) cells of the alveoli are large and clear, very faintly granular, with a rounded or oval nucleus near their periphery surrounded by a trace of protoplasm. They possess a cell-wall, and a strongly refracting process which springs from the cell in the neighbourhood of the nucleus.

In addition to the characteristic mucous cells there are found in the alveoli of most mucous salivary glands when examined in a state of rest, situated at some parts of the periphery, *i.e.*, lying more internal than, or nearer to, the membrana propria than the mucous cells, half-moon-shaped aggregations of small cells, possessed of a round nucleus easily stained with carmine, and containing albumin; to these aggregations the term of *demilunes* or *lunulæ* of *Giannuzzi* has been applied. In some cases we find alveoli in which these small cells are not arranged in demilunes, but form a row of cells lying external to the mucous cells, and completely encircling them (see fig. 3).

As has been said, in certain mucous glands the mucous cells are supplemented by the cells of the demilunes, though there are other mucous glands, as those of the tongue, where the typical mucous cells alone occur. There are glands, and the submaxillary of man is an example, which are termed mixed glands, inasmuch as some of the acini have all the characters of serous, others of mucous glands. The submaxillary gland of the guinea-pig possesses, according to Klein, a structure undistinguishable from that of the pancreas.

We shall not enter, in this place, into a detailed description of the innervation of any one of the salivary glands, but shall confine ourselves to the following statements.

Each salivary gland is supplied by at least three classes of fibres, viz., secretory, vaso-constrictor, and vaso-dilator fibres, of which the first and the third are conveyed to the glands in branches of cerebral nerves; these are, the chorda tympani for the submaxillary and sublingual, and the auriculo-temporal (which, however, derives them through communications with the otic ganglion from the glosso-pharyngeal nerve) for the parotid. The second class, the vaso-constrictor or vaso-motor fibres, run in sympathetic trunks. When, therefore, one of the cranial branches supplying a gland is stimulated there occur two acts, viz., secretion and simultaneous dilatation of blood-vessels; that these two acts are not absolutely interdependent is proved by the fact that certain drugs paralyse the one set of fibres, but leave the other intact. When, on the other hand, the sympathetic filaments supplying the gland are stimulated, the blood-vessels of the gland contract, and there is produced a small quantity of saliva differing in physical characters and chemical composition from that obtained under the circumstances first referred to. According to Heidenhain, however, in each of the two kinds of nerves supplying a salivary gland there exist, besides the vascular nerve-fibres, secretory and trophic fibres, though the number of one or other of these classes may be insignificant,—the secretory predominating in the cranial nerve branches, the trophic in the sympathetic. Stimulation of secretory fibres leads, according to Heidenhain, to an

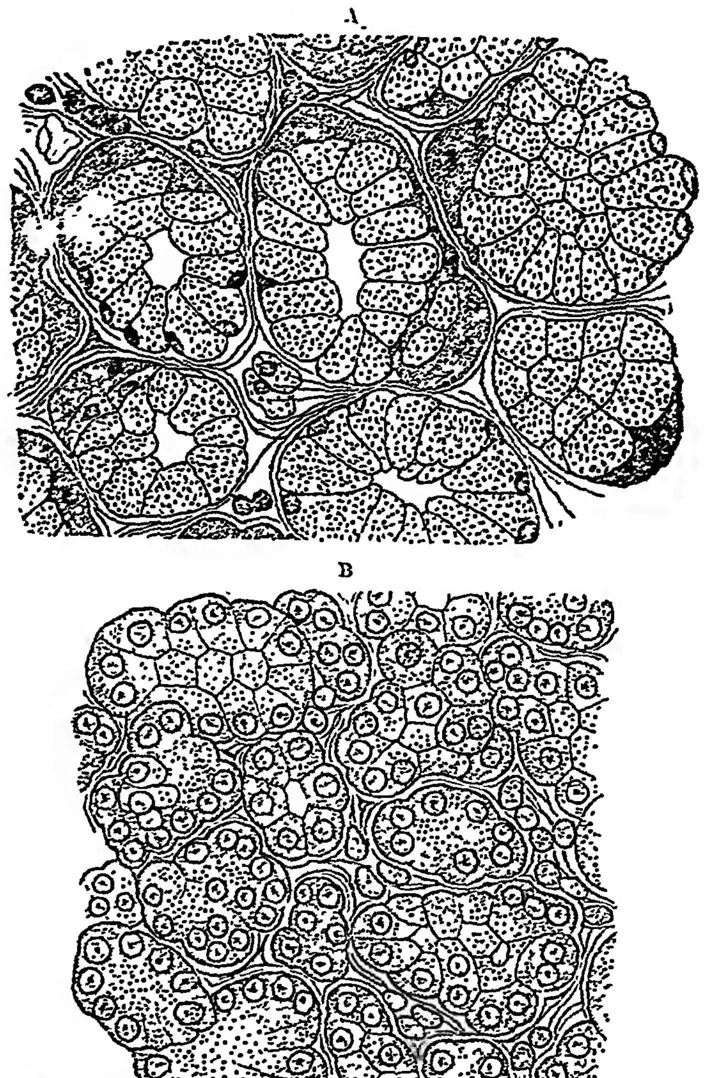


FIG. 3.—Sections of a Mucous Gland of the Dog. A, during rest; B, after activity. (From Quain's *Anatomy*, fig. 505.)

increased flow of water, stimulation of the trophic to an increased secretion of specific substances and to an increased production of protoplasm.

When a salivary gland passes from the state of rest into that of activity it is at once the seat of an increased blood flow, which is associated with the dilatation of the blood-vessels of the organ. Under these circumstances, the blood leaving the gland presents a florid arterial colour, instead of the venous colour which characterizes the blood of the organ when at rest. This vascular dilatation is explained by the coming into action of the before-mentioned vaso-dilator fibres; it is independent of the act of secretion.

As was shown in a now classical investigation of Ludwig, when the salivary glands are thrown into activity there is a rise in temperature, so that the temperature of the saliva leaving the submaxillary gland may exceed by 1°·5 C. that of the blood flowing to the gland. This rise in temperature cannot be explained by a study of the chemical characters of the salivary secretion, but is doubtless the result of the increased metabolic changes which necessarily accompany the act of secretion in the gland-cells, and which chiefly affect their protoplasm.

That the secretion of saliva (and indeed secretion in general) is not a mere act of filtration was proved by Carl Ludwig when he showed that saliva can be secreted

by a gland though the pressure within it is many times higher than that of the blood circulating through the arteries which supply it. On many grounds it may be positively asserted that the secreting cells are the primary agents in the withdrawal from the blood of the water necessary for the secretion, though the exact nature of the process is yet unknown; similarly, on the grounds stated below, we know that within the protoplasm of the gland-cells are formed the characteristic soluble constituents of the secretion.

The researches made during the last few years by Heidenhain, and fully confirmed by a large number of observers, have demonstrated that in the salivary glands, as indeed in all secreting glands, structural and perfectly obvious microscopic changes occur, which stand in close relation to the different conditions of functional activity.

The resting gland-cell is large, but possesses comparatively little protoplasm, and therefore comparatively little matter which can be stained by colouring bodies, especially by carmine; it contains instead a store of material which has been elaborated in, or at the expense of, the protoplasm. This material does not constitute the specific matter of the secretion, but is its antecedent. That it differs chemically in the case of the mucous glands is proved by the fact cited by Heidenhain, and discovered by Watney and Klein, viz., that, whilst mucin is stained by hæmatoxylin, its antecedent (mucigen) is not affected by that colouring matter; in all other respects the two bodies are identical. When, however, a gland passes into a state of activity, as, for example, by the irritation of its so-called secretory (trophic?) nerves, the gland-cells undergo the following changes, which may proceed simultaneously though not necessarily so:—the stored-up matter previously referred to is converted into soluble constituents of the secretion, and at the same time there occurs a growth of the protoplasm of the cells, at the expense doubtless of the richer supply of lymph which during the secretory act bathes the gland.

The period of activity in so far as the gland-cell is concerned is indeed a period of removal of ready-made constituents of secretion, in some cases, as in the mucus-bearing cells of the mucous glands, a period of destruction of cells laden with such constituents; but at the same time in all cases a period in which the protoplasmic constituents of the cells generally increase, and active proliferation of secreting cells occurs.

Whilst we have in a few sentences sketched the general characters of the changes which glands undergo during secretion, our picture is wanting in all details, and the reader is referred for further information to works on histology and physiology.

Glands of the Stomach and Secretion of Gastric Juice.—In vol. vii. p. 225 a brief description has been given of two kinds of glands which are found embedded in the mucous membrane of the stomach, and which are concerned in the preparation of the secretion of this organ, the so-called *gastric juice.* The first kind of glands, the "mucous glands of the stomach," so called from their having been formerly erroneously supposed to be engaged in the secretion of mucus only, are situated chiefly at the pyloric end (figs. 4, 5) of the stomach. The second kind, the so-called "peptic glands," owe their name to the view that they alone secreted the digestive gastric juice, and are found in most animals in the mucous membrane of other parts of the stomach than the pylorus. The pyloric glands are tubular glands, simple or compound, composed of a basement membrane lined by two kinds of epithelium-cells, (1) cylindrical epithelium-cells confined to the neck of the gland, (2) cylindrical or cubical epithelium-cells lining the part of the tube below the neck, and which, though not very different in form from the cells of the neck, possess an *entirely different function.* The peptic glands of the older writers, now usually called "glands of the fundus," present three varieties of epithelium-cells. Their "neck" is lined by cylindrical epithelium similar to that of the neck of the pyloric glands. The deeper part of the glands is lined by small cubical "central" cells, below which and interposed between them and the basement membrane is a discontinuous layer of large ovoid "border" cells, the so-called "peptic cells" of older writers.

During active digestion the cubical cells of both pyloric glands and glands of

FIG. 5.—Cardiac Gland, from the Dog's stomach (Klein and Noble Smith) Highly magnified. *b*, base or fundus of a tubule; *d*, duct or mouth of gland, *c*, central cells; *p*, parietal cells. (From Quain's *Anatomy*, fig 517.)

the fundus become swollen and granular; after a period of rest they return to their original size and assume a comparatively clear appearance. The ovoid cells also swell during digestion, but in other respects remain unchanged.

When the stomach is inactive, *i.e.*, in the fasting condition, its mucous membrane is pale and the organ contains no fluid; the mucous membrane in the pyloric region presents an alkaline reaction. When, however, food enters the stomach, or the mucous membrane is subjected to mechanical stimulation, an acid juice, the so-called gastric juice, is poured out, the act of secretion being accompanied by a reddening of the mucous membrane.

Evidence appears to be most conclusive in support of the view that the three kinds of epithelium-cells found in the stomach and its glands possess entirely separate functions. The epithelium-cells which line the interior of the stomach, and which, like those of the neck of both kinds of glands, are cylindrical in shape, appear to be mucus-forming cells. The cubical cells which are found in the deeper parts of the pyloric glands appear functionally to be identical with the central cells of the glands of the fundus, both being engaged in forming the chief ferment of the gastric juice, viz., pepsin, whilst the ovoid cells of the glands of the fundus are the sole elaborators of the acid of the gastric juice. The glands which possess these

acid-forming cells have of late been termed (Langley) oxyntic glands (ὀξύνειν, to render acid).

No accurate estimate can be formed of the amount of gastric juice secreted during twenty-four hours. It has been calculated to be between 20 and 30 pints.

Secretion of the gastric juice may occur after all the nerves going to the stomach have been divided, though it is for a time arrested after division of the pneumogastric nerves. It is probable that the process of gastric digestion is essentially under the control of an intrinsic nervous mechanism situated in the mucous membrane, though this is normally influenced by the higher nerve centres.

Liver and Secretion of Bile.—The structure of the liver has already been sufficiently described (vol. vii. p. 229 *sq.*), and need not be further alluded to in this place. The secretion of the liver, the bile, is being continually formed, though not always at the same rate. In animals possessed of a gall-bladder it is stored in the intervals of digestion in this reservoir. When food is taken into the stomach the bile begins to be secreted in larger quantities, the maximum being reached about six hours after the meal. As the so-called acid "chyme," to be afterwards referred to, passes the opening of the bile-duct in the duodenum, it is probable that a stream of bile is poured upon it by the reflex contraction of the gall-bladder. During the time when bile is being secreted much heat is evolved in the liver. The bile, as will be shown in the sequel, should be looked upon as a liquid containing only certain, for the most part useless, by-products resulting from great chemical operations going on in the liver. Little is known as yet of the exact changes which occur in the liver-cells during activity, nor of the manner in which the nervous system influences the secretion of bile.

Pancreas and the Secretion of Pancreatic Juice.—The pancreas possesses a structure which presents great resemblance to that of serous salivary glands, and its alkaline secretion was until lately looked upon as closely resembling the saliva.

The secreting cells of the pancreas, which differ but little microscopically from those of such a salivary gland as the parotid, exhibit very marked differences, which correspond to different states of functional activity. During a period of glandular repose the cells contain innumerable granules, which are congregated at that side of the cell which lies towards the centre of the acini (fig. 6, B). The outer or peripheral portion of the cells—the smaller part of the resting cell—is clear. After a period of glandular activity the granular half of each cell is found to have diminished greatly (fig. 6, A); the whole cell is clear and distinctly smaller than before, and its behaviour towards colouring matters is very different. The pancreas, when perfectly fresh and just removed from the yet warm body of an animal which is killed, does not contain, ready formed, all ferments which will in the sequel be referred to as characterizing the pancreatic juice. If we treat the gland, for instance, with glycerin, which possesses the power of extracting and dissolving all the ferments, we fail to obtain a solution which possesses the power of digesting proteids: but, instead, we find a substance in the solution from which, by the addition of a little acetic acid, the proteolytic ferment may be formed.

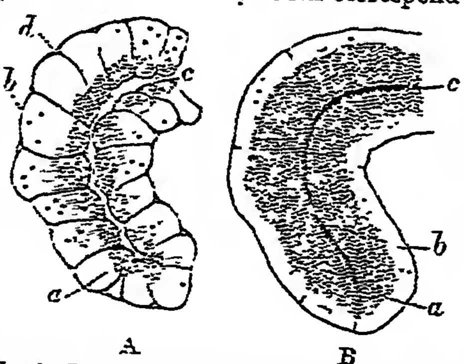

Fig. 6.—Pancreas of Rabbit. A. during rest; B. in activity. a, inner granular zone; b, outer transparent zone; c, lumen; d, indentation at junction of two cells. (From Foster's *Physiology*, fig. 43.)

The cells of the pancreas thus elaborate a substance which is the antecedent of the proteolytic ferment, and which yields it when it passes into the pancreatic ducts; it is customary to speak of this body as *zymogen* or ferment-former, because it gives rise to one of the chief enzymes or ferments of the juice. The secretion of pancreatic fluid is slight except during digestion. After the taking of a full meal the secretion is suddenly exalted, reaching its maximum two or three hours afterwards. The secretion then diminishes until a period which extends from the fifth to the seventh hours, when a rise occurs, which lasts to between the ninth and eleventh hours after food. The secretion then gradually sinks, until it absolutely ceases. Stimulation of the gastric mucous membrane starts the secretion of pancreatic juice; it is arrested during nausea and vomiting, as also when the central end of the divided pneumogastric is stimulated.

Intestinal Glands and their Secretion.—The mucous membrane of both the small and the large intestine contains embedded in its substance innumerable simple tubular glands, the so-called crypts or glands of Lieberkühn, which are lined by a single layer of cylindrical epithelium continuous with and resembling that covering the exposed surface of the intestine. Very little is known as to the function of these glands, whose office is probably widely different in different sections of the intestinal tube, particularly in the large as distinguished from the small intestine. We do know that the epithelium-cells of these glands are capable of forming mucus, and that in the small intestine they are doubtless the source whence is derived the so-called intestinal juice or "succus entericus" which is poured into the intestine in large quantities under particular circumstances, as, for instance, when all the nerves supplying the gut are divided.

Physical and Chemical Properties of the Several Alimentary Juices.

The mixed saliva of man is, when perfectly fresh, a clear, transparent, viscid liquid, which, on microscopic examination, is found to contain cells of squamous epithelium derived from the mouth, besides certain globular cells derived from the salivary glands and called "salivary corpuscles." Its reaction is alkaline; it has a specific gravity of about 1·003, and contains about five or six parts per thousand of solid matters. Its solid constituents consist (1) of certain saline matters transuded from the blood and, in addition, of a small quantity of a soluble *sulphocyanide*, detected by the reddish tinge caused by the addition of solution of ferric chloride to the saliva; (2) small quantities of *soluble proteids*, coagulable by heat; (3) *mucin*, to which saliva owes its viscidity, and which is thrown down when the liquid is acidulated with acetic acid; (4) a ferment or enzyme called *ptyalin*, *salivary diastase*, or *the diastatic ferment of saliva*. The last-mentioned is the most important constituent. It possesses the power of rapidly rendering cooked starch soluble, though its action on raw starch is but very slight. Not only does it dissolve starch, but it progressively decomposes the complex starch molecules into isomeric bodies of less complexity. Starch has a chemical composition which may be represented by the empirical formula $(C_{12}H_{10}O_{10})_n$, the exact value of n being yet a matter of doubt. The salivary diastase, under suitable conditions, as has been said, first converts insoluble into soluble starch (hence it is sometimes termed an amylolytic ferment) which, it has been surmised, probably has the composition $(C_{12}H_{10}O_{10})_{10}$. This soluble starch, like the insoluble body, gives a beautiful blue colour with iodine. By the further action of the ferment the soluble starch yields a series of dextrins which are isomeric with starch, though they possess smaller molecular weights and differ-

ent reactions, and at the same time a sugar which, from its identity with that which is produced in the process of malting of barley, is called "maltose," and which, though possessing many of the reactions of grape-sugar, is an isomer of cane-sugar: when crystallized it has the composition $C_{12}H_{22}O_{11} + H_2O$.

The changes which are brought about by the action of the salivary ferment on the starchy constituents of food are hastened by a temperature near that of the mammalian body. Boiling destroys the diastatic power, as also does the presence of strong acids or alkalies. A very feeble acid reaction does not absolutely stop the characteristic action.

Whilst the saliva of man and some few animals possesses the remarkable diastatic ferment just referred to, this is absent from the saliva of the majority of animals, so that we are forced to conclude that the saliva is an alimentary juice which subserves mechanical rather than essential chemical functions.

Gastric Juice.—This is a thin colourless or straw-coloured liquid of strongly acid reaction, and of a mawkish taste. Its specific gravity varies between 1·001 and 1·010, and it contains from $\frac{1}{2}$ to 1 per cent. of solid matters.

The gastric juice contains (1) free hydrochloric acid, (2) certain mineral matters, and (3) a ferment or enzyme called pepsin. It has been much disputed whether the gastric juice contains the hydrochloric acid in a free condition, but the question may be considered to have been settled in the affirmative by many facts, amongst which one of the most striking is that the gastric juice behaves towards certain organic colouring matters as only liquids do which contain free mineral acids. The pepsin, which has never been separated in a pure condition, is soluble in water, weak spirit, and glycerin, and confers upon all these solvents its characteristic property, viz., that of dissolving, in the presence of a dilute free acid, and at a suitable temperature, insoluble proteids, and of converting these into soluble and diffusible modifications termed peptones. Peptones differ from other albuminous or proteid bodies in their greater diffusibility, as well as in their much higher solubility in pure water. They are not coagulated by heat or by nitric acid, and are not thrown down by many mineral salts which precipitate other soluble proteids.

Gelatin under the same conditions is converted into an ungelatinizable modification, the so-called gelatin-peptone. Boiling destroys the activity of solutions of pepsin. If their reaction ceases to be acid, and, further, if the acid reaction be not due to a free acid, no action is exerted upon proteids. A temperature approximately the same as that of the mammalian body is that most favourable to gastric digestion. The accumulation of the products of gastric digestion, viz., peptones, hinders the continued activity of the juice. Pepsin, though probably containing nitrogen, is not a proteid body.

In addition to pepsin the gastric juice contains an entirely independent ferment which is called the "curdling ferment" or the "rennet ferment," because of its power of rapidly inducing at the temperature of the body the coagulation of the casein of milk, which it converts into cheese. Unlike pepsin, this ferment will act in solutions which contain no trace of free acid.

The following table (Hermann) shows the average composition of the gastric juice of man, the dog, and the sheep.

	Man.	Dog.		Sheep.
Water	994·4	973·1	971·2	986·1
Hydrochloric acid	0·2	3·3	2·4	1·2
Organic constituents (pepsin, &c.)	3 2	17·1	17·3	4 1
Mineral matters	2·2	6·5	9·1	8·6

Bile.—Bile is a bitter liquid of golden-red colour in man and carnivorous animals, but green in herbivorous animals. It is commonly viscid owing to admixture with mucus derived from the walls of the gall-bladder and hepatic ducts. Its reaction is neutral or faintly alkaline. It contains about 14 per cent. of solid constituents. (1) It includes the sodium salts of certain so-called bile-acids, which in man are glycocholic and taurocholic acids. The former has the formula $C_{26}H_{43}NO_6$, and is readily decomposed into glycin, $C_2H_5NO_2$, and an acid termed cholic acid, $C_{24}H_{40}O_5$; the latter has the formula $C_{26}H_{45}NSO_7$, and can be split up into a base called taurin, $C_2H_7NSO_3$, and into cholic acid. (2) It contains bile-colouring matters, of which the chief is a red one termed bilirubin, $C_{16}H_{18}N_2O_3$, with which is closely connected the green colouring matter of the bile of herbivores, termed biliviridin, $C_{16}H_{18}N_2O_4$, bilirubin is unquestionably derived from the decomposition of the blood-colouring matter or hæmoglobin. (3) It has fats, and a body called cholesterin, which belongs to the class of alcohols and has the composition $C_{26}H_{44}O + H_2O$. (4) It includes saline matters which are rich in sodium salts. Whilst the bile-acids and the bile-colouring matters are formed in the liver itself, the cholesterin of the bile is probably derived entirely from the blood, which obtains it from the nervous organs, in the white matter of which it is abundantly present.

The proportion of the constituents of the bile present in this liquid is shown by the following analyses.

Composition of Human Bile.

	(1)	(2)
Water	860·0	822·7
Sodium glycocholate and taurocholate	102·0	107·9
Mucin and colouring matters	26 6	22·1
Cholesterin	1 6	47·3
Fatty matters and lecithin	3·2	
Mineral matters	6·5	10 8

The amount of bile secreted by man has been estimated at from about 136 grains to about 309 grains per kilogramme (2·20 lb) of body-weight; but in certain cases, through abnormal circumstances, the total amount of bile secreted in twenty-four hours has been found to be less than this, viz., to vary between about 16 and 21 oz.

The action of the bile in digestion, it must be admitted, seems trifling and out of proportion to the size of the gland and the amount of the secretion. It is a weak solvent for fats; it has the power of emulsifying fats, especially, perhaps, when added to the pancreatic juice, and it may help the passage of fat through animal membranes. At least it is certain that, when filter-paper is wetted with bile, oils filter through it more readily than when it is wetted with water. The most important use of the bile is, however, as an adjuvant to pancreatic digestion. The pancreatic juice, as will be stated more particularly below, contains a ferment which is either a proteid body or inseparably connected with a proteid body. Strangely, though this ferment possesses the power of dissolving proteids under suitable circumstances, in the presence of pepsin and any free acid it is itself destroyed. It would then be acted upon by the pepsin passing into the duodenum from the stomach if the conditions were favourable. To prevent this untoward accident the alkaline bile is poured over the acid contents of the stomach as they pass the duodenum; these are neutralized, and a precipitate is thrown down which mechanically entangles the pepsin that may be in the mixture. Although the definable uses of the bile are small, the part which it plays in the economy is of essential importance. Animals whose bile is allowed to escape externally soon grow lean and ill-conditioned. The

fat which should be absorbed in the alimentary canal remains in part in the fæces, which acquire a peculiar putrescent odour.

Pancreatic Juice.—If we except the gastric juice, the chemical action exerted by the pancreatic juice is the most potent and useful of any of the digestive secretions.

When freshly secreted and perfectly normal, the pancreatic juice is a clear viscid liquid of strongly alkaline reaction and highly coagulable by heat. Its solid constituents may reach the proportion of 10 per cent.

It contains (1) water, (2) various albuminous bodies which cause the liquid to be coagulable by heat, and of which one is intimately connected, or indeed perhaps identical, with the ferment trypsin, (3) a number of ferments, (4) traces of products of digestion, as leucin and tyrosin, (5) salts. The ferments of the pancreatic juice are the following:—(1) a proteolytic ferment termed trypsin, (2) a diastatic ferment, (3) a ferment which acts on fats, (4) a curdling ferment (?).

The first-named ferment, unlike pepsin, which is quite inactive under this condition, acts most energetically in solutions which contain a free alkali or an alkaline carbonate, although it possesses some action when the reaction is neutral or even faintly acid. Like pepsin, trypsin dissolves insoluble proteids and converts them into peptones; it possesses, however, an activity which surpasses that of pepsin, inasmuch as it splits up certain of the peptones formed into simpler bodies, such as leucin, $C_6H_{13}NO_2$, and tyrosin, $C_9H_{11}NO_3$, the former of which is an organic body allied to the fatty acid group, and the latter to the aromatic group. According to the views of Kühne, the molecule of an albuminous or proteid body is capable of being broken up under the influences of such ferments as pepsin and trypsin into the allied bodies of smaller molecular weight, the peptones, which, though possessing general and common reactions, may by their behaviour towards certain chemical agents as well as towards ferments be subdivided into two groups, a *hemi*-group and an *anti*-group. Kühne believes that both pepsin and trypsin decompose the proteids with the production of so-called *hemi-peptones* and *anti-peptones*, and that, whilst neither pepsin nor trypsin can further decompose anti-peptones, trypsin possesses the power of splitting up hemi-peptones into simpler bodies.

The amylolytic or diastatic ferment of the pancreatic juice resembles that of the saliva in its action. Whilst the saliva of most animals contains no such ferment, the pancreatic juice of all animals is very *rich in diastatic* ferment, so that the action of the pancreatic juice on starch is much greater than that of saliva.

The fat-decomposing ferment—sometimes, though erroneously, called the "emulsifying ferment"—of the pancreas is present in exceedingly small quantity and is very readily destroyed, so that its existence has sometimes, though erroneously, been denied. It breaks up the neutral fats in part into their respective fatty acids and glycerin. This slight acidification unquestionably facilitates the formation of an emulsion of the remaining fats.

All these ferments are influenced by temperature in nearly the same manner as the ferments of saliva and gastric juice. Boiling destroys them absolutely, cold retards their activity, the body temperature is very favourable to them. The most suitable medium for them is the alkaline juice in which they occur, and the alkalinity of which is due to sodium carbonate.

The following is an analysis of the pancreatic juice of the dog:—

Water (in 1000 parts)	900·8
Solids	99·2
Organic matters	90·4
Inorganic matters	8·8

Intestinal Juice.—This juice, which is also called not unfrequently by its Latin name *succus entericus*, is a thin, yellowish, alkaline, albuminous liquid of specific gravity 1·01, concerning which we possess very little certain information. It has been said to act upon fibrin alone of the albuminous bodies; it not only contains a small quantity of a diastatic ferment but probably also a so-called inverting ferment, possessing the power of converting cane-sugar into grape-sugar.

Fate of Food-Stuffs in the Alimentary Canal.—The food which is introduced into the mouth is an exceedingly complex substance. Leaving out of account those substances which are insoluble and incapable of absorption, and which are also not amenable to the influences of the digestive juices, we may classify the true food-stuffs as follows.

(1) *Albuminous matters*, including (*a*) the true *proteids*, such as albumen of egg, casein of milk, myosin of muscle, fibrin of blood, &c., and (*b*) the *albuminoid bodies*, such as gelatin from tendons and bones, chondrin from cartilages, and elastin from various elastic structures: (2) *hydrocarbons* or *fats*, of which those chiefly used for food are stearin, olein, and palmitin: (3) *carbohydrates*; (4) the various *inorganic salts*: (5) *water*. The third group includes the *amyloids* or starch-like bodies, the *saccharoses* like cane-sugar, the *glucoses* like the grape-sugar and fruit-sugar found in honey and in ripe fruits, the sugar of milk, &c. In addition to these may be mentioned allied bodies, cellulose, pectin, arabin, mucilage, &c., which in some animals, or in some conditions, are certainly digestible. In a subdivision of the same group we may place the various vegetable acids, lactic, acetic, citric, malic, &c., which are essentially foods.

It may be premised that the fate which befalls a given example of ingested food does not depend solely upon the theoretical power of the digestive juices to act upon it. Thus digestible food may be imperfectly digested owing to being passed into the stomach in lumps and masses, which the juices cannot permeate and the stomach cannot crush; or starch may be so incorporated and encapsuled with fat that the saliva and even the pancreatic juice may fail to reach it; or digestion from one cause or another may be so prolonged that fermentative changes, to which most samples of food are inevitably liable from containing organized ferments or "germs," may have time to begin and to alter materially the sequence of events. Hence we shall feel no surprise that much food escapes altogether the action of digestion. The most perfect and economical feeding is that in which the least quantity of food is passed through the alimentary canal unchanged. When, however, the just quantity is taken, and the digestive organs are sound, the following is the order of the changes which occur.

Food placed in the mouth at once excites the flow of mixed saliva and mucus. Solid food is broken up, rubbed together with the juices of the mouth and entangled air-bubbles, and rolled into a slimy bolus. Soluble constituents of it thus have an opportunity of becoming dissolved at once; sugar, dextrin, vegetable acids, and many inorganic salts would, in part at least, pass into solution in the mixed saliva. The process of mastication, besides triturating the food and mixing it with the alkaline saliva, permits it to become raised nearly to the body-temperature, in which condition the dextrin and the starches readily fall a prey to the ptyalin, and begin to be converted into dextrins and maltose. This change is very rapidly effected —it begins instantly if the starch is already boiled; so that, unless the food is "bolted," a considerable quantity of soluble dextrin and sugar is formed before the bolus is swallowed. The act of deglutition passes the softened bolus into the stomach, where already a certain quantity of acid gastric juice is ready to receive it. The presence of food in the stomach is a greater stimulus to the gastric flow than its presence in the mouth: the juice is more rapidly secreted, but still it is comparatively poor in pepsin

and still more so in free acid; but after a time, as more food is added, and as the first-coming food begins to be dissolved and absorbed, the proportion of pepsin is increased. The movements of the stomach mix intimately the acid juice and the alkaline food: the first effect of this is a neutralization of the mass, but, as the secretion of juice goes on for some time after the last portion of an ordinary meal has been swallowed, the mass becomes more and more acid. The amylolytic action of the swallowed saliva is gradually checked, and the still unchanged starch remains unchanged so long as it lingers in the stomach.

Such saline and other dissolved matters as are still soluble in slightly acid solutions remain dissolved, and, with the water which is swallowed, may pass at once into the blood-vessels by absorption. Other salts, as the carbonates and phosphates of the alkaline earths, become dissolved in the presence of an acid. The gelatigenous tissues—connective tissue holding together in its meshes fibres of muscle, globules of fat, strands of nerve, &c.—are dissolved. The skins or pellicles of the fat-vesicles suffer the same fate. The elastic sarcolemma is now thought to be similarly affected. As a consequence the proteid and fatty portions of the organs referred to escape and fall into smaller fragments. Muscular fibres readily split into fibrillæ and disks, and are then in the very best physical condition for the free play of the gastric juice. The fat escapes, flows together to form larger globules, but is otherwise unchanged. Cane-sugar, which is of no use to the organism until it is converted into maltose or glucose, finds in some slight degree the condition for this conversion in the combined action of the gastric juice and the gastric mucus, although we are still in great doubt as to where the greatest conversion takes place. The all-important change which the food undergoes in the stomach is, however, the change of its proteid element into the more diffusible form of peptones, about which it will be enough to say that it is not a mere solution of proteid in a dilute acid, although this may be the first step in the operation, but probably a decomposition of the original proteid molecule. The obvious effect of gastric digestion is to reduce the food to a grey pulpy mass called chyme, in which condition it passes into the duodenum along with more refractory or less perfectly digested portions of food such as may still remain in the stomach at the end of the normal period of gastric digestion.

The presence of food in the stomach, as has been remarked, is of itself a stimulus to the secretion of bile and pancreatic fluid; by the time, therefore, that the chyme passes into the duodenum, a considerable quantity of the fresh juices is prepared for it. Not only so; the contact of the acid chyme with the duodenal membrane at once brings on a reflex contraction of the ducts and gall-bladder of the liver, by which a sharp stream of alkaline fluid is at once poured out, wherewith the chyme is drenched. So far as the mixture is made perfect and the point of neutralization is reached, a precipitate of parapeptones and peptones is formed, carrying down with it the active pepsin. But the acidity of the chyme is not at once overcome; not until the middle of the small intestine is reached does the acid reaction entirely disappear; and we may therefore assume that a kind of exotic gastric digestion may go on in the parts of chyme which still remain acid. But whenever the reaction ceases to be strongly acid the pancreatic juice takes up the work of digestion. Proteids are changed into soluble peptones, and the conversion of starch into dextrin and maltose begins again with redoubled vigour. Fats are seized upon, resolved into glycerin and their fatty acids, and emulsified both by bile and by pancreatic fluid. The resulting fatty acids combine with the alkalies of the mass to form soaps, which in turn aid the process of emulsification. The chyme, which, from being grey, became of a golden-orange colour when saturated with bile, acquires a decidedly cream-like appearance from the emulsion that is formed.

It is still an interesting question whether pancreatic proteolysis ever, in health, goes beyond the formation of peptones, as it may certainly do in artificial digestion in the laboratory. Some leucin and tyrosin undoubtedly appear in the small intestine; but, inasmuch as they are bodies which, if formed, would be rapidly absorbed, it is impossible to say whether any considerable amount of proteid matter suffers this fate, or whether leucin and tyrosin are formed, as it were, accidentally, from the too long staying of an excess of proteid in the alimentary canal. Leucin and tyrosin are never found in the fæces.

As the remnant of food passes down the intestine, changes allied to putrefaction invariably occur. Lactic acid is always to be detected in the small intestine, and the amount of it increases as the ileo-cæcal valve is approached. Possibly the butyric acid fermentation likewise occurs as a constant, if not an essential, phenomenon of intestinal digestion. At least the gases of the small intestine always contain a small amount of hydrogen; but if we are to gauge the butyric acid fermentation by the amount of hydrogen detected, we must assume it to be of very small proportions. We are so ignorant of the nature of the enteric or intestinal juice that we need not here speculate as to the changes in the remnant of food which the addition of it may bring about. Let it suffice to say that the intestinal contents pass through the ileo-cæcal valve with none of the odour and little of the appearance of fæcal matter. While in the large intestine they become reduced in bulk, and approach a solid consistency by the abstraction of water from them. Their reaction becomes distinctly acid once more; but now, from inward processes of putrefaction and fermentation which were started already in the small intestine, putrefactive gases may arise, light carburetted hydrogen, carbonic acid, sulphuretted hydrogen, nitrogen, and hydrogen. The fæces themselves are commonly acid; besides the indigestible parts of food, such as horny matter and cellulose (the denser sorts at least), and the undigested but digestible overplus of starch, proteid, &c., they contain derivatives from the bile which cause the characteristic colour, and some final decomposition products of elements of food, such as indol.

II.—Absorption of Nutritive Matters into the Blood.

The complex processes of digestion result in the conversion of insoluble and indiffusible food-stuffs into soluble and diffusible sugars and peptones. These, with the soluble saline matters, the finely-divided or emulsified fats and water, are (if we except the small quantity of soaps formed in the course of pancreatic digestion, and the small amount of soluble leucin and tyrosin evolved in the same process) the only contents of the alimentary canal capable of entering the organism from the outer world. They are not indeed the only soluble and absorbable bodies in the intestine; a large part of the digestive juices themselves are reabsorbed, and may possibly do duty over again in their respective secretions. But these are not foods. How, it may now be asked, do these soluble or finely-divided substances pass the confines of the body? From what has already been said about the organs of digestion it will be evident that, from the stomach downwards, the alimentary cavity is separated from an infinite number of thin-walled vessels by a delicate layer of columnar epithelium and a filmy basement membrane. There seems at first sight to be no difficulty in understanding how water and dissolved and diffusible matters may pass these barriers with the greatest readiness by physical processes of diffusion which

are so simply imitated in the laboratory. We know also that, in fact, solutions do with the greatest ease and rapidity pass through such a membrane as the conjunctiva, by the readiness with which the pupil may be dilated on putting a drop of atropinized fluid beneath the eyelid. But it is by no means clear that the process is so simple in the living intestine. A fresh specimen of epithelium scraped from the interior of the mouth of a pig may be bathed in a solution of colouring matter and yet admit no trace of the colour into the substance of its cells so long as they remain alive. It is only when they cease to be living protoplasm that the physical processes of diffusion come into play and that the cell-substance takes up the colour. Guided by this simple observation we shall hesitate to assume, because we have water containing soluble sugars, salts, and peptones on one side of the epithelium of the alimentary tract, while on the other we have fluids differently constituted, that therefore we must needs have a process of transfusion tending to the passage of the dissolved substances from one side to the other. This "absorption" of matters, even simple saline solutions, at the surface of the intestine may be, and most probably is, a vital operation. Be the nature of the process what it may, it is easy to conceive how fluids at least arrive at the interior of the blood and the lymph capillaries of the alimentary mucous membranes. The case of the particles of emulsified fat presents more difficulty; but even here there are only two possibilities open to us. Either the fine globules pass *through* the columnar cells, or they pass *between* them; if they pass through them they must traverse the thick striated inelastic end of the cells in a manner which it is somewhat difficult for us to picture; if they only pass between the cells it is difficult to explain why so many of the acutest observers have described the occurrence of fat-particles within the epithelial cells of recent preparations of intestinal mucous membranes.

Once through the epithelial layer the absorbed matters pass into the blood-vessels or the lymphatics in some way the details of which are as yet mere matters of speculation. The axial lymphatic vessels of the villi—the so-called lacteal radicles—have a special interest, since villi are pre-eminently the absorbent rootlets of the body. As soon as they become filled, the layer of muscular fibres investing them contracts and empties the contents of the lacteal towards the deeper vessels of the mucosa. The subsequent expansion of the radicle will evidently favour the refilling of it.

It is very disputable where absorption takes place. The filtrate obtained from the contents of the stomach yields very little peptones, the inference being that much has already become absorbed by the gastric capillaries, hæmic or lymphatic. There seems to be no reason why water, salines, and dissolved sugars should not also be taken up at the same place. In the large intestine water at least is absorbed, for the contents become drier as they pass along the bowel. But it is the small intestine chiefly which is the scene of most extensive absorption of digested products; here fats are demonstrably taken into the organism; and here, doubtless, more than elsewhere, peptones, sugars, and other soluble bodies suffer the same fate.

Blood-vessels and lymph-vessels are both sharers of the work, though to what extent each is employed is a matter of surmise rather than of observation. The lacteals certainly absorb the largest part of the fat, though, as the relative amount of fat in the portal vein increases after a meal, fat must also be absorbed by the blood-capillaries. The material absorbed into the portal vein is at once submitted to the smaller circulation of the liver and the activity of the liver-cells; that absorbed into the lacteals traverses many lymphatic glands before it reaches the thoracic duct and the general circulation at the root of the neck. Thus in both ways of absorption the raw material is immediately passed into certain organs before it reaches the common stock of blood. That changes are effected in the constitution of the just-received food-stuffs during their stay in these organs there is every reason to believe; for, on the one hand, the blood issuing from the liver in the hepatic veins differs from the blood entering it by the portal vein; and, on the other, the contents of the thoracic duct differ from the contents of vessels nearer the absorbent radicles, as, for example, the contents of the mesenteric lacteals. The nature of these changes must be discussed in the next section.

III.—Chemical Processes in the Tissues and Organs of the Body.

While it is probable that the liver modifies the recently-digested raw material of food before it reaches the common stock of the blood, it is quite unknown what (or, indeed, if any) difference exists between the action of the liver on blood laden with raw material immediately after a meal and its action on blood traversing its capillaries during a fast. Does the liver exert an action on recently-imported fat, peptones, and sugar in any sense different from the action it exerts on fatty, albuminous, and sugary matters as they exist in the common stock of blood? Or—which is the same question—do the fats, albuminous matters, and sugars of the portal blood differ at all from the fats, albuminous matters, and sugars of ordinary blood? While this question remains unanswered it will be well to consider the liver as like any other tissue drawing on the common source of nutriment, the blood, for its own particular purposes, and not as an organ akin to the special digestive organs, devoted to the elaboration of food for the benefit of the other tissues.

It need not be so, however, with the lymphatic structures with which the chyle of the lacteals comes into contact before it is poured into the blood. Chyle from the thoracic duct at its entrance into the veins is of course mixed with the general lymph of the body,—the juice of the tissues which is collected in the lymph-vessels and carried back to the blood. It is a milky fluid which coagulates on standing, the clot of which after some time becomes tinted red at the surface from the presence of immature red corpuscles. The coagulum consists of fibrin resembling that of the blood. Other constituents of chyle are white corpuscles, oil-globules coated with albuminous matter, *i.e.*, emulsified, and exceedingly fine fatty granules usually spoken of as the "molecular basis of chyle." Chyle obtained from vessels nearer the intestines has very little fibrin, very few white corpuscles, and no red corpuscles. It is probable, therefore, that the raw matters of digested food are undergoing a process of manufacture into blood during their passage through the lymphatic glands to reach the thoracic duct.

When once they arrive at the blood, the imported materials of food are lost beyond our power to follow them individually. The question now becomes one of the interchanges between the blood generally and the tissues. That such an interchange occurs there can be no doubt; for if all food be withheld from an animal the tissues rapidly grow less in quantity, while the blood maintains a fairly constant composition. If such an animal be fed, the tissues regain their former weight, and may even store up an overplus of matters, while again the blood remains of approximately constant composition. The tissues can both take away from the blood and give to the blood such matters as are necessary. But the matters taken from the blood are not in the same form as the matters given up to the blood. When blood is made to circulate through living tissues of

whatever kind the blood entering the tissue always has a different composition from the blood which leaves it. The tissues, therefore, are laboratories in which materials abstracted from the blood are transformed. To these chemical operations of transformation which occur in living tissues the term "metabolic" has been applied, a term first used by Schwann, and happily reintroduced by Michael Foster.

What now becomes of the products of the metabolic activity of the tissues? We have hitherto considered the tissues as taking matter from the blood, changing the form of it, and giving it back to the blood; but this is far from being the true account of the process. It does indeed represent all that we know of the metabolism of many tissues. In muscle, for example, matters are drawn from the blood, converted to other shapes within the tissue, and sooner or later cast out into the blood-current again. The same may be said of nerve-tissue and possibly of some other tissues. In secreting glands the case is different. Some only of the products of tissue-metabolism are returned to the blood; others are poured into the ducts of the glands as the glandular secretion, and so leave the body altogether. This happens, for example, in the digestive glands, the milk-glands, and the kidneys. In a third order of tissues the case is different again, for here some of the products of metabolism may be retained in the tissue for an indefinite time. This occurs in certain tissues which have been called storage tissues, and of which fat is a typical example. Lastly, the liver is a complex organ whose metabolic products are disposed of in all three ways,—part being cast at once into the blood, part being accumulated in the tissue itself as glycogen and passing into the blood at intervals as the body needs it, and a third part being poured into the biliary ducts in order that it may escape into the intestine. It will be well, therefore, to recognize three methods of the disposal of metabolic products, and to classify the tissues accordingly.

Metabolism of Muscular Tissue.—To arrive at a knowledge of the chemico-vital changes occurring in any tissue we must compare the matters entering the tissue with the matters issuing from it. It is only from such a comparison that we can infer the changes which go on within the tissue. In the case of muscle there is yet another method by which we can obtain inferences as to the nature of the metabolic changes. We have reason to believe that the tissue-changes of active muscles are simply the exaggerated form of changes which constantly occur. If we may assume this, a comparison of the chemical composition of muscle before and after a period of activity will help us to a knowledge of the changes that occur in muscular action, and, by implication, a knowledge also of the common metabolic changes of the tissue. Now a comparison of muscle before and after action shows that during activity the quantity of CO_2 becomes very largely increased; at the same time the muscle becomes of acid reaction from the development of lactic acid; the amount of bodies soluble in water decreases, while the amount of bodies soluble in alcohol increases; the amount of glycogen decreases, while that of sugar increases; and, finally, bodies develop which have a strong affinity for oxygen. If we compare the matters entering and issuing from muscular tissue we shall find that muscle gives up much CO_2 during activity, that the issuing blood is rich in reducing substances, and that it acquires sarcolactic acid. The circumstance of most importance in this comparison is that carbon dioxide is liberated in large amount without the immediate interaction of oxygen; the CO_2 is produced from some body in the muscle which already contains within itself the O necessary for its formation. The fact of next importance is the absence of all indications of a large expenditure of nitrogen. Relying on these discoveries, physiologists have supposed that the metabolic changes of muscle follow some such course as the following. Non-nitrogenous organic material, along with oxygen, is absorbed into the tissue from the blood. In the tissue-cells it is elaborated with nitrogenous matter already in the tissue into a complex body called *inogene substance*, containing a nitrogenous factor linked to carbon, hydrogen, and oxygen. During the life of the tissue, and to a much greater extent during muscular activity, this inogene substance is split up into a nitrogenous portion and a non-nitrogenous portion, of which the former is retained in the tissue to be again worked up into inogene substance, while the latter is resolved into more stable bodies which escape. The full number of the effete bodies is not at present known to us; it doubtless includes more than carbon dioxide and sarcolactic acid, but these are the only bodies whose existence has been definitely determined.

Metabolism of Glandular Organs.—Of late years very much light has been shed on the processes of glandular cells, but it has been chiefly on their anatomical aspect. We know very little, indeed, of the nature of the chemical changes going on within the glandular cells, because, although we can ascertain approximately the composition of those products of the changes which escape into the glandular duct, we as yet know so little of those products which escape into the blood. We know, however, that mucin is capable of being formed in the interior of epithelial cells out of some non-mucous antecedent. We also have some reason for supposing that the gastric glandular cells—the border-cells—select phosphate of sodium and sodium chloride from the blood, and these bodies have been shown to be capable of interacting in such a way as to yield free hydrochloric acid. In the secretion of milk it is tolerably certain that the fat and the casein are both formed out of proteid matter within the glandular cells. Even the milk-sugar has been thought to be elaborated out of some non-saccharine substance, or even out of some substance that is not a carbohydrate. In the case of the pancreas we know nothing of the actual chemical decompositions that occur, but we do know that they occur in two well-marked stages. In the first a body is formed which is stored in the gland-cells, as the inogene substance is supposed to be stored in muscle; in the second this body is resolved into other but still complex bodies, of which the trypsin ferment of the secretion is one. Among the glandular organs we may mention the kidney, respecting whose secretive activity it is far from certain that it entirely consists of physical filtration or powers of mere selection. No doubt many of the constituents of urine are simply filtered off from the blood, while others are undoubtedly abstracted owing to some peculiar attraction which the renal cells exert upon them. But there is some reason to think that others may be formed within the kidney-tissues as products of cell-metabolism. As yet we have no definite knowledge concerning the nature of the metabolic changes.

Metabolism in the Storage Tissues.—Of these the first that we shall describe is adipose tissue or fat. Fat appears to be accumulated in ordinary connective-tissue corpuscles. What metabolic changes occur in connective-tissue corpuscles which are not accumulating fat we do not know; but under certain conditions of overfeeding the metabolism is so varied that fat is deposited within the cell. At first it appears in the form of fine granules; these soon coalesce to globules, which afterwards enlarge by the confluence of granules subsequently formed. The exact changes of which this fat is the outcome, or one of the products, are entirely obscure. It is enough if we can establish the probability that fat may be derived from the proteid proto-

plasmic matter of the fat-cell. We are not here guided, as in the case of muscle, by analysis of the blood approaching the adipose tissue and the blood leaving it. Nevertheless, there is little doubt that fat may be derived from the proteid elements of food through the activity of living tissue-cells. That proteid matter readily lends itself to a decomposition of which fat is one product is seen in the formation of fat-like "adipocere" in the nitrogenous tissues of dead bodies which have been for some time buried or immersed in water; and it is likewise seen in the process of "ripening" in cheese, in which the fat increases while the albuminous matter diminishes. But in addition to these general facts, suggestive though they are, there are not wanting proofs of a more particular kind that fat may result from proteid decompositions. If dogs are fed on starch and fat with no proteid food at all, the carbon stored up in the body can all be accounted for by reference to the fat of the food and the proteid matter of the body which, in the state of starvation, came to be disintegrated. In many other cases it seems clear that the fat stored up by animals during fattening unquestionably comes in part from the nitrogenous matters of food. But a consideration of the relative amount of carbon and nitrogen contained in proteids and in urea, which is the final product of the oxidation of proteid matter, would alone lead us strongly to suspect such an origin of fat. If all its nitrogen reappeared in the form of urea, 300 grains of proteid would give rise to 100 grains of urea. But 100 grains of urea contain but 20 grains of carbon, whereas 300 grains of proteid matter yield 159 grains of carbon. What has become of the deficit of carbon? If it has not been burnt off as carbon dioxide, it must remain within the body in some non-nitrogenous form.

If fat may be derived from proteids in the body, it is now equally certain that in some animals at least fat may come from carbohydrates of the food. Lawes and Gilbert have conclusively shown that as much as 40 per cent. of the stored-up fat in well-fattened pigs could not possibly have come from the nitrogenous parts of the food, and that it must have been derived from the carbohydrates.

All these facts render it very probable that the fat-forming tissues pick out from the blood albuminous or non-nitrogenous matter, transform it, retain the fatty element and discharge the rest. But it must not be forgotten that fat of food may, on finding itself in the blood, be taken up by appropriate tissue-cells and stored up without undergoing further change. Even this, although it seems so probable, may not at once be assumed to occur in such a simple manner. It is true that, if an animal be fed on fat resembling the fat of its own tissues, it might be assumed that the fat which it stores is simply absorbed by the tissue-corpuscles as an amœba absorbs its food. But if this were really the manner of the process we should expect that allied fats substituted for the natural fat would be equally well taken up and stored. This, however, is not at all the case. Dogs fed on a mixture of palmitin and olein, but no stearin, are found on analysis to have stearin in their body-fat; just as dogs fed on palmitin and stearin, but no olein, are found to have an abundance of olein stored up. And, even when fed on spermaceti, a dog was found to present mere traces of it in the fat accumulated in its tissues during the experiment. In short, all facts go to show that the accumulation of fat does not take place without some display of formative or transformative energy.

The last tissue whose metabolism we shall discuss is the hepatic tissue of the liver. Hitherto we have considered the liver as a digestive gland secreting the bile for the purposes of digestion; but the liver has other functions which overshadow entirely its function as a digestive organ. It seems to have the power of accumulating amyloid material very much as adipose tissue accumulates fat. It would probably be a mistake to regard these two functions of the liver as altogether independent of one another, although it is necessary to state that a direct dependence has not yet been established. There can, however, be little doubt that the hepatic tissue draws to itself a variety of matters from the blood flowing into it by the portal vein and hepatic artery, and elaborates these constituents into various products, some of which escape into the blood again, others of which appear as the bile, while a third order remain in store within the substance of the liver. But, although these products are probably associated more or less intimately in their origin, they have, in the natural development of physiology, been studied independently of one another for the most part.

If an animal be richly fed on starchy or saccharine food it is found, within a short time of the digestion of the food, that the liver contains a large quantity of a starchy body called glycogen $(C_6H_{10}O_5)_n$. In order to obtain glycogen from liver-substance it is necessary to make use of the tissue of an animal just killed, for the starchy body undergoes an extremely rapid *post-mortem* conversion into a sugar. Liver taken quickly from the still warm body of a rabbit is rapidly divided into small pieces and plunged at once into briskly boiling water. The high temperature prevents the *post-mortem* change and leaves the glycogen in a condition to be separated. The pieces of liver may then be pounded with sand and water, and the mixture acidulated and filtered. From the filtrate the glycogen may be precipitated by alcohol, and the precipitate may be purified by boiling in caustic potash and afterwards neutralizing and reprecipitating with alcohol. Or the albuminous matters may be thrown down by a solution of mercuric iodide in iodide of potassium before precipitating the glycogen with alcohol. Glycogen so prepared is a white amorphous powder resembling starch in chemical composition; it is colourless and tasteless. Its aqueous solution is milky, and generally opalescent.

Other tissues and organs besides the liver have been found to contain glycogen. For example, muscles contain some glycogen, which diminishes during muscular activity, while it has been detected in the tissues of embryos and of young animals, as well as in newly-formed pathological growths.

There can be little doubt that glycogen is manufactured mainly out of carbohydrates conveyed to it in the portal vein. If a rabbit be starved for some days, the whole of the glycogen disappears from the liver; but the store is at once, in the course of a few hours, replenished if starch or sugar of whatever sort (cane, grape, or milk) be introduced into the alimentary canal. The metabolic powers of the liver-cells in respect of glycogen-production are not, however, limited to starches or sugars. If glycerin be injected into the intestines the amount of glycogen in the liver is at once increased. But some preparation of the glycerin is necessary before the liver-cells are able to appropriate it; and this preparation is accomplished in the true digestive organs, since glycerin introduced into the blood by subcutaneous injection does not bring about any increase in the glycogen of the liver. Even albuminous bodies, such as fibrin and albumin, freed from all trace of amyloid matter, seem in the case of carnivorous animals to yield glycogen in the laboratory of the hepatic tissue. The same may be said of gelatin. Now it is easy to form a chemical conception of the manner in which such a body as grape-sugar leads to the storing of glycogen, for the dehydration of the sugar would be all the change required for the conversion. But we can at present form no picture of the operation in the case of glycerin and of the albuminous matters; and the fact that these substances also are amenable to the liver-cells should make us hesitate to assume at once that in the case of sugar the process is the simple one of dehydration. We must wait for further light to be shed upon the interdependence of what we may for the moment call the biliary metabolism and the glycogenic metabolism of liver-cell before we speculate as to the exact nature of the changes.

The liver has, beyond a doubt, the faculty of manufacturing an amyloid body out of various raw matters brought within the range of its activity, and of storing it up for future use. The use to which it is put has been the subject of much speculation and experimental inquiry. The amyloid matter when drawn upon may leave the liver in the form in which it exists there, or it may be converted into some other modification and afterwards transferred to the blood. The fact that other tissues besides the liver contain glycogen and the fact that some, as muscle, seem to make use of glycogen in the act of contraction have been thought to support the hypothesis that the glycogen is conveyed by the blood to their tissues and then consumed. According to this theory the

hepatic metabolism ends in the production of glycogen, which merely waits to be cast out into the blood-current at the call of the body generally. Against this hypothesis, as a complete explanation of the use of liver-glycogen, it may be urged that the glycogen of muscle at least disappears on starvation long before the store of glycogen in the liver has been used up. Moreover, the glycogen of muscle is by no means invariably present, and is certainly not indispensable to the activity of the tissue. We may therefore conclude that the use of glycogen by the tissues (when we judge of it by the case of muscle) is not constant enough or important enough to account for the large store of glycogen in the liver. But, if the hepatic glycogen does not leave the liver as such, it must undergo some other change in the liver; and the circumstance above referred to, that glycogen so readily becomes converted into sugar *post mortem*, at once leads us to inquire whether a similar conversion is not normally effected during life. The inquiry becomes of especial value when we remember that the blood contains a constant proportion of sugar in its composition, which argues such a constancy of supply as could not be due to the direct importation of sugar during the irregular periods of the daily meals. As the amount of sugar in the blood is constant, the periodic introduction of carbohydrate into the organism must be followed by some temporary storing of it in some organ from which it may be constantly, and without intermission, doled out. Now the body contains in many parts the means of the conversion of starches into sugar. The salivary or pancreatic juices with the utmost readiness at the body-temperature change glycogen into a sugar. Many tissues, as well as blood, are said to effect the same conversion, although it is denied that the blood does so unless the blood-corpuscles have been first destroyed. The liver itself, as we have already seen, may bring about the same change, at least after death; but the activity of the converting substance may be prevented by subjecting it to a temperature of boiling water. If the liver contain the ferment-like body during life, unless its activity be restrained in some way or other, the glycogen which is formed in the liver will be speedily changed into sugar. In regard to the existence of this starch-converting body it is significant that, while it certainly may arise in the blood when the blood-corpuscles are destroyed, the liver is known to be the seat of an extensive destruction of blood-corpuscles. Considerations of this sort, however, are of little cogency; it would be a strong presumption of the existence of the ferment in question if sugar could be proved to be normally present in the hepatic tissue during life, but the experimental proof of this is beset by great difficulties, and discordant results have been obtained by the different observers. Claude Bernard, to whose researches we owe so much of our knowledge on this interesting question, detected small but perceptible quantities of sugar in quite fresh liver-substance; but other observers, among whom Dr Pavy is to be reckoned the first, have failed to find even a trace. Further, Bernard was able to make out a decided difference between the amount of sugar contained in the portal vein and the hepatic vein respectively when there was no starch or sugar in the food to load the portal vein. In such circumstances the blood issuing from the liver by the hepatic vein was found to contain a small quantity of sugar in excess of the blood entering the portal vessels. The most accurate and reliable investigations have, however, conclusively proved that this difference does not exist. The matter, therefore, still awaits some crucial test not yet devised. In the meantime we may accept the hypothesis of a conversion of liver-glycogen into soluble sugar as one which, however probable, is not supported by sufficient evidence. Amongst those who have rejected this hypothesis some have had recourse to other assumptions to account for the fate of glycogen in the body; and it has been suggested that glycogen undergoes conversion into fat either in the liver itself or partly there and partly in some other tissue. This suggestion has little direct evidence to support it. It is true that animals, especially the pig, have the power of storing up fat in their bodies which they cannot have obtained otherwise than from the carbohydraceous constituents of their food. It is also true that the hepatic tissue is often found to contain fat in considerable quantities. But it is easy to see how these facts admit of simple explanation without assuming a conversion of glycogen into fat within the liver-cells. The chemical nature of such a conversion is difficult to imagine; but it would be rash to assume that the metabolic powers of animal protoplasm are not sufficient to accomplish it.

With regard to the metabolism of liver-tissue which leads to the production of bile we possess but little direct knowledge. The secretion of bile is not a mere act of filtration of already-formed matters from the blood; but we have at present no conception of the chemical changes which occur in the interior of the liver-cells in the elaboration of bile. There is strong reason to think that the bile-pigments are derived from the colouring matter of blood, not only from the circumstance of the large destruction of blood-corpuscles which takes place in the liver but also from the resemblance or identity of bilirubin and hæmatoidin, a body derived from extravasated blood. A large number of facts point very clearly to the conclusions (1) that the liver is an organ in which chemical changes of great magnitude and importance have their seat, (2) that their operation consists in great part in decomposition of proteids.

The high temperature of the blood which leaves the liver, and which is the hottest blood of the body, is the chief proof of the correctness of the first of these conclusions, whilst the second rests upon many considerations. The bile-acids unquestionably do not exist in the blood, but are the results of proteid metabolism within the liver-cells. There are strong grounds for believing that urea, $CH_4N_2O_1$, as well as uric acid, has its principal origin in the liver, which is equivalent to localizing the chief seat of proteid metabolism in this organ.

Diabetes.—In connexion with the glycogenic function of the liver it is necessary to refer to a disease which is of special interest to physiologists, from the ease with which the symptoms may be artificially reproduced. The disease itself may be defined as the appearance of large quantities of sugar in the urine, while the total amount of the urine excreted is also increased. Now diabetes of a temporary nature may be produced in animals in a variety of ways. If certain fibres of the medulla oblongata near what is known as the vaso-motor centre be divided, as they may be by means of a special instrument, without producing any serious abnormal motor or sensory symptoms, there follows very speedily the excretion of large quantities of sugar in the urine. It is evident that this result is due in some way to an abnormal influence of the nervous system. The path by which the abnormal influence is transmitted has been carefully traced down the spinal cord to the first thoracic sympathetic ganglion; if this path be interrupted at any point symptoms follow similar to those caused by the local injury to the medulla oblongata. The circumstance that interruption of this nervous pathway at any point causes the appearance of sugar in the urine at once leads to the suspicion that the escape of sugar is not directly caused by the shock of the operation or injury. We are rather brought to the conclusion that the natural absence of sugar from the urine is due to a restraining influence of the nervous system acting continually in a manner to be discussed hereafter, and that the division of the path by which the continual restraint is exercised merely intercepts the inhibitory influence. This is confirmed by the observation that the medulla is in communication with certain afferent nerves, though which also the restraint may be removed. These nerves are the vagi; division of them leads to a transient appearance of sugar in small amount in the urine; but stimulation of their cerebral ends brings about the escape of sugar to a remarkable degree. This clearly can only be due to an inhibition by afferent nerves very similar to the inhibition of the heart which follows stimulation of the cerebral end of the abdominal sympathetic nerve in the frog.

The intercepting of this hypothetical restraint by the anatomical section of nerves is not the only way of artificially bringing about diabetes. Sugar may appear in the urine during the action of curare and after a suitable dose of morphia, and also after the injection of dilute saline solutions into the blood-vessels. The probable relationship of these various methods of causing diabetes will be referred to later.

There can be no question that diabetes is a disease affecting the glycogenic function of the liver. In many cases of natural or pathological diabetes, if all carbohydrates be withheld from the patient, the urine becomes free or almost free from sugar; and in like manner, if an animal be starved until there is every reason to suppose that its liver has become free from glycogen, and afterwards it be subjected to the operation for producing artificial diabetes, no sugar appears in the urine. Similarly, if an animal be drugged with arsenic, which leads to a rapid loss of all the glycogen of the liver, and afterwards poisoned with curare, the latter drug no longer brings about diabetes. In short, if the liver contains no glycogen no sugar can appear in the urine. This being so, in what special way is the glycogenic function modified in diabetes? If we assume that the function of the liver is to seize upon all sugar passing along the portal veins from the intestinal canal and store it up as glycogen, in order that it may be piecemeal returned to the blood to be burnt off in distant organs, we can easily review the various conceivable ways in which diabetes might be caused. It must, in the first place, be premised that the blood is unable to contain more than a certain percentage of sugar. When this percentage is overtopped the excess of sugar escapes in the urine. Of

this there is direct experimental proof in the facts that if sugar be slowly injected into the jugular vein, no escape of it by the kidneys takes place, because the organism can make use of a small excess of sugar; but if it be injected *quickly* diabetes ensues from the too rapid accumulation of it in the blood. Accepting this, we can readily see that diabetes might be caused (1) by the failure of the liver to pick out the sugar in the portal vein in order to store it, (2) by an unusually large escape of glycogen from the liver in the form of sugar, (3) by the failure of the distant organs whose function it is to burn off the daily quantum of sugar.

It is not improbable that there may be different sorts of diabetes arising from different causes. Thus it has been said that the diabetes of curare-poisoning appears even when the liver has previously been emptied of glycogen by starving the animal. When we reflect that muscles are the organs especially affected by curare, the fact (if it be a fact) just mentioned at once suggests that the sugar which appears in the urine during curare-poisoning is due to some defect in the muscular tissue, in consequence of which the glycogen normally used up by it fails to be used and passes back into the blood. Further, the failure of glycogen-using organs may be due to no disqualification of theirs for the work of utilizing normal glycogen, but to some abnormal constitution of the glycogen (or the sugar) offered to them. Again, the diabetes caused by copious injection of dilute saline solutions into the blood-vessels may be due to the large destruction of blood-corpuscles which follows such injections, and the consequent production of a large quantity of the starch-converting substance which is known to arise in the disintegration of blood-cells. But the common form of artificial diabetes —"puncture diabetes," as it is sometimes called—the diabetes of anatomical nervous lesions, is undoubtedly due to defects in the hepatic apparatus brought about by the injury. Thus the puncture of the medulla oblongata is of no avail to cause diabetes if the liver has first been deprived of its glycogen by starving the animal experimented upon. It is, however, far from necessary to suppose that the puncture diabetes is due to any incapacity of the liver-cells for their usual metabolic changes; this may be the cause of some kinds of pathological diabetes, but it is almost certainly not the cause of the traumatic variety, and for the following reason. If sugar be freely administered to an animal in which the diabetic nervous lesion has been established, although it is impossible to load the liver with glycogen as, in such conditions, it would become loaded during health, yet a certain amount of glycogen does become stored in the liver. The liver seems still to possess the power of converting the sugar of food into a store of starch, but not the fulness of opportunity which it has in health.

The conditions which deprive the liver of the opportunity of storing glycogen are to be sought in an altered vaso-motor mechanism. The circumstance that the "diabetic centre" in the medulla coincides with part of the general vaso-motor centre at once leads to the vaso-motor theory of diabetes; but it may be admitted that this consideration is almost the strongest support of the theory. How a vaso-motor paralysis brings about diabetes we have as yet no clear picture. Perhaps it is by permitting such a rapid current of blood through the vessels that there is not time enough for the usual transmutations. If we may assume this to be the method by which diabetes is produced, then the vaso-motor theory receives much support from the following consideration. Inasmuch as diabetes is caused by a local (hepatic) dilatation of blood-vessels leading to a superabundant torrent of blood, if means be taken to provide other channels for the blood and so relieve the superabundance, diabetes should be prevented. This may be done by dividing the splanchnic nerves and dilating the enormous vascular tracts of the abdominal organs. In these circumstances the diabetic puncture makes but a trivial change in the circulation of the liver compared with that which it makes when the blood-pressure is normal; and, as might have been foretold from the vaso-motor theory, no diabetes follows. If diabetes from nervous lesions is a vaso-motor phenomenon, other forms of artificial diabetes are not so. Arsenic and antimony seem to destroy the power of the hepatic cells to manufacture glycogen; sugar ingested with the food passes, in consequence of the failure, directly into the blood and out of it into the urine. Ligature of the bile-duct also rapidly leads to profound disorganization of the hepatic tissues, in consequence of which imported sugar passes the portal system unheeded and escapes by the kidneys.

Metabolism of the Blood.—We have hitherto regarded the blood as subordinately related to the great processes of the body, as playing the mechanical part of a carrier, and as if it had no *direct* interest in the metabolic operations themselves; the reader, however, need scarcely be reminded that, but for the respiratory exchanges between the blood on the one hand and the anatomical elements of the tissues on the other, all metabolic processes would be impossible. In the article RESPIRATION, and in treating the particular section "the respiration of the tissues," the influence of those exchanges on metabolism will be carefully considered.

The older physiologists regarded the blood as the very seat of the chemical changes of the body,—a view which is almost entirely opposed to that which we now hold, and which is disproved by many facts.

We have little or no evidence that the blood exhibits transformations of matter such as we have been discussing in the case of the tissues generally. There are few such transformations known to us in which carbonic acid is not one of the most abundant end-products of the change, and therefore, when we find that blood removed from contact with the tissues and freed from carbon dioxide produces very little of this body, although an abundance of oxygen be supplied to it, we have the right to suspect strongly that it is due to the absence of any active metabolism.

It is not certain that blood (or lymph), without the intervention of some other tissue, has even the power of converting non-coagulating albumins fresh from the digestive organs into the characteristic fibrin-formers. It is true that when lactate or caprate of soda is injected into the blood of an animal it is readily oxidized; but this may easily be due to the operation of some organ through which the blood passes, and which finds the bodies referred to suitable to its own metabolic processes; and this view of the case is further strengthened when we find that formiate of sodium, which also is a readily oxidized body, passes through the same ordeal unchanged.

Nevertheless, the blood is to a certain extent an active living tissue. The white corpuscles, at least, are definite living structures whose life-history, could we but decipher it, would be found to be a history of constant metabolic processes. Towards these elements of the blood the fluid plasma must behave as towards any other tissue-element, supplying them with raw material, and receiving from them the end-products of their internal chemical decomposition; and therefore the blood, as a whole, must be classed among the metabolic tissues. The production of the anatomical elements of the blood does not concern us here; it may suffice to say that the white cells are added to the blood or lymph from certain structures of which the spleen, thymus body, lymphatic glands, and mucosa of the alimentary canal are the chief, and that probably the red corpuscles are developed from the white ones. It may also be pointed out that there are certain parts of the body—*e.g.*, the spleen, liver, marrow of bones, &c.—where there is evidence to show that red corpuscles undergo rapid and wholesale destruction, either for the production of some secretion, or possibly because the corpuscles have become old and unfit for work, and their invaluable constituent, iron, is wanted for younger and more active corpuscles.

IV.—PROCESSES OF EXCRETION.

The blood, as has been more than once said, is subject to continual additions and subtractions on the part of the tissues. The subtractions effected by the tissues are made good in part by the importation of fresh material of food from the alimentary canal. The analogous counterbalancing operations which serve to check the accumulation of used-up tissue-substance in the blood take place in certain organs called *excretory*. In a strict sense, all organs which cast out material from the body are excretory; the digestive glands, for example, pour their secretions into the alimentary canal, *i.e.*, outside the strict limits of the body. But so much of their constituents are reabsorbed before the alimentary canal is traversed that they may, for practical purposes, be regarded as never having left the body. Even the constituents of tears, when these do not fall over the

cheeks or escape at the nose, are reabsorbed from the nasal mucous membrane. With respect to the alimentary secretion, it is merely a small proportion of the bile which remains in the fæces that is to be regarded as truly excretory in the sense of being utterly lost to the organism. If excreta are those substances which the body rejects utterly, then we may reckon as excreta (1) the urine, (2) the sweat and oily secretions of the skin, (3) the milk, (4) certain elements of bile contained in the fæces, (5) the gaseous and watery losses at the lungs, (6) the exuviated horny scales of skin and nails and hair, (7) the products of the generative organs, but not those constituents of fæces which are but the undigested remains of food. Among these (if we except the milk and the generative secretions whose elaboration is so peculiar and exceptional) the urine and the excretory products of the lungs and skin are those of paramount importance. The excretion from the lungs will be treated under RESPIRATION; we shall therefore here concern ourselves with the excretion of kidneys and skin.

Kidneys and their Excretion.—Urine is a clear amber-coloured fluid, somewhat acid in reaction, with a peculiar aromatic odour and bitter saline taste. Its specific gravity varies, consistently with health, within wide limits, being affected very greatly (*a*) by the quantity of liquid consumed by the individual in a given time, (*b*) by the greater or less activity of the secretion of sweat. Whilst the average specific gravity may be stated to be about 1·020, it is often temporarily much lower and occasionally considerably higher. As a rule the specific gravity is higher in summer than in winter. The average quantity of urine passed by a healthy adult may be reckoned at 52 fluid ounces, though it is affected by the same causes as those which influence the specific gravity no less than by individual peculiarity and other circumstances.

The urine is essentially a watery solution of certain organic matters, of which much the most abundant and important is urea, and of mineral salts, of which the most abundant is common salt (sodium chloride).

Urea.—A well-nourished man passes, on an average, about 33 grammes (500 grains) of urea in twenty-four hours. This body, which has the composition CH_4N_2O, is looked upon by chemists as carbamide, *i.e.*, it is the amide of carbonic acid, and on this view may be written $CO(NH_2)_2$. It is isomeric with ammonium cyanate. This body represents the chief-product of the metamorphosis of albuminous or proteid substances in the body.

Even during starvation the destruction of proteid matter continues, and the amount of urea may reach about 230 to 310 grains. The quantity is, however, specially and directly affected by the amount of proteid matter contained in the food; so that, for instance, by consuming a sufficient quantity of meat certain persons have excreted as much as 1540 grains of urea. The excretion of urea, which is a measure of the metamorphosis of proteids in the body, is not, as was formerly supposed, *directly* influenced by the amount of mechanical work done by the body, the greater activity of the muscles not being *necessarily* accompanied by their greater waste; *indirectly*, however, the excretion of urea is increased by bodily exertion, inasmuch as man and other animals appear instinctively to desire and to need a larger quantity of proteid food when much work is to be done than when the body is comparatively at rest.

It was formerly believed that urea was a direct result of the oxidation of proteids in the body. The view actually held is, that it is the product of a synthesis occurring in the body in which a body or bodies resulting from the oxidation of the proteids take part. It has recently been shown that when salts of ammonia are introduced into the system the nitrogen of the ammonia is excreted as urea; in this case it is obvious that a synthesis have occurred in which the ammoniacal salt intro has taken a part no less than some other body. It for instance, been surmised that in the oxidation o proteid molecule cyanic acid arises, and that in the pre of ammonia ammonium cyanate is formed, which i organism, as outside, may be changed into urea; or, a that cyanic acid is formed, which, uniting with the elem of water, gives rise to urea, carbonic acid being sepa in the reaction.

Uric acid combined with bases exists in small quantities i urine of man, about 7 to 10 grains being passed by an adu twenty-four hours, though individual peculiarities appear to in a remarkable manner the excretion of this constituent (r mum limits of quantity ·3086 to 15·43 grains). In some ani as in snakes and birds, uric acid and its salts represent the nitrogenous excretory product, *i.e.*, take the place of the ur the urine of man and carnivorous animals.

Uric acid has the composition $C_5H_4N_4O_3$. Its constitutio yet involved in great doubt, in spite of the most profound an tensive researches which have been made on its more or less in diate relations, and in spite of the fact that its synthesis recently been effected. It may be looked upon in all probab as a derivative of cyanic acid, CNOH, and glycocin, $C_2H_5NO_2$, there are many facts which seem conclusively to show that in system it does not arise directly from a decomposition of prot but is the result of a synthesis in which derivatives of these bo take a part.

Xanthin, $C_5H_4N_4O_2$, *hypoxanthin*, $C_5H_4N_4O$, and *gua.* $C_5H_5H_5O$, are immediate derivatives of uric acid, of which first is a constant constituent of urine, and the second occur certain states of disease.

Hippuric acid, $C_9H_9NO_3$, benzo-amido-acetic acid, is present small quantities in the urine of man (about 15 grains a day), is the chief nitrogenous constituent of the urine of herbivo animals. It is formed whenever benzoic acid, or a body which yield benzoic acid in the organism, is ingested.

In addition to the organic matters already enumerated the ur contains small quantities of other bodies, amongst which may mentioned (1) colouring matters, of which one alone is known w any degree of accuracy, and is termed *urobilin*, a derivative pro mately of the biliary colouring matters, and more remotely of t blood-colouring matter, and (2) minute traces of ferments.

As has already been said, the chief salt of the urine is comm salt; there are, however, also excreted in the urine considera quantities of phosphates and sulphates. The two latter salts present in part similar salts introduced as such into the syste but in part they are the products of oxidation of organic bod which contain sulphur and phosphorus respectively: to the form belong the proteids, to the latter certain phosphorus-containi fatty bodies of great complexity, which occur widely diffus throughout the body, but particularly in the white matter of t great nerve-centres and in the nerves.

The changes which urine undergoes after it is passed may briefly referred to. The faint acid reaction proper to freshly-draw urine is increased, probably in consequence of an acid-fermentatio process started by the mucus accidentally present. The visib effect of this is the deposit of acid urates or free uric acid. In short time, especially if the urine be kept at a warm temperatur the acid-fermentation is overwhelmed by a fermentation for whic organic germs are needed, and which leads to the resolution of ure into carbonate of ammonia. The reaction becomes alkaline, an the smell strongly ammoniacal. Precipitates of ammonia, urate, an ammonio-magnesian phosphate are deposited, the odour become putrefactive and multitudes of micro-organisms develop whose germ have been derived from the surrounding air.

Kidney.—The urine is excreted continuously in th *kidneys*, two organs situated at the back of the abdomina cavity. The fluid is continuously poured by two ducts called *ureters* into a common reservoir situated in the pelvis, and known as the *urinary bladder*. From this reservoir the urine is intermittently ejected by the *urethra*. The two kidneys never secrete symmetrically; they exhibit an alternation of vascular and secretory activity. Similar variations have been observed in the different portions of one kidney,—first one and then another region of the kidney will be found to be in full activity. Nevertheless, when one kidney is extirpated or unfitted for its function, the other may be capable of the whole work of excretion.

The excretory portion of the kidney, like the secretory

portion of all glandular organs, consists of tubes of basement membrane lined with cells of peculiar attributes and surrounded by capillaries for blood and lymph, which allow their fluids to come into close communication with the secreting cells. The complex disposition of the tubes, of which there are hundreds in each kidney, has been traced after an infinite amount of patient research. An account of the arrangement of the tubuli uriniferi falls beyond the scope of the present article.

Excretion of Urine.—A review of the constituents of the urine discloses that the function of the kidneys is to separate from the blood chiefly (1) nitrogenous crystalline bodies which are undoubtedly the end-products of the oxidation of nitrogenous bodies, and (2) inorganic salts and water. We have now to describe the probable manner in which this separation is effected. Ever since the whole course and form of the renal tubules became mapped out, and the existence of a double system of capillaries was established, it has been the habit of physiologists to regard the excretion of urine as a twofold operation. Sir William Bowman, so long ago as 1842, in the course of a histological investigation of the structure of the kidney, came to the conclusion that the watery portions of the urine are excreted in the capsule, while the solid parts are removed from the blood surrounding the lower parts of the renal tubule. Ludwig, about the same time, advanced the theory that the whole of the urine is separated from the blood in the glomeruli, but that it is separated in an extremely watery condition, the object of the complicated renal tubules being to permit of the reabsorption of the water, and to bring the urine into a suitable state of concentration for removal from the body. The progress of investigation has completely vindicated the theory proposed by Bowman, which now rests not merely on inference from anatomical structure, but upon a sound basis of physiological facts.

Not only is the process twofold in respect of the two classes of constituents secreted; it may be twofold also in respect of the processes of the act. There is at least much reason for thinking that the water is separated from the blood mainly, though not entirely, by a physical process of filtration, while some, if not all, of the specific elements of the urine are secreted by a peculiar selective or elaborative action of living epithelial cells. The reason for supposing that the excretion of water is mainly a process of filtration is the simple one that the flow of urine seems, in a general way, to obey the same laws of pressure as the flow of water through a filter. For example, whatever tends to increase the blood-pressure in the branches of the renal artery tends to increase the flow of urine in a given time. If the heart beats more quickly than usual more urine is excreted. If cold contracts the superficial vessels of the skin, and drives a larger quantity of blood upon the kidney, or if the same result ensues from moderate stimulation of the splanchnic nerves, the blood-pressure in the renal artery becomes raised, and an enlarged secretion follows. If the spinal cord be divided in the lower part of the cervical region, the great fall of blood-pressure which results is associated with suppression of the excretion of urine. Further, if the pressure in the ureters be allowed to reach the value of 10 to 40 mm. (·3937 to 1·5748 inches) of mercury the transfusion of fluid from the blood is prevented. Now the blood-pressure in the renal artery is about 120 to 140 mm. (4·7244 to 5·5118 inches) of mercury. Secretion stops, therefore, long before the pressure in the glandular ducts reaches that of the glandular vessels,—a relationship between pressure and secretion the very reverse of that which obtains in the case of the salivary gland. These facts sufficiently justify the conclusion that the secretion of water in the kidney is a process of filtration. But there are other facts which demand the assumption that even the separation of water is in part an act of living protoplasm. The free ingestion of water by drinking is one of the most certain ways of producing a copious flow of urine; and yet there is no evidence to show that in most cases this effect is brought about by a raising of the blood-pressure. On the contrary, if one animal be bled into the veins of another there is no increase produced in the amount of urine excreted, and it is difficult to imagine that the blood-pressure may be more easily raised by the drinking of water, however freely, than by introducing into the blood-vessels of one animal the quantity of blood proper to two. In such cases we must assume that the outflow of water from the blood is due to the activity of living cells aiding the normal influence of pressure.

While the secretion of water cannot wholly be ascribed to physical processes, there is no doubt that the secretion of some other bodies is a selective act of living protoplasm taking place independently of, or it may be in opposition to, physical processes. The first substance whose secretion was experimentally proved to be due to the renal epithelium was sulphindigotate of soda, or indigo-carmine. If this substance be injected into the blood-vessels of an animal in which the blood-pressure has been so far lowered by division of the spinal cord below the medulla that the flow of urine has stopped altogether, it can be traced in a short time into the epithelium of the renal tubules, and through them into the lumen of the duct. The absence of the usual flow of water has left the granules stranded at the place where they entered the renal system of tubes. No trace of the substance was found by the original observer, Heidenhain, in the glomeruli or capsules; but it may be stated that later experimenters have succeeded, by injecting the drug freely and pursuing it over longer intervals, in tracing it into the glomerular cells also.

Sulphindigotate of soda is not a normal constituent of the urine; but there is little doubt that what happens in the case of this body happens also in the case of some of the usual constituents. Thus, uric acid has been detected within the epithelium of the renal tubules; and by a comparatively new and beautiful observation it is placed beyond doubt that urea also enters the secretion at the same cells rather than through the glomeruli. This proof was rendered practicable by the discovery that in the frog the kidney is supplied with blood from two separate and distinct sources. The renal artery supplies the glomeruli with blood, while the so-called renal portal vein, a branch from the femoral vein which runs along the outer border of the kidney, supplies the capillary network surrounding the uriniferous tubules. If the renal artery be tied and the blood-supply shut off from the glomeruli, sugar when introduced into the circulation is not excreted with urine, although it readily is when the vascular supply of the kidney is untouched. But in the same circumstances, when the action of the glomeruli is eliminated, urea is readily excreted. Urea and sugar are therefore removed from the blood by different organs; or at least the renal epithelium of the tubules can excrete urea, although it cannot excrete sugar. At the same time that urea is being excreted a copious flow of water is determined, which most presumably escapes at the point where the urea is excreted. This fact is significant when we remember that ligature of the renal artery usually stops the flow of water, and that sulphindigotate of soda injected into the circulation when the glomeruli are tied out of it may be traced into the same epithelium, but gives rise to no flow into the bladder.

The renal epithelium, then, has the power of attracting to itself and removing from the blood certain elements which the latter already contains. It may now be asked whether the kidney has the power of elaborating any of

the components of its excretion from antecedent forms which it obtains from the blood. In other words, is the kidney a simple separating or straining mechanism, or are the constituents of the urine, like the constituents of bile or saliva, elaborated in the course of metabolic changes going on within the secreting epithelium?

This question has already been touched in discussing the metabolism of liver-cells. There is little doubt that the kidney exhibits some metabolic activity. Inasmuch as the blood of herbivorous animals contains no trace of hippuric acid, this must presumably be formed within the kidney. If blood containing sodium benzoate and glycocin be passed through the vessels of a fresh kidney, hippuric acid arises. The kidney, therefore, must be assumed to be capable of elaborating hippuric acid out of simpler antecedent forms. But it is not certain that it has any further power. With regard to urea, it appears certain that the activity of the kidney is confined to straining it off from the blood. Normal blood contains about 1 part of urea in 4000, while the blood of the renal vein contains less than this. Urea, therefore, is separated from the blood in the kidney. If the kidneys be extirpated, or if their blood-vessels be ligatured so as to exclude them from the circulation, or if the ureters be tied (the effect of which is speedily to unfit the kidney-epithelium for the work of excretion), then the amount of urea increases in the blood up to 1 part in 300 or 400, while much urea is voided in the fluids ejected from the stomach and intestines during such experiments. Similar experiments in birds have led to similar results in the case of uric acid. All these facts point to the conclusion that urea and the allied bodies in urine are derived proximately from the blood rather than elaborated in the kidney itself. We are therefore justified in regarding the kidneys as almost exclusively an apparatus for purifying the blood from the injurious products of the cell-metabolism of other organs and tissues.

Excretions of the Sweat-Glands.—The second great excretory system is that of the skin, which supplements in important particulars the excretory functions of the kidneys. This function of the skin is effected in great measure by certain glands, called sweat-glands, opening on the surface of the skin. There are, indeed, other glands besides the sweat-glands connected with the skin, viz., the sebaceous glands, which open chiefly into the sacs of hair-follicles and secrete an oily material which keeps the surface of the skin supple and water-tight. The sebaceous secretion resembles in its formation the secretion of milk. Inasmuch as it is not reabsorbed, it is a true excretion; but there is reason to believe that the material removed from the blood is elaborated out of complex fat-yielding molecules contained in the blood very much as the milk is secreted. We know very little either of the nature of the bodies excreted or of the processes of their formation. The chief excretory products of the skin are furnished by the sweat-glands, and constitute sweat. In addition, however, there is constantly being thrown off from the skin a certain quantity of carbonic acid.

Nature of Sweat.—It is impossible to collect sweat for analysis under perfectly normal conditions; either the body must be subjected to great heat to adduce a copious flow, or a part of the body must be enclosed in an air-tight bag of india-rubber. In both cases the conditions are abnormal. So far as can be ascertained, sweat is a colourless clear fluid of acid reaction and characteristic odour. The odour varies with the part of the skin from which the sweat is obtained. It consists of water containing 1·81 per cent. of solids. The solids are (1) sodium chloride and other inorganic salts, (2) urea and other nitrogenous bodies, (3) fats and cholesterin (which are not altogether due to contamination with sebaceous matter), (4) fatty acids (formic, acetic, butyric, &c., but not lactic), (5) a trace of pigment. In addition to these bodies the skin excretes a small amount of carbon dioxide. Although the excretion of the skin is small in amount (if we except the water), if the escape of it be prevented by varnishing the skin death very quickly ensues. This is probably due to the retention of some poisonous substance, the nature and production of which are very little understood.

In concluding these remarks on excretory organs it may be pointed out that the lungs (looked at as excretory organs), the kidneys, and the skin are all engaged in the great task of ridding the system of its superfluous matters, and that each supplements the action of the others. The lungs are the great excretors of carbonic acid, which is the chief oxidation product of the body, though they share with the kidneys and skin the task of getting rid of water. The kidneys have thrown upon them the task of removing from the system nearly the whole of the nitrogenous waste products and the superabundant salts, besides being the greatest excretors of water. The skin, on the other hand, looked upon as an excretory organ, is second in importance to the kidneys as a remover of water, and comes next to the lungs in separating carbonic acid. The skin, it must be remembered, however, has many functions besides those of an excretory organ, for, besides being an organ of sense, it takes the chief part in regulating the temperature of the animal body.

V.—Transformations of Energy associated with the Exchange of the Matters of the Body.

The chemical changes which occur in all the tissues and organs of the body are, it has been stated, in the main, processes of oxidation, in which energy that was potential in the organic compounds and the oxygen that takes part in them become in great part kinetic. This energy takes the form of mechanical work and heat; the mechanical work is in part expended within the body itself and ultimately takes the form of heat; in part, however, it is expended upon the objects of the external world, and, though even then ultimately transformed into heat, this is not heat which is available for the purposes of the body. There can be no doubt, however, that a large portion of the total heat evolved in the body is the immediate result of chemical operations, and has not in the first instance taken the form of mechanical work.

In the article Dietetics (*q.v.*) attention has been drawn to the amount of energy which is stored up in the organic matters constituting the food of animals, and which can approximately be estimated by determining the amount of heat which the organic matters evolve when burned in a calorimeter. An approximate estimate is thus formed of the energy which is at the disposal of the animal or man whose diet is subjected to study. Thus it has been calculated that the available energy derived from the oxidation of the organic matters of the food of a well-fed man amounts to about 2,700,000 units of heat, the unit chosen being the amount required to heat 1 gramme of water 1° C. When the man is doing no external work this energy is dissipated from the body almost entirely as heat, and, according to the calculations of Helmholtz, the losses of heat are approximately distributed as follows:—

	Units of Heat.	Percentage of total Heat produced
Employed in raising the temperature of matters introduced into the alimentary canal	70,157	2·6
Employed in warming inspired air	70,032	2·6
Employed in bringing about the vaporization of water in the lungs	397,536	14·7
Lost by radiation, conduction, and evaporation from the skin	2,162,275	80·1
	2,700,000	100·0

The total income and expenditure of energy of an average man in twenty-four hours is thus calculated to correspond to the amount of heat required to raise 595 lbs of water from the temperature of melting ice to that of boiling water.

Where, it will be asked, does this transformation of energy chiefly have its seat? The answer to this question is that it is firstly in the muscles, then in the glands of the body. At all times, whether in rest or activity, heat is evolved, but the quantity increases in the case both of glands and of muscles as they pass from the former into the latter condition. In the resting body, it has been remarked, the losses of energy are represented by the loss of heat, for the mechanical work done within it takes the form of heat within the body itself. It is difficult, nay, impossible, to calculate the amount of energy which in the first instance takes the form of mechanical work in the body, and which is always transformed into heat. The case of the heart is one in which, however, an approximate calculation can be made. Upon fairly reliable data it has been calculated that the work expended by the heart of a man in twenty-four hours amounts to not less than 627,768 foot-pounds, an amount of work which is equivalent to nearly 45 pound-units of heat, and which represents the energy evolved as heat in the complete combustion of about 386 grains of carbon.

These calculations enable one to form some idea of the magnitude of the nutritive processes which have their seat in the muscular substance of the heart; and to a less degree the same is the case with all the other muscles which are engaged in so-called *opus vitale*, that is, in the performance of internal work absolutely essential to the continuance of the life of the organism.

The proportion of the total energy of the body which takes the form of mechanical work varies within very wide limits. Assuming that the conversion of potential into kinetic energy in equal times were a constant quantity, it would follow that all external work done diminished the amount of heat set free from the body. To a certain extent it is probable that such a relation exists. It is, however, to be remembered that when external work has to be done there is invariably an increased consumption of organic constituents of food, and therefore an increased store of available energy. The working animal consumes more O and produces more CO_2 than the resting animal. Different animals, like steam-engines of different construction, vary in the proportion borne by the external work they are capable of performing to the total energy which becomes kinetic. Experiments made with the separate muscles of animals, no less than observations on the relation between the external mechanical work done by and the total heat evolved in the body of animals, have, however, shown that animals are more economical machines than the most perfect steam-engines. Whilst the latter cannot convert more than one-eighth of their available energy into work, the animal may yield as much as one-fifth of its energy in the form of available external work.

VI.—Growth, Decay, and Death.

In the adult body in a state of health the income of matter balances as nearly as possible the expenditure, and therefore the weight of the body and its dimensions remain nearly constant, and the same is approximately true of the different organs and tissues which compose the body, as well as of the anatomical elements which enter into their formation. Even when the conditions to which the organism is subjected undergo great variations—as, for instance, when from a state of rest it passes into a state of great activity, or when the temperature of the medium which it inhabits undergoes great changes—and when, to meet these variations in external circumstances, the rate of the exchanges of matter has to undergo great fluctuations, the weight of the body remains nearly constant. This remarkable result is one which doubtless depends upon a great many factors which are for the most part hidden from us.

In the growing body matters are, however, very different; in it normally the income must be always so much in excess of the expenditure that an accumulation of capital may occur, and that the body may increase in weight and in dimensions. The growing body is always the seat of a more active exchange of matter than the fully-developed body, *i.e.*, weight for weight, it requires more food and oxidizes it more rapidly.

The increase of weight and of dimensions occurs in part by addition of matter to, and increase in weight and in dimensions of, individual organs and their constituent anatomical elements; in part, however, it is due to an actual multiplication of anatomical elements occurring at a rate which greatly exceeds that which occurs in the adult body. To what an extent this multiplication occurs and how it gradually diminishes is evident when we reflect that the whole organism was originally derived from a single cell, the ovum.

Upon what depends this tendency to multiplication of anatomical elements, and this tendency to increase in size of individual anatomical elements or of organs, until a certain approximate limit has been attained, is absolutely unknown. We know to a certain extent that the process of *growth* depends upon and is influenced by certain circumstances, as amount of food, temperature, blood-supply to the particular organ, and so on, but yet the knowledge is wanting which would tell us why, when a certain limit has been attained, the processes of income and expenditure balance and growth ceases.

That the nervous system has a great influence upon nutrition and therefore upon growth is certainly known, and in great measure explicable. By its control over the blood-supply to organs and tissues the nervous system exerts a remarkable influence, as well as by its relations more or less direct upon the anatomical elements through nerve-fibres, which, inasmuch as they appear to influence in a direct manner the nutrition of anatomical elements, have been surmised to exist, and have received the name of "trophic fibres." Yet, even apart from the influence exerted by the nervous system, it appears to be a property of individual anatomical elements that, consistently with health, they shall only develop at a certain rate and attain a certain magnitude.

Scarcely less mysterious than the primary causes of growth is the fact that every organism having arrived at maturity remains in a state of apparent structural and functional integrity for a term which possesses an approximately constant mean value for each species, and then sooner or later necessarily passes into a condition of gradually lessening efficiency, which ultimately terminates in death. Were the animal organism a machine undergoing a constant though very slow process of waste, its decay and ultimately its death would be more obvious than they actually are. The organism, however, differs from the machine in that its matter is continually the seat of change, and that during long periods (*i.e.*, during healthy adult life) the processes of gain and loss of matter appear to be going on with perfect evenness and equality. Why, then, the ultimate deterioration resulting in waste and then in death? The answer is that the organ as a whole unquestionably does suffer by work, and, though at first the degree of impairment is so slow as to be imperceptible, it doubtless is a continuous process.

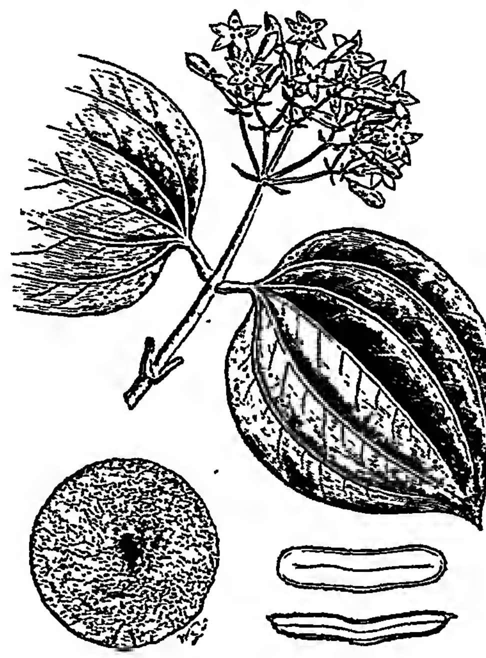
A general impairment of the mechanism of the body as

it passes from the age of mature or adult life into old age is evidenced (1) by a diminished rate in the exchange of matter of the body; (2) by a diminished power manifested by the organism as a whole, as well as by each of its individual organs, to accomplish work; (3) by a general loss of weight of the body and of its essential tissues and organs, though the weight of the body as a whole may increase by the development and storage of fat; (4) by a tendency to structural change of organs or parts of organs whose proper function is essential to life, as, for example, of the circulatory, respiratory, and nervous apparatuses; (5) by a readiness to be injuriously affected by external circumstances, which at an earlier period produce no obvious effect upon the body or only temporary impairment of its functions. The gradual and general deterioration of the organism thus evidenced is usually interrupted by the supervention of some process impairing so greatly the functions of a vital organ that the organism as a whole ceases to perform the functions which characterize it as living, and death results. Whatever the remote cause of death, the proximate cause is in every case an arrest of the circulation of the blood, putting an end to the exchanges of matter and energy which are the most characteristic of the accompaniments of life. (A. G.*)

NUTTALL, Thomas (1786-1859), botanist and ornithologist in the United States of America, where he lived and worked from 1808 until 1842, was born at Settle in Yorkshire in 1786, and spent some years as a journeyman printer in England. Soon after going to the United States he was induced by Professor Barton to apply himself to the study of the plants of that region; and in pursuance of his investigations he undertook many long and arduous as well as dangerous journeys, usually spending the summers in the field and the winters in working out the materials accumulated during his expeditions. In 1822 he was appointed curator of the botanic gardens of Harvard university, but continued his explorations, and in 1834 crossed the continent to the Pacific Ocean, and visited the Sandwich Islands. Some property having been left him in England on condition of his residing on it during part of each year, he left America in 1842, and did not again revisit it, except for a short time in 1852. He died at St Helen's, Lancashire, 10th September 1859.

Almost the whole of his scientific work was done in the States, and his published works appeared there. The more important of these are, *The Genera of North American Plants, and a Catalogue of the Species for the year* 1817, 2 vols. (1818); *Journal of Travels into the Arkansas Territory during the year* 1819 (1821); *The North American Sylva*, 3 vols. (1842-1849); *Manual of the Ornithology of the United States and of Canada* (1834 and 1840); and numerous papers on similar subjects in the various American scientific periodicals.

NUX VOMICA, a poisonous drug, consisting of the seed of *Strychnos Nux-Vomica*, L., a tree indigenous to most parts of India, and found also in Burmah, Siam, Cochin China, and northern Australia. The tree, which belongs to the natural order *Loganiaceæ*, is of moderate size, with a short, thick, often crooked stem, and ovate entire leaves, marked with 5 or 6 or 7 veins radiating from the base of the leaf. The flowers are small, greenish-white, and tubular, and are arranged in terminal corymbs. The fruit is of the size of a small orange, and has a thin hard shell, enclosing a bitter, gelatinous, white pulp, in which from 1 to 5 seeds are vertically embedded. The seed is disk-shaped, rather less than 1 inch in diameter, and about $\frac{1}{4}$ inch in thickness, slightly depressed towards the centre, and in some varieties furnished with an acute keel-like ridge at the margin. This is particularly the case with the seeds imported from Bombay and collected in that province. Those imported from Madras and Cochin China have usually a rounded margin (*Pharm. Journ.* [3], xii. p. 1053). The acute margin is considered in commerce indicative of superior quality, seeds so characterized yielding the largest quantity of the active principles. The external surface of the seed is of a greyish-green colour and satiny appearance, due to a coating of appressed silky hairs. The interior of the seed consists chiefly of horny albumen, which is easily divided along its outer edge into two halves by a



Flowers, Fruit, and Seed of Nux Vomica.

fissure, in which lies the embryo. The latter is about three-tenths of an inch long, having a pair of heart-shaped membranous cotyledons.

The drug owes its poisonous property chiefly to the alkaloids *strychnia* and *brucia*, the mixed alkaloids found in the seed being in the proportion of about 1 per cent. of the former to 2 per cent. of the latter. These alkaloids occur in the seeds in combination with a probably complex body which has been named strychnic or igasuric acid. Brucia is distinguished from strychnia by giving a red colour when moistened with strong nitric acid, and by being soluble in 150 parts of boiling water, while strychnia requires 2500 parts for its solution. It is remarkable that although the pulp contains strychnia it is not poisonous to birds, being eaten by the hornbill, *Buceros malabaricus*, and other species. Parasitic plants of the natural order *Loranthaceæ*, when growing on *Strychnos Nux-Vomica*, acquire the poisonous properties of the latter.

Nux Vomica seeds are imported into Great Britain from Bombay, Madras, and Cochin China to the average extent of about 200 tons per annum, valued at £1600.

NYANZA. For Albert Nyanza and Victoria Nyanza, see Nile, *supr.* pp. 504, 505.

NYASSA, Lake. See Zambesi.

NYBORG, a town and seaport of Denmark on the east side of the island of Fünen, 28$\frac{1}{4}$ miles by rail east of Odense, and the point from which the steam-packets cross the Great Belt to Korsör in Zealand. The fortress, built by Christian IV. and Frederick III., was dismantled in 1869, and the ruins of the castle are now used as a prison. From 4812 in 1870 the population increased to 5402 by 1880.

As early as the 12th century the town was founded and a castle erected on Knudshoved (Canute's Head) by Knud, nephew of Waldemar the Great; and from the 13th to the 15th century Nyborg was one of the most important places in Denmark, a seat of the royal court, and a frequent meeting-place of the estates. In 1531 the people of Lubeck took the town by storm. In 1658 it surrendered to the Swedes; but Peter Bredal, icebound in the harbour, held

them at bay till he was able to make his escape. By the defeat of the Swedes under the walls of the fortress in 1659 the country was freed from their dominion. In 1808 the marquis La Romana, who with a body of Spanish troops garrisoned the fortress for France, revolted from his allegiance and held out till he and a portion of his men got off with the English fleet.

NYIREGYHÁZA, a town of Hungary, in the district of Szabolcs, is situated at the junction of the river Theiss and the railways of the north-east of Hungary, 30 miles to the north of Debreczin. It contains four churches, a gymnasium, and a mineral bath. The inhabitants of the town, who numbered 24,102 in 1880, are engaged in agriculture, wine-growing, and the manufacture of soda, matches, and saltpetre. The annual fairs are largely frequented. A little to the north-west is the famous wine-producing district of Tokay, which yields about 18 million gallons of wine annually, including 3 or 4 million gallons of genuine Tokay.

NYKÖPING, a city of Sweden, the chief town of the province of Nykoping (Södermanland), is situated on both banks of a stream which unites Lakes Yngaren, Tisaren, &c., with By Fjord, and so with the Baltic. Connected by a branch line with the railway from Stockholm to the Norwegian frontier, it lies about 100 miles by rail south-west of Stockholm. The ruins of its once famous castle, the governor's residence, the churches of St Nicholas and All Saints, the town-house (1662), and the hospital are the more noteworthy buildings. The population was 4825 in 1862, 4813 in 1880.

Nykoping (*i.e.*, New-Market, Latinized as Nicopia) begins to appear as a regular town with churches and monasteries early in the 13th century. Its castle was the seat of the kings of Sodermanland, and after those of Stockholm and Calmar was the strongest in Sweden. The death of Waldemar in 1293, the starving to death of Dukes Waldemar and Eric in 1318, the marriage and the deaths both of Charles IX. and his consort Christina of Holstein, the birth of their daughter Princess Catherine, and in 1622 the birth of her son Charles X. are the main incidents of which it was the scene. Burned down in 1665 and again damaged by fire in 1719, it still remained the seat of the provincial authorities till 1760. The town was burned by Albert of Mecklenburg's party in 1389, by an accidental conflagration in 1665, and by the Russians in 1719.

NYLGHAU, or NIL-GAI, one of the largest of the antelopes, a handsome and graceful animal, with short, straight, erect horns, pointed and turned slightly forwards at the tips, and present in the male only (see Plate II., vol. ii.). It has a short erect mane, and the male has also a tuft of hair upon the throat. When adult the sexes are very different in colour, the male being generally of a dark iron-grey or slate colour, approaching black on the head and legs, while the female and young are of a bright light-brown or fawn colour. In both male and female at all ages the lips, chin, and under-parts as well as two transverse stripes on the inner sides of the ears and rings on the fetlocks are white, and the mane and tip of the tail black. The horns are black, and from 8 to 9 inches long. The male stands about 4 feet 4 inches high at the shoulder, the female is smaller. The tail is 18 to 21 inches in length.

The nylghau is one of the few true antelopes occurring in India, and is peculiar to that country, being found from near the foot of the Himalayas to the south of Mysore, though rare to the north of the Ganges and also in the extreme south. It is most abundant in central India, and does not occur in Assam or the countries to the east of the Bay of Bengal. It frequents forests and low jungles, though often found in tolerably open plains, associating in small herds. One, or very often two, young are produced at a birth, and when caught early they are readily tamed. They are often kept in captivity in the menageries of the native princes, and also in Europe, but the temper of the old males is uncertain. When fighting they drop on their knees, and then, advancing in this position until within convenient distance, make a sudden spring, butting with their horns with great force.

The first description of this animal, accompanied by a rude figure, was given by Dr Parsons in a paper entitled "An Account of a Quadruped brought from Bengal, and now to be seen in London," published in the *Philosophical Transactions* for 1745. No name was assigned to it, but the author identified it with an animal called "Biggel," seen in the stables of the viceroy of Goa by John Albert de Mandelsloe in his voyage through the Indies in 1638. In 1767 and the following years several living specimens were sent to England, from which Dr William Hunter drew up an excellent account of the characters of the male, female, and young, and of their habits in captivity, which, with a very spirited figure by Stubbs (often since copied), was published in the *Philosophical Transactions* for 1770. Dr Hunter was apparently unaware of Parsons's paper, and gives the animal the native name of "Nyl-ghau," signifying in Persian "blue bull." On Parsons's description Pallas founded his *Antilope tragocamelus* (*Spicilegia Zoologica*, i. p. 9, 1767), which was therefore its earliest specific name, though others have been used in later times, especially *A. picta*, given by Pallas (*Spicilegia*, xii. p. 14, 1777) to the animal described by Hunter under the supposition that it was a different species. It has also had several generic names, *Boselaphus*, *Damalis*, *Portax*, &c., the first-named being the one to which preference is now usually given.

NYMPH. The belief that the nature which surrounds mankind—the woods, the springs, the hills—is full of a life resembling, yet different from, human life is universal in a primitive stage of thought. At Psophis in Arcadia a row of tall cypress trees was called αἱ παρθένοι, the damsels. In other places the name κόραι was used, but the general term for the spirits who dwell in external nature was νύμφαι. All three words have the same meaning. There is a close relation between the souls of dead men and the life of nature; the Nymphs often play the part of death and carry away human beings to dwell with them. This idea appears in a slightly different form when heroes and favoured mortals live in communion with them. The connexion of a human being with a Nymph has something unnatural about it, and almost always brings some disaster on the mortal. Yet another form of the idea appears in the word νυμφόληπτος; he whose mind the Nymphs take possession of loses his human wit and becomes mad, but has wisdom more than human. The worship of the Nymphs was practised throughout the classical period in places where they seemed to have chosen a home for themselves, in shady groves and beside springs of clear water. It retained its primitive simplicity. No temple, no statue, no priest was needed; the offerings of a rural people were placed on the simple altar. The cultus is therefore not often mentioned in literature; but it appears to have been closely connected with the household life of the people, and to have had a strong hold on them. Among the ceremonies of marriage an acknowledgment of the power of the Nymphs was included. The bride, herself a νύμφη, was sprinkled with water from the fresh spring of the Nymphs, or she went to bathe in the spring.

The Nymphs, the ever-youthful spirits of nature, protected and nourished children (κουροτρόφοι); they were themselves often, especially in Asia Minor, the mothers of the heroes of the land. In the Troad, Hermes and the Sileni sport with them in the mountain caves. Their life was long, according to Hesiod 9720 times that of man; it was a common belief that they were born and died along with the trees of the forest. It was usual to distinguish Nymphs of the rivers and fountains, Naiads, from those of the forests and mountains, Dryads, Hamadryads, Oreades; but they were all κοῦραι Διός, the maidens of heaven, or, in more anthropomorphic language, the daughters of Zeus. The worship of the Nymphs became more fashionable in later time, and shrines of Nymphs (νυμφαῖα) were built even in cities.

O

O. The history of the symbol O is parallel to that of E. Each represents several sounds which are distinguished habitually in speech without any difficulty, but for which, owing to the imperfection of the English alphabet, there are no separate symbols. Probably the confusion is worst in English; but French and Italian also have more sounds for each of these symbols than can be properly included under them, and so they distinguish these sometimes by diacritical marks, as ò or ó, and sometimes they do not distinguish at all.

The different sounds which O is used to denote in English lie, with one exception, on the line between the pure *a*-sound and the pure *u*-sound. We have already seen that *e* denotes several different sounds on the other line—that between pure *a* and pure *i*. The difference between the sounds on these two lines is this. In the *a*—*i* line only the tongue is employed; it is raised more and more for each successive sound. But in the *a*—*u* line the tongue is not the only agent; the cavity of the mouth is also contracted, so that the passage is narrowed, and the lip-aperture is lessened more and more for each sound; in technical phrase the lips are "rounded," so that for *u* the aperture is the smallest possible to allow of the utterance of a true vowel, hence the great ease with which the *u* sound passes into a *w*, in which there is friction caused by the still greater closing of the lips, and therefore we have a consonant not a vowel sound.

The following different sounds—denoted by O in English—are readily discriminated. Beginning from the *a*-end of the line, we come first to the sounds heard in "not" and in "lord"; for both of these the back of the tongue is much depressed and the lips are only slightly rounded. The difference between the two sounds consists in this—for the first the back of the tongue is more convex than for the second; the passage is therefore somewhat narrowed, and the two corresponding sounds are therefore (here and in all the other similar pairs) known technically as "narrow" and "wide," or as "open" and "close." The narrow sound is written by *o* in English when *r* or *l* follows, and the wide is written *aw* as in "law," or *au* as in "Paul," or even *a* as in "pall." The next pair may be exemplified by "pole" and "pour," narrow and wide respectively; for these the tongue is higher and the rounding greater. Here again several digraphs represent the same sound, as in "foal," "soul," "hoe," "grow." Next the doubled *o* is generally used to represent the last sound in the scale, the close *u*, for which the tongue is highest and the "rounding" greatest, as in "pool"; but in "rule" and others the same symbol is used for this sound as would be used in other European languages. Lastly—the exception mentioned above—*o* is one of the symbols employed to denote the neutral vowel, as in "son," as well as *u* in "sun" and *a* in "final."

The modified German *o*—written *ö* or *oe*—is a sound unknown in English. It is produced by putting the tongue into the position for the sound denoted by *a* in "fate" or *e* in "fête"—a middle sound in the line between *a* and *i*—and then by rounding the lips. It thus combines the specialities of the two scales of vowel-sound—the *i*-scale and the *u*-scale.

In Italian there are an "open" *o* (marked *ò*) and a "close" *o* (marked *ó*). The "open" *o* corresponds to the open or wide sound described above. The "close" *o* is not quite the same as the "narrow" *o* of English, but comes a little nearer to *u*.

In the form of the symbol there is no recorded variation, except that in old Latin it was sometimes square, as ◇. In Greek two symbols were employed—O and Ω—for short and long *o* respectively. But it is not improbable that the second of these denoted at first not merely long *o* but a more open sound, more near to the sound of "law" in English.

OAJACA, or OAXACA, the chief town of the province of the same name in Mexico, lies 1600 feet above the sea in a beautiful valley on the left bank of the Atoyac, or Rio Verde, which reaches the Pacific after a course of about 170 miles. The city is surrounded by luxuriant gardens, orchards, and cochineal plantations; its streets are wide and regular, and among its public buildings are the cathedral, the bishop's palace (fashioned after the type of a similar ancient edifice at Mitla), and the Dominican monastery and church. Chocolate, cigars, cotton-cloth, wax candles, &c., are manufactured. The population was 26,228 in 1877. The city, which dates from 1522, was visited by a severe earthquake in 1870.

OAK (Anglo-Saxon, *āc* or *æc*), a word found, variously modified, in all Germanic languages, and applied to plants of the genus *Quercus*, a well-marked section of the natural order *Corylaceæ* (*Cupuliferæ* of De Candolle), including some of the most important timber trees of the north temperate zone. All the species are arborescent or shrubby, varying in size from the most stately of forest trees to the dwarfish bush. Monœcious, and bearing their male flowers in catkins, they are readily distinguished from the rest of the Cupuliferous family by their peculiar fruit, an acorn or nut, enclosed at the base in a woody cup, formed by the consolidation of numerous involucral bracts developed beneath the fertile flower, simultaneously with a cup-like expansion of the thalamus, to which the bracteal scales are more or less adherent. The ovary, three-celled at first, but becoming one-celled and one-seeded by abortion, is closely invested by the perianth, toothed on

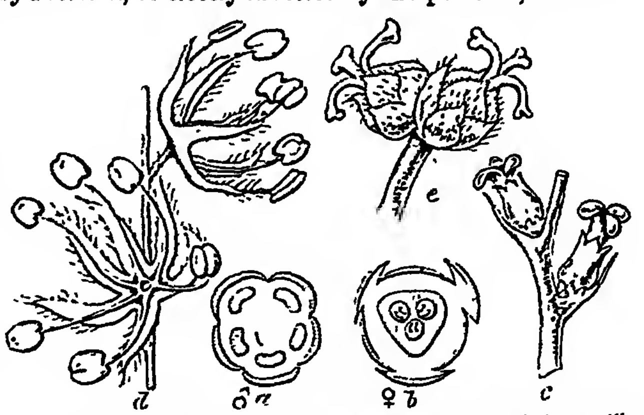


FIG. 1.—Inflorescence of Oak. *a*, *b*, *c*, *Quercus Robur*. (From Behrens, *Allgemeine Botanik*, pp. 209, 210.) *d*, *e*, *Q. sessiliflora* (Smith); half natural size. (From Kotschy, *Die Eichen Europa's*, Vienna, 1862, plate xxxii.)

the margin, and adherent below; the male flowers are in small clusters on the usually slender and pendent stalk, forming an interrupted catkin; the stamens vary from six to twelve. The alternate leaves are more or less deeply sinuated or cut in most of the species, but in some of the deciduous and many of the evergreen kinds are nearly or quite entire on the margin. The oaks are widely distributed over the temperate parts of Europe, Asia, North Africa, and North America. In the western hemisphere they range along the Mexican highlands and the Andes far into the tropics, while in the Old World the genus, well

represented in the Himalayas and the hills of China, exists likewise in the peninsula of Malacca, in Java, and in some other islands of the archipelago, several species occurring in the Moluccas and Borneo. On the mountains of Europe and North America they grow only at moderate elevations, and none approach the arctic circle. The multitude of species and the many intermediate forms render their exact limitation difficult, but those presenting sufficiently marked characters to justify specific rank probably approach 300 in number.

The well-known *Q. Robur*, one of the most valued of the genus, and the most celebrated in history and myth, may be taken as a type of the oaks with sinuated leaves. Though known in England, where it is the only indigenous species, as the British oak, it is a native of most of the milder parts of Europe, extending from the shores of the Atlantic to the Ural; its most northern limit is attained in Norway, where it is found wild up to lat. 63°, and near the Lindesnæs forms woods of some extent, the trees occasionally acquiring a considerable size. In western Russia it flourishes in lat. 60°, but on the slope of the Ural the 56th parallel is about its utmost range. Its northern limit nearly coincides with that of successful wheat cultivation. Southwards it extends to Sardinia, Sicily, and the Morea. In Asia it is found on the Caucasus, but does not pass the Ural ridge into Siberia. In Britain and in most of its Continental habitats two varieties exist, regarded by many as distinct species: one, *Q. pedunculata*, has the acorns, generally two or more together, on long stalks, and the leaves nearly sessile; while in the other, *Q. sessiliflora*, the fruit is without or with a very short peduncle, and the leaves are furnished with well-developed petioles. But, though the extreme forms of these varieties are very dissimilar, innumerable modifications are found between them; hence it is more convenient to regard them as at most sub-species of *Q. Robur*. The British oak is one of the largest trees of the genus, though old specimens are often more remarkable for the great size of the trunk and main boughs than for very lofty growth. The spreading branches have a tendency to assume a tortuous form, owing to the central shoots becoming abortive, and the growth thus being continued laterally, causing a zigzag development, more exaggerated in old trees and those standing in exposed situations; to this peculiarity the picturesque aspect of ancient oaks is

FIG. 2.—*Q. pedunculata*; half natural size (From Kotschy, *op. cit.*, plate xxvii.)

largely due. When standing in dense woods the trees are rather straight and formal in early growth, especially the sessile-fruited kinds, and the gnarled character traditionally assigned to the oak applies chiefly to its advanced age. The broad deeply-sinuated leaves with blunt rounded lobes are of a peculiar yellowish colour when the buds unfold in May, but assume a more decided green towards midsummer, and eventually become rather dark in tint; they do not change to their brown autumnal hue until late in October, and on brushwood and saplings the withered foliage is often retained until the spring. The catkins appear soon after the young leaves, usually in England towards the end of May; the acorns, oblong in form, are in shallow cups with short, scarcely projecting scales; the fruit is shed the first autumn, often before the foliage changes.

Vast oak forests still covered the greater part of England and central Europe in the earlier historic period; and, though they have been gradually cleared in the progress of cultivation, oak is yet the prevailing tree in most of the woods of France, Germany, and southern Russia, while in England the coppices and the few fragments of natural forest yet left are mainly composed of this species. The pedunculated variety is most abundant in the southern and midland counties, the sessile-fruited kinds in the northern parts and in Wales, especially in upland districts; the straighter growth and abundant acorns of this subspecies have led to its extensive introduction into plantations. The name of "durmast" oak, originally given to a dark-fruited variety of *Q. sessiliflora* in the New Forest, has been adopted by foresters as a general term for this kind of oak; it seems to be the most prevalent form in Germany and in the south of Europe. A variety of the sessile oak with sweet acorns appears to be the *Q. Esculus* of some writers. Many of the ancient oaks that remain in England may date from Saxon times, and some perhaps from an earlier period; the growth of trees after the trunk has become hollow is extremely slow, and the age of such venerable giants only matter of vague surmise. The celebrated Newland oak in Gloucestershire, known for centuries as "the great oak," was by the latest measurement 47½ feet in girth at 5 feet from the ground. The Cowthorpe oak, standing (a ruin) near Wetherby in Yorkshire, at the same height measures 38½ feet, and seems to have been of no smaller dimensions when described by Evelyn two centuries ago; like most of the giant oaks of Britain, it is of the pedunculate variety. The preservation of these old trees has been in past times largely due to the survival of the reverence in which the oak was held by Celt and Saxon,—a feeling which seems to have been shared by several Aryan races. The great regard paid to the oak probably originated in the value attached to its timber and fruit; the largest and most durable of European trees, its wood was looked upon as the most precious produce of the forest. With both Greek and Roman it was the favourite timber for house, bridge, and ship building; and the furrowed columns with spreading base that upheld their stone-built temples of historic age seem to indicate the oak-trunk as their archaic prototype. The tree was not in less esteem among the Teutonic nations; the long ships of the Northmen were hewn from the same "heart of oak" of which the war-ships of England were until lately constructed. The Anglo-Saxons employed oak timber not only for their dwellings and their fleets but occasionally for more sacred architecture,—the church till recently standing at Greenstead in Essex, and supposed to have been erected in the 10th century, was wholly formed of oak trunks roughly squared. The few ancient timber mansions still existing in England are generally built entirely of oak, which in many cases remains sound after the lapse of several hundred years, sometimes outlasting the brick and stone with which the structures have been repaired. The great oak woods that in early days covered the larger part of Britain had in Tudor times become so reduced that an Act was passed in the reign of Henry VIII. to enforce their preservation, and by the end of the 16th century oak plant-

ing became common. At present large quantities of timber are still obtained from hedgerows and copsewoods; but, although some attempts have been made to renew the royal forests, much of the oak timber employed in Britain is imported from abroad. Many of the Continental woods are failing to produce their former supply; the large quantity still obtained from the port of Memel, and formerly drawn from Prussia and nearer Poland, is now brought thither from the distant forests of the Dnieper and the Don.

The wood of the British oak, when grown in perfection, is the most valuable produced in temperate climates. The heart-wood varies in colour from dark brown to pale yellowish-brown; hard, close-grained, and little liable to split accidentally, it is, for a hard wood, easy to work. Under water it excels most woods in durability, and none stand better alternate exposure to drought and moisture, while under cover it is nearly indestructible as long as dry-rot is prevented by free admission of air. Its weight varies from 48 to about 55 lb the cubic foot, but in very hard slowly-grown trunks sometimes approaches 60 lb. The sap-wood is lighter and much more perishable, but is of value for many purposes of rural economy. The relative

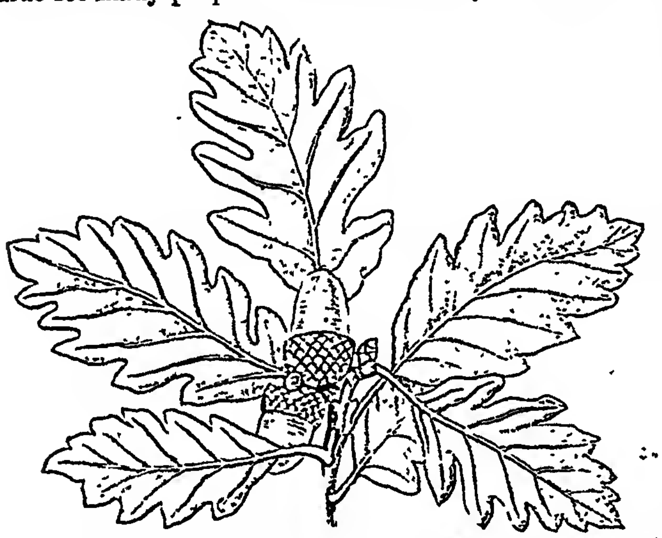

FIG. 3.—*Q. sessiliflora*; half natural size. (From Kotschy, *op. cit.*, plate xxxii.)

qualities of the two varieties have been the frequent subject of debate, the balance of practical testimony seeming to establish the superiority of *Q. pedunculata* as far as durability in water is concerned; but when grown under favourable circumstances the sessile oak is certainly equally lasting if kept dry. The wood of the durmast oak is commonly heavier and of a darker colour, hence the other is sometimes called by woodmen the white oak, and in France is known as the "chêne blanc." The oak of Britain is still in great demand for the construction of merchant shipping, though teak has become in some measure its substitute, and foreign oak of various quality and origin largely takes its place. Its great abundance of curved trunks and boughs rendered the oak peculiarly valuable to the shipwright when the process of bending timber artificially was less understood; the curved pieces are still useful for knees. The younger oaks are employed by the carpenter, wheelwright, waggon-builder, and for innumerable purposes by the country artisan. The most durable of fences are those formed of small oaks, split lengthwise by the wedge into thin boards. The finely-grained heart-wood is sought by the cabinetmaker for the manufacture of furniture, and high prices are often given for the gnarled and knotted portions of slowly-grown trees, to be sawn into veneers. Oak was formerly largely used by wood-carvers, and is still in some demand for those artists, being harder and more durable than lime and other woods that yield more readily to the sculptor's tool. Oak was thus applied at a very early date; the shrine of Edward the Confessor, still existing in the abbey at Westminster, sound after the lapse of 800 years, is of dark-coloured oak-wood. The wood, of unknown age, found submerged in peat-bogs, and of a black hue, is largely used in decorative art under the name of "bog-oak."

The oak grows most luxuriantly on deep strong clays, calcareous marl, or stiff loam, but will flourish in nearly any deep well-drained soil, excepting peat or loose sand; in marshy or moist places the tree may grow well for a time, but the timber is rarely sound; on hard rocky ground and exposed hillsides the growth is extremely slow and the trees small, but the wood is generally very hard and durable. The oak will not bear exposure to the full force of the sea gale, though in ravines and on sheltered slopes oak woods sometimes extend nearly to the shore. The cultivation of this tree in Europe forms one of the most important branches of the forester's art. It is frequently raised at once by sowing the acorns on the ground where the trees are required, the fruit being gathered in the autumn as soon as shed, and perfectly ripe seeds selected; but the risk of destruction by mice and other vermin is so great that transplanting from a nursery-bed is in most cases to be preferred. The acorns should be sown in November on well-prepared ground, and covered to a depth of 1½ or 2 inches; the seeds germinate in the spring, and the seedlings are usually transplanted when one or two years old to nursery-beds, where they are allowed to grow from two to four years, till required for the plantation. Some authorities recommend the tap-roots to be cut in the second year, with the view of increasing the ball of fibre; but, if the trees are removed from the seed-bed sufficiently early, the root is best left to its natural development. The oak requires shelter in the early stages of growth; in England the Scotch pine is thought best for this purpose, though Norway spruce answers as well on suitable ground, and larch and other trees are sometimes substituted. The conifers are allowed to grow to a height of from 3 to 5 feet before the young oaks are planted, and are gradually thinned out as the latter increase in size. The distance between the oaks depends upon the growth intended before thinning the young wood; usually they are placed from 8 to 12 feet apart, and the superabundant trees cut out as they begin to interfere with each other. The lower branches often require removal, to ensure the formation of a tall straight trunk, and this operation should be performed before the superfluous shoots get too large, or the timber will be injured; but, as with all trees, unnecessary pruning should be avoided, as every branch removed lessens the vigour of growth. Where artificial copsewood is the object, hazel, hornbeam, and other bushes may be planted between the oaks; but, when large timber is required, the trees are best without undergrowth.

The oak, after the trunk is felled, throws up shoots from the cut stump more surely and abundantly than most trees; hence it is well adapted for the formation of brushwood, of which great quantities are employed in Britain for the manufacture of crates and hoops, and for many other uses. Where the underwood consists mainly of oak it is generally cut once in twenty years, but in some places fifteen years are thought sufficient, while on poor land thirty years are sometimes allowed to intervene between the cuttings. Oak coppices are generally cut in the spring, because the bark is then more readily separated, and large timber trees are very often felled at the same period; but winter felling is probably best when sound heart-wood is the chief thing in view. The growth of the oak is slow, though it varies greatly in different trees; Loudon states that an oak, raised from the acorn in a garden at Sheffield Place, Sussex, became in seventy years 12 feet in circum

ference; but the increase of the trunk is usually very much slower, and when grown for large timber oak can rarely be profitably felled till the first century of its growth is completed. The tree will continue to form wood for 150 or 200 years before showing any symptoms of decay. As firewood oak holds a high position, though in Germany it is considered inferior to beech for that purpose. It makes excellent charcoal, especially for metallurgic processes; the Sussex iron, formerly regarded as the best produced in Britain, was smelted with oak charcoal from the great woods of the adjacent Weald, until they became so thinned that the precious fuel was no longer obtainable.

An important product of oak woods is the bark that from a remote period has been the chief tanning material of Europe. The most valuable kind is that obtained from young trees of twenty to thirty years' growth, but the trunks and boughs of timber trees also furnish a large supply; it is separated from the tree most easily when the sap is rising in the spring. It is then carefully dried by the free action of the air, and when dry built into long narrow stacks until needed for use. The value of oak bark depends upon the amount of tannin contained in it, which varies much, depending not only on the growth of the tree but on the care bestowed on the preparation of the bark itself, as it soon ferments and spoils by exposure to wet, while too much sun-heat is injurious. That obtained from the sessile-fruited oak is richer in tannic acid than that yielded by *Q. pedunculata*, and the bark of trees growing in the open is more valuable than the produce of the dense forest or coppice. The bark of young oak branches has been employed in medicine from the days of Dioscorides, and is occasionally used in modern practice, chiefly as an astringent: in decoction it is given as a gargle for throat affections depending on relaxation, and is administered in dysenteric hæmorrhages and some forms of diarrhœa; it was regarded by the practitioners of a former age as useful in consumption, a disease from which tanners are said to be nearly exempt. Poultices made of the crushed or powdered bark have been used with advantage where astringent external applications are indicated; as a tonic it has in modern medicine given place to other remedial agents. The astringent principle is a peculiar kind of tannic acid, called by chemists *querci-tannic*, which, yielding more stable compounds with gelatine than other forms, gives oak bark its high value to the tanner. According to Neubauer, the bark of young oaks contains from 7 to 10 per cent. of this principle; in old trees the proportion is much less.

The acorns of the oak possess a considerable economic importance as food for swine. In the Saxon period the "mast" seems to have been regarded as the most valuable produce of an oak wood; nor was its use always confined to the support of the herds, for in time of dearth acorns were boiled and eaten by the poor as a substitute for bread both in England and France, as the sweeter produce of *Q. Esculus* is still employed in southern Europe. Large herds of swine in all the great oak woods of Germany depend for their autumn maintenance on acorns; and in the remaining royal forests of England the inhabitants of the neighbouring villages yet claim their ancient right of "pannage," turning their hogs into the woods in October and November. Some trees of the sessile-fruited oak bear sweet acorns in Britain, and several varieties were valued by the ancient Italians for their edible fruit. A peculiar kind of sugar called *quercite* exists in all acorns. A bitter principle to which the name of *quercin* has been applied by Gerber, its discoverer, has also been detected in the acorn of the common oak; the nutritive portion seems chiefly a form of starch. A spirit has been distilled from acorns in process of germination, when the saccharine principle is most abundant.

The British oak grows well in the northern and middle States of America; and, from the superiority of the wood to that of *Q. alba* and its more abundant production of acorns, it will probably be much planted as the natural forests are destroyed. The young trees require protection from storms and late frosts even more than in England; the red pine of the north-eastern States, *Pinus resinosa*, answers well as a nurse, but the pitch pine and other species may be employed. In the southern parts of Australia and in New Zealand the tree seems to flourish as well as in its native home.

The oak in Europe is liable to injury from a great variety of insect enemies: the young wood is attacked by the larvæ of the small stag-beetle and several other *Coleoptera*, and those of the wood-leopard moth, goat moth, and other *Lepidoptera* feed upon it occasionally; the foliage is devoured by innumerable larvæ; indeed, it has been stated that half the plant-eating insects of England prey more or less upon the oak, and in some seasons it is difficult to find a leaf perfectly free from their depredations. The young shoots are chosen by many species of *Cynipidæ* and their allies as a receptacle for their eggs, giving rise to a variety of gall-like excrescences, from which few oak trees are quite free.

Of the European timber trees of the genus, the next in importance to the British oak is *Q. Cerris*, the Turkey oak of the nurserymen. This is a fine species, having when young straighter branches than *Q. Robur*, but in old age the boughs generally curve downwards, and the tree acquires a wide spreading head; the bark is dark brown, becoming grey and furrowed in large trees; the foliage varies much, but in the prevailing kinds the leaves are very deeply sinuated, with pointed, often irregular lobes, the footstalks short, and furnished at the base with long linear stipules that do not fall with the leaf, but remain attached to the bud till the following spring, giving a marked feature to the young shoots. The large sessile acorns are longer than those of *Q. Robur*, and are dark-brown when ripe; the hemispherical cups are covered with long, narrow, almost bristly scales, giving them a mossy aspect; the fruit ripens the first autumn. The foliage in some of the numerous varieties is almost evergreen, and in Britain is retained long after the autumnal withering.

This oak abounds all over the Turkish peninsula, and forms a large portion of the vast forests that clothe the slopes of the Taurus ranges and the south shores of the Black Sea; it is likewise common in Italy and Sardinia, and occurs in the south of France and also in Hungary. It was introduced into England by Miller about 1735, and is now common in parks and plantations, where it seems to flourish in nearly all soils. The Turkey oak in southern England grows twice as fast as *Q. Robur*; in the mild climate of Devonshire and Cornwall it has reached a height of 100 feet and a diameter of 4 feet in eighty years, which is about the limit of its profitable growth for timber. The wood is hard, heavy, and of fine grain, quite equal to the best British oak for indoor use, but of very variable durability where exposed to weather. The ships of Greece and Turkey are largely built of it, but it has not always proved satisfactory in English dockyards. The heart-wood is dark in colour, takes a fine polish, and from the prominence of the medullary rays is valuable to the furniture maker; it weighs from 40 to 50 ℔ the cubic foot. The comparatively rapid growth of the tree is its great recommendation to the planter; it is best raised from acorns sown on the spot, as they are very bitter and little liable to the attacks of vermin; the tree sends down a long tap-root, which should be curtailed by cutting or early transplanting, if the young trees are to be removed. It seems peculiarly adapted for the mild moist climate of Ireland. It succeeds in many parts of the United States, but is less hardy than the native species. It would appear well fitted for New Zealand planting. Acorns are produced on the Turkey oak in great abundance in some seasons, but in cold wet years do not always ripen in Britain; notwithstanding their bitterness they are greedily eaten by swine. Some southern varieties of this tree bear acorns comparatively sweet, and they are sometimes eaten after being roasted, in which process the tannic acid is partly destroyed. Dalechamps says that some of the esculent acorns of southern Europe occasionally prove unwholesome, causing effects resembling those of poisoning by *Lolium temulentum*.

In North America, where the species of oak are very numerous, the most important member of the group is *Q. alba*, the white oak, abounding all over the eastern districts of the continent from Lake Winnipeg and the St Lawrence countries to the shores of the Mexican Gulf. In aspect it more nearly resembles *Q. Robur* than any other species, forming a thick trunk with spreading base and, when

growing in glades or other open places, huge spreading boughs, less twisted and gnarled than those of the English oak and covered with a whitish bark that gives a marked character to the tree. The leaves are large, often irregular in form, usually with a few deep lobes dilated at the end; they are of a bright light green on the upper surface, but whitish beneath; they turn to a violet tint in autumn. The egg-shaped acorns are placed singly or two together on short stalks; they are in most years sparingly produced, but are occasionally borne in some abundance. On rich loams and the alluvial soils of river-valleys, when well drained, the tree attains a large size, often rivalling the giant oaks of Europe; trunks of 3 or 4 feet in diameter are frequently found, and sometimes these dimensions are greatly exceeded. The wood is variable in quality and, though hard in texture, is less durable than the best oak of British growth; the heart-wood is of a light reddish brown varying to an olive tint; a Canadian specimen weighs 52¼ lb the cubic foot. In the States it is largely used in shipbuilding, for house timber, and many other purposes; wheels and the frames of waggons and sleighs as well as casks are often made of it; large quantities are exported to England from Canada. The young wood is very strong, flexible, and elastic; it is split into thin strips, to be made into baskets. The large roots, often presenting a very fine grain and taking a good polish, are sought for by the cabinetmaker. The bark is inferior to that of many oaks. The acorns are sweet, and were formerly eaten by the Red Men, but are too scantily produced in most seasons to be of much economic importance. White oaks have often been planted in England, but the trees do not grow as fast as in their native land, while the wood is inferior. According to some American authorities, the timber of *Q. alba* is of better quality in the southern and middle States than in Canada and New England.

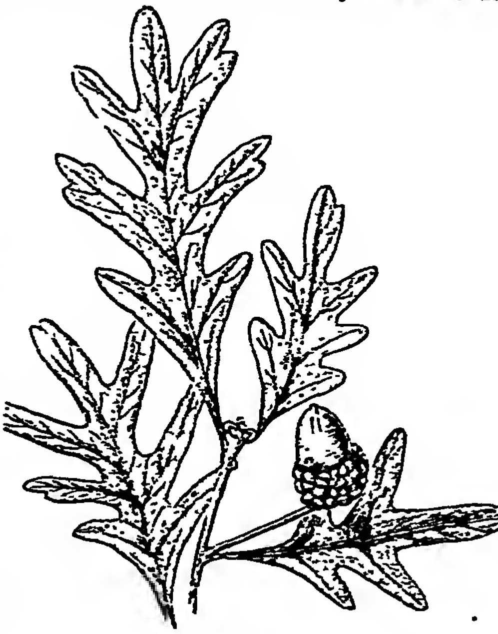

Fig. 4.—*Q. alba pinnatifida*; one-third natural size. (From Michaux, *Histoire des chênes de l'Amérique*.)

Q. obtusiloba, the post oak of the backwoodsman, a smaller tree with rough leaves and notched upper lobes, produces an abundance of acorns and good timber, said to be more durable than that of the white oak.

The pin oak, sometimes called the "over-cup" oak, *Q. macrocarpa*, is remarkable for its large acorns, the cups bordered on the edge by a fringe of long narrow scales; the leaves are very large, sometimes from 10 inches to a foot in length, with very deep lobes at the lower part, but dilated widely at the apex, and there notched. The tree is not of large growth, but its tough wood is useful for bolts and trenails; it is sometimes called the "burr-oak."

The true over-cup oak, *Q. lyrata*, is a large tree, chiefly found on swampy land in the southern States; the lyrate leaves are dilated at the end; the globose acorns are nearly covered by the tuberculated cups.

In the woods of Oregon, from the Columbia river southwards, an oak is found bearing some resemblance to the British oak in foliage and in its thick trunk and widely-spreading boughs, but the bark is white as in *Q. alba*; it is *Q. Garryana*, the western oak of Nuttall. This tree acquires large dimensions, the trunk being often from 4 to 6 feet in diameter; the wood appears to be good, but experience has scarcely tested its durability; the acorns are produced in great quantity, and are used by the Indians as food.

The red oak, *Q. rubra*, has thin large leaves on long petioles, the lobes very long and acute, the points almost bristly; they are pink when they first expand in spring, but become of a bright glossy green when full-grown; in autumn they change to the deep purple-red which gives the tree its name. Common throughout the northern and middle States and Canada, the red oak attains a large size only on good soils; the wood is of little value, being coarse and porous, but it is largely used for cask-staves; the bark is a valuable tanning material.

A species nearly allied is the scarlet oak, *Q. coccinea*, often confounded with the red oak, but with larger leaves, with long lobes ending in several acute points; they change to a brilliant scarlet with the first October frosts, giving one of the most striking of the various glowing tints that render the American forests so beautiful in autumn. The trunk, though often of considerable size, yields but an indifferent wood, employed for similar purposes to that of *Q. rubra*; the bark is one of the best tanning materials of the country. Both these oaks grow well in British plantations, where their bright autumn foliage, though seldom so decided in tint as in their native woods, gives them a certain picturesque value.

Fig. 5.—*Q. rubra*; one-fourth natural size. (From Michaux, *op. cit.* plate xxxv.)

Nearly akin to these are several other forms of little but botanical interest; not far removed is the black or dyer's oak, *Q. tinctoria*, a large and handsome species, with a trunk sometimes 4 feet in diameter, not uncommon in most forests east of the Mississippi, especially in somewhat upland districts. The leaves are frequently irregular in outline, the lobes rather short and blunt, widening towards the end, but with setaceous points; the acorns are nearly globular. The wood is coarsely grained, as in all the red-oak group, but harder and more durable than that of *Q. rubra*, and is often employed for building and for flour-barrels and cask-staves. The bark, very dark externally, is an excellent tanning substance; the inner layers form the *quercitron* of commerce, used by dyers for communicating to fabrics various tints of yellow, and, with iron salts, yielding a series of brown and drab hues; the colouring property depends on a crystalline principle called *quercitrin*, of which it should contain about 8 per cent. The cut-leaved oaks are represented in eastern Asia by several species, of which *Q. mongolica* is widely spread over Dahouria, north China, and the adjacent countries; one of the Chinese silkworms is said to feed on the leaves.

The chestnut oaks of America represent a section distinguished by the merely serrated leaves, with parallel veins running to the end of the serratures. *Q. Prinus*, a beautiful tree of large growth, and its sub-species *Q. castanea* and *Q. montana*, yield timber little inferior to white oak. *Q. Chinquapin* or *prinoides*, a dwarf variety, often only a foot in height, forms dense miniature thickets on the barren uplands of Kansas and Missouri, and affords abundant sweet acorns; the tree is called by the hunters of the plains the "shin-oak."

Fig. 6.—*Q. castaneæfolia* (Meyer); one-third natural size (From Kotschy, *op. cit.*, plate xi.)

Evergreen oaks with entire leaves are represented in North America by *Q. virens*, the live oak of the southern States; more or less abundant on the Atlantic coasts of Carolina and Florida, its true home is the country around the Mexican Gulf, where it rarely grows more than 50 or 60 miles inland. The oval leaves are dark-green above, and whitish with stellate hairs beneath, the margin entire and slightly recurved. The live oak is one of the most valuable timber trees of the genus, the wood being extremely durable, both exposed to air and under water; heavy and close-grained, it is perhaps the best of the American oaks for shipbuilding, and is invaluable for water-wheels and mill-work. Live oaks grow but slowly, and few large trees are left in the settled districts; but when standing in open places the trunk sometimes attains a great size, and an old tree, with its far-spreading boughs, often clothed with the beard-like "Spanish moss," has a peculiarly

venerable aspect. One growing at Grove Creek, near Charleston, is said to have attained a girth of 45 feet at the ground; trees of 12 feet in circumference were formerly not unfrequent. The stalked oblong acorns in elongated cups are pleasant in taste, and were eaten by the Indians of Texas. The tree in England is scarcely hardy, though it will grow freely in some sheltered places. Many varieties of *Q. virens* are found in the Mexican isthmus.

The evergreen oak of southern Europe is *Q. Ilex*, usually a smaller tree, frequently of rather shrub-like appearance, with abundant glossy dark-green leaves, generally ovate in shape and more or less prickly at the margin, but sometimes with the edges entire; the

Fig. 7.—*Q. Ilex* (L.); half natural size. (From Kotschy, *op. cit.* plate xxxviii.)

under surface is hoary; the acorns are oblong on short stalks. The ilex, sometimes called by gardeners the "holm oak" from its resemblance to the holly, abounds in all the Mediterranean countries, showing a partiality for the sea air. The stem sometimes grows 80 or 90 feet in height, and old specimens are occasionally of large diameter; but it does not often reach a great size. In its native lands it attains a vast age; Pliny attributes to several trees then growing in Rome a greater antiquity than the city itself. The wood is very heavy and hard, weighing 70 lb the cubic foot; the colour is dark brown; it is used in Spain and Italy for furniture, and in the former country for firewood and charcoal. In Britain the evergreen oak is quite hardy in ordinary winters, and is useful to the ornamental planter from its capacity for resisting the sea gales; but it generally remains of small size. *Q. Ballota*, an allied form, abundant in Morocco, bears large edible acorns, which form an article of trade with Spain; an oil, resembling that of the olive, is obtained from them by expression. *Q. Gramuntia*, another allied species, also furnishes a fruit which, after acquiring sweetness by keeping, is eaten by the Spaniards.

In America several oaks exist with narrow lanceolate leaves, from which characteristic they are known as "willow oaks." *Q. Phellos*, a rather large tree found on swampy land in the southern States, is the most important of this group; its timber is of indifferent quality.

The cork oak, *Q. Suber*, has been described in a preceding article (Cork). In Spain the wood is of some value, being hard and close-grained, and the inner bark is used for tanning. From its rugged silvery bark and dark-green foliage, it is a handsome tree, quite hardy in Cornwall and Devonshire, where it has grown to a large size.

Fig. 8.—*Q. Vallonea*; half natural size. (From Kotschy, *op. cit.*, plate vii.)

The valonia of commerce, one of the richest of tanning materials, is the acorn of *Q. Ægilops*, a fine species indigenous to Greece and the coasts of the Levant, and sometimes called the "Oak of Bashan." The very large acorns are remarkable for their thick cups with long reflexed scales; the leaves are large, oblong, with deep serratures terminating in a bristle-like point. The cups are the most valuable portion of the valonia, abounding in tannic acid; immature acorns are sometimes exported under the name of "camatina." The allied *Q. Vallonea* likewise yields valonia.

Some oaks are of indirect importance from products formed by their insect enemies. Of these the Aleppo gall (see Galls) is yielded by *Q. infectoria*. *Q. coccifera*, a small bush growing in Spain and many countries around the Mediterranean, furnishes the kermes dye (Kermes). *Q. persica*, or according to some *Q. mannifera*, attacked by a kind of *Coccus*, yields a sweet exudation which the Kurds collect and use as manna, or as a substitute for honey or sugar in various confections (see Manna). (C. P. J.)

OAKAPPLE, or Oakgall. See Galls, vol. x. p. 45.

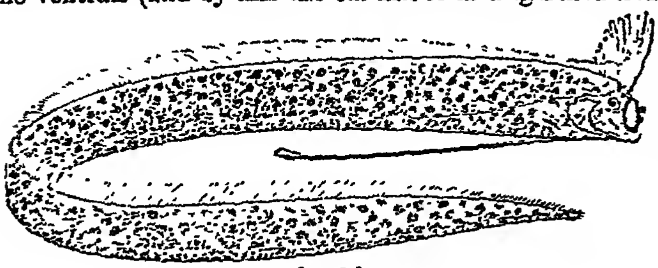
OAKLAND, a city of the United States, in Alameda county, California, lies opposite San Francisco, of which it is practically a residential suburb, on the eastern shore of San Francisco Bay, at the terminus of the Central Pacific Railroad. Its beautiful situation, its shady streets, and the excellent quality of its buildings make it a distinctly attractive place. A branch of the bay, dividing the city into East and West Oakland, forms a good harbour, but is obstructed by a bar. The railway pier, 2 miles long, contains a number of warehouses and is traversed by a broad carriage road. Among the local industrial establishments are flour-mills, planing-mills, potteries, tanneries, and a jute-factory turning out 5,000,000 sacks per annum. Oakland, deriving its name from a grove of oaks in the midst of which it was built, was incorporated as a city in 1854. Its population was 1549 in 1860, 10,500 in 1870, and 34,555 in 1880.

OAKUM is a preparation of tarred fibre used in ship-building, for caulking or packing joints of timbers in wood vessels and the deck planking of iron and steel ships. Oakum is made by preference from old tarry ropes and cordage of vessels, its teasing and preparation being a common penal occupation in prisons.

OAMARU, a municipal borough on the coast of Otago, New Zealand (South Island), 73 miles by rail north from Dunedin, and in 45° 5′ S. lat. and 171° 2′ E. long., is a thriving seaport. It is the outlet of the largest agricultural district in New Zealand, and comprises land of exceptional fertility. It is on the main railway between Christchurch and Dunedin, and is connected by branch lines with fertile inland districts. A breakwater and mole, constructed of blocks of concrete like those used at Port Said in Egypt, enclose a large and commodious basin in what was an open roadstead; and the harbour, when completed, will be one of the safest in the colony, and capable of accommodating very large ships. Steamers run three or four times a week between Oamaru and Dunedin. The town is well supplied with gas and water, and is built of white Oamaru limestone, an excellent building-stone abundant in the district. The population in 1881 was 5791; and the capital value of the rateable property in 1883 was £810,428. Coal is obtained at the entrance of Shag Valley, 40 miles to the south. The district is famed for its stock, and the fine quality of its grain, which is often equal to that of South Australia; also for the character of the English grasses laid down there, which flourish in a rich black loam on a limestone formation. The local industries comprise flour-mills, an elevator in connexion with storing grain, a woollen factory, the Oamaru stone company, a boot and shoe factory, a meat-preserving factory, breweries, and a bacon-curing factory. There are several public buildings, including a grammar school, a hospital, an athenæum, and a public hall.

OAR-FISH, a fish of the family of ribbon-fishes (*Trachypteridæ*), to which great interest is attached no less on account of the extraordinary shape of its body than of its internal organization, which is unmistakably that of a deep-sea fish. As in the other members of this family, the body is much elongated and compressed, sword-shaped;

but in the oar-fish this character is excessive, the length of the body being about fifteen times its depth. The head likewise is compressed, short, resembling in its form that of a herring; the eye is large; the mouth is small, and provided with very feeble teeth. A long many-rayed dorsal fin, of which the very long anterior rays form a kind of high crest, extends from the top of the head to the end of the tail; the anal and perhaps the caudal fins are absent; but the ventrals (and by this the oar-fish is distinguished from



Oar-fish.

the other ribbon-fishes) are developed into a pair of long filaments, which terminate in a paddle-shaped extremity, but are too flexible to assist in locomotion. The whole body is covered with a layer of silvery epidermoid substance, which easily comes off and adheres to other objects.

Oar-fishes are the largest deep-sea fishes known, the majority of the specimens observed measuring 12 feet in length; but some are recorded to have exceeded 20 feet. Their range in the great depths of the ocean seems to extend over all seas, from the North Sea to the South Atlantic, from Mauritius and Japan to the coasts of New Zealand. But, however numerous they may be in the depths which are their home, it is only by rare accident that specimens reach the surface; and of these a very small proportion only have come under the observation of naturalists, and been actually recorded. Thus from the coasts of Great Britain only about twenty captures are known in the long space of a century and a half, and not more than thirteen from those of Norway. Oar-fishes have been considered by naturalists to have given rise to some of the tales of "sea-serpents," but their size as well as the facility with which they are secured when observed render this solution of the question of the existence of such a creature improbable. When they rise to the surface of the water they are either dead or in a helpless and dying condition. The ligaments and tissues by which the bones and muscles were held together whilst the fish lived under the immense pressure of great depths have then become loosened and torn by the expansion of the internal gases; and it is only with difficulty that the specimens can be taken entire out of the water, and preserved afterwards. Every specimen found has been more or less mutilated; and especially the terminal portion of the tail, which seems to end in a delicate tapering filament, has never been perfect;—it is perhaps usually lost as a useless appendage at a much earlier period of the life of the fish.

OASES. Throughout the great belt of desert extending from the west coast of Africa to central Asia, various fertile tracts occur, clothed with vegetation and watered by springs, to which the name oases has been applied. Those which are best known are met with in the central and eastern portions of the Great Sahara and in the Libyan Desert. In that region they consist generally of deep depressions or valleys, locally termed "wádis," where the water comes to the surface in natural springs, or where it may be procured by sinking wells. Under the influence of these beneficent springs vegetation bursts forth and covers a more or less extensive area, which becomes a halting-place for travellers in the desert, and frequently supports a considerable population. Many of the oases are situated in the mountainous regions, where the ground is sufficiently elevated to precipitate the moisture in the atmosphere. The rain which falls, however, is rapidly absorbed by the rocks or sandy soil, and much of it collects in depressions at no great depth from the surface. The Arabs have long been in the habit of tapping these subterranean waters by sinking wells, a copious supply being usually obtained at depths varying down to 200 fathoms. Indeed, so rapidly does the water ascend when the aqueous strata are pierced in certain localities that the well-sinkers are sometimes suffocated ere they reach the surface. In the Algerian Sahara a large number of artesian wells have been sunk by the French, resulting in the formation of oases, which have to some extent affected the habits of the native tribes by inducing them to become cultivators of these fertile tracts. It is evident, therefore, that, notwithstanding the arid climate which prevails generally throughout the African deserts, a tolerably plentiful supply of water can be obtained by artificial means at various points. The springs, being essential to the very existence of the oases, are naturally guarded with care so as to prevent the sands encroaching on them. Should they cease to flow, the decay of the vegetation rapidly ensues and the oases disappear. Another characteristic feature of these fertile tracts is the palm-tree forests, which are admirably adapted to such unfavourable conditions. The date and the dûm palm are the commonest species met with in the forests; they are highly prized by reason of the produce which they yield to the cultivators of the soil and the shelter which they afford from the scorching sun. Indeed, so serviceable are they that in some cases the Arabs artificially create an oasis with the aid of a few palm trees by digging holes deep enough to allow the roots to pierce the aqueous strata.

From the accounts given by various travellers it would appear that, while the larger oases cover extensive tracts, the smaller ones are liable to be effaced by drifting sand As an example of one of the largest, Aïr or Asben may be mentioned, which measures 180 miles from north to south Such extensive fertile tracts are dotted over with villages, whose inhabitants carry on the cultivation of the soil and export various articles of produce. By means of irrigation different cereals are successfully cultivated, such as barley, rice, and millet.

In the western Sahara the chief oases are:—(1) Tuát, about 1000 miles to the south-west of Tripoli, the principal town being Insálah ('Ain Sálah); (2) Taudeni, south-west of Tuát; (3) 'Arawán, south of Taudeni and north of Timbuktu; and (4) Wálata, south-west of 'Arawán. In the eastern portion of the Great Desert the important oases are:—(1) Fezzán, the capital of which is Morzúk, lying to the south-south-east of Tripoli; (2) Ghadámes, north-west of Fezzán; (3) Tibesti, south of Fezzán; (4) Bilma, west-south-west of Tibesti; and (5) Aïr or Asben, west from Bilma and north-west from Lake Tchad. The last is perhaps one of the most remarkable oases in the African desert, forming a tableland whose average elevation is 2000 feet, with peaks rising to a height of 5000 feet. Heavy tropical rains are precipitated by this lofty plateau, and hence the valleys are clothed with vegetation. This oasis is richly cultivated, producing barley, maize, and millet. The capital is Agades, a town with 7000 inhabitants, which is situated on the caravan route between Morzúk and Sokoto, and constitutes one of the important centres of trade in central Africa.

In the Libyan Desert the chief oases are:—(1) Khargeh or Khárija (the outer oases), sometimes termed the *oasis magna*, about 120 miles to the west of Thebes; (2) Dakhel or Dákhila (the inner oases), situated to the west of Khargeh; (3) Farafreh (Farafira), north-west of Dakhel; (4) Bahriya (northern), to the north of Farafreh; (5) Síwa (the famous oasis of Jupiter Ammon), at the northern limits of the Libyan Desert; and (6) the Kufra group, south-west of Síwa. Perhaps the most fertile of these tracts is Dakhel, which was first made known to Europeans in 1819 by Sir A. Edmonstone. The chief produce consists of dates, rice, olives, and apricots, but durra, barley, lemons, citrons, and figs also grow on the rich soil of this oasis. It contains eleven villages, the total population being estimated at 6000.

Similar fertile tracts, though of smaller extent, occur in Arabia and in that part of Persia lying to the west of the Salt Desert. In

central Asia the great desert of Gobi, ranging from Turkestan to Manchuria, is interspersed with a few oases, the chief one being Kami, which is characterized by a rich growth of vegetation.

OAT, *Avena sativa*, L., one of about forty species mostly dispersed through the temperate regions of the Old World. It belongs to the tribe *Aveneæ* of the order *Gramineæ* or Grasses. The spikelets form a loose panicle, familiar in the cultivated oat, the flowering glume having its dorsal rib prolonged into an awn, which is in some species twisted and bent near the base.

The origin of the cultivated oat is generally believed to be *A. fatua*, L., or "wild oat." Prof. J. Buckman succeeded in raising "the potato-oat type" and "the white Tartarian oat" from grain of this species.[1] Mr A. Stephen Wilson, however, thinks that as yet there is no real proof of this relationship, because his own cultivation of the wild oat made no difference upon it;[2] but there appears to be a great tendency in the oat to degenerate on stiff clay soils into "weed oats," a fact which may perhaps account for this divergence of opinion. Lindley had previously suggested that the cultivated oat was a domesticated variety of some wild species, and that it might not improbably be referred to *A. strigosa*, Schreb., "the bristle-pointed oat," which is the origin of the Scotch oat, according to Buckman. The white and black varieties of this species, Mr Wilson observes, were cultivated in England and Scotland from remote times, and "are frequently mentioned in Rogers' *History of Agriculture and Prices* . . . and they are still grown as a crop in Orkney and Shetland."[3] Both these species are found in Europe, North Africa, Siberia, and north-west India.[4] The "naked oat," *A. nuda*, L., is probably only a race of *A. sativa*;[5] it was found by Bunge in waste ground about Pekin. "According to Lindley," writes Mr Wilson,[6] "*the naked oat* is the pilcorn of the old agriculture, and we see from Rogers[7] that it was in cultivation in England in the 13th century." Both this and the "common otes," *A. vesca*, are described by Gerard.[8] Parkinson tells us that in his time [early in the 17th century] *the naked oat was sown in sundry places*, but "nothing so frequent" as the common sort. The chief differences between *A. fatua* and *A. f.*, var. *sativa*, according to Buckman,[9] are, that in the former the chaff-scales which adhere to the grain are thick and hairy, and in the latter they are not so coarse and are hairless. The wild oat, moreover, has a long stiff awn, usually twisted near the base. In the cultivated oat it may be wanting, and if present it is not so stiff and is seldom bent. The grain is very small and worthless in the one, but larger and full in the other. Mr Wilson adds that in the point of attachment "in the wild oat the hanger terminates in a little oval spatula, . . . forming a kind of ball-and-socket connexion. . . . In the cultivated oat the continuity of the vascular tissue in the hanger is not broken off by any point of the kind."[10] There are now many varieties of the cultivated oat.[11] With regard to the antiquity of the oat, De Candolle observes that it was not cultivated by the Hebrews, the Egyptians, the ancient Greeks, and the Romans.[12] Central Europe appears to be the locality where it was cultivated earliest, at least in Europe, for grains have been found among the remains of the Swiss lake-dwellings perhaps not earlier than the bronze age,[13] while Pliny alludes to bread made of it by the ancient Germans.[14] Pickering also records Galen's observations (*De Alim. Fac.*, i. 14), that it was abundant in Asia Minor, especially Mysia, where it was made into bread as well as given to horses; he also states that ten varieties were introduced by Mohammed Ali into Egypt for fodder, and that it was seen by Bruce wild in Abyssinia, sometimes tall enough to conceal horse and rider (Grev.). And he adds that eastward from Syria it is called "sulu" by the Tatars, and was observed by Kaempfer and others in Japan; that it was brought over by colonists, and is now cultivated in north-east America; and that it has now become naturalized in parts of South America.[15]

FIG. 2.—Spikelet of *A. fatua*, var. *sativa*; with two fertile florets, and one terminal, rudimentary. (After Nees.)

FIG. 3.—Spikelet of Wild Oat, *A. fatua*; glumes hairy and long-pointed; awn twisted at base. (After Buckman.)

Besides the use of the straw when cut up and mixed with other food for fodder, the oat grain constitutes an important food for both man and beast. Being cultivated best in comparatively low temperatures, it has long formed the staple food for Scotland, north England, and Derbyshire, as well as for Germany, wherever wheat does not flourish. It is extensively grown in all the northern States of the American Union, and in New England its production largely exceeds that of wheat. The oat grain (excepting the naked oat), like that of barley, is closely invested by the husk. "This latter is used both in Scotland and Wales for the preparation of a kind of porridge . . . called sowans and sucan."[16] Oatmeal is made from the kiln-dried grain from which the husks have been removed; and the form of the food is the well-known "porridge." In Ireland it is mixed with Indian-corn meal and is called "stirabout." Groats or grits are the whole kernel from which the husk is removed. Their use is for gruel, which used to be consumed as an ordinary drink in the 17th century at the coffee-houses in London. The meal can be baked into "cake" or biscuit, as the Passover-cake of the Jews; but it cannot be made into loaves in consequence of the great difficulty in rupturing the starch grains, unless the temperature be raised to a considerable height. With regard to the nutritive value of oatmeal, as compared with that of wheat flour, it contains a higher percentage of albuminoids than any other grain, viz., 12·6—that of wheat being 10·8—and less of starch, 58·4, as against 66·3 in wheat. It has rather more sugar, viz., 5·4—wheat having 4·2—and a good deal more fat, viz., 5·6, as against 2·0 in flour. Lastly, salts amount to 3·0 per cent. in oat, but are only 1·7 in wheat. Its nutritive value, therefore, is higher than that of ordinary seconds flour.[17]

OATES, Titus (*c.* 1650 to 1705), was, according to one account, the son of an Anabaptist preacher, chaplain to Pride, and, according to another, of Samuel, the rector of All Saints' Church, Hastings. He was admitted on 11th June 1665 to Merchant Taylors', having, according to one authority, been previously at Oakham. There he remained a year, more or less, "and seems afterwards to have gone to Sedlescombe school in Sussex, from whence he passed to Caius College, Cambridge, on 29th June 1667, and was admitted a sizar of St John's, 2d February 1668/9, aged 18." Upon very doubtful authority he is stated to have been also at Westminster School before going to the university. On leaving the university he apparently took Anglican orders, and officiated in several parishes, Hastings among them. Having brought malicious charges in which his evidence was rejected, he narrowly escaped prosecution for perjury. He next obtained a chaplaincy in the navy, from which he appears to have been speedily dismissed for bad conduct and with the reputation of worse. He now, it is said, applied for help to Dr Tonge, rector of St Michael's in Wood Street, an honest half-crazy man, who even then was exciting people's minds by giving out quarterly "treatises in print to alarm and awake his majesty's subjects." Oates offered his help, and it was arranged that he should pretend to be a Roman Catholic so as the better to unearth the Jesuit plots which possessed Tonge's brain (Lingard). Accordingly he was received into the church by one Berry, himself an apostate, and entered the Jesuit College of Valladolid as Brother Ambrose. Hence he was soon expelled. In October 1677 he made a second application, and was admitted to St Omer on 10th December. So scandalous, however, was his conduct that he was finally dismissed in 1678. Returning in June 1678 to Tonge, he set himself to forge a plot by piecing together things true and false, or true facts falsely interpreted, and by inventing treasonable letters and accounts of preparations for military action. The whole story was written by Oates in Greek characters, copied into English by Tonge, and finally told to one of Charles II.'s confidential servants named Kirkby (Lingard). Kirkby having given the king his information, Oates was sent for (13th August), and in a private interview gave details, in forty-three articles, of the plot and the persons who had engaged to assassinate Charles. The general improbability of the story was so manifest, and the discrepancies were so glaring, that neither then nor at any subsequent time did Charles express anything but amused incredulity. To bolster up the case a fresh packet of five forged letters was concocted (31st August); but the forgery was transparent, and even Sir William Jones, the attorney-general, though a violent upholder of the plot, dared not produce them as evidence.

Oates now (6th September) made an affidavit before Sir Edmondbury Godfrey to an improved edition of his story, in eighty-one articles. Among the persons named was Coleman, secretary to the duchess of York, whom Godfrey knew, and to whom he sent word of the charges. Coleman in turn informed the duke, and he, since the immediate exposure of the plot was of the utmost consequence to him, induced Charles to compel Oates to appear (28th September) before the privy council. Here Oates delivered himself of a story the falsehood of which was so obvious that the king was able to expose him by a few simple questions. At this moment an accident most fortunate for Oates took place. Amongst the papers seized at his request were Coleman's, and in them were found copies of letters written by the latter to Père la Chaise, suggesting that Louis should furnish him with money, which he would use in the French and Catholic interest among members of parliament. Among them, too, were these passages: "Success will give the greatest blow to the Protestant religion that it has received since its birth"; "we have here a mighty work upon our hands, no less than the conversion of three kingdoms, and by that perhaps the utter subduing of a pestilent heresy, which has so long domineered over great part of the northern world." The credit of Oates was thus, in the eyes of the people, re-established, and Coleman and others named were imprisoned. Charles was anxious for his brother's sake to bring the matter to a conclusion, but he dared not appear to stifle the plot; so, when starting for Newmarket, he left orders with Danby that he should finish the investigation at once. But Danby purposely delayed; an impeachment was hanging over his head, and anything which took men's minds off that was welcome. Possibly, too, he was sincerely desirous of frustrating Charles's Catholic sympathies and secret dealings with France. Shaftesbury, with very different views, was eager in his patronage of the plot and its founder.

On 12th October occurred the murder of Godfrey, and the excitement was at its highest pitch. That Oates could ever have induced any one to believe in his tales is incredible to one who does not recollect the victories of Catholic France, the relaxing of the penal laws, the activity of the Jesuits, the fear of a standing army and of James, the agitation of the opposition led by Shaftesbury, and the ignorance and apprehension of the designs of the court. On 21st October parliament met, and, though Charles in his speech had barely alluded to the plot, all other business was put aside and Oates was called before the House. Here he gave details of a pretended apportioning by Oliva, the general of the Jesuit order, of all the chief posts to leading Roman Catholics in the country. The proceedings which followed are best read in the parliamentary history. A new witness was wanted to support Oates's story, and in November Bedloe came forward. At first he remembered little; by degrees he remembered everything that was wanted. Not even so, however, did their witness agree together, so, as a bold stroke, Oates, with great circumstantiality, accused the queen before Charles of high treason. Charles both disbelieved and exposed him, whereupon Oates carried his tale before the House of Commons. The Commons voted for the queen's removal from court, but, the Lords refusing to concur, the matter dropped. It was not, however, until 18th July 1679 that the slaughter of Jesuits and other Roman Catholics upon Oates's testimony and that of his accomplices was to some extent checked. Sir George Wakeman, the queen's physician, was accused of purposing to poison the king, and the queen was named as being concerned in the plot. The refusals of Charles to credit or to countenance the attacks on his wife are the most creditable episodes in his life. Scroggs had intimation that he was to be lenient. Sir Philip Lloyd proved Oates to have perjured himself in open court, and Wakeman was acquitted. On 26th June 1680, upon Oates's testimony, the duke of York was presented as a recusant at Westminster, and in November the informer gave evidence in the trial of Strafford. But the panic had now worn itself out, and the importance of Oates rapidly declined; so much so that after the dissolution in 1682 he was no more heard of during Charles's reign, but enjoyed his pension of £600 or £900, it is uncertain which, in quiet. Shortly before the death o. Charles, James brought, and won, a civil action against Oates, with damages of £100,000; in default of payment Oates was taken to prison; while there he was indicted for perjury, and was tried in May 1685, soon after the accession of James II. He was convicted, and received an awful sentence, the execution of which was expected to kill him, and which was rigorously carried out; but to the astonishment of all he survived.

Oates was in prison for three and a half years. Upon

the flight of James. and during the excitement against the Catholics, he partially gained his liberty, and brought an appeal against his sentence before the Lords, who, while admitting the sentence to be unjust, confirmed it by a majority of thirty-five to twenty-three. The Commons, however, passed a bill annulling the sentence; and a conference was held in which the Lords, while again acknowledging that legally they were wrong, adhered to their former determination. The matter was finally settled by Oates receiving a royal pardon, with a salary of £300 a year. In November 1689 he was again seen in Westminster Hall, when Peterborough, Salisbury, and others were impeached. In 1690, finding that there was no hope of preferment in the English Church, he became a Baptist, but in less than a year was ejected from their body. In 1691 he became acquainted with William Fuller, whom he induced to forge another plot, though not with the success he had himself attained. He appears to have lived after this chiefly in retirement, though we read in Evelyn that in 1696 he dedicated to William a book against James. He died 13th July 1705.

On the question of the place of his education see *Notes and Queries*, 22d December 1883. (O. A.)

OATH, Anglo-Saxon *áth*, a word found throughout the Teutonic languages (Gothic *aiths*, modern German *eid*), but without ascertainable etymology. The verb to *swear* is also Old Teutonic (Gothic *swaran*, modern German *schwören*); this word, too, is not clear in original meaning, but is in some way connected with the notion of answering, —indeed it still forms part of the word *answer*, Anglo-Saxon *and-swarian*; it has been suggested that the swearer answered by word or gesture to a solemn formula or act. Among other terms in this connexion, the Latin *jurare*, whence English law has such derivatives as *jury*, seems grounded on the metaphorical idea of binding (root *ju*, as in *jungo*): the similar idea of a bond or restraint may perhaps be traced in the Greek ὅρκος. It may be worth notice that the Latin *sacramentum* (whence modern French *serment*) does not really imply the sacredness of an oath, but had its origin in the money paid into court in a Roman lawsuit, the loser forfeiting his pledge, which went to pay for the public rites (*sacra*); thence the word passed to signify other solemn pledges. such as military and judicial oaths.

The subject of oaths and swearing, difficult in itself, has been made more obscure by the unsatisfactory methods employed by most writers on it. This is not due to want of ability in the writers themselves, among whom are included such men as Calvin and Paley, but to their not having followed their subject on the lines of historical development; on the contrary, the usual plan has been to accommodate to modern views. and discuss with modern arguments, an institution which originated in an early stage of knowledge. and has been confused by the changes it has undergone while being carried on into the midst of new ideas. The student who finds. by consulting modern theological and legal authorities. how indefinite are their views of the binding operation of an oath and the consequences of breaking it (apart from prosecution for perjury) will understand that its meaning must be sought, not among those who now administer and take it. but in the history of other states of culture in which it arose. The very formula, "so help you God," by which legal oaths are administered in England, has not for ages had any precise signification.

An oath may be defined as an asseveration or promise made under non-human penalty or sanction. Writers, viewing the subject among civilized nations only, have sometimes defined the oath as an appeal to a deity. It will be seen, however, by some following examples, that the harm or penalty consequent on perjury may be considered to result directly, without any spirit or deity being mentioned; indeed it is not unlikely that these mere direct curses invoked on himself by the swearer may be more primitive than the invocation of divinities to punish. Oaths scarcely belong to the lowest or savage level of life, unless when rude tribes may have learned them from more civilized neighbours. Their original appearance may rather have been in a somewhat higher barbaric stage of society, where legal forms had already come into use, and oaths were needed as a means of strengthening testimony or promise. Examples of the simplest kind of curse-oath may be seen among the Nagas of Assam, where two men will lay hold of a dog or a fowl by head and feet, which is then chopped in two with a single blow of the dao, this being emblematic of the fate expected to befall the perjurer. Or a man will stand within a circle of rope, with the implication that if he breaks his vow he may rot as a rope does, or he will take hold of the barrel of a gun, a spear-head, or a tiger's tooth, and solemnly declare, "If I do not faithfully perform this my promise, may I fall by this!" (Butler in *Journ. Asiatic Soc. Bengal*, 1875, p. 316). Another stage in the history of oaths is that in which the swearer calls on some fierce beast to punish him if he lies, believing that it has the intelligence to know what he says and the power to interfere in his affairs. In Siberia, in lawsuits between Russians and the wild Ostyaks, it is described as customary to bring into court the head of a bear, the Ostyak making the gesture of eating, and calling on the bear to devour him in like manner if he does not tell the truth (Erman, *Travels in Siberia*, vol. i. p. 492, London, 1848). Similar oaths are still sworn on the head or skin of a tiger by the Santals and other indigenous tribes of India. To modern views, a bear or a tiger seems at any rate a more rational being to appeal to than a river or the sun, but in the earlier stage of nature-religion these and other great objects of nature are regarded as animate and personal. The prevalence of river-worship is seen in the extent to which in the old and modern world oaths by rivers are most sacred. In earlier ages men swore inviolably by Styx or Tiber, and to this day an oath on water of the Ganges is to the Hindu the most binding of pledges, for the goddess will take awful vengeance on the children of the perjurer In New Guinea certain tribes are reported to swear by the sun, or a mountain, or a weapon, that the sun may burn them, or the mountain crush them, or the weapon wound them if they forswear themselves. The Tunguz brandishes a knife before the sun, saying, "If I lie may the sun plunge sickness into my entrails like this knife." The natural transition from swearing by these great objects of nature to invoking gods conceived in human form is well shown in the treaty-oath between the Macedonians and the Carthaginians recorded by Polybius (vii. 9); here the sun and moon and earth, the rivers and meadows and waters, are invoked side by side with Zeus and Hera and Apollo, and the gods of the Carthaginians. The heaven-god, able to smite the perjurer with his lightning, was invoked by the Romans, when a hog was slain with the sacred flint representing the thunderbolt, with the invocation to Jove so to smite the Roman people if they broke the oath (Liv., i. 24; Polyb., iii. 25). Another form of this Aryan rite was preserved by the old Slavonic nation of Prussia, where a man would lay his right hand on his own neck and his left on the holy oak, saying, "May Perkun (the thunder-god) destroy me!" The oaths of the lower culture show

a remarkable difference from those of later stages. In the apparently primitive forms the curse on the perjurer is to take effect in this world, as when an African negro swears by his head or limbs, which will wither if he lies; this kind of oath by the swearer's body is still found in both the Eastern and the Western worlds, and generally with the same implication of evil to fall on the part sworn by. But as nations became more observant, experience must have shown that bears and tigers were as apt to kill truth-tellers as perjurers, and that even the lightning-flash falls without moral discrimination. In the *Clouds* of Aristophanes, indeed, men have come openly to ridicule such beliefs, the Socrates of the play pointing out that notorious perjurers go unharmed, while Zeus hurls his bolts at his own temple, and the tall oaks, as if an oak-tree could perjure itself. The doctrine of miraculous earthly retribution on the perjurer lasted on in legend, as where Eusebius relates how three villains conspired to bring a false accusation against Narcissus, bishop of Jerusalem, which accusation they confirmed by solemn oath before the church, one wishing that if he swore falsely he might perish by fire, one that he might die of the pestilence, one that he might lose his eyes; a spark no man knew from whence burned to ashes the first perjurer's house and all within, the second was consumed by the plague from head to foot, whereupon the third confessed the crime with tears so copious that he lost his sight (Euseb., *Hist. Eccl.*, vi. 9). As a general rule, however, the supernatural retribution on perjury has been transferred from the present world to the regions beyond the grave, as is evident from any collection of customary oaths. A single instance will show at once the combination of retributions in and after the present life, and the tendency to heap up remote penalties in the vain hope of securing present honesty. The Siamese Buddhist in his oath, not content to call down on himself various kinds of death if he breaks it, desires that he may afterwards be cast into hell to go through innumerable tortures, among them to carry water over the flames in a wicker basket to assuage the thirst of the infernal judge, then that he may migrate into the body of a slave for as many years as there are grains of sand in four seas, and after this that he may be born a beast through five hundred generations and an hermaphrodite five hundred more.

The forms of oath belonging to all nations and ages, various as they are in detail, come under a few general heads. It may be first observed that gestures such as grasping hands, or putting one hand between the hands of another in token of homage, are sometimes treated as of the nature of oaths, but wrongly so, they being rather of the nature of ceremonies of compact. The Hebrew practice of putting the hand under another's thigh is usually reckoned among oath-rites, but it may have been merely a ceremony of covenant (Gen. xxiv. 2, xlvii. 29; see Joseph., *Ant.*, i. 16). Even the covenant among many ancient and modern nations by the parties mixing their blood or drinking one another's is in itself only a solemn rite of union, not an oath proper, unless some such ceremony is introduced as dipping weapons into the blood, as in the form among the ancient Scythians (Herod., iv. 70); this, by bringing in the idea of death befalling the covenant-breaker, converts the proceeding into an oath of the strongest kind. The custom of swearing by weapons, though frequent in the world, is far from consistent in meaning. It may signify, in cases such as those just mentioned, that the swearer if forsworn is to die by such a weapon; or the warrior may appeal to his weapon as a powerful or divine object, as Parthenopæus swears by his spear that he will level to the ground the walls of Thebes (Æschyl., *Sept. contra Theb.*, 530; see the custom of the Quadi in Ammian. Marcellin., xvii.); or the weapon may be a divine emblem, as when the Scythians swore by the wind and the sword as denoting life and death (Lucian, *Toxaris*, 38). Oaths by weapons lasted into the Christian period; for instance, the Lombards swore lesser oaths by consecrated weapons and greater on the Gospels (see Ducange, *s.v.* "Juramenta super arma"; Grimm, *Deutsche Rechtsalterth.*, p. 896). Stretching forth the hand towards the object or deity sworn by is a natural gesture, well shown in the oath of Agamemnon, who with uplifted hands (Διὶ χεῖρας ἀνασχών) takes Heaven to witness with Sun and Earth and the Erinnyes who below the earth wreak vengeance on the perjurer (Homer, *Il.*, xix. 254; see also Pindar, *Olymp.*, vii. 120). The gesture of lifting the hand towards heaven was also an Israelite form of oath: Abraham says, "I have lifted up my hand to Jehovah," while Jehovah Himself is represented as so swearing, "For I lift up My hand to heaven, and say, I live for ever" (Gen. xiv. 22; Deut. xxxii. 40; see Dan. xii. 7; Rev. x. 5). This gesture established itself in Christendom, and has continued to modern times. In England, for example, in the parliament at Shrewsbury in 1398, when the Lords took an oath on the cross of Canterbury never to suffer the transactions of that parliament to be changed, the members of the Commons held up their hands to signify their taking upon themselves the same oath (J. E. Tyler, *Oaths*, p. 99). In France a juror takes oath by raising his hand, saying, "Je jure!" The Scottish judicial oath is taken by the witness holding up his right hand uncovered, and repeating after the usher, "I swear by Almighty God, and as I shall answer to God at the great day of judgment, that I will," &c. In the ancient world sacrifice often formed part of the ceremony of the oath; typical examples may be found in the Homeric poems, as in Agamemnon's oath already mentioned, or the compact between the Greeks and Trojans (*Il.*, iii. 276), where wine is poured out in libation, with prayer to Zeus and the immortal gods that the perjurer's brains shall, like the wine, be poured on the ground; the rite thus passes into a symbolic curse-oath of the ordinary barbaric type. Connected with such sacrificial oaths is the practice of laying the hand on the victim or the altar, or touching the image of the god. A classic instance is in a comedy of Plautus (*Rudens*, v. 2, 45), where Gripus says, "Tange aram hanc Veneris," and Labrax answers "Tango" (Greek instance, Thucyd., v. 47; see Justin, xxiv. 2). Thus Livy (xxi. 1) introduces the phrase "touching the sacred objects" (*tactis sacris*) into the picturesque story of Hannibal's oath. Details of the old Scandinavian oath have been preserved in Iceland in the Landnámabók (*Islendinga Sögur*, Copenhagen, 1843): a bracelet (baugr) of two rings or more was to be kept on the altar in every head court, which the godi or priest should wear at all law-things held by him, and should redden in the blood of the bullock sacrificed, the witness pronouncing the remarkable formula: "Name I to witness that I take oath by the ring, law-oath, so help me Frey, and Niörd, and almighty Thor," (hialpi mer svâ Freyr, ok Niördr, ok hinn almâttki Âss), &c. This was doubtless the great oath on the holy ring or bracelet which the Danes swore to King Alfred to quit his kingdom ("on tham halgan beage," *Anglo-Sax. Chron.*; "in eorum armilla sacra," Ethelwerd, *Chron.*, iv.). An oath, though not necessarily expressed in words, is usually so. In the Homeric instances the prayer which constitutes the oath has a somewhat conventional form, and in the classical ages we find well-marked formulas. These are often references to deities, as "by Zeus!" "I call Zeus to witness" (ναὶ μὰ Δία; ἴστω Ζεύς); "by the immortal gods!" "I call to witness the ashes of my ancestors" (per deos immor-

tales; testor majorum cineres). Sometimes a curse is invoked on himself by the swearer, that he may perish if he fail to keep his oath, as "the gods destroy me," "let me perish if," &c. (dii me perdant; dispeream si). An important class of Roman oaths invokes the deity to favour or preserve the swearer in so far as he shall fulfil his promise—"as the gods may preserve me," "as I wish the gods to be propitious to me" (me ita di servent; ita deos mihi velim propitios). The best Roman collection is to be found in the old work of Brissonius, *De Formulis et Solemnibus Populi Romani Verbis*, Paris, 1583. Biblical examples of these classes of oaths are "as the Lord liveth" (1 Sam. xiv. 39, and elsewhere), "so do God to me, and more also" (2 Sam. iii. 35, and elsewhere).

The history of oaths in the early Christian ages opens a controversy which to this day has not been closed. Under Christ's injunction, "Swear not at all" (Matt. v. 34; also James v. 12), many Christians seem at first to have shrunk from taking oaths, and, though after a time the usual customs of judicial and even colloquial oaths came to prevail among them, the writings of the Fathers show efforts to resist the practice. Chrysostom perhaps goes furthest in inveighing against this "snare of Satan": "Do as you choose; I lay it down as a law that there be no swearing at all. If any bid you swear, tell him, Christ has spoken, and I do not swear" (Homil. ix. in *Act. Apostol.*; see a collection of patristic passages in Sixt. Senens., *Bibliothec. Sanct.*, vi. adnot. 26). The line mostly taken by influential teachers, however, was that swearing should indeed be avoided as much as possible from its leading to perjury, but that the passages forbidding it only applied to superfluous or trifling oaths, or those sworn by created objects, such as heaven or earth or one's own head. On the other hand, they argued that judicial and other serious swearing could not have been forbidden, seeing that Paul in his epistles repeatedly introduces oaths (2 Cor. i. 23; Phil. i. 8; Gal. i. 20). Thus Athanasius writes: "I stretch out my hand, and as I have learned of the apostle, I call God to witness on my soul" (*Apol. ad Imp. Const.*; see Augustine, *De Mend.*, 28; *Epist.*, cl., iii. 9; cl., iv. 250; *Enarr. in Psalm.* lxxxviii. (4); *Serm.*, 307, 319). This argument is the more forcible from Paul's expressions being actually oaths in accepted forms, and it has also been fairly adduced that Christ, by answering to the adjuration of the high priest, took the *judicial* oath in solemn form (Matt. xxvi. 63). The passages here referred to will give an idea of the theological grounds on which in more modern times Anabaptists, Mennonites, and Quakers have refused to take even judicial oaths, while, on the other hand, the laws of Christendom from early ages have been only directed against such swearing as was considered profane or otherwise improper, and against perjury. Thus from the 3d or 4th century we find oaths taking much the same place in Christian as in non-Christian society. In the 4th century the Christian military oath by God, Christ, the Holy Spirit, and the majesty of the emperor is recorded by Vegetius (*Rei Milit. Inst.*, ii. 5). Constantine's laws required every witness in a cause to take oath; this is confirmed in Justinian's code, which even in some cases requires also the parties and advocates to be sworn (*Cod. Theod.*, xi. 39; *Justin. Cod.*, iv. 20, 59). Bishops and clergy were called upon to take oath in ordination, monastic vows, and other ecclesiastical matters (see details in Bingham, *Antiq. of Chr. Church*, xvi. 7). By the Middle Ages oaths had increased and multiplied in Christendom far beyond the practice of any other age or religion. The Reformation made no change in principle, as is seen, for instance, in Art. xxxix. of the church of England: "As we confess that vain and rash swearing is forbidden Christian men by our Lord Jesus Christ, and James His apostle, so we judge, that Christian Religion doth not prohibit, but that a man may swear when the Magistrate requireth, in a cause of faith and charity, so it be done according to the Prophet's teaching, in justice, judgement, and truth." But about this time began a legal reformation, which has for reasons of public policy continually reduced the number of oaths required to be taken, and apparently tends toward their total abolition.

The history of swearing in early Christendom would lead us to expect that the forms used would be adopted with more or less modification from Hebrew or Roman sources, as indeed proves to be the case. The oath introduced in the body of one of Constantine's laws—"As the Most High Divinity may ever be propitious to me" (Ita mihi summa Divinitas semper propitia sit)—follows an old Roman form. The Roman oath by the genius of the emperor being objected to by Christians as recognizing a demon, they swore by his safety (Tertull., *Apol.*, 32). The gesture of holding up the hand in swearing has been already spoken of. The Christian oath on a copy of the Gospels seems derived from the late Jewish oath taken holding in the hand the scroll of the law (or the phylacteries), a ceremony itself possibly adapted from Roman custom (see treatise "Shebuoth" in *Gemara*). Among the various mentions of the oath on the Gospels in early Christian writers is that characteristic passage of Chrysostom in a sermon to the people of Antioch: "But do thou, if nothing else, at least reverence the very book thou holdest forth to be sworn by, open the Gospel thou takest in thy hands to administer the oath, and, hearing what Christ therein saith of oaths, tremble and desist" (*Serm. ad Pop. Antioch.*, Homil. xv.). The usual mode was to lay the hand on the Gospel, as is often stated in the records, and was kept up to a modern date in the oath in the university of Oxford, "tactis sacrosanctis Evangeliis"; the practice of kissing the book, which has now almost superseded it in England, appears in the Middle Ages (J. E. Tyler, *Oaths*, pp. 119, 151). The book was often laid on the altar, or (after the manner of ancient Rome) the swearer laid his hand on the altar itself, or looked towards it; above all, it became customary to touch relics of saints on the altar, a ceremony of which the typical instance is seen in the representation of Harold's oath in the Bayeux tapestry. Other objects, as the cross, the bishop's crosier, &c., were sworn by (see Ducange, *s.v.* "Jurare"). An oath ratified by contact or inspection of a sacred object was called a "corporal" or bodily oath, as distinguished from a merely spoken or written oath; this is well seen in an old English coronation oath, "so helpe me God, and these holy euangelists by me bodily touched vppon this hooly awter." The English word signifying the "sacred object" on which oath is taken is *halidome* (Anglo-Saxon, *háligdóm*; German, *heiligthum*); the halidome on which oaths are now sworn in England is a copy of the New Testament. Jews are sworn on the Old Testament; the sacred books of other religions are used in like manner, a Mohammedan swearing on the Koran, a Hindu on the Vedas.

Among the oath-formulas used in Christendom, that taken by provincial governors under Justinian is typical of one class: "I swear by God Almighty, and His only begotten Son our Lord Jesus Christ, and the Holy Ghost, and the Most Holy Glorious Mother of God and ever Virgin Mary, and by the Four Gospels which I hold in my hand, and by the Holy Archangels Michael and Gabriel," &c. The famous oath of the kings Louis and Charles at Strasburg in 842 (A.D.) runs: "By God's love and the Christian people and our common salvation, as God shall give me knowledge and power," &c. Earlier than this, as in the oath of fealty in the capitularies of Charlemagne in 802, is found the familiar form "Sic me adjuvet

Deus," closely corresponding to above-mentioned formulas of pre-Christian Rome. This became widely spread in Europe, appearing in Old French "Si m'ait Dex," German "So mir Gott helfe," English "So help me God." A remarkable point in its history is its occurrence in the "So help me Frey," &c., of the old Scandinavian ring-oath already described. Among the curiosities of the subject are quaint oaths of kings and other great personages: William Rufus swore "by that and that" (per hoc et per hoc), William the Conqueror "by the splendour of God," John "by God's teeth"; other phrases are given in Ducange (*l.c.*), as "per omnes gentes," "per coronam," "par la sainte figure de Dieu," "par la mort Dieu," &c.

Profane swearing, the trifling or colloquial use of sacred oaths, is not without historical interest, formulas used being apt to keep up traces of old manners and extinct religions. Thus the early Christians were reproved for continuing to say "*mehercle!*" some of them not knowing that they were swearing by Hercules (Tertull., *De Idol.*, 20). Oaths by deities of pre-Christian Europe lasted into the modern world, as when a few generations ago Swedish peasants might be heard to swear, "Odin take me if it is not true!" (Hylten-Cavallius, *Wärend och Wirdarne*, vol. i. p. 228). The thunder-god holds his place still in vulgar German exclamations, such as "Donner!" (Grimm, *Deutsche Mythologie*, pp. 10, 166). The affected revival of classical deities in Italy in the Middle Ages still lingers in such forms as "per Bacco!" "corpetto di Bacco!" (by Bacchus! face of Bacchus!). In France the concluding oath of the last paragraph has dwindled into "mordieu!" or "morbleu!" much as in England the old oaths by God's body and wounds became converted into "odd-bodikins!" and "zounds!"

The oaths now administered among civilized nations are chiefly intended for maintaining governments and securing the performance of public business. They fall under the headings of political, ecclesiastical, and legal. In England the coronation oath is to be administered by one of the archbishops or bishops in the presence of all the people, who, on their parts, reciprocally take the oath of allegiance to the crown.

The archbishop or bishop shall say: "Will you solemnly promise and swear to govern the people of this kingdom of England and the dominions thereto belonging according to the statutes in parliament agreed on, and the laws and customs of the same?" *The king or queen shall say:* "I solemnly promise so to do." *Archbp. or bp.* "Will you to your power cause law and justice, in mercy, to be executed in all your judgments?" *K. or Q.* "I will." *Archbp. or bp.* "Will you, to the utmost of your power, maintain the laws of God, the true profession of the Gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this nation, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them, or any of them?" *K. or Q.* "All this I promise to do." *After this the king or queen, laying his or her hand upon the holy Gospels, shall say:* "The things which I have here before promised I will perform and keep; so help me God," *and then shall kiss the book.*

The chief officers of state take an "official" oath well and truly to serve his (or her) majesty. Special oaths are taken by privy councillors, archbishops and bishops, peers, baronets and knights, recruits, and others. The old oath of allegiance, as administered (says Blackstone) upwards of 600 years, contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him without defending him therefrom" (Blackstone, *Commentaries*, book i. chap. x.). In the reign of William III. it was replaced by a shorter form, and in the present reign stands: "I —— do swear that I will be faithful and bear true allegiance to Her Majesty Queen Victoria, her heirs and successors, according to law." Statutes of Charles II. and George I. enacted that no member should vote or sit in either house of parliament without having taken the several oaths of allegiance, supremacy, and abjuration. The oath of supremacy in the reign of William III. was: "I A B doe swear that I doe from my heart abhorr detest and abjure as impious and hereticall this damnable doctrine and position that princes excommunicated or deprived by the Pope or any authority of the see of Rome may be deposed or murdered by their subjects or any other whatsoever. And I doe declare that no forreigne prince person prelate state or potentate hath or ought to have any jurisdiction power superiority preeminence or authoritie ecclesiasticall or spirituall within this realme. Soe," &c. The oath of abjuration introduced in the time of William III. recognizes the king's rights, engages the juror to support him and disclose all traitorous conspiracies against him, promises to maintain the Hanoverian Protestant succession, and expressly renounces any claim of the descendants of the late Pretender. This oath was not only taken by persons in office, but might be tendered by two justices to any person suspected of disaffection. In modern times a single parliamentary oath was substituted for the three, and this was altered to enable Roman Catholics to take it, and Jews were enabled to sit in parliament by being allowed to omit the words "on the true faith of a Christian." In its present form the parliamentary oath consists of an oath of allegiance and a promise to maintain the succession to the crown as limited and settled in the reign of William III. The "judicial" oath taken by judges of the Court of Appeal or of the High Court of Justice, and by justices of the peace, is "to do right to all manner of people after the laws and usages of this realm, without fear or favour, affection or ill-will." Jurors are sworn, whence indeed their name (*juratores*); in felonies the oath administered is: "You shall well and truly try and true deliverance make between our sovereign lady the Queen and the prisoner at the bar whom you shall have in charge, and a true verdict give according to the evidence." In misdemeanours the form is: "Well and truly try the issue joined between our sovereign lady the Queen and the defendant, and a true verdict," &c. The oath of the jurors in the Scottish criminal courts is: "You [the jury collectively] swear in the name of Almighty God and as you shall answer to God at the great day of judgment that you will truth say and no truth conceal in so far as you are to pass upon this assize." The oldest trace of this form of oath in Scotland is in *Reg. maj.*, i. cap. 11, copied from Glenville, which points to an origin in the Norman inquest or "recognition." In the ancient custom of compurgation, once prevalent in Europe, the accused's oath was supported by the oaths of a number of helpers or compurgators who swore to their belief in its validity. A remnant of it lasted on till the 17th century in the "ex officio" oath of a clergyman cited before the ecclesiastical court for misconduct, who might be required to call his neighbours as compurgators to swear to their belief in his innocence. The *jusjurandum* or decisory oath of Roman law, which was of greater authority than *res judicata* (*Digest* xii. 2, 2), is still represented in modern law by the *serment décisoire* of the Code Civil, and the "reference to the oath of the party" of Scotch law (see the case of Longworth *v.* Yelverton, in *Law Reports*, 1 Scotch Appeals, 218). Such an oath is final and conclusive. It has something in common with the old "wager of law" in England, abolished by 3 and 4 William IV. c. 42, s. 13, in so far as it makes an oath the *finis litium*. The decisory oath was formerly used in the ecclesiastical courts (Burn, *Eccl. Law*, *s.v.* "Oaths"). It seems to be still used in admiralty cases in Massachusetts (Dunlop, *Adm. Pr.*, 290). Witnesses are sworn: "The evidence you shall give . . . shall be the truth, the whole truth, and nothing but the truth. So," &c. Where a witness is sworn on the *voir dire*, the oath is: "You shall true answer make to all such questions as the court shall demand of you. So help you God." As to witnesses of religions other than Christian, an oath is to be administered to them in such form and with such ceremonies as they may declare to be binding. The great number of oaths formerly required have been much reduced by modern legislation, in many cases a voluntary declaration before a justice, notary, &c., being substituted. Many alterations of the English law as to oaths have been made of late years in relief of those conscientiously objecting. Quakers, Moravians, and Separatists are allowed to make affirmation, whether as witnesses or on other occasions, where an oath was formerly required. Thus a Quaker in the witness-box affirms by answering "Yea!" and when taking his seat in parliament substitutes for "swear" the words "solemnly, sincerely, and truly declare and affirm," and omits "So help me God." The Evidence Further Amendment Act, 1869 (32 and 33 Vict. c. 68, s. 4), allowing affirmations in place of oaths in certain cases in judicial proceedings, is by the Evidence Amendment Act, 1870 (33 and 34 Vict. c. 49), extended to proceedings before all persons having authority to administer oaths. It was specially intended to meet the case of an arbitrator. But the right to affirm in lieu of taking the parliamentary oath has been held not to apply to the case of avowed atheists, as appears from the case of Mr Charles Bradlaugh, elected member for Northampton, but not permitted to take the affirmation and sit (1883; see Clarke *v.* Bradlaugh, 7 Q. B. D. 38). False witness given under affirmation is punishable as perjury. Profane swearing and cursing is punishable by law, any labourer, sailor, or soldier being liable to forfeit 1s., every other person under the degree of a gentleman 2s., and every gentleman or person of superior rank 5s., to the poor of the parish.

The administering or taking of certain oaths is criminal in English and Scotch law. It is a felony punishable by penal servitude for life (*a*) to administer or cause to be administered or aid or assist at the administering of any oath or engagement purporting or intending to bind the person taking the same to commit treason or murder or any felony which on the 12th of July 1812 was punishable with death; (*b*) to take any such oath or engagement, not being compelled thereto (52 George III. c. 104, s. 1). It is a felony punishable with penal servitude for seven years (*a*) to administer or cause to be administered or aid or assist at or be present and consenting to the administering or taking of any oath

or engagement purporting or intending to bind the person taking the same to engage in any mutinous or seditious purpose; to disturb the public peace; to be of any association, society, or confederacy formed for any such purpose; to obey the orders or commands of any committee or body of men not lawfully constituted, or of any leader or commander, or other person not having authority by law for that purpose; not to inform or give evidence against any associate, confederate, or other person; not to reveal or discover any unlawful combination or confederacy or any illegal act done or to be done, or any illegal oath or engagement which may have been administered or tendered to or taken by any person, or the import of any such oath or engagement; (*b*) to take any such oath or engagement, not being compelled thereto (37 George III. c. 123, s. 1). Compulsion is no defence unless the person taking the oath or engagement within fourteen days (in the case of oaths falling under 52 George III. c. 104) or within four days if not prevented by actual force or sickness, and then within four days after the cessation of the hindrance produced by such force or sickness (in the case of oaths falling under 37 George III. c. 123), declares the circumstances of the administration of the oath by information on oath before a justice of the peace or a secretary of state or the privy council, or, if on active service, to his commanding officer. The Draft Criminal Code proposes to incorporate these provisions with little alteration. The Irish Act (50 George III. c. 102) is more stringent than 37 George III. c. 123, as the person administering the oath is punishable with penal servitude for life, the person taking the oath is punishable as in England and Scotland. A club or society in which members are required or permitted to take an unlawful oath is unlawful, and the members may be proceeded against either summarily or by indictment (39 George III. c. 79, 57 George III. c. 19). The latter statute, as appears from the preamble, was specially aimed at the *corresponding* societies which existed in Great Britain at the time of the French Revolution.

Politicians and moralists have placed much reliance on oaths as a practical security. It has been held, as Lycurgus the orator said to the Athenians, that "an oath is the bond that keeps the state together" (Lycurg., *Leocr.*, 80; see Montesquieu, *Spirit of Laws*). Thus modern law-books quote from the leading case of Omychund *v.* Barker: "No country can subsist a twelvemonth where an oath is thought not binding; for the want of it must necessarily dissolve society." On the other hand, wherever the belief in supernatural interference becomes weakened, and oaths are taken with solemn form but secret contempt or open ridicule, they become a serious moral scandal, as had already begun to happen in classical times. The yet more disastrous effect of the practice of swearing is the public inference that, if a man has to swear in order to be believed, he need not speak the truth when not under oath. The early Christian fathers were alive to this depreciation of ordinary truthfulness by the practice of swearing, and opposed, though unavailingly, the system of oaths which more and more pervaded public business. How in the course of the Middle Ages oaths were multiplied is best seen by examining a collection of formulas such as the *Book of Oaths* (London, 1649), which range from the coronation oath to the oaths sworn by such as valuers of cloths and the city scavengers.[1] Oaths of allegiance and other official oaths are still taken throughout Europe, but experience shows that in times of revolution they are violated with little scruple, and in the case of the United Kingdom it is doubtful whether they have any more practical value than, if so much as, simple declarations. The question of legal oaths is more difficult. On the one hand, it is admitted that they do induce witnesses, especially the ignorant and superstitious, to give evidence more truthfully than they would do on even solemn declaration. On the other hand, all who practise in courts of justice declare that a large proportion of the evidence given under oath is knowingly false, and that such perjury is perceptibly detrimental to public morals. The lowering of truth in ordinary intercourse, which follows from the requirement of swearing as a confirmation in public matters, remains much as it was in ancient times. One noteworthy point is that an effect is now produced by oaths foreign to their proper purpose, which is to use the sanction of religion for the enforcement of obligations; now, however, the oath has passed into a sanction of the religion, so that an oath taken in legal form is construed as a confession of faith in Christianity, or at least in the existence of God. (E. B. T.)

[1] As to reform of the excessive multiplication of oaths see Paley, *Moral Philosophy*, book iii. part i. chap 16; and J. E. Tyler, *Oaths*.

OBADIAH (עֹבַדְיָה, Ὀβδειού, Ἀβδιού, Abdias) is a name pretty frequent in the Old Testament, meaning "servant" or worshipper "of Jehovah." It is synonymous with Abdi and Abdeel, and of a type common in Semitic proper names; compare the Arabic ʽAbdallâh, Taimallât, ʽAbd Manât, &c., the Hebrew Obed Edom, and many Phœnician forms. The name of Obadiah is prefixed to the fourth and shortest book of the minor prophets, and as no date or other historical note is added it is not surprising that an early Hebrew tradition recorded by Jerome (*Comm. in Ob.*) identified the prophet with the best-known Obadiah of the historical books, the protector of the prophets in the reign of Ahab (1 Kings xviii.). His tomb was shown in Samaria with those of Elisha and John the Baptist, and the *Epitaphium Paulæ* describes the wild performances, analogous to those of modern dervishes, that took place before these shrines.

It is now agreed on all hands that it is vain to connect Obadiah the prophet with any other Obadiah of the Old Testament, and that our only clue to the date and composition of the book lies in internal evidence. The prophecy is directed against Edom. Jehovah has sent a messenger forth among the nations to stir them up to battle against the proud inhabitants of Mount Seir, to bring them down from the rocky fastnesses which they deem impregnable. Edom shall be not only plundered but utterly undone and expelled from his borders, and this he shall suffer (through his own folly) at the hand of trusted allies (vers. 1-9). The cause of this judgment is his cruelty to his brother Jacob. In the day of Jerusalem's overthrow the Edomites rejoiced over the calamity, grasped at a share of the spoil, lay in wait to cut off the fugitives (vers. 10-14). But now the day of Jehovah is near upon all nations, Esau and all the heathen shall drink full retribution for their banquet of carnage and plunder on Jehovah's holy mountain. A rescued Israel shall dwell in Mount Zion in restored holiness; the house of Jacob shall regain their old possessions; Edom shall be burned up before them as chaff before the flame; they shall spread over all Canaan, over the mountain of Esau and the south of Judah as well as over Gilead and the Philistine and Phœnician coast. The victorious Israelites shall come up on Mount Zion to rule the mountain of Esau, and the kingdom shall be Jehovah's (vers. 15-21).

In vers. 10-14 the expositor finds sure foothold. The calamity of Jerusalem can only be the sack of the city by Nebuchadnezzar; the malevolence and cruelty of Edom on this occasion are characterized in similar terms by several writers of the exile, but by none with the same circumstance and vividness of detail as here (Ezek. xxv. 8, 12 *sq.*, xxxv.; Lam. iv. 21; Psalm cxxxvii.). It is impossible to doubt that these verses were written under the lively and recent impression of the events to which they refer; to regard them as predictive (Caspari, Pusey, &c.) is to misunderstand the whole character of prophetic foresight, and to ascribe them with Hitzig to the Persian or Greek period is equally unreasonable. The opening verses of the prophecy, on the other hand, present a real difficulty. Obad. 1-6, 8 agree so closely and in part verbally with Jer. xlix. 14-16, 9, 10, 7 that the two passages cannot be independent; nor does it seem possible that Obadiah quotes from Jeremiah, for Obad. 1-8 is a well-connected whole, while the parallel verses in Jeremiah appear in different order, interspersed with other matter,

and in a much less lucid connexion. In Jeremiah the picture is vague, and Edom's unwisdom (ver. 7) stands without proof. In Obadiah the conception is quite definite. Edom is attacked by his own allies, and his folly appears in that he exposes himself to such treachery. Again, the probability that the passage in Jeremiah incorporates disjointed fragments of an older oracle is greatly increased by the fact that the prophecy against Moab in the preceding chapter uses, in the same way, Isa. xv., xvi., and the prophecy of Balaam. In spite of the objections of Blau (*Z. D. M. G.*, xx. 173 *sq.*) there is no good reason to doubt that the prophecy against Edom ascribed to Jeremiah is really from his pen; it is earlier than the fall of Jerusalem,[1] and is one of a circle of prophecies in which Nebuchadnezzar (the lion ascending from Jordan, ver. 19) appears as the instrument of divine judgment on the nations. This being so, it seems necessary to conclude, with Ewald (*Propheten*, i. 489 *sq.*), Graf (*Jeremia*, p. 558 *sq.*), and others, that Jeremiah and our book of Obadiah alike quote from an older oracle. Ewald supposes that the treacherous allies of Edom are the Aramæans and the time that of Ahaz (2 Kings xvi. 6): but the tone of the prophecy seems rather to refer it to a later date, when Edom had been for some time independent and powerful; and it is not improbable that in Obad. 1-8 we have the first mention of that advance of the Arabs upon the lands east of Palestine which is referred to also in Ezek. xxv. (comp. Moab, vol. xvi. p. 535). That the book of Obadiah, short as it is, is a complex document might have been suspected, apart from Jer. xlix., from an apparent change of view between vers. 1-9 and vers. 15 *sq.* In the former verses Esau is destroyed by his allies, and they occupy his territory, but in the latter he perishes with the other heathen in the day of universal retribution, he disappears before the victorious advance of Israel, and the southern Judæans occupy his land.

The eschatology of Obadiah contains little that is peculiar. The conceptions of the "rescued ones" (פלטה), of the sanctity of Zion, of the kingship of Jehovah, are the common property of the prophets from the time of Isaiah. The restoration of the old borders of Israel and the conquest of Edom and the Philistines are ideas as old as Amos ix., Isa. xi. 14; but the older prophets more often represent this conquest as a suzerainty of Israel over its neighbours, as in the days of David, while in Obadiah, as in other later books, the intensified antithesis—religious as well as political—between Judah and the surrounding heathen finds its expression in the idea of a *consuming judgment* on the latter,—the great "day of Jehovah." This view is not, however, original in Obadiah; it is already expressed in Zephaniah. Between Joel and Obadiah there are points of material and verbal agreement, so close as to imply that Joel used the earlier book (Joel iii. 19.—Ob. 10, 14; Joel iii. 3,—Ob. 11; Joel ii. 32, iii. 17,—Ob. 17). Another characteristic common to Obadiah with the latest prophets is that, while he uses the words house of Jacob and house of Joseph, the northern tribes have become to him a mere name; the restoration he thinks of is a restoration of the kingdom of Jerusalem, and even Gilead is to be occupied not by Joseph but by Benjamin.

An indication of the place where Obadiah wrote seems to lie in ver. 20, where he speaks of "the exiles in this חל." The word as pointed has been variously explained to mean "bulwark" or "army"; it may also be read as "sand" or "sea-coast" (Ewald), but, as the text of the verse is not sound and cannot be translated without some correction, it is unsafe to build on this obscure allusion. The prominence given to Edom, and the fact that Chaldæa is not mentioned at all, make it probable that the book was not written in Babylonia. The same verse speaks of exiles in Sepharad. Sepharad is probably Sardis, the Çparda of Darius in the Behistun inscription. Many of the Jews were doubtless sold as slaves by Nebuchadnezzar. Lydia was a great slave-market, and Asia Minor was a chief seat of the Diaspora at an early date (comp. Gutschmidt, *Neue Beiträge*, p. 77), so that this identification does not supply ground for Hitzig's argument that Obadiah was written in the Greek period, when we read of many Jews being transplanted to Asia Minor (Jos., *Ant.*, xii. 3). Schrader, however (*K. G. F.*, 116 *sq.*; *K. A. T.*, 446), thinks of a Shaparda mentioned by Sargon, and lying in south-west Media.

Literature.—The commentaries on the minor prophets (see Hosea); Jäger, *Ueber das Zeitalter Obadja's*, Tubingen, 1837; Caspari, *Der Pr. Obadja*, 1842; Delitzsch in *Z. f. Luth. Th.*, 1851. A fuller list is given by Reuss, *Gesch. des A.T.* (1881), p. 449. (W. R. S.)

[1] In ver. 12 "have assuredly drunken" should be "shall assuredly drink."

OBAN, a seaport town and parliamentary burgh of the Western Highlands of Scotland, is situated in Argyllshire, 70¾ miles north-west of Callander by rail, and 96 from Glasgow. It lies along a deep and sheltered bay in the Firth of Lorn opposite the island of Kerrera, and its villas are scattered over the hill-slopes behind. The public buildings comprise six churches, a court-house, four banks, a high school, and a large number of hotels. There are no manufactures except the distilling of whisky; but eleven fairs for cattle, sheep, horses, &c., are annually held in the town. A considerable trade is carried on in connexion with the fisheries, particularly in herrings. Oban is an important centre of the Highland tourist traffic. The rental of the burgh increased from £1719 in 1847 to £7160 in 1864, and upwards of £20,000 in 1882; and the population, which was only 1480 in 1831 and 2413 in 1871, reached 3991 in 1881, or, within the extended area, 4330.

A Renfrew trading company erected what was practically the first house in Oban in 1713; a custom-house was built in 1763; in 1786 the hamlet was made a Government fishing-station; in 1791 a plan was drawn up for laying out a large village; and in 1796 the Stevensons started a shipbuilding-yard, which remained in operation for about thirty years. Made a burgh of barony in 1811, Oban became a parliamentary burgh in 1832, and adopted the Lindsay Act in 1862.

OBELISK. See Alexandria, vol. i. p. 495; Architecture, vol. ii. p. 390; and Egypt, vol. vii. pp. 768, 778. The obelisk known as "Cleopatra's Needle," referred to in vol. i. p. 495 as having been offered to the English Government by Mehemet Ali, but declined, has since been brought to London, and placed on the Thames Embankment in 1878. The other was conveyed to the United States and erected in Central Park, New York, in 1880.

OBERAMMERGAU, a small village in the mountain valley of the Ammer, in Upper Bavaria, lies 2760 feet above the sea, and about 45 miles to the south-west of Munich. In 1880 it contained 1349 inhabitants, who were mainly engaged in making toys and in carving crucifixes, images of saints, and rosaries. Many of the houses are adorned with quaint frescos of Biblical subjects. The interest of Oberammergau to the outer world is derived from the Passion Plays which are performed here by the villagers at intervals of ten years (the last in 1880), and are now attended by many thousands of European and American visitors.

The Oberammergau Passion Play, or dramatic representation of the sufferings of Christ, is not a survival of a mediæval mystery or miracle-play, but took its rise from a vow made by the inhabitants in 1633, with the hope of staying a plague then raging. The original text and arrangements were probably made by the monks of Ettal, a monastery a little higher up the valley; but they were carefully remodelled by the parish priest at the beginning of the present century, when the Oberammergau play obtained exemption from the general suppression of such performances by the Bavarian Government. The music was composed by Rochus Dedler, schoolmaster of the parish in 1814. The performances take place on the Sundays of summer, in a large open-air theatre holding 6000 persons, and each lasts about nine hours, with a short intermission at noon. Each scene from the history of Christ is prefaced by a tableau of typical import from the Old Testament. About 700 actors are required, all belonging to the village. The proceeds of the performances are devoted to the good of the com-

munity, after defrayal of the costs and payment of a small remuneration to the actors. The villagers regard the Passion Play as a solemn act of religious worship, and the performances are characterized by the greatest reverence. The principal parts are usually hereditary in certain families, and are assigned with regard to moral character as well as dramatic ability. It is considered a disgrace not to be allowed to take part in the play, and the part of Christ is looked upon as one of the greatest of earthly honours. In the years intervening between the representations the villagers are carefully drilled in dramatic performances by their pastor, and most witnesses agree in rating very highly the results produced by the combined religious fervour and artistic instinct of these Alpine peasants. It is to be feared, however, that the concourse of fashionable visitors who now flock to the performance will gradually have the effect of impairing its genuineness and simplicity.

Edward Devrient (in 1850) was among the first to direct general attention to Oberammergau; and numerous German monographs have since appeared on the same subject. A short notice of the play is also given by Hase, *Das Geistliche Schauspiel* (Engl. tr. by A. W. Jackson, 1880). English accounts of the performances have been given by Blackburn (new ed., 1880), MacColl (reprinted from the *Times*, 1880), Molloy (1880), Oxenham (1880), and others. An English version of the text of the Passion Play has been published by E. Childe (1880). Articles on the subject have also appeared in the following magazines:—*Century*, 1883; *Blackwood's*, vol. cviii.; *Contemporary*, vol. xviii.; *Macmillan's*, vol. ii.; *Harper's*, vols. xlii. and xliii.; *Once a Week*, vol. xxiii.

OBERHAUSEN, a Prussian town of recent origin, in the province of the Rhine, is situated 5 miles from the east bank of that river and 20 miles to the north of Düsseldorf. Its importance is due to the fact of its being one of the busiest railway junctions in Germany, and to the extensive coal-pits in the vicinity. The town also possesses iron-works, rolling-mills, zinc smelting-works, railway workshops, and manufactures of wire-rope, glass, porcelain, and soap. The annual export of coals is estimated at about 700,000 tons. The first houses of Oberhausen were built in 1845, and it received its municipal charter in 1875. In 1880 it contained 16,680 inhabitants, of whom 12,079 were Roman Catholics.

OBERLIN, a village of the United States, in Russia township, Lorain county, Ohio, 35 miles west-south-west of Cleveland by the Lake Shore and Michigan Railway, has a population of 3242 (1880), and is well known as the seat of Oberlin College. This institution for liberal education, open to all irrespective of sex or colour, was founded in 1833 by the Rev. John J. Shipherd and Philo P. Stewart, and named in honour of J. F. Oberlin; by the year 1835 it comprised a theological seminary, a college proper, a ladies' department, and a preparatory school; and since then a conservatory of music has been added. In 1883 nine distinct buildings were occupied by the various sections; the total number of teachers was 73, and of pupils 1474 (698 male, 776 female, 78 coloured), and the library contained 20,000 volumes.

OBERLIN, JEAN FRÉDÉRIC (1740-1826), pastor and philanthropist, was the son of a teacher, and was born 31st August 1740 at Strasburg, where he studied theology. In 1766 he became Protestant pastor of Waldbach, a remote and poverty-stricken region in the Steinthal (Ban de la Roche) in Alsace. At once he set himself to better the material equally with the spiritual condition of the inhabitants. He began by constructing roads through the valley and erecting bridges, inciting the peasantry to the enterprise by himself taking a mattock and commencing operations. His example proved equally effectual in introducing an improved system of agriculture, with the result that the sterile Waldbach soon "began to blossom as the rose." Substantial cottages were erected, various industrial arts were introduced, and activity and comfort began to prevail in homes formerly tenanted by listless and ignoble poverty. Regarding the intellectual needs of his parishioners Oberlin was also keenly solicitous. He founded an itinerant library, originated infant schools—the first that have existed—and established an ordinary school at each of the five villages in the parish. In the work of education he received great assistance from Louise Scheppler, who lived in his house in the capacity of servant and housekeeper. By his unselfish devotion to their interests Oberlin won so entirely the confidence of his parishioners that he was consulted in the most minute domestic affairs, and his word became the recognized unwritten law of the district. He died 1st June 1826, and was interred with great manifestations of honour and affection at the village of Fouday. Since his death the Steinthal has suffered no interruption to its prosperity. When he began his labours its inhabitants did not number more than 500; in the beginning of the century they had increased to about 3000; and now they are supposed to number about 6000.

Among the numerous narratives of the labours of Oberlin mention may be made of Sims, *Brief Memorials of Oberlin*, London, 1830; *Memoirs of Oberlin, with a short notice of Louisa Scheppler*, London, 1838, 2d ed. 1852; H. Ware, *Biography of Oberlin*, Boston, 1845; Spach, *Oberlin le pasteur*, Strasburg, 1865, 2d ed. 1868; Riff, *Drei Bilder aus dem Leben von Papa Oberlin*, Strasburg, 1880; and Butler, *Life of J. F. Oberlin*, 1882. The collected writings of Oberlin were published by Burkhardt at Stuttgart in 1843, in 4 vols.

OBERLIN, JÉRÉMIE JAQUES (1735-1806), archæologist, brother of Jean Frédéric Oberlin noticed above, was born at Strasburg 8th August 1735. While studying theology at the university he devoted special attention to Biblical archæology. In 1755 he was chosen professor at the gymnasium of his native town, in 1763 librarian to the university, in 1770 professor of rhetoric, and in 1782 of logic and metaphysics. Oberlin published several manuals on archæology and ancient geography, and made frequent excursions into different provinces of France to investigate antiquarian remains and study provincial dialects, the result appearing in *Essai sur le patois Lorrain*, 1775; *Dissertations sur les Minnesingers*, 1782-89; and *Observations concernant le patois et les mœurs des gens de la campagne*, 1791. He also published several editions of Latin authors. He died 10th October 1806.

OBERON (Auberon, Alberon), king of the fairies, husband of Titania, first appears in literature as protector of the hero in *Huon de Bordeaux*, a chanson de geste, dating from about the 12th century (see FRANCE, vol. ix. p. 638). The name corresponds to the German Alberich or Elferich (elf-king). The fairy element in the legend of Huon has been treated in modern times by Wieland in the poem, and by Weber in the opera, of *Oberon*; and the story of the elf-king's quarrel with Titania, as every one knows, supplies an important *motif* in Shakespeare's *Midsummer Night's Dream*.

OBESITY. See CORPULENCE, vol. vi. p. 435.

OBI. See SIBERIA.

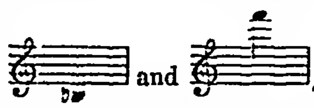
OBLIGATION, in law, is a term derived from the Roman law, in which *obligatio* signified a tie of law (*vinculum juris*) whereby one person is bound to perform or forbear some act for another. The *obligatio* of Roman law arose either from voluntary acts or from circumstances to which legal consequences were annexed. In the former case it was said to arise *ex contractu*, from contract, in the latter *quasi ex contractu*, *ex delicto*, or *quasi ex delicto*,—that is to say, from tort, or from acts or omissions to which the law practically attached the same results as it did to contract or tort. *Obligatio* was used to denote either end of the legal chain that bound the parties, the right of the party who could compel fulfilment of the *obligatio*, the *creditor*, or the duty of the party who could be compelled to fulfilment, the *debitor*. In English law obligation has only the latter sense. Creditor and debtor have also lost their Roman law signification; they have been narrowed to mean the parties where the obligation is the payment of a sum of money. In English law obligation is used in at least four senses—(1) any duty imposed by law; (2) the special duty created by a *vinculum juris*; (3) not the duty, but the evidence of the duty,—that is to say, an instrument under seal, otherwise called a bond; (4) the

operative part of a bond. The third use of the word is chiefly confined to the older writers. *Simplex* and *duplex obligatio* were the old names for what are now more commonly called a single and a double or conditional bond. The party bound is still called the obligor, the party in whose favour the bond is made the obligee. The fourth like the third, is a use scarcely found except in the older writers. The word "bond" is of course a mere translation of *obligatio*. Obligations may be either perfect or imperfect. A perfect obligation is one which is directly enforceable by legal proceedings; an imperfect or moral obligation (the *naturalis obligatio* of Roman law) is one in which the *vinculum juris* is in some respects incomplete, so that it cannot be directly enforced, though it is not entirely destitute of legal effect. A perfect obligation may become imperfect by lapse of time or other means, and, conversely, an imperfect obligation may under certain circumstances become perfect. Thus a debt may be barred by the Statute of Limitations and so cease to be enforceable. The obligation, however, remains, though imperfect, for if there be a subsequent acknowledgment by the debtor, the debt revives, and the imperfect obligation becomes again perfect. At one period there was some doubt among English lawyers whether a moral obligation could be regarded as sufficient consideration for a contract; it has now, however, been long decided that it cannot be so regarded.

The Scotch law as to obligations closely follows the Roman. As in English law, the term obligation is used to express the instrument itself by which the obligation is imposed. The bond or unilateral obligation of Scotch law is a simple contract to pay the sum borrowed, &c., with interest. The English bond is generally a contract to pay double the sum of the debt, with a condition that the bond is to be void if the debt be paid by a certain day. In Scotch law gratuitous obligations rank in competition with the claims of creditors; in English law a voluntary bond, though effectual against the grantor, cannot be set up against creditors. Bonds in Scotland which are heritable securities still rank as immovables for certain purposes, though they have been made movables as regards the succession of the creditor, unless executors are expressly excluded (31 and 32 Vict. c. 101, s 117).

American law is in general agreement with English, except in the case of Louisiana, where the terms obligor and obligee are used in as wide a sense as the *debitor* and *creditor* of Roman law. By art. 3522 of the Louisiana civil code obligor or debtor means the person who has engaged to perform some obligation, obligee or creditor the person in favour of whom some obligation is contracted, whether such obligation be to pay money or to do or not to do something. The term obligation is important in America from its use in art. i. s. 10 of the constitution of the United States, "No State shall pass any law . . . impairing the obligation of contracts." This does not affect the power of Congress to pass such a law. Contracts between private individuals are of course within the provision. So are private conveyances, charters of private corporations, and statutory and other grants by a State. On the other hand, marriage and divorce, and arrangements which are political in their nature, such as charters of municipal corporations, licences to carry on particular trades, or regulations of police, are not within the provision. In order to fall within it, the law must act upon the terms of the agreement, and not merely upon the mode of procedure. If it act not upon the terms but upon the remedy, it impairs the obligation if it purport to be retrospective, but it is valid so far as it applies to subsequent contracts.

OBOE, or HAUTBOY. The oboe is an instrument containing a conical column of air, which is set in vibration by means of a double-tongued reed. A series of holes pierced in the side of the pipe permits the instrumentalist to progressively shorten the column by the successive opening of the lateral holes, and thus produce a series of fundamental sounds, the scale of which, in the primitive instruments without keys, does not exceed the extent of an octave. All wind instruments with a conical column of air, whatever may be the mode by which that is set in motion, are subject to the laws of vibration of open pipes, according to which, by a stronger pressure in blowing, the oboe reproduces each of its fundamental sounds in the octave higher, and thus acquires a scale of two octaves, which, partially chromatic in the old instruments, has become completely chromatic by the adoption of keys. This extension of compass is further augmented in modern instruments, in the grave sounds by keys permitting lengthenings of the primitive column of air, and in the acute by the employment of other partial sounds than the first of the harmonic series. In the present day the mean chromatic extent of the oboe is comprised between the notes



The double reed is the most simple, as it is probably the oldest, of all reed contrivances. It is sufficient to flatten the end of a wheat straw to constitute an apparatus capable of setting in vibration by the breath the column of air contained in the rudimentary tube; the invention of this reed is certainly due to chance. An apparatus for sonorous disturbance thus found, it was easy to improve it: for the wheat stalk a reed stalk was substituted, and in the extremity of its pipe another reed stalk much shorter in length was inserted, pared and flattened at the end; and then came the lateral holes, probably another discovery of the great inventor chance. For the reed tube a wooden one was substituted, still preserving the reed tongue, and it is in this form, after having played an important part amongst the sonorous contrivances of antiquity, that we find the ancestor of the oboe playing a part no less important in the 16th century, in which it formed the interesting families of the cormornes, the corthols, and the cervelas. All these families have disappeared in the instrumental combinations of Europe, but they are still to be found in Eastern wind instruments, such as the Caucasian *salamouri*, the Chinese *kvantze*, and the *hitshiriki* of Japan. It is important to remark that the column of air in a cylindrical pipe, disturbed by any reed, submits to the laws of vibration of stopped pipes; accordingly, to produce a sound of a given pitch, the pipe must be theoretically half as short as an open pipe would be to obtain a note of the same pitch. Moreover, open pipes under an increasing pressure of blowing, produce, in subdividing the air column, the harmonics according to the arithmetical progression 2, 3, 4, 5, &c., while the stopped pipes can only produce the odd harmonics in the series. In other words, the conical pipe reproduces its fundamental sounds in the interval of the octave, the cylindrical in that of the twelfth. A double reed associated with a cylindrical pipe can only be used for columns of air of small diameter. Practice has demonstrated that the reed stalk of which the tongue reed is made should not be of narrower internal diameter than the pipe containing the column of air it is to act upon. By the flattening necessary to form the tongues of a double reed, it must be tolerably large, from which it happens that its proper sound is relatively grave, and will only agree with instruments not above the region of the male voice. It must be remembered that the reproduction of fundamental sounds in the twelfth is only possible by an artifice of modern invention. But it is evident that chance has again intervened to show that a very small double reed can set in vibration columns of air of considerable diameter, provided that the column becomes gradually narrower towards its superior extremity where it receives the reed, so as to terminate in a diameter equivalent to that of the reed itself. It is impossible to say when it was that man first employed the phenomena of double reeds and conical pipes, but the knowledge of them must at least have been later than that of the cylindrical pipe, which we may regard as directly furnished by nature. That antiquity made use of them, however, has been proved by M. Gevaert in his admirable *Histoire de la musique dans l'antiquité*; but this learned author shows that the double-reed pipes held but

an insignificant place in the instrumental music of ancient Greece and Rome.

The instrument we call oboe appears for the first time in Sebastian Virdung's *Musica getutscht und auszgezogen* (1511). It there bears the name of *schalmey*, and is already combined with an instrument of similar construction called *bombardt*. This beginning of the oboe family suggests the possibility of Virdung's schalmey having existed in the Middle Ages. Where, when, and how it was introduced into western Europe is at present unknown, but the *zamr-al-kebîr* still used in Moslem countries is practically identical with it, a circumstance which suggests the possibility of its having been brought into Europe by the crusaders.

The manufacture of musical instruments could not remain unaffected by the great artistic movement known as the Renaissance; accordingly, we find them not only improved and purified in form in the 16th century, but also ranged in complete families from the soprano to the bass. Prætorius, in his *Syntagma Musicum* (1615-20), gives us the full nomenclature of the family with which we are concerned, composed of the following individuals.
